Along with the above-mentioned Remedies, external Discutients, nervous and balsamic Medicines, are to be used: Of this kind Sternutatories have a remarkably discutient Quality, and especially volatile Sal Ammoniac dried, and incorporated with Oil of Sage, Oil of Marjoram, and Balsam of Peru, snuffed up the Nose; or, which is still more effectual, Extract of Guaiacum Wood, in the Form of Refin, which remains after an Evaporation of the Decoction of that Wood, and was discovered by myself. Two or three Grains of this, taken up the Nose, excite a Sneezing, and powerfully draw the Phlegm from all Parts of the Head. A Bag likewise, stuffed with Valerian-root, Fennel-seed, and Rose-flowers, and besprinkled with the Water called, by the French, *L'Eau d'Arquebuse*, may be applied to the Eyes; or the Steam of the Infusion, mentioned in the preceding Paragraph, may be admitted into them. But, of all other Medicines, my *Balsamum Vitæ* is the most powerful, when Part of it is rubbed on the Temples, and Part of it dropt upon Sugar, and swallowed down; for, by using it in this manner, I have often carried off this Sort of Blindness, which has not been of a long standing.

PRACTICAL CAUTIONS.

Before Cauteries and Setons be used, the Body must be drained not only of its too great Quantity of Blood and Humours, but also of their Impurities; and the first Organs of Digestion must be cleared of all manner of Impurities: For which purpose Bleeding, mild Laxatives, and Medicines that

dilute and cleanse the Blood, are previously to be used. The same Caution ought to be used with regard to Sternutatories; for if they should be administered before the Body and Head are sufficiently purged, they would occasion a violent Afflux of Humours to the Head; but when the Body is duly prepared, they are of singular Advantage in the Beginnings of the Disease.

II.

Of corroborating Medicines, which are, at the same time, possess of a discutient Quality, my *Balsamum Vitæ* is one of the most efficacious against a *Gutta Serena*, especially if it proceeds from the falling of a serous Humour upon the Optic Nerves of phlegmatic Patients; in which Case, I have known this Balsam applied, upon Linen Cloths, to the Head and Forehead, about the Beginning of the Disease, entirely to remove the Blindness. But greater Caution is to be used in Bodies full of Blood, where the great Quantity and Congestion of Blood has brought on the Disorder; for, in that Case, Temperance, and such Medicines as not only diminish the Mass of Blood, but likewise check the Rapidity of its Motion, are most proper.

III.

As to the Use of external Applications, every one must see, that they are plainly of no Moment, in a true and inveterate Amaurosis, because their Virtues cannot reach the Parts affected; but when the Fault is not in the Optic Nerve itself, but rather in the Eye, and its Humours, or other Parts, then topical Applications are of considerable Importance; the chief of which are, either a Fomentation of the Decoction of Valerian-root, Cubebs, and Fennel-seed, made with Water and Wine, and conveyed into the Eyes, by means of a Funnel for that Purpose; or Cataplasms made after the following manner:

Take of the Roots of Angelica, of Master-wort, and Valerian, each two Ounces; of the Herb Chervil, German Leopard's-bane, of the Flowers of Elder, Lavender, and Roses, each three Pugils; of the Seeds of Fennel and Dill, each one Dram and an half; cut and beat them to a Powder, which boil in equal Quantities of Rose-water, and the Water called by the French *L'Eau d'Arquebuse*.

IV.

Sometimes the Cure of an obstinate Amaurosis is most seasonably and advantageously attempted by Hunger and Abstinence; which are principally conducive to this Purpose, in impure and cacoehymic Constitutions, and such as abound with Blood and Juices; but this Method previously requires the Patient to be gently, but at the same time effectually, purged. If a Cure is intended this way, the Patient must eat only a little boiled Bread, a little roasted Flesh, and Raisins; he must carefully avoid all Wine and Ale, and drink a Decoction of Sarsaparilla, Liquorice, Raisins, and Fennel-seed; in which Course he must persist for three or more Weeks, as the State of the Disease shall require.

V.

There is great Hope of curing a *Gutta Serena*, which seizes young Girls and Children after the Small-pox, the Measles, and other eruptive Disorders; for as the Years of Maturity approach, and the Menstrual Discharges begin to appear, it either quits the Patient of its own Accord, or is surprisingly lessened; and at this Season there is particular Occasion for proper Means to assist and promote the Menstrual Discharge, a singular Example of which Case I have given, *Syst. Tom. 4. P. 1. Cap. 8.*

CASES stated, and Answers.

A Man, thirty Years old, about six Years ago, exposed his Body to a sudden Cold, after he had been over-heated by hard Labour, and violent Exercise; hence he felt a heavy Pain in his Head, and happening, at the same time, to get a Contusion of his Right Eye, he perceived the Sight of it to be very weak; whilst at the same time no Fault or Defect appeared externally: He therefore had recourse to various Remedies, Vesicatories, Fontanels, Collyriums, and Purgatives, but all to no Purpose. Before he had remained two Years in this Condition, he was seized with the Itch, after which the Disorder was also conveyed to his other Eye; the Sight of which was not only weak, but he also perceived Sparks and Atoms dancing before it, and saw every Object double with it. He was besides harassed with a prodigious Ringing of his Ears, great Weakness of the Stomach, Eructations, and Flatulencies, Costiveness, and spasmodic Pains in his Joints; his Complexion was of a livid Colour, and he still continued to live a sedentary Life, which called for a frequent Exercise of the Mind, and much Writing.

REFLECTIONS.

This Indisposition deserves the Name of a beginning, and, as yet, imperfect *Gutta Serena*, and has its Seat in the Optic Nerve, and in the Brain; for which Reason, no Fault appears externally.

externally. It arises from the cacochymical Impurity of the Blood and Humours; for daily Experience teaches us, that People of scorbutic, cacochymic, and cachectic Constitutions, are much subject to Disorders of the Eyes from an internal Cause, and that in them the Distemper is convey'd from one Eye to the other. The Itch of the Patient now under our Consideration, his bad Digestion, his Flatulencies, the Pains in his Joints, and the Singing of his Ears, all concur to prove the bad and corrupted State of his Fluids, which was originally brought on by his sedentary Life, as well as the exposing of his Body, when hot, to a sudden Cold: By this means also, a Foundation was laid for the Weakness of his Sight; for, in Consequence of this, the repressed Humours flowed more plentifully to the fore Parts of the Brain, and his Right Eye happening to be contused, obstinately crowded upon its Nerves, which were now weakened by the Contusion. It had been easier to have removed this Disorder, in its Infancy, by proper Medicines; but now it is become inveterate, and has gained so much Ground, the Task is altogether difficult. But I am not of Opinion, that we are, for this Reason, to lose our Courage, or give way to Despair: It is our Business, rather, first to attempt the rendering the Juices mild and balsamic, and then to set about strengthening and invigorating the nervous Parts which have been weakened. The former of these Intentions is answered by Decoctions of the Woods, antimonial Tinctures, absorbent and diaphoretic Powders, Purgatives made up of the Gums, and a proper Regimen, with regard to the Non-naturals. The latter is answered by Plasters, made with cephalic and aromatic Oils, liquid Balsams, and resinous Gums, applied to the Forehead and Temples: Spirit of Wine also, strongly impregnated with Camphire, and mixed with Essence of Peruvian Balsam; and, last of all, my *Balsamum Vitæ*, are proper in this Case. If these Means, for a considerable time persisted in, do not answer the Intention; and if the vital Juices are not, by them, rendered sufficiently sweet and balsamic, it will not be amiss to raise a gentle Salivation, which is most conveniently done by Preparations of Cinnabar, or Æthiops Mineral: However, after sufficiently purging the first Organs of Digestion by the Cephalic Pills, or any other proper Purge, let the Æthiops Mineral be given every Morning, to the Extent of ten Drams, with half a Dram of Sugar, and two Drops of the Oil of Turkish Balm, for three or more Weeks, as Circumstances require; and let the Patient have, for his Drink, a Decoction of China Root, with Raisins and Cinnamon; and use, at the same time, a proper Diet and Regimen. By this Method I have known Persons happily recovered, who, by violent Contusions of the Head, have been in imminent Danger of becoming blind, but yet not without the Use of Externals.

C A S E II.

A Girl, seven Years old, of a weak and tender Constitution, and of a livid unwholesome Complexion, which often assumed a yellowish Cast, fell into a slight Fever, attended with a Pain of her Back and Head, and with a Vertigo when she stood up. On the third Day, after the Fever seized her, her Skin was all covered over with little red Eruptions; to prevent the farther spreading of which, temperating and gently expelling Medicines, together with a low Regimen, were prescribed. Notwithstanding which, these Eruptions sometimes disappeared; upon which Occasion she complained of Shiverings, and sometimes broke out again, with an intense Heat of the Skin: Besides she complained, especially about the seventh Day, of an intolerable Pain in her Head and Eyes; and when she was afterwards cured of this Disorder, she was, all on a sudden, so effectually deprived of her Sight, that she could see nothing at all: No Fault or Defect appeared externally in her Eyes, unless that the Pupil seemed to be a little larger, and more dilated, than usually.

R E F L E C T I O N.

This Disease, which brought on the *Gutta Serena*, was the Purple Fever, a Disease much incident to Children, especially those of cachectic Constitutions, who, thro' the Weakness of their Stomach, and the Want of Energy in the Bile, contract a great deal of impure Serum; for the Purple Fever is occasioned by an impure and acrid Serum, stagnating in the small glandular Ducts, which Serum is, by the feverish Commotion, protruded into the Habit. If the Quantity of this Serum is greater than it should be, or if the Constitution is weak, or, which amounts to the same, if the Patient be destitute of such Motions as are necessary for expelling it, hence it happens, that a Taint is even communicated to the solid Parts by the corrupt Juices, which stagnate here and there, and vellicate them. For this Reason we observe, that lingering Coughs, Consumptions, slow Fevers, Diarrhoeas, Head-achs and Megrims, not only accompany, but also succeed this Disease. Hence 'tis pretty plain, that in the present Case, this Serum falling upon the Head, and especially

on the Optic Nerves, brought on the *Gutta Serena*; the Cure of which consists chiefly in purging the Body of the corrupted Mass of serous Humours, which have received a Taint from the Purple Fever, and in draining them from the Head. For which Intention, besides internal Purifiers of the Blood, diluting Decoctions, Diaphoretics, and Laxatives, I say besides these, Vescicatories are of singular Service, provided only they be applied betimes; for by drawing the acrid Serum to the Skin or Surface of the Body, they rid the Head of it. Besides, we are to endeavour by mild and balsamic Stomachics, to restore Strength, and a vigorous digestive Faculty, to the Stomach, that so a generous Chyle, and laudable Juices, may be generated.

C A S E III.

A Girl nine Years old, who during the whole Course of her Life had been troubled with Defluxions of Rheum, Achors, and Tumours of the Glands of her Neck, her Nostrils being sometimes extraordinarily dry, was seized with a Vertigo, and so great Pains in her Back, and Hypochondria, that a Vomiting and Head-ach coming on at the same time, she was oblig'd to keep her Bed. Growing better in a few Days, she again expos'd herself to the open Air, which was then very cold; but relapsing, she was seiz'd with a prodigious Vertigo, a Swelling of her Face, and a slight Fever, attended with the Purples. Soon after, being heated by a strong Commotion of Mind, she fell into an epileptic Fit, during which her Teeth ground strongly upon each other, her Eyes were fixed and staring, her Senses lost, and her Pulse vehement and unequal. About an Hour after she had recover'd from this Paroxysm, she became quite blind, and amidst the exquisite and racking Pains of her Head, threw up, by a Vomit, a considerable Quantity of bilious Filth. By injecting a Clyster, and administering antispasmodic, absorbent, and diaphoretic Medicines, her Vomiting and Head-ach were render'd less, but her Blindness remained the same for four Days; on every one of which the above-mentioned Paroxysms return'd. When her continual Watchings bore hard upon her, and her Pains began again to rack her vehemently, in the Evening a few Grains of the *Pilulæ de Cynoglossa* were prescrib'd, upon which she had an easier Night than usual; and when next Morning, she took in an Infusion, by way of Tea, a little of the *Oleum Cajaputi*, her whole Body was cover'd with a plentiful Sweat; and she all on a sudden recover'd her Sight: But an Hour after the Head-ach returning, she was seiz'd with a total Blindness; and next Day all her Spasms and Pains being less'n'd, her Sweat return'd with so much Success, that the Patient by means of its long Continuance, was, in sixteen Days time, restored at once to her Sight and Health.

R E F L E C T I O N.

1. This Case shews us what terrible Mischief may be produced by the acrid Serum protruded to the Skin in the Purple Fever, when 'tis retain'd within the Body. It frequently happens, that it lies dormant in the Body for some time, and only by some accidental Cause begins to exercise its Tyranny. In the present Case, two accidental Causes concurr'd, the Commotion of her Mind, and her being expos'd to the Cold, by both which violent Spasms were brought upon the nervous System; and the Cold affecting the Skin, the noxious Humours were in too great a Quantity driven inwards, and especially towards the Head.
2. The Blindness which happen'd in this Case deserves to be call'd Spasmodic, since by Spasms of the external and lower Parts, the Humours, being driven forcibly upwards, affected not only the Membranes of the Brain, whence the Epilepsy proceeded, but likewise the nervous Membranes of the Eyes. Hence it happen'd, that plentiful Sweats coming on, the acrid Serum was evacuated, the Spasms banish'd, and all the other Symptoms remov'd.

C A S E IV.

An Infant, scarce yet a Quarter old, was seized with the Small-pox, which not suppurating, nor coming out as it should have done, disappear'd again in three Days time. After this, the State of his Health being bad and inconstant, he was frequently troubled with Defluxions of Rheum, and before a Year was expir'd, a kind of Hardness appear'd in his Abdomen. For removing this Symptom, besides other Medicines, he had a Vomit given him twice in one Week, by which spontaneous Vomiting, and a Looseness of his Belly, were brought on, and continued for ten Days. Then these Excretions ceasing, the Swelling of his Abdomen fell, but a great Weakness succeeded; notwithstanding which a good Appetite, and a Habit of sleeping well, continued long. Last of all, he was seized with a total Loss of Sight, his Eyes remaining, to Appearance, without any Defect; his Body, tho' sufficiently muscular for one of his Age, was yet so weak and languid, that when he was raised from his Bed, his Joints seem'd, as it were, to collapse and yield under him; a Trembling frequently seiz'd his Left Arm,

Arm, his Head swell'd, and it was with great Difficulty he could speak. His Belly was sufficiently loose, and his Appetite good; but his Nostrils were continually dry, and frequent Sweats broke out upon him.

REFLECTION.

The Cause of the Symptoms, which succeed the Small-pox, now at a Stand, is a *serous Plethora*, or a great Abundance of thick and impure Serum and Lymph in the Body, which is no uncommon Case with most Infants. Hence Defluxions of Rheum on the Ears, Nostrils, Eyes, and Head, are not more incident to Persons of any Age, than to Infants and Children. In our present Patient indeed, the stopping of the Small-pox laid the Foundation for the subsequent Train of Disorders; for the excrementitious Humours, which in other Cases use to be thrown off by this Species of Exanthema, being retain'd in the Body, corrupted the serous and lymphatic Juices; the Pustles not being duly thrust out, by reason, probably, of a natural Weakness of the Nerves: Hence arose the Catarrhs, and the Hardness of the Abdomen. And a Translocation happening of the serous Matter to the Brain, and spinal Marrow, hence sprung paralytic Relaxations of various Parts, as of the Eyes, the Tongue, and the Nerves, which go off to the Feet and Arms.

The Cure of this terrible Disorder consists almost wholly in the Use of internal Medicines, which must be calculated at once to remove the Viscidity, and lessen the Quantity of the Lymph. I therefore think it advisable to proceed in the following Method: After purging the Body with a sufficient Quantity of *Cornachinus's Powder*, let the Patient take every Morning of the Powder made of well prepar'd Cinnabar, five Grains; Crabs-eyes, eight Grains; and of *Mercurius dulcis*, half a Grain. After using this for six Days, let a Laxative be again taken. And then, after taking the Powder for six Days more, let the Laxative be repeated. Under this Course, let the Patient have for his Drink a Decoction of three Ounces of *Sarsaparilla Root*, of the Bark of *Sassafras Wood*, three Drams; of *Salt of Tartar*, half a Dram, boil'd in a close Vessel with twelve Pints of Spring-water, which let him also drink instead of Tea. Let his Food also be attenuating, and let him eat no Flesh, but what is roasted, and *fine Wheat Bread*, and these too in a very small Quantity. After this, for about eight Days, let his Body be put into a Bath of common Water, Wheat-bran, and Pot-ash; after which, let the Nape of his Neck, and his Os Sacrum, be anointed with *Unguentum Nervinum*. Internally, let him continue the Use of the above-mentioned Decoction; and a little before his Meals, let him drink, in order to strengthen his Stomach, an Elixir made of the Essence of white Burnet, and red Gentian, each half an Ounce; Sweet Spirit of Nitre two Drams; and Oil of Mace, Cedar, and Cinnamon, of each six Drops. Externally, let him apply to his Nostrils the dry volatile *Sal Ammoniac*, impregnated with the unadulterated Oil of *Marjoram*. I do not in the least doubt, but the Consequences of this Method will be very good.

CASE V.

A Boy twelve Years old, subject for some Years past to Catarrhs, Heaviness, and a Cough, a moist Season and Northerly Winds coming on, was seized with a Fever, attended with a Catarrh, which on the ninth Day was followed with a grievous Pain of the Head and Eyes; and at last, a total Blindness. No Defect appear'd in his Eyes, unless that the Pupil contracted itself, and the Boy could but just distinguish Light from Darkness; his Appetite was good, and his Stools were regular enough. After, therefore, he had laboured a whole Fortnight under this Disorder, various kinds of Medicines being used to no Purpose, he was committed to my Care; and I made use of nothing but my balsamic Pills to be taken once a Week, and Linen Cloths soaked in my Balsam of Life, apply'd twice a Day to his Forehead and Temples; by which means, accompany'd with the Blessing of Heaven, he in a few Weeks recovered his Sight entirely.

REFLECTION.

This Gutta Serena seems to be only a Bastard one, which arises from a Defluxion of Serum surrounding the nervous Parts, which serve for the several Purposes of Sight and Vision; for the Optic Nerve, inasmuch as 'tis contain'd in the Brain, is in such a Case almost free from all Hurt, and as yet brings a most subtil Fluid to the nervous Parts of the Eye, which being nevertheless compress'd on all Sides by the serous Filth, become scarce fit for receiving the Rays of Light, and answering the Purposes of Vision. Hence, we frequently observe, that Infants and Children, who are of too phlegmatic Constitutions, or who are troubled with Defluxions of Rheum, labour under such Defects both of Seeing and Hearing, in which Case we prescribe Medicines against the Catarrh; but since such were in our present Case used to no

Purpose, nothing remain'd for us to do, but by corroborating and nervous Medicines, such as my Balsam of Life is, to discuss the stagnating Juices, and strengthen the weaken'd Parts. *Hoffman, Vol. 3. Cap. 4.*

Some Cases referr'd to in the preceding Dissertation.

CASE I.

A Man thirty seven Years old, of a sanguine melancholic Constitution, had from his Infancy been addicted very much to study, and reading in the Night; but had applied himself that way in an uncommon Degree, for the last two Years, having the Education of Youth committed to his Care: For then he study'd till late at Night, and rose again by four next Morning. As he took nothing till Dinner-time, except a Glass of burnt Wine, and as he used very little Drink at his Meals, he was always inclinable to be covetous. Having liv'd in this way for about two Years and an half, upon a violent Fit of Anger, he was seiz'd first with a Head-ach, accompany'd with a Sensation, which is usually call'd Formication. After which he became suddenly blind, with a Dulness of Hearing; faltering in his Speech, and tenseive Pains in his Right Leg and Arm. Baths for his Feet were immediately order'd; and a Vein was open'd in the Left Foot, from which, as well as from that open'd in his Left Arm about a Fortnight before, no Blood was discharg'd: Upon this, Scarification upon the Nape of his Neck, and the Crown of his Head, which he had formerly been accusom'd to, but which had been omitted for the last two Years, were prescrib'd; and for removing his Costiveness, emollient Clysters were injected: Then his Sight return'd in some Degree, so that he could see better by a lighted Candle than one sees by the Light of the Moon; however he could not as yet read, but still complain'd of small Clouds before his Eyes.

I being call'd to a Consultation, prescrib'd this Powder first of all:

Take of Native Cinnabar prepar'd, Crabs-eyes, and prepar'd Amber, each two Drams; of volatile Salt of Amber, and Hartshorn, each ten Grains, and mix them up into a Powder. Let a Dram be taken for a Dose.

Then I prescrib'd the following Pills:

Take of *Mercurius dulcis*, and of my Pills, each one Dram; of the Extractum Panchymagogum of *Crollius*, half a Dram; of Extract of Castor, four Grains: Mix; and out of each Scruple make twenty Pills.

The Patient took twenty of these Pills every Morning for three Days successively; then for five Days successively, in the Morning and at Night he took the Powder: Then the Pills for three Days more; then again the Powder; and thus he us'd them alternately.

I also order'd him the following Decoction:

Take of Valerian-root, one Ounce; Balm, one Handful; Fennel-seed, two Drams: Cut and bruise them together. This Powder is to be us'd like Tea: The Patient is to receive the Steam of it into his Eyes in the Morning; and after taking the Medicines prescrib'd, he is to drink eight or ten Cups of the Infusion itself.

I also prescrib'd him my Balsam of Life, and desired him to apply it to his Nostrils, and anoint his Temples with it. I also order'd him to take eight Drops of it in the Morning, in the before-mention'd Infusion. Lastly, he daily us'd Baths for his Feet, which reach'd as far as the Calfs of his Legs, made with Wheat-bran and Chamomile-flowers; and by this Course duly persisted in, he in a few Weeks recover'd the perfect Use of his Sight.

REFLECTION.

Blindness which comes on suddenly, seems to be a Palsy, and is occasion'd principally by the Separation of the Serum from the Blood, and its Stagnation about the Thalami of the Optic Nerves, the Compression of which thinders the free Influx of the Animal and Nervous Fluid into the Optic Nerves: Hence arises a Loss of Sight, the Structure of the Eye remaining at the same time, to all Appearance, unalter'd; for outwardly no Fault or Blemish can be discovered in them. This Stagnation of the Serum proceeds principally from the Weakness of the Brain, and too great a Relaxation of its Fibres, which renders the Course of the Blood thro' this Part somewhat more difficult: The Blood, in Consequence of this, remaining as it were pent up in the Vessels of the Brain, lets fall its serous Parts, which being thrown together pretty plentifully in some Place at the lower Part of the Brain, compress sometimes one, and sometimes another, Pair of Nerves; and either deprave

deprave or quite destroy the Functions of those Parts, to which the said compress'd Nerves are branch'd out and extended. In the Case now under our Consideration, too intense Application of Mind, frequent and too long protracted Watchings, together with long and obstinate Grievs, had greatly weaken'd the Brain, and the Pairs of Nerves arising from it; for such is the Nature and Tendency of these Things, that when they concur and meet together, they render the Patient subject to grievous Head-achs, Melancholy, the Palsy, the Apoplexy, and Drowsiness; to this End contributed also the Thickness and Impurity of his Blood, together with its Congestion in the Brain, all which Circumstances are to be ascrib'd to his too great Abstemiousness in point of Drink, his Use of Wine in the Morning, the stubborn Costiveness of his Belly, and his intermitting his usual Evacuations of Blood by Venesection or Scarification. We need not therefore wonder, that in such a State of the Humours and Brain, the Blood being, by the strong Commotion of Mind, thrown upon the Brain with an uncommon Force, and remaining there, should excite not only the heavy Pain in his Head, and Blindness, but also the pungent and darting Pains in his Right Foot and Arm. But since the Disorder was not inveterate; but as yet of a short standing, we may easily conceive, that there still remain'd some Hopes of restoring the Patient's Sight, provided only proper Medicines should be prescrib'd, and duly and seasonably administred.

For answering which Intention, besides Venesection, Scarification, and Purgatives, those Medicines are most proper which attenuate and discuss the stagnating Humours, and derive them from the Head, and upper Parts, to those that are lower, and less noble, and which invigorate and restore the whole System of weakened Nerves. But as right mercurial Preparations, and especially those of the cinnabarine kind; duly and seasonably administred, are very effectual for removing the stagnating Lymph, and putting it in a proper Motion, even in the remotest Parts; and as this Truth is sufficiently confirm'd, from their Use in Venereal Cases; I have, on this Account, us'd them, and that too with remarkable Success, in long and grievous Head-achs, Palsies, and Epilepsies, not only with an Intention to purge, but also to promote a Diaphoresis, which is the more easily brought about, by the Patient's drinking at the same time warm Infusions impregnated with some Substance of a diaphoretic Quality. Having therefore remov'd the Causes, and attenuated the Humours stagnating about the Thalami of the Optic Nerves, nothing is more proper than to strengthen and corroborate the Brain, and nervous System, by the Use of the richest Balsamics, as well externally as internally, and to restore their pristine Tone, and Strength, to the relax'd and weaken'd Fibres; for which Purposes my liquid Balsam is greatly to be commended. From the History, and successful Cure of this Disease, we may infer, that Mercurials, and Preparations of Cinnabar, together with the Use of Balsamics, are extremely efficacious for removing Blindness, or the *Gutta Serena*, when not old and inveterate; nor is it to be doubted, but the like Practice would be attended with Success in other terrible Disorders of the Head and Brain, which proceed from the Extravasation and Stagnation of any Quantity of the serous Part of the Blood, provided only such Disorders are taken in time. *Hoffman, Consult. Med. Cent. I. Sect. I. Cas. 42.*

C A S E II.

A certain Gentlewoman forty nine Years old, who had in her Constitution a Mixture of Choler and Melancholy, having liv'd sixteen Years without a Husband, and had always enjoy'd a perfect State of Health, except from her Infancy, she was troubled with a small Difficulty of Breathing. This Gentlewoman, happening to be expos'd to Colds and Hardships, had her menstrual Evacuations very irregular, for the Space of two Years; sometimes they were too copious, sometimes suppress'd for three Months, and during the last Year they ceas'd entirely. Upon this, being often troubled with Inflammations of her Eyes, she always found means to remove them, till in the Month of December 1726, they return'd with double Force, accompanied with pungent Pains, and seiz'd first her Right, and then her Left Eye. Upon this, there ensued a kind of Dilatation of the Iris, and a Dimness of Sight, which by Degrees increas'd to such a Degree, that she became quite incapable of discerning any Object. Her Eyes indeed were free from Pain, but not altogether without Inflammation; and the crystalline Humour of the Right Eye appear'd whiter than in its natural State it ought to do; nor was it as yet plain, whether a Cataract, or a Glaucoma, threaten'd the Patient. In the Left Eye the Pupil only appear'd to be dilated, and the Humours turbid. For removing these Symptoms, various Means were us'd, such as Bleeding in the Feet, as well as in the Arms, Vescicatories, Fontanels in the Nape of her Neck,

V O L. I.

and Arms, Baths for her Feet, Collyriums, Bags of discutient Ingredients apply'd to her Eyes, Purgatives, Mercurials, Sudorifics, Millepedes mix'd with native Cinnabar, and the Spawwaters: But the Symptoms were so far from being remov'd by these means, that they rather acquir'd new Force, and render'd the Patient very anxious and uneasy.

R E M A R K S.

If we look for the immediate Cause of this Disorder, it seems to consist partly in a Corruption and Disturbance of the crystalline and vitreous Humours of the Eye, which are naturally pellucid; which Corruption is occasion'd by an Afflux of thick and impure Lymph, and partly in the Optic Nerves being hurt and injur'd; for these, I mean the Optic Nerves, being compress'd by the Load of impure and stagnating Humours thrown upon them, on that very Account the Access of the nervous Fluid to the Retina is prevented; and the Sight being by this means destroy'd, a *Gutta Serena* is brought on, of which we may be convinc'd by the too great, and almost paralytic Dilatation of the Pupil and Iris. Since therefore these Symptoms are brought on by too great an Afflux of Humours to the Head and Eyes, and especially to those Parts that are most contiguous to the Brain, which is plain from their Redness, Pain, and Inflammation; and since this Afflux was brought on, and is still encourag'd, partly by the ceasing of her menstrual Discharges; and partly by her Commotion of Mind, and her being frequently expos'd to Colds, great Care must, in the first Place, be taken to free the Eyes of the Humours which stagnated in them, and to prevent their flowing to the same Parts for the future; and then the nervous and membranous Parts of the Eye are to be strengthen'd, and the natural Transparency of its several Humours restor'd.

This is no easy Task in this inveterate Disorder; at least, the Means commonly prescrib'd in parallel Cases, such as Setons, Vescicatories, Fontanels, Mercurials, Collyriums, Discutients, Sudorifics, and Purgatives, will all be us'd to no manner of Purpose: But you ought not for this to lose all Hopes, nor lay aside all Thoughts of recovering the Patient, especially since I find, that such Medicines, as both from Reason and Experience I have found effectual in the like Cases, have not as yet been us'd. I would therefore advise, that the Patient should have a continual Seton in her Neck, and that her Belly should be kept open; for which Purpose, two Ounces of Manna, mixt with one Ounce of Cream of Tartar, and taken twice every Week, will be very proper. She must also carefully abstain from drinking any Wine or Ale, instead of which she must use the following Decoction:

Take of Vipers-grass, of Shavings of Hartshorn; and of Sarsaparilla, each six Ounces; of Fennel-seed; and of the stellated Aniseed, each three Drachms; of Liquorice-root, one Ounce: Let these be cut, and beat together into a Powder, of which an Ounce and an half is to be boiled in three Measures of Water; for Use.

A Bag fill'd with Valerian-root, Fennel-seed, Rose-leaves, and impregnated with the Water call'd *L'Eau d'Arquebuse*, is to be apply'd to her Eyes; and sometimes she is to snuff the following Powder up her Nostrils:

Take of the dry volatile Sal Ammoniac, one Ounce; Oil of Sage, Oil of Marjoram, and Balsam of Peru, each one Dram: Mix for Use.

She will also probably receive considerable Advantage from an Infusion, by way of Tea, made of one Ounce of Valerian-root; of the Herbs Balm, Betony, Sage, and Basil, each a Handful; of Fennel-seed, and Cubebs, each three Drams: The Steam of which is to be receiv'd into her Eyes every Morning; and ten Cups of the Infusion, but less saturated, are to be drank.

It will also be worth the Patient's while, to take a Dram and an half of the following Powder, when she is going to bed:

Take of Cinnabar duly prepared, of Piony-root, of Crabs-eyes, of diaphoretic Antimony, of prepar'd Amber, each two Drams; and of my Sulphur of Antimony corrected, one Scruple: Mix into a Powder.

She must persist in this Course for a Month, and every Night use a Bath for her Feet made of River-water and Wheat-bran; but if these things should not answer the Intention, I think it advisable, in order to excite a gentle Salivation, that her Ankles and Knees be twice a Week rubb'd with mercurial Ointment. She must also sit three Quarters of an Hour every Day in River-water boil'd up with Wheat and Barley-bran; after which, she is to proceed again in the

manner above directed. From this Course, if as yet a Possibility of restoring Health remains, I doubt not but the Patient will find the desired Effects. *Hoffman, Consult. Med. Cent. 1. Sect. 1. Cas. 44.*

Celsus, speaking of Venereal Commerce, gives this remarkable Advice: *Cavendum ne in secunda valetudine, adversæ præsidia consumantur*; that is, We should be cautious of consuming wantonly in a State of Health, what should be our Support during Sickness.

As I am afraid there are many who do not attend to this Rule so much as would be convenient for them, perhaps the following Case may be of some Importance to such as have not yet utterly destroy'd themselves by an immoderate Pursuit after Pleasure.

C A S E III.

A Weakness of Sight proceeding from an excessive Effusion of the Seminal Matter.

A Youth of twenty five Years of Age, of a phlegmatico-sanguine Habit, and who, from his very Infancy, had a tender Constitution, and a pale Complexion, happen'd in the seventh Year of his Age to fall into an Atrophy, and to appear consumptive; which Misfortune was, in all Probability, occasion'd by his beginning too soon to drink Wine: But getting rid of his Disease gradually, he began to grow apace; and when about fifteen Years of Age, learnt of a wicked School-fellow, the execrable Trick of Masturbation, a Crime not to be mention'd, much less to be practis'd, in a Country where Virtue, Decency, or Politeness, have the least Regard paid them. He indulg'd himself in this vile and unmanly Practice very frequently, even almost daily, from the fifteenth to the twenty third Year of his Age, and applied himself at the same time to writing in a very small Character; by which means he contracted such an excessive Weakness of his Head and Eyes, that these latter were frequently convuls'd during his preposterous Entertainment. About four Years ago, when he was wickedly employ'd in this manner, and his Design upon the very Point of being executed, some Person or other unexpectedly knock'd at his Chamber-door; which Accident put him in so much Confusion, that the ultimate Scene of his Diversion was left unaccomplish'd. Upon this, he immediately felt so exquisite a Pain, and so vehement a Tension in his Testicles, and Spermatic Vessels, that he could not walk without the utmost Difficulty. The Force of his Genius, and the Sight of his Eyes, seem'd at the same time to be diminished and impaired. Tho' he had the Danger, with which his execrable Practices threaten'd him, full in View, yet after the Pains of his Testicles were remov'd, he was so much infatuated, as to repeat his Crime, and begin afresh his former Course; but he was soon after seiz'd with the like Pain in his Genitals, and especially in his Testicles, where the Pain was accompany'd with a very considerable Tension. By the Use of external and internal Medicines, for about half a Year, he also got this Disorder remov'd, but with some Difficulty. Soon after he was seiz'd with a Swelling in those Vessels which go to the Left Testicle. This Swelling appear'd larger than ordinary after his Meals, but was not accompany'd with Pain, unless when by his Folly he brought a Stimulus on the Parts; but tho' it was void of Pain, it was attended with another unlucky Circumstance, for it remains with him to this very Day. To this was join'd so great a Weakness of his Head and Eyes, that when he was about to read any thing, he seem'd to be drunk, and flush'd with Wine. The Pupils of his Eyes were extremely dilated, his Eyes themselves rack'd with darting Pains, accompanied with some Degree of Tension. His Eyelids seem'd as it were loaded and oppress'd with a kind of Weight: in the Morning they were conglutinated together, and water'd very much: But this was not all, for both Corners of his Eyes, besides the violent Pains with which they were rack'd, were also clogg'd and stuff'd with a whitish kind of Matter. In this deplorable State he was oblig'd to give over Reading, and interrupt the Course of his Studies, for the Space of six Weeks; during which Time he only employ'd himself in Exercises and Recreation, and in taking the Medicines which were judg'd proper for one in his Condition: By which means he recover'd so far, as to be able to apply himself to his Studies, for two or three Hours a Day, which he can still do; but if at any time he should chance to protract his Application, and lengthen out his Studies, beyond their stated time, he is immediately seiz'd with the above-mention'd Symptoms. Besides, he was become so lean, that his Body was little more than a Skeleton; and tho' his Appetite was good, yet he was indispos'd after his Meals, and was affected with a kind of Drunkenness. But when he got a juster Sense of Things, and had, for almost the Space of two Years, abstain'd from his former Practices, and from all Commerce with Women, he began to be troubled with very frequent nocturnal Pollutions; by which he found his Body gradually more and more weaken'd,

and his Strength impair'd; so that now what seems principally to be regarded, is the Removal of this Imbecillity.

R E M A K K S.

We learn from this Account, that Venery, us'd either too soon, or too much, not only impairs the Strength of the Body in general, but also debilitates the noble Functions of the Brain and Eyes, to such a Degree, that the Loss becomes almost irreparable. But what deserves our principal Attention in the present Case, is the particular Time at which his Eyes more especially began to suffer from his continued, and almost daily, preposterous Venery. And indeed I have had an Opportunity of seeing a great many Cases where Persons well advanc'd in Years have by immoderate Venery, not only brought upon their Eyes Redness, darting Pains, accompanied with Tension, a heavy Sensation, as if a Weight was laid upon them, and a frequent shedding of Tears, but likewise such a Weakness of Sight, that they were render'd incapable either to read or write; and I have found, that in these very Cases, the Pupil was always dilated, as it is in a Gutta Serena, by reason of the weaken'd or lost Tone of the muscular and nervous Fibres which surround it: But why need I stop here? since I myself knew two Cases, in which a Gutta Serena itself was brought on by excessive Venery, and a long Series of Grief. Hence it appears, how great and surprising a Consent there is between the Seminal Parts, or rather the Spirituous Seminal Fluid itself, and the Fabric of the Eye, which is compos'd of the finest Membranes, Nerves, and Muscular Fibres, as well as the most clear and transparent Fluids. The Lymphatic Seminal Fluid is almost of the same Nature and Quality with that Fluid which is secreted in the Brain, and distributed through all the Nerves of the Body; for which Reason, the more plentiful the Evacuation of the former is, the more scanty and defective the Secretion of the other in the Brain must of course be. Hence also a Reason may be assign'd, why those Youths who begin too early to taste the forbidden Joys of *Venus*, sustain a considerable Loss of Memory, and are render'd unfit for Study; and likewise why Persons farther advanced in Years, who are excessively addicted to Venereal Pleasures, lose their Strength, and bring on a premature Death.

But to return to our Case: We find also another observable Circumstance in it, which is, that upon his leaving this monstrous Practice, the nocturnal Pollutions appear'd, the Reason of which is very plain; for the more copious and frequent the Afflux of the Humours, especially of the Seminal Matter, has been to the Organs destin'd for Generation, either by the Force of Imagination, or otherwise; I say the more frequent and copious such an Afflux has been, the more the Spermatic Vessels are dilated and relaxed, and the Seminal Juice, for that very Reason, flows into them in a greater Quantity, and lays a Foundation for those wanton Ideas, and Seminal Excretions, which even during Sleep affect People of a warm Imagination.

As for what relates to the Cure of the Disorder now under our Consideration, I prescrib'd the following Method, as most proper to be pursued:

First, let a Measure of Asses-milk, mixed with a third Part of the *Selter Waters*, be taken every Morning.

And at Night I prescribed a Dram of the following Powder:

Take of Hartshorn, philosophically prepar'd, and of Scuttlebone, each half an Ounce; of Amber prepar'd, by the Infillation of Oil of Tartar per Deliquium, two Drams; and of Cascarella-bark, one Dram: Mix up into a Powder, to be taken in Black-cherry Water.

Before and during this Cure, and after it was completed, I prescrib'd a laxative Potion, in the following Form:

Take of the best Rhubarb, one Dram; of Manna, one Ounce; of Nitre prepar'd with Antimony, five Grains: Boil and dissolve over a gentle Fire, in six Ounces of *Selter Water*; and to the strain'd Liquor add three Drops of the Oil of Cedar: Mix for Use.

Besides, I prescribed for the Patient's ordinary Drink, this Decoction:

Take of red and yellow Sanders, China-root, and Vipers-grass, of each four Ounces; of Succory-root, one Ounce; of Cinnamon, half an Ounce; and of Mastich, two Drams: Mix together, and beat into a Powder, of which two Ounces, together with a Handful of small Raisins, are to be boil'd for three Quarters of an Hour, in three Measures of Water.

Besides,

Besides, I ordered him to abstain from salt Aliment, and all aromatic Substances, as also from all Liquors of a hot Quality; but prescrib'd him Broths made of Veal, Vipers-grass, and Succory-roots; and in the Morning injoin'd him to use an Infusion, by way of Tea, made of the Herbs Mint and Balm. At last the Cure being completed, I order'd him for some time longer to persist in the Use of the above-mention'd Decoction; and of my balsamic Elixir for the Bowels; by which means I in six Weeks freed the Patient from all the Symptoms of his Disorder, and restor'd him to his usual Health. *Hoffman, Consult. Med. Cent. 2: Sect. 3: Cas. 104.*

C A S E IV.

A Gentleman's Daughter, of twelve Years of Age, complain'd of Lassitude, want of Appetite, Weakness, and darting Pains in her Legs and Arms; her Colour at the same time was livid, and somewhat resembling that of Lead. Eight Days after this she was seiz'd with a Shivering, which was succeeded by a scorching Heat, and an excessive Pain of her Head and Loins. The third Day after this the Measles, which then happen'd to be epidemical, appear'd. She was at the same time troubled with a most uneasy Cough; and by reason of the continual Pain in her Head and Eyes, could neither sleep, nor bear the now offensive Light. On the fifth Day the Eruptions disappear'd and vanish'd almost from all the Parts of her Body, but the Pain of her Head and Eyes remain'd; and she had been so coſtly from the very Beginning of the Disease, that she had no Stool, except when procur'd by a Clyster. When the Disease seem'd to be thus upon the Decline, she was unexpectedly seiz'd with a prodigious Pain in her Bowels, a scorching Heat all over her Body, Thirst, Weakness, and Difficulty of Breathing, upon which the Red-purple Fever, complicated with white or miliary Eruptions, appear'd, and the Pain of her Eyes and Head remain'd obstinate. The Removal of these terrible Symptoms was attempted by such Medicines as were judg'd proper to allay the Acrimony of the Humours, carry off the Spasms, and promote a gentle and natural Eruption: Her Head-ach gradually abating by this means, she recover'd her Health. The Force of the Disease being conquer'd, she suffer'd a Diminution of Sight, which gradually increasing, degenerated in a Month's time into a *Gutta Serena*; so that she was now incapable of discerning any Object whatever, tho' her Eyes seem'd to be in every respect entire, except that the Pupils appear'd as large again as they were in their natural State. Many approv'd Medicines were prescrib'd for carrying off this Disorder, but all to no Purpose. But her menstrual Discharges beginning to appear about the fourteenth Year of her Age, her Eyes again became capable of discerning a faint and glimmering Light. Upon this, I being consulted, advis'd, that her menstrual Discharges should be assist'd and promoted by mild Balsamics, that she should apply a gentle Veficatory for some time, that her Eyes should be frequently anointed every Day with the Fat of Vipers, and that a few Drops of my Balsam of Life should now-and-then be given her in her Aliment; by which means her Sight was not indeed totally recover'd, but yet so far restor'd, as that in a certain Attitude and Position of her Eyes, she was able to discern Objects, tho' in a very disadvantageous manner, for she only saw half of them. In every other respect her Health was good; and not long ago she entered into a married State.

R E M A R K S.

In the Small-pox and Measles, it is always a bad Prognostic, when the excessive Pain of the Head and Eyes, which usually leaves the Patient upon the Eruption, continues through all the several Stages of the Distemper; for it generally leaves terrible Disorders of the Head behind it, and in the Case now mentioned left the Patient afflicted with a *Gutta Serena*; which Distemper is, indeed, for the most part incurable; but in Infants it may be discuss'd and carried off, and especially in young Girls of tender Constitutions, upon the Appearance of their Menstrual Evacuations, which alter the State of their Solids as well as their Fluids, especially if Art be brought in to assist the Efforts of Nature. *Hoffman's Medic. Rational. Systemat. Sect. I. Cap. 8. Observ. I.*

C A S E V.

An Amaurosis, from a globous Tumour in the Brain pressing the Optic Nerves.

A Frenchman, twenty-four Years of Age, was taken with a Pain in the Head; a Fever soon followed, which being over, the Reliques of his Head-ach still remained, with Want of Sleep, and Weakness of the Head. At length, his Vision in the Left Eye began to be darkened, and a Month after in the Right Eye; and soon after he became quite blind, no Defect appearing in his Eyes. Some time after the poor Man was seized with Convulsions, which held him, with Intermittions, during the Winter: In the Spring they went off, and were succeeded by a Cough, hectic Fever, a Spitting of purulent Matter, and

a Phthisis, which, after long Molestation, brought him quite emaciated to the Grave.

The Body being opened, we discovered the Defect in his Lungs; but when we came to open the Skull, and examine into the Cause of his Blindness, by inspecting into his Brain, we found it moistened throughout with a copious watery Humour, and its Forepart, especially on the Left Side, swelled: When we had taken off Part of it, there appeared a globous Sort of a Tumour, like a Glandule, or Struma, included within the Substance of the Brain; yet separated from it, and contained in its proper hard Membrane, with capillary Veins dispersed through it. It was bigger than a Hen's Egg, uneven, and shaped like a Pine-nut; the inner Substance was white and smooth, resembling the White of an Egg, hardened by boiling: It was somewhat prominent upwards, in form of an obtuse Cone, but wider at the Base; by which it rested forwards on the Ventricle of the Brain, and pressed with its Weight, which was fourteen Drams, upon the Origin of the Optic Nerves, which were compressed by it. We concluded this to be the Cause of his Blindness, by intercepting the Passage of the Animal Spirits to the Eyes, since there was no visible Obstruction, or Defect, either in the Eyes, or Optic Nerves. *Bonetus, Lib. 1. Sect. 18. Observ. 1.*

C A S E VI.

An Amaurosis, caused by a Vesicle pressing upon the Optic Nerves, near the Place of their crossing.

In the Year 1590, I dissected the Daughter of a Burgo-master of Holland, aged eighteen Years. She had laboured under a Diabetes for some Years before her Death, and but a few Days before had been seized with this Sort of Blindness, in which both Eyes appeared clear; nor was there any visible Defect either in the Membranes or Humours, tho' the Patient could not so much as perceive the Light of a Candle, when held near her Eyes.

Upon opening the Cranium, I discovered a remarkable Vesicle, which pressed upon the Optic Nerves about the Place where they cross. Upon making an Incision in it, there issued about half a Pint of very limpid aqueous Matter; for when the Kidneys, through Weakness, were incapable of attracting what was drank, there commenced, by an *adspersion*, a Regurgitation to the Head, by which the Vesicle was formed. *Bonetus, Lib. 1. Sect. 18. Obs. 1.*

C A S E VII.

In July 1622, the Son of one *Nicolas Blewet*, a Peasant of the Village of *Rietzwyl*, in the Canton of *Soleure*, by Name *John*, about eight Years of Age, fell from a Tree, and received three Wounds in his Head, at the Concourſe and Connexion of the Lambdoidal with the other Suture, but without hurting the Cranium. Immediately he vomited up his Food indigested, and lost his Speech and Senses to such a Degree, that he was carried home for dead to his Father's House, and remained in that Condition for some Days, still vomiting whatever he received. A Barber was sent for from the neighbouring Town of *Biel*, who only took care to heal the Wounds, not troubling himself about Universals; however, he cicatrized them within three Weeks. For some time the Symptoms, as the Fever, the Nausea, and the Vomiting, were very grievous; but when after some Days they had remitted, and the Patient was restor'd to his Senses, it was discovered, that he was stark-blind; and on the twenty-seventh of August, the Father brought his Boy to me, imploring my Advice. His Eyes, as far as could be discerned by outward Inspection, had no manner of Hurt; for which Reason I signified to the Father, that the Fault lay in the Optic Nerves, which, from the very great Concussion of the Brain, and the Humours therein contained, were obstructed by some viscid Matter. I advis'd him, after sufficient Purging, and Application of Cupping-glasses, to apply a Seton to the *Nucha* (Nape of the Neck). The Man carried his Boy home, to consult with his Wife and Friends about it; whether he will return, I know not; but, to speak freely, I have but little Hopes of his Sight: For I doubt not but the viscid Matter, confluent about the Optic Nerves, which should have been purged out of the Head, or drawn off to other Parts, in the Beginning, while it was yet in Motion, is, by this time, so concreted as to be incapable of being removed. *Hildanus, Cent. 5. Observ. 8. P. 389.*

C A S E VIII.

In December 1689, I attended a Woman who had been happily enough delivered of a Child a Day and a half before; but had entirely lost her Sight twelve Hours after her Delivery. This Woman was of a very full Habit of Body, and had very inconsiderable Evacuations during her Travail, as her Midwife told me, and her Purgations were at this time but inconsiderable; besides she had a very great Pain in her Head. I therefore had her blooded in the Foot, as soon as I saw her in this Condition. This so seasonable a Remedy, in that urgent Necessity, proved so beneficial, that the Brain being discharged of the Plethora, which

which was the Cause of that surprizing Accident, the Woman recovered her Sight the very next Day. She told me, that a Month before she was brought to bed, she had laboured under some convulsive Motions, which probably rendered her more disposed to this last Accident, from which she was entirely delivered by this Bleeding in the Foot. But thirteen Months afterwards, being again big with Child, I had her blooded thrice in the Arm, in the Time of her going with Child, and once while she was in Labour, by which Precautions she was entirely preserved from the Return of that melancholy Accident, and I happily delivered her, on the twelfth of October 1691, of a large Male Child, which came the natural Way. *Mauriceau, Obs.* 568.

AMAZONUM PASTILLUS, *The Amazons Troch*, is thus prepared :

Take of the Seeds of Smallage and Anise, each six Drams; the Tops of Wormwood, four Drams; of Myrrh, Pepper, Opium, Castor, each two Drams; Cinnamon, six Drams; make them into Troches, of which give a Dram for the greatest Dose. *Galen* says, that he used to leave out the Myrrh, and instead thereof doubled the Quantity of Pepper.

In Pains of the Stomach it is taken in a Quarter of a Pint of Wine diluted; for bilious Vomiting; in cold Water; to those who throw up their Food, if they be thirsty, and have a Sensation of Heat about the Mouth of the Stomach, or were used to drink cold Water, when in Health, it is likewise prescribed in cold Water; if otherwise, in warm Water; for the Colic and Gripes, in a Decoction of Myrrh; and for a disorder'd Spleen, in a Quarter of a Pint of Oxymel. *Ætius Tetr. 3. Serm. 1. Cap. 11.*

AMBA, a Name for the **MANGA**, Mango-tree. See **MANGA**.

AMBAIBA. This is the *Ambaiba Brasiliensis* of **MARGRAV. Pison. Raii Hist.**

This Tree is of a beautiful Height, almost perpendicular, and in general without Branches, which, in those that have them, grow only at the Top.

The outward Bark resembles that of a Fig-tree, and consists first of a thin ash-colour'd Cuticle, under which lies a thick, clammy, green Bark. The Wood is white, like that of the Birch-tree, but soft, and easy to break.

The Trunk is of a moderate Thickness, and entirely hollow from the Root to the Top; and this Cavity is divided, or intersected throughout, at every half Finger's Distance, by a transverse Membrane, in the Middle of which is a round Hole, about the Bigness of a common Pea. It is of a Liver-colour, and red Ants are always found in it. Towards the Top grow the Leaves in a circular Order, as in the *Mamoeira* or *Papa-tree*, each on a thick Pedicle, two or three Foot long, of a Reddish-brown on the Outside, and spongy within. The Leaf itself is broad, round, and of the Bigness of a whole Sheet of Paper expanded, and sometimes larger, indented with nine or ten Laciniae or Jags, in whose Centre stands the Pedicle, from which a reddish-brown Rib runs lengthways thro' each of the Laciniae or Jags, and many prominent Veins obliquely. They are of a very deep Green on the Upper side, and of an Ash-colour underneath, and seem in the Whole, something of the Colour of Blood mixed with Water, rough like the Leaves of the Fig-tree, and have an ash-coloured Line or Border round the Edges of the Laciniae or Jags. The Cavity at the Top of the Tree contains a white, succulent, pinguious Pith, with which the Negroes are very successful in healing their Wounds.

The Tree receives its Increase in this manner: At the Top there is an oblong, foliaceous, hoary Capsule, which contains in it one Leaf, and two or three, or four lesser Capsules. When the outermost Capsule opens or unfolds itself, the Tree is augmented with a Leaf, and becomes sensibly higher. This Leaf, even when wrapt up in its Capsule, is of the Bigness of a Trencher; and when the Capsule opens itself, is discovered beautifully folded up, and upon its first Appearance, strikes the Eye of the Spectator very agreeably, being hoary and of a faint-green Colour at the Bottom, and at the Top red and shining like *Morocco* Leather. In the Centre of the Leaf, where the Pedicle is inserted in the superior Surface, something like a reddish Star appears, adorn'd with faint Streaks of Green and Yellow, and is probably the Centre of all the Nerves, which being shining and of a faint-yellow Colour, are longitudinally distributed thro' all the Jags. When the outer Capsule is open'd, the other lesser ones successively unfold themselves, and present us with Leaves of the same Kind.

The Flowers come forth on a short Pedicle from the upper Part of the Trunk where the Leaves grow, and hang four or five in a Cluster like so many Saucages. They are of a cylindrical Form, six, seven, or perhaps nine Inches long, an Inch thick, hollow within, and their Cavities stuffed with Down; they are soft, but towards their Surfaces have Kernels of a brownish Colour; the Flowers falling off, the Kernels grow

somewhat larger, and may be eat, when the Husks, in which they are inclosed, are taken off with one's Teeth. These Trees grow to great Height in a very short Time.

Without the Assistance of Flint and Steel, the *Brasilians* extract Fire from it in this manner: They take the Fruit, or rather a Piece of the Root of this Tree dry'd sufficiently for their intended Purpose; in this they bore a small Hole, into which they thrust a sharp-pointed Piece of hard Wood; and by giving this a quick and rapid Motion, resembling that of a Piercer, whilst they hold the Fruit, or Piece of the Root fix'd by their Feet, the Attrition of the Parts produces such a Degree of Heat, as is sufficient to kindle any combustible Matter that is apply'd to it, such as dry Leaves of Trees, or Cotton.

It is rarely found in Woods; but is for the most part to be met with in Fields, that have been formerly cultivated.

The fat Juice express'd from the Tops of this Tree, is of Use in the Cure of inveterate as well as recent Ulcers. Its Leaves, when fresh and tender, or the finer Part of its Bark, deterge the Part affected, and assuage its Pain.

The Juice express'd from its Buds, is of a cooling and astringent Quality; and when mix'd in a proper Quantity with a Mefs of Gruel made of a farinaceous Substance, which the *Indians* call *Tipioca*, stops such Fluxes of the Belly, as are occasioned by a Redundance of Humours preternaturally hot. It checks immoderate menstrual and seminal Discharges; and *Piso* asserts, that he has experimentally found it to be remarkably beneficial, apply'd by way of Cataplasm to the Navels of Women, who laboured under immoderate menstrual Discharges after Delivery. *Raii Hist. Plant.*

AMBAITINGA. The *Ambaitinga* of *Piso* and *Marggrave* has Branches of a reddish Colour; its Wood is of a pretty close Contexture, and its Leaves, towards their Tops, are of a bright, and, towards their lower Parts, of a languid Green, and at the same time so rough, that some Substances may be polished with them instead of a File. This Tree contains an oily Liquor of the same Use and Efficacy with the Juice of the *Ambaiba*. It bears a large but slender Fruit, about a Hand's-breadth in Length, and, when ripe, is sweet, and may be eaten. *Raii Hist. Plant.*

AMBALAM. This is the Name of an *Indian* Tree, call'd also *Mangæ affinis flore parvo stellato, nucleo majore osseo*. It is a high Tree, not stretching its Branches upwards, but spreading them out pretty far in a transverse Direction. It grows in sandy Soils. It has a long Root, from which many Fibres spring forth. Its Trunk is so large as to fill the Arms of a Man. The Wood of it is soft, and covered with a thick Bark. Its large Branches are of an ash, and its small ones of a green Colour, and besprinkled with a Dew of a Sky-colour. Its Leaf consists of a double Pair of lesser Leaves, terminating with an odd Leaf. These lesser Leaves are of an oblong-round Form, their Length is almost the double of their Breadth, and they terminate in a small contracted Point. They are of a close Contexture, soft, smooth, and both their Sides shining, with a lively Green on the superior Part, but somewhat fainter underneath. From the Middle-rib, the Nerves distribute themselves in transverse, strait, and parallel Directions. Many Flowers sprout forth at a time, from the tender Twigs, that spring from the larger Branches. These Twigs, as well as the Leaves, are of a bitterish acid Taste, somewhat resembling the Taste of the Fruit produced by the Mango-tree. Their Smell is likewise strong and acid. The Flowers are small and white, having the Appearance of little Stars, consisting of five or six slender, but pointed Petals, which towards their Extremities are contracted into small Points, and are somewhat hard and shining. In the Middle of the Flower, is a yellow little Heart, which is the Matter of the future Fruit, and is surrounded with ten, twelve, or more *Stamina*, according to the Number of the Petals. These *Stamina* are small, slender, white, and yellow at their Tops. From the very Middle of this little Heart five or six Points, or small Styles, arise. When the Buds of the Flowers begin to shoot forth, the Tree is stript of its Leaves, and remains destitute of them all the Time the Bud is flourishing, but reassumes its Foliage when the Fruit appears.

The Fruit hangs in Clusters from the Twigs and Stalks, which are long, thick, pliant, bended, and of a yellowish Ash-colour. It is of an oblong-round Shape, hard, and resembling the Fruit of the *Mango*. It is of a lively-green Colour, when almost ripe; then it becomes yellowish, and is gratefully acid both to the Taste and Smell. Its Pulp may be eaten, and contains in it a large hard Kernel, which almost fills the whole Cavity of the Fruit, has its Surface wove over in Form of a Net, with a whitish kind of woody Nerves, and under this Net is here-and-there soft, so that it will yield to any sharp Instrument; but 'tis hard within. This Tree flourishes and bears Fruit twice a Year.

Its Root, us'd by way of Pessary, promotes the menstrual Discharge when suppress'd. Its Bark, reduced to a Powder, and drank in acid Milk, is beneficial in *Dysenteries*, which Intention is also answered by its Juice mix'd with Rice, of which two Ingredients, that kind of Bread, commonly called by the

Natives

Natives *Apen*, is made. A Decoction of its Wood is given with Success in Gonorrhœas; and its Fruit, pounded, and mix'd with the Juice of its Leaves, asswages Pains in the Ears, if put into them.

The *Cat-Ambalam* so nearly resembles this Tree, that Botanists have scarce thought it worth their while to spend Time in enumerating the Particulars in which they differ: They only tell us, that the Leaves of the *Cat-Ambalam* are of a smaller Size, and less oblong; that its Fruit is less oblong, somewhat rounder and smaller; that it has a bitterish acid Taste, and is not produced in such Abundance as the former; for which Reason it is not so much used in Food.

Its medicinal Virtues are the same with these of the *Ambalam*. *Raii Hist. Plant.*

AMBAPALA, the Name of an Indian Tree, called also MAMOERA, which see.

AMBARE, *Ambare Indica*, Garc. Acoft. Trag. *Ambares*, Cast. *Arbor Indica*, foliis juglandis, fructu nucis magnitudine, C. B.

It is a large and thick Tree, growing in the *Indies*; its Leaves are as large as those of the Walnut, but of a clearer Green, beautify'd with many Veins or Nerves; it hath small white Flowers; its Fruit is as large as a Nut, green at first, having a strong Smell, and a rough Taste; but as it grows ripe, it acquires a yellow Colour, an agreeable Smell, and a pleasant acidish Taste; it is full of a hard cartilaginous Pulp, interwoven with many little Veins; they season it with Vinegar and Salt. It creates an Appetite, and precipitates the Bile. *Lemery de Drogues.*

AMBARVALIS, this is the Flower of an Herb, which flourishes at a particular Season, when Processions are made thro' the Fields. It seems to have received its Name from the *Latin* Word *Ambire*, *Blancard. Lexic.* The Author here means the Flower of the Herb called *Polygala*, or *Milkwort*. See *POLYGALA*.

AMBE, ἀμβη, a surgical Instrument, taken Notice of by *Hippocrates* in his Treatise *de Articulis*, Sect. 6. Of this I have given a Figure from *Heister, Tab. 31. Fig. 4, 5.*

This Machine consists of a Fulcrum A A, and a moveable Lever B C, which is brought under the dislocated Shoulder, and fitted to it by Deligation with several Fillets, as you see represented Fig. 5. This done, the Extremity B of the Lever is warily and leisurely to be pressed downwards, which causes the other Extremity C of the Lever to move upwards; by which means the dislocated Arm will be extended, and its Head, which had slipped out of Joint, will be gently forced up into its natural Place. This Operation has been so frequently successful, that the Machine acquir'd a great Name, and is to this Day called the *Ambe* of *Hippocrates*. But tho' in those Cases where the dislocated Arm is protruded downwards, it has oftentimes been eminently successful, and may still be so; yet when the Head of the Shoulder falls either on the Inside or Outside of the Scapula, as is generally the Case; and since this Machine only elevates strait upwards, it often fail'd of affording the Help required; nay further, if the aforesaid Head should, by the Strength of the Muscle, or the Violence of the Luxation, be protruded with uncommon Force to the hinder Part of the Scapula, it will not sufficiently extend, but violently compress the Head in its Motion against the lower Margin of the Pit of the Scapula, to the manifest Hindrance of its Restoration into its natural Place; and at the same time may bruise, and occasion acute Pains; for which Reason, to omit other Defects at present, it has long lain neglected by many, or rather wholly thrown aside. *Heister, P. 1. L. 3. Cap. 7. vi.*

Galen, in his *Exegesis*, explains ἀμβη by ὀπρωδὸς ἐκ τῆς ἀσπίδος, an Eminence like a Border; and says, that the whole Machine takes that Name, because its Extremity runs out with an Edge like the Lip or Brim of a Pot towards the interior Cavity, which, as well as the Edge or Border of any thing on the Top or Extremity, are signify'd by the Word ἀμβη, *Ambe*.

Of all the ways of restoring a Luxation of the Shoulder, the best is what follows: Let there be a Piece of Wood of the Breadth of four or five Fingers, and about two Fingers, or somewhat less, in Thickness, and two Cubits, or a little less, in Length, having one Extremity round, and very narrow and slender in that Part. From the Top of the round Extremity, let there be a Lip [ἀμβη] a little prominent on one Part, which must not be towards the Ribs, but towards the Head of the Arm, under which being placed, it may be fitted to the Armpit close by the Ribs. The Top of the Piece ought also to have some Linen, or soft Filleting, glued upon it, to render it more easy. Things being thus prepared, the Head of the Piece must be intruded under the Armpit, between the Ribs and the Head of the Arm, as far inward as possible; after which the whole Arm is to be extended on the Wood, and tied to it above the Cubit, at the Cubit, and at the Wrist, that it may rest thereon with the greatest Firmness. But we must principally endeavour to intrude the Head of the Piece as far as may be under the Armpit, and beyond the Head of the Arm. This

VOL. I.

done, a small Beam is to be firmly ty'd across two Posts, upon which Beam, the Arm, with the Wood to which it is fasten'd, must be laid in such a manner; that the Arm shall be on this Side, the Body on the other, and the Beam under the Armpit. Then the Arm with the Wood is to be pressed down on one Side of the Beam, and the rest of the Body on the other. The Beam is to be ty'd so high, that the Body may stand on Tiptoe.

This is by much the best way of setting the Shoulder; for the Operation is exactly by way of Lever, provided the Wood enters beyond the Head of the Arm, the Librations on either Side are very just, and the Bones of the Arm in perfect Security. Fresh Luxations are restored with a Quickness beyond Imagination, and hardly give room for Extension; and as for inveterate ones; this is the only way to cure them, unless thro' Length of Time, the Socket, that should receive the Head of the Bone, be filled with Flesh, and the Head of the Arm, by long Continuance under Luxation, has worn itself a Place. Yet I am apt to think, that an inveterate Luxation of the Arm will give way to this Operation; for what will the Power of the Lever not move? tho' I don't believe the Bone then restored would abide in its Place, but slip out again as usual.

The same Effect, after a like Preparation, would be produced by Depression over a Ladder, and the *Theffalian* Chair would serve very well for a recent Luxation. The Piece of Wood must be prepared as before, and the Patient placed sideways in the Chair, and the Arm with the Wood stretched over the Back of the Chair; then on one Side the Body is depress'd, on the other the Arm with the Wood; and the like may be effected over a folding Door; either of these Methods may be used as Occasion requires. *Hippocrat. πει ἀσθεν.*

AMBELA, the Name used by the *Turks* and *Persians*, for a Tree thus distinguished:

Arbor exotica, fructu racemoso, Charamais dicta, C. B. Charamei Aosta, folio pyri, J. B. Charamai. Purging corner'd Hazel-nuts.

There are two Kinds of this Tree, called *Charamei* by all the *Indians* generally; but the *Persians* and *Arabians*, *Ambela*. The one is as great as the Medlar-tree, with Pear-tree pale great Leaves, and yellowish Fruit; somewhat like to Hazel or Filberd-nuts, ending in sundry Corners, of the Taste of sour Grapes, yet more pleasant, which they pickle up as well ripe as unripe, and usually eat them with Salt. The other Kind is of the same Bigness, but hath lesser Leaves than the Apple-tree, and a greater Fruit, which the *Indians* use, being boiled with Saunders, and give the Decoction against Fevers. The Bark of the Root of the former Kind, which groweth by the Watersides, is chiefly used (so as it grow far from the Sea) which yieldeth Milk, by taking four Fingers Length thereof, which being bruised with a Dram of Mustard-seed, they give to those that are purfy and short-winded; for it purgeth mightily both upwards and downwards: But if a Super-purgation chance thereupon, they give one of the Fruits of *Curambolas* to help it, or else a Draught of the Vinegar of Canara (which is nothing else but the Decoction of Rice) set by for a Day, two or three, until it grow sour. The Fruit is familiarly eaten through all Parts, unripe as well as ripe, and pickled, or eaten with Salt and Vinegar to procure an Appetite, putting it to their Meat to give them a Relish, by reason of its Tartness. *Parkinson's Herbal, P. 1638.*

AMBERBOI, the *Turkish* Name for the *Cyanus Orientalis* Odoratus. *Sweet Sultan.*

Mr. *Vaillant*, in the *Memoires* of the Academy of Sciences for 1718, enumerates the following Sorts of Amberboi:

Amberboi flore purpureo odorato. Cyanus floridus odoratus Turcicus, sive Orientalis, major, Park. Theat. 481. The Purple Sweet Sultan.

Idem flore incarnato odorato. Cyanus floridus odoratus Turcicus, sive orientalis, major, flore incarnato. H. L. Bat. & J. R. Herb. 446. Sweet Sultan, with a pale Flower.

Idem disco candido, cum corona dilute lanthina, D. Lippi.

Idem flore albo. Cyanus floridus odoratus Turcicus, sive orientalis, major, flore albo. H. R. Par. The white Sweet Sultan.

Idem flore luteo odorato. Cyanus floridus odoratus Turcicus, sive orientalis, major, flore luteo. H. R. Par. The yellow Sweet Sultan.

Amberboi alterum, flore purpureo, cum corona amplissima. Cyanus orientalis alter, sive Constantinopolitanus, fistuloso purpureo flore. H. R. Par. & J. R. Herb. 446. Item, Cyanus peregrinus, Amberboi sive Emberboi dictus. Ambros. 187. & J. R. Herb. 446.

Idem flore candicante, cum corona amplissima. Cyanus orientalis alter, sive Constantinopolitanus, flore fistuloso candicante. H. R. Par.

Idem flore luteo, cum corona amplissima. Cyanus orientalis, flore luteo fistuloso. A. R. Par. 75.

Idem foliis magis dissectis. Cyanus orientalis major, foliis magis dissectis, flore luteo, ex Aleppo. Hist. Oxon. 3. 135. No. 8.

Amberboi erucæ folio, majus. Fœcæ foliis erucæ lanuginosus. J. R. Herb. 444. *Fœcæ major exotica, ad foliorum margines spinulis donata.* Pluk. Tab. 39. Fig. 3.

Amberboi erucæ folio, minus. D. Lippi.

Monsieur Lippi found this last Sort betwixt *Alexandria* and *Rosetta*. There is a Figure of it in the Memoires of the Royal Academ. of Sciences for 1719. with the following Description:

The lesser Rocket-leav'd Amberboi has a single Root a little bent, two or three Inches in Length, about the Thickness of two Lines at the Neck, insensibly diminishing till it comes to end in a Thread, and from Space to Space shooting forth capillary Fibres. The Bark is of a dirty White, covering a ligneous Substance of a whiter Colour.

From this Root arises a Stalk from nine to eleven Inches in Height, sending forth Branches at Intervals; it is about two Lines thick at its Origin, lessening by Degrees to the Extremities of the Branches and their Sprays, which have no more than a third, or a quarter of a Line in Thickness. This Stalk is solid and substantial, of a pale-green Colour, slightly striated in its whole Length, and bespread with dirty white Hairs, the longest of which don't exceed a Line. When cut, the Inside appears of a clearer Green, and whiter than the Bark.

The Leaves of this Plant are of a muddy Green, deeply enough colour'd above, but paler under. They are almost flat, thin, without a Pedicle, disposed in alternate Order, and covered with whitish Hairs. The great Leaves adorn the Bottom and Middle of the Stalk, and the principal Branches; the smaller Leaves set off the rest. All the Branches, and smaller Boughs, proceed from the Bosom of a Leaf. Among the great Leaves, which well enough resemble those of a kind of Rocket, some are three Inches or three Inches and a half in Length, and an Inch, or fifteen Lines in Breadth, being very deeply jagged on each Side, some into four, others into five Lobes, from six to seven Lines in Length, and from three to four in Breadth, each indented also in several Places, a little rounded, and terminating in a yellowish-green, and, as it were, dry Point, which is very short, and not prickly. The two great Lobes, which jointly terminate each Leaf, are also indented like the others. The wavy and indented Wings, which are observed in some Places of the Stem and the Branches, seem to belong to these Leaves, being nothing but Appendages to their Lobes. Most of the small Leaves keep well enough the Figure of the great ones, though their Lobes are not so much indented. Among the Leaves, that adorn the Tops of the Branches and Sprays, some are from two to nine Lines in Length, and from half a Line to a Line and half in Breadth; some of them also have a single Indentment, others have none, but are entire, resembling the Leaves of *Linaria* (Toad-flax).

The main Rib of all these Leaves, as well as the Fibres, which it communicates to their Lobes, are of a whitish Green; they form Ridges above, and rounded Ribs underneath.

The Flowers have hardly any Smell, are of a gridelin Colour, and are surrounded with hermaphrodite Fleurets. The Stalk, Branches, and Sprays, produce no more than a single Flower at each Extremity, which is distant sometimes six Lines, sometimes an Inch and half from the last Leaf.

The Diameter of each Flower is about nine Lines, of which the Disk commonly takes off two Lines and an half, or three Lines. The Disk consists of fifteen or eighteen regular and hermaphrodite Fleurets, three Lines long, standing out of the Calyx two thirds of a Line, which is nearly the Length of the Indentments of their Pavilion, and the half of their Depth; the other half, which is white, and their cylindrical Tube, which is about a Line and half long, and almost one fifth of a Line in Diameter, are sunk within the Calyx. The Pavilion is also cylindrical, cut with five equal Jags, of a gridelin Hue, opens very little, and is no more than about half a Line in Diameter. The Extremities of the five Cuts, or Jags, roll and curl up on the Inside. From the lower and inner Part of the Pavilion, arise five Stamina, whose Apices unite in one cylindrical striated Tube, a Line and half in Length, and a quarter of a Line in Thickness, sunk half a Line within the Mouth of the Pavilion: This last is white, but the rest, which appear above the Mouth, is of a purple Colour.

The Bottom of each Fleuret rests upon a white Ovary, about half a Line high, and a third of a Line thick, the Head of which is adorned with an antique Crown, which is much about the same Height. From the Head of the Ovary proceeds a capillary Trunk; which passing through the Fleuret, and the Tube, comes out at last from the latter about half a Line, including its two Horns, which are of a gridelin Colour.

Ten or a dozen barren and irregular Fleurets, resting each on a false Bud, commonly form the Crown of this Flower. The Tube of each Fleuret is white, cylindrical, of the Length of two Lines, and above one fifth of a Line in Diameter, wholly sunk in the Calyx, and terminating in a Pavilion, from three and a half to four Lines in Length, and two in Breadth in its Fore-part. This Pavilion is a sort of a Mouth, almost close,

whose upper Lip is regularly cloven on this Side the Origin of the Pavilion, into three Laciniae nearly equal, and sometimes into two. The lower Lip is entire, more short, though inconsiderably, than the upper, and a little wider than its Divisions.

The Placenta is cover'd with white Hairs, of the Length of two Lines, or two Lines and a half, amongst which the Ovaries are lodged.

All these Parts are contained in a scaly Calyx, shaped like a Pear, about four Lines in Length, and two and a half or three Lines in Diameter in its thickest Part, which is towards the Base. The Scales are oblong, entire, green on the Back, white on the Edges, covered with whitish Hairs, and terminating in a little dry Beak, about a Line in Length, and of the Colour of Wood, whose Basis is brown. These Scales shine like Silver, on the Side towards the Cavity of the Calyx. The largest are not above two Lines and a half in Length, from the Beak to the Unguis or Bottom, and almost a Line in Breadth.

The Ovaries, when thoroughly ripe, are of a conic Figure, of the Colour of Wood, hairy, channelled according to their Length, which is no more than a Line, and not half so much in Diameter at the Base, which supports an antique Crown. This Crown is open a Line and half; its Rays are white, shining, unequal, the longest being two thirds of a Line, and the shortest only a fourth Part. At the Point of the Ovary may be observed a small Cavity, in which was articulated a fistulous Nipple, whence proceeds an umbilical Cord, which affords Nutriment to the Seed contained in that Ovary.

This Plant is annual, flowers in *June* and *July*, and yields ripe Seed at the Beginning of this last Month.

Having chewed the Leaves, I found them at first of a disagreeable Taste, after which, they left somewhat of an acid Savour in the Mouth.

The Juice of the Root, Leaves, and Flowers, turns blue Paper red. *Memoires de l'Acad. Roy. des Scienc.* 1719.

AMBIA Monard. Is a yellow liquid Bitumen, smelling like *Tacamahaca*; it flows from a Fountain situated near the *Indian Sea*.

It is resolute, strengthening, and lenitive; it cures Tetters, and the Itch; they also use it against cold Humours; it has the same Properties as the Gums *Caranna*, and *Tacamahaca*. *Lemery de Drogues.*

AMBIDEXTER, ἀμριδξισ. It imports the being as strong, ready, and adroit, with the Left Hand, as with the Right, as if the Person had two Right Hands. This, *Hippocrates* pronounces, never happens to Women. *Aphor.* 43. *Seet.* 7.

AMBLOSIS, ἀμβλωσις, a Miscarriage. See **ABORTUS**.

AMBLYOGMOS, ἀμβλυογμός, from ἀμβλός, dull. Dimness of Sight.

This Word is frequently made use of by *Hippocrates*. Thus in his Book of Prognostics, he takes Notice of this Dimness of Sight, together with Coruscations of Light seeming to dart before the Eyes, amongst the Symptoms of an approaching Hemorrhage, in continual Fevers, and genuine Tertians. Again (*Prædict.* L. 1. r8.) he mentions a Noise in the Ears, accompany'd with Dimness of Sight, and a Sense of Heaviness at the Nose, as the immediate Forerunners of a violent Delirium in a burning Fever.

Sometimes this Author makes use of the Word ἀμβλυωσις, Amblyosmos, to express the same thing. *Galen* indeed explains ἀμβλωσις, a Miscarriage; but *Foetius* thinks it a Mistake for ἀμβλωσις, Amblosmos, in which he seems to be right.

AMBLYOPIA, ἀμβλυωπία, from ἀμβλός, dull, and ὤψ, the Eye. In *Hippocrates* it signifies that Dimness of Sight which old People are most subject to; and in this Sense it is used *Aph.* 31. *Seet.* 3.

But *Paulus* and *Aetarius* use this Word to express an Amaurosis, or Gutta Serena.

The ἀμβλυωπία, is an Hebetude, or Dulness of Sight, which has a manifest, but not visible Cause. For since neither the Tunics nor Humours of the Eyes appear to be alter'd, the Fault must necessarily lie in the Defect or Interception of the visual Spirits, caused either by a preceding Preclusion or Obstruction of the Nerve, that convey'd the Light, or the Brain being in part disorder'd; any of which Causes is sufficient to stop the Course of the Spirits: Whence the Eyes are in the same State as Candles, which are full and complete in all the necessary Requisites, and want nothing but Light to illuminate them. *Aetarius de Meth. Med. Lib. 2. Cap.* 7.

AMBON, ἄμβων the Edge, or Margin of those Cavities or Sockets, into which the prominent Parts of Bones are inserted in some Sorts of Articulation, as in that of the Femur into the Acetabulum. *Castellus.*

AMBRA is the common Name which the *Italians* and *French* have for *Succinum* or *Electrum*. *Ambra* also is the vulgar Word, which the same People use, to signify what the *Arabians* call *Ambar*; but this is a thing quite different from *Succinum*.

Therefore,

Therefore, though they would have the same Name to belong to them both, yet, for Distinction sake, they have of late called this latter Kind of Ambra, *Ambergriſe* (*Ambra grifea*).

Whence this Term *Ambra*, uſed by us for *Succinum*, is derived, I know not; for the *Arabians* call it *Karabe*, as you find it in an old *Latin-Arabic* Gloſſary, *Karabe Succinum*. A *Saracen* Lexicon in the *Vatican* has it, *Kāgbe*, τὸ πλεῖστον. But there it is alſo written *κέρμε*, and in another *κέρμε*. *Aviſena* affures us, that it is a *Persian* Word, which ſignifies an *Attractor of Straws*; ſo indeed it is in the *Latin* Translation: But *Aviſena*, ſpeaking in *Arabic*, does not ſay, that it is a *Persian* Word; and the *Arabic* Term in his Book is written *Kerabe*, with *Kef*, not *Kaf*, as it is in the old Gloſſary. He ſays, that it attracts *Straws*, and Bits of rotten Wood, and thence took its Name in *Arabic*, *Kerabe*, which ſignifies an *Attractor of Straws*.

The *Greeks*, however, 'tis certain, called *Amber* ἄμμιον, "*Harfax*," on the ſame Account. *Pliny*, *Lib. 37. Cap. 2.* ſays of *Amber*: "In *Syria* the Women make Whorles of it, and call it *Harpaga*, "*Snatcher*," becauſe it ſnatches to itſelf *Leaves*, *Straws*, and *Edges of Garments*."

That *Amber* is a Species of *Bitumen*, is generally agreed; and *Car* too by the *Arabians* is reckoned among the Kinds of *Bitumen*. *Alchar*, or *Alchir*, in *Alpagus*, is the Matter of a natural Vein, fluid, and like Pitch, which bubbles out of the Earth, like Water out of a Spring, in the Country of *Bagaded*; and as ſoon as it gets above Ground, becomes thicker than liquid Pitch, being condenſed by the cold Air; the *Arabians* commonly call it *Chur*. He plainly deſcribes to us ſome liquid *Bitumen*, or *Naphtha*. The ſame Author, under the Word *Kir*, or *Kar*, informs us, that it is ſomething which is like Pitch, that it flows from Springs in the Territories of *Bagaded*, and is the ſame as *Chur*, or *Kur*, to which Word he refers us. *Car*, or *Adkar*, is the *Naphtha*, which the *Antients* inform us, iſſued out of Springs in the Country about *Babylon*, after the manner of liquid *Bitumen*. In *Arabic* it is called *Kar*, or *Alkar*, and is the very ſame with *κάρδα*, (*Naphtha*) and called by the *Arabians* alſo *Nafth*. As to the Opinion of *Alpagus*, that *Kar* is the ſame with *Chur*, I don't doubt but it was commonly ſo pronounced. For after the ſame manner they ſay *uſſach* inſtead of *aſſach*, and *uſen* for *aſnan*, and ſo of an infinite Number of others. But under the Word *Chur*, to which he refer'd us for a fuller Explication of *Kar*, he expounds it, according to the Opinion of the *Arabian* Interpreters, to be the *Sordes*, that ſtick to the Walls of *Bee-hives*. This *Kur* is quite a different thing from the *Kar*, which is a kind of liquid *Bitumen*, and is written otherwiſe; viz. *Kaar*, with the middle Syllable *Ain*, not *Elif*. They call the *περίστασις*, (*Bee-glue*) of the *Greeks*, and *Wax* itſelf, by that Name, which may ſeem to be derived from *Κέρς*, or *Καέρς*, "*Ceros*," or *Caros*. "*Bellunensis*, at the ſame Paſſage, adds, that according to ſome Writers, *Kar* is to be taken for *Bdellium*, in the ſecond Canon of *Aviſena*, in the Chapter of *Dadi*, where he ſays, that in its ſtead, there were put two thirds of a Pound of *Kur*. But in the *Arabic* you don't read *Kur*, but *Luz*, or *Lauz*, that is, an *Almond*; inſtead of which, the Interpreter ſeems to have read *Kur*, which in that Place can ſignify nothing to the Purpoſe. *Kur* is a *Furnace*, or *Fire-place*, and ſome take it for a *Hive*; but a *Hive* is called *Kouvarab*, the Plural of which is *Kouvarath*; from whence perhaps, the later *Greeks* have uſed *Κυβέρη*, and *Κυβέρηον*, (*Kuberte*, and *Kuberton*) for a *Bee-hive*. *Hefychius*: *Κύβηλον*, *Κυβέρηον* μελισσῶν, "*Cypſelus*, a *Hive of Bees*." But the *Sordes* which ſticks to the Walls of *Bee-hives*, is not called *Kur*, but *Kar*. Some render it *Wax*. But the *Propolis*, or *Sordes of Bee-hives*, is by *Aviſena* called *Almum*, of which he makes two Sorts, the *Pure*, and the *Black*. The pure *Mum* is ſpoken of the waxen Cells in which the *Bees* ſtow their *Honey*; and this is the true *Wax*. Hence an ancient *Arabian* Author interprets the *Κέρς* of *Dioſcorides* by *Almum*. Others call *Wax* *Xemba*, which was the Name given by ſome to the *Propolis* of the *Greeks*, called by *Aviſena*, *Almum alaſnad*, "*black Mum*," that is to ſay, *black Wax*. This is a Subſtance found about the Mouths of *Bee-hives*, and may be ſaid to be *Κνεξιδής*, "*ſomewhat like Wax*," rather than *Κέρς*, "*Wax*."

To reſume our Diſcourſe on the *Karabe*, or *Succinum*, it has a great Agreement with *Bitumen*. *Serapion*, we know, ſpeaking the Opinion of ſome Authors, ſays, that the *Bitumen* *Judaicum* was called the *Karabe of Sodom*, and was the Gum of Funerals. This was the *Asphaltum*, or *Piſſaſphaltum*, which they uſed about the Bodies of the Deceased, and called *Mumia*. And becauſe Carcaſes, eſpecially thoſe of the poorer Sort, were embalmed with *Bitumen*, hence one Name came to ſerve both for the *Bitumen* and the Funerals, of which it was a principal Part of the Apparatus. *Strabo*, *Lib. 16.* *Χρῶſται δ' Ἀργυπύου τῇ ἀσφάλῳ πρὸς τὰς ταριχίας τῶν νεκρῶν.* "*The Egyptians uſe Asphaltus for embalming of the Dead.*" The *Mumia* of *Aviſena* is the *Piſſaſphaltus*.

I was once of Opinion, that the Word *Mumia*, for a Funeral thus prepared, was a Corruption of the *Greek* ἀμμία,

"*Amomia*;" for the *Antients* did, for the moſt part, embalm Carcaſes with *Amomum*. Hence we meet with *Trifte Amomum*, "*mournful Amomum*," in *Statius*; and *Craſſis lutatus Amomis*, "*bedawb'd with thick Amomum*," in *Perſius*, of the dead Body placed in order to be carry'd forth; and in *Ovid* we read *Oſſa Pulvere Amomi condita*, "*Bones ſeaſoned with the Powder of Amomum*." The old *Scho- liaſt* alſo, in a very antient Copy of *P. Ægineta*, at the Word ἀμμιον, "*Amomum*," remarks, that it is what the *Arabians* commonly call *Momia*, "*ἀμμιον ὃ λέγεται μίμις*. In *Myreſus* μίμια, "*Mumia*," ſignifies the Sanies of a human Carcaſe. In his *Antidote Athanaſia*, *αἷμα ἀνθρώπου τρεβνέσθαι ἐν δὲ κέ- κληται παρ' Ἱταλοῖς μίμια*. "*The Blood or Sanies of a dead Perſon is called by the Italians Mumia*."

But I have now another Notion of the Etymology of *Mumia*. *Mum* is a *Persian* Word, which ſignifies *Wax*. *Aviſena* diſtinguiſhes between the pure *Mum*, and the black *Mum*. His *Almum alaſaf*, is the pure bright *Mum*, and the *Almum alaſnad*, is the black and dirty *Mum*; ſo he calls the *Propolis* of the *Greeks*. His old Expoſitor interprets it by the *Sordes* which ſtick to *Bee-hives*, or rather are the Foundation of the Work, and the Rudiments of *Wax*. What is almoſt *Wax*, is called *Propolis*, and by *Aviſena*, *Black Mum*. The *κόμμοσις*, (*Commofis*) and *πιſſόκερος*, "*Piſſoceros*," is a ruder and more un- finiſhed Work. This latter is a kind of diluted *Wax*, with which the *Bees* overlay their Structures. The *Commofis* is the firſt Foundation and Cruſt, which is ſpread before all other things. *Pliny's* Words are to be read thus, partly from the Copies; viz. *Commofis cruſta eſt prima, ſaporis amari; Piſſo- ceros ſuper eam venit picantium modo, ceu dilutior cera e vitium populorumque mitiore commi*. "*The firſt Cruſt is the Commofis, which is of a bitter Taſte; over this comes the Piſſoceros, like a Layer of Pitch, being a more diluted kind of Wax, which the Bees make of a milder Gum of Vines and Pop- lars.*" *Κόμμοσις*, (*Commofis*) is ἀπὸ τῆς κόμμοσις, "*from Commis*." *Hefychius* interprets it διὰ χειρὸς τῶν σμύνης, "*the ſmearing of the Hive*." By *Ariſtotle* it is called κόννοις, (*Koneſis*) that is, *Pication*, (doing over with Pitch); for κόννη, or κώνη, ſignifies liquid Pitch. *Dioſcorides*: *Πίσα ὕγρον, ἢ ἐνίοις κόννον καλεῖται*, "*Liquid Pitch, which ſome call Conus*." Others name it κώνη, "*Cone*," by which Name it went among the *Greek Veterinarii*, or *Horſe-physicians*; as in *Cap. 176.* ἀσφάλην, κώνην, ἀμμιαντακῆ, and *Cap. 843.* ὄξος φοσφήματι, κώνης περιβά- νης, ἀμφοτέρω ὁμοίως συμβαλὼν χρῶ. "*Take Vinegar, of the Refin of the Pine-tree, and the liquid Pitch of the ſame, and apply them to Uſe*;" and in many other Places. Hence the κώνης οἶνος: "*Wine ſtopped up with Pitch*," of *Hippo- crates*, which *Galen* expounds by *πιſσίτης*. And hence alſo κώνηται πῖθον, "*to pitch a Hogthead*," and ἀκωνήσας ἀγρῶν, "*a Veſſel not pitched*."

To go on, what *Aviſena* calls *Black Mum*, is by other *Arabians* called *Car*, which ſome however interpret *Piſſaſphal- tus*, and *Bitumen*, as *Alpagus* obſerved. But it is written other- wiſe when it ſignifies *Bitumen*, as thus, *Kar*; and for *Wax*, and *Propolis*, *Kaar*. With the ſame *Arabians*, *Kefer* is *Bitu- men*; but moſt think *Charabe* a Species of *Bitumen*, and to flow out of Springs in the ſame manner.

Now from this *Mum* aforeſaid, I doubt not, but the Word *Mumia* is derived. For moſt Nations uſed *Wax* in embalming and medicating Bodies for Interment, eſpecially the *Babyloni- ans*, who in moſt things had the ſame Cuſtoms with the *Persians*. *Strabo*: *Θάπτουσι δ' ἐν μέλιτι, καὶ περικλάσαιτες*. "*They bury their dead Bodies in Honey, having firſt cover'd them over with Wax*." The ſame was practis'd in *Greece*: We read at leaſt, that the like Treatment was once uſed to the dead Body of a *Greek* Man. *Cornelius Nepos*, of King *Agſilaus*: *Ibi eum Amici, quo Spartam facilius perferre poſſent, cera circumfuderunt, atque ita domum retulerunt*. "*There his Friends, that they might the more conveniently transport his Body to Sparta, cover'd it all over with Wax, and ſo brought it home*." Moreover it was a cuſtomary thing with the *Arabians*, to uſe indifferently the Names of all Things which ſerved for the ſame Uſes, and to put one Name for another. Thus *Kitrān*, which properly ſignifies the Pitch of a Cedar, is by ſome interpreted *Bitumen*. Thus again, they made no Diſtinction in their Notions between the *Fucus-marinus*, the *Scarlet-worm*, and *Madder*. After the ſame manner *Bitumen*, becauſe it was uſed by various Nations, as well as the other, in ſeaſoning their dead Bodies, had by them the Ap- pellation of *Mumia* beſtow'd on it, which is a Word derived from *Mum*, that is, *Wax*; ſo they took *Karabe*, which properly is *Succinum*, to ſignify alſo *Bitumen*. The *Karabe of Sodom*, in *Serapion*, is *Bitumen*, or *Funeral-gum*, as he calls it, the *Almumiai*.

Some antient Authors affirm, that *Amber* works out of Springs, like *Bitumen*, the Truth of which is warranted by modern Discoveries, ſeveral Writers aſſuring us, that *Amber* is gotten out of the *German Sea*; and that it riſes from Springs in the Sea itſelf, after the manner of *Bitumen*.

But

But of all the Opinions of Antiquity about Amber, the *Arabians* seem to approve of that alone, which, deriving its Authority from the Fable of *Phaeton*, makes it to be the Tears of the Black Poplar. The Truth of this they every-where assert in their Writings. 'Tis certain, that the Black Poplar weeps a kind of Gum. *Pliny* says, that the Bees make their *Piscoceros*, (pitchy Wax) which is a clearer sort of Wax, of the milder Gum of Vines and Poplars. *Dioscorides* calls this milder Gum of the Poplar *Αἰγερὸν ῥῆσιν*, "the Resin of the Poplar." Most of the Antients believed, that the Tears of the Black Poplar falling into the *Po*, there concreted and made the Amber. *Dioscorides*, of the Black Poplars: *Ἰσχυρῶτα δὲ τὸ ἐξ αὐτῶν δάκρυον κατὰ τὸν Ἡεῖδανον πῶτα μὲν κατὰ χεῖμα πρὸς γῆναι, καὶ γίνεσθαι τὸ καλέμενον ἡλεκτρον*. "It is reported, that their Tears running into the River *Po*, condense, and become what they call Amber." All the Gum of the Poplar does not turn to Amber, but only that which falls into the River, and there concretes in the Water, and acquires the Hardness of a Stone, by virtue of the Cold. Whether the *Arabians* believed, that Amber was so generated, or confounded all the Gum of the Poplar and Amber together, they never speak of Amber, which they call *Karabe*, than as the Tear of the Poplar. The *Arabians* call the Poplar *Haur*, and sometimes *Haur Rumi*, that is, the Roman Poplar. The Latin *Avifena*, *Cap.* 349. renders *Haurus*, the Tear of the Poplar: *De Haur*, id est, *Populi Lacryma*. He takes the Name of the Tree for the Tear; as, on the other hand, *Cap.* 375. in his Translation, he makes *Karabe*, which is the Amber, or Tear of the Poplar, to be the Poplar itself: *De Karabe*, id est, *Populo*. So also the Translator of *Serapion*: *Haur Rumi*, id est, *Karabe*. So *χαλβάιν* (*Chalbaine*) signifies as well the Gum, as the Shrub from whence it is produced; and the same may be observ'd in other Particulars.

From the Premises, I can hardly make a Doubt, but that this *Haurus* was, by the barbarous People, first chang'd to *Habrus*, and afterwards corrupted into *Hambrus*, to signify Amber: So from the old Word *Abiga*, "Expeller," which was the Name by which the *Latins* call'd the Chamæpitys of the *Greeks*, because of its Efficacy in expelling the Foetus, the same Barbarians coin'd their *Ajuga*; but later Ages, instead of *Abiga*, pronounced *Aviga*. An old Expositor of the *Arabian* Nouns has it, *Aurum Romanum*, id est, *Archirosa*, *cujus Gummi dicitur Karaba*. Read, id est, *achiros*, or *acchiros*, from *αἰγερὸς* (*Aigirus*, a Poplar).

'Tis certain, that the Name *Ambri*, for *Succinum*, (Amber) is not of *Greek* nor *Arabic* Original. The *Arabians* call it *Karabe*, the antient *Greeks* *ἡλεκτρον*, "Electrum," the more modern *βερενίκη*, "Berenice." From this *Berenice* the Barbarians hammer'd out their *Vernix*, which is their Term also for another kind of Gum; for so they call'd the Gum of Juniper, because it was so much like Amber. *Avifena*, *Cap.* 273. says, the *Karabe* was like *Sandarach*; so they called the *Vernix*. Some even made *Karabe* the same with *Sandarach*, as *Serapion* assures us, *Cap.* 366. *De Karabe*. Hence the Barbarians, as I said, call'd the *Sandarach Vernix*, which was the Name the later *Greeks* used for *Electrum*. *Neophytus*: *Βαγύλιος λίθος, ὅστις ἐστὶ τὸ δένδρον, ἐστὶ δὲ τὸ λεγόμενον βερενίκη*. "The Beryl Stone is the Juice of a Tree, or what they call 'Berenice.'" The same Author, on the Word *ἡλεκτρον*: *Ἄλλαι δὲ φασὶν ὅτι τὸν αἰγερὸν ἐστὶ καλλώδες*. "Others say it is the 'Glue of the Poplar.'"

Perhaps, besides the Similitude of the Gums, the near Affinity of the Names in *Arabic*, was a Cause of their being confounded. For the Poplar is call'd *Raur*, whose Gum is the *ἡλεκτρον*, or *βερενίκη*; and the Juniper is call'd *Harar*, and its Gum *Sandarac*. And yet, which is strange, in the *Arabic* *Avifena*, we always read *Giauzi*, and not *Haur*, for a Poplar. *Giauzi* indeed with him signifies simply a Walnut-tree; but he always puts *Giauz Alrumi*, that is, the Roman Nut-tree, for the Poplar.

The Gum, commonly called *Vernix*, is written in *Arabic* *Sandarac*, in *Avifena* with the Letter *Sin*. And in the Chapter of *Karabe* it is call'd *Alсандάρυς*, which is also pronounced *Sandarac*; for *Elif* and *Vau* are often chang'd one for another in *Arabic* and *Hebrew*, for which Reason the Translators always render it *Sandarac*. The *Karabe*, that is, Amber, and this *Sandarac*, are so much alike, that they often exchange Names. *Avifena*, in the Chapter of *Caucamum*, writes the same things upon *Sandarac*, which he afterwards repeats almost *verbatim* of the *Karabe*, in his Account of *Lacca*. This, as I said before, is what the Barbarians call'd *Vernix*, by a Corruption from *Berenice*, which with the later *Greeks* signifies *Electrum*.

But the *Sandarac*, which is the Gum of a Tree, agrees in nothing but Name with the metalline *Sandarac*, which the *Arabians* call *Zarnig*; nor are we to suppose, that the *Arabians* made that Name, which with them signifies the Gum of a Tree, out of the Name of the metalline *Sandarac*.

The Antients had another *Sandarac*, which was the Food of Bees, and gather'd by them from the Juice of Trees, after the manner of Gums; of which *Pliny* speaks, *Lib.* 2. *Cap.* 7.

which Passage is thus to be read: *Præter hæc convexitur Erithace, quam alii Sandaracham, alii Cerinthum vocant. Hic erit Apium, dum operantur, Cibus, qui sæpe invenitur in Favorum Inanitatibus sepositus, et ipse amari Saporis: Gignitur autem Rore verno, et Arborum Succo, Gummi modo, Africæ minor, Austri Platu nigrior, Aquilonibus melior, et rubens, plurimus in Græciis nucibus. Menecrates Florem esse dicit, sed nemo præter eum.* "Besides these, they convey thither *Erithace*, which some call *Sandarach*, others *Cerinthus*. This is what the Bees feed on while they are at Work, being often found in the empty Spaces of the Combs, and is of a bitter Taste. It is generated of the Spring-due, and the Juice of Trees, after the manner of Gums; it is diminish'd by the South-west Wind, grows blacker with a South Wind, but is meliorated and redder'd by a North Wind, and is very plentiful on Almond-trees. *Menecrates* says it is a Flower, but he is the only Person who says so." This *Sandarac* is from Gum, and is a sort of Glue. *Varro*, we know, observes, that the Matter with which the Bees glew together the Extremities of their Combs, is call'd *Erithace*, and is a different thing from the *Propolis*, having the virtue of alluring the Bees. The *Greeks* expound it by *τροφή μελισσῶν*, "the Food of the Bees"; *σανδαράχην*, (*Sandarache*) is the same thing; and so is *κηρίθου*, (*Cerinthus*) which is as much as to say *Cerago* (a waxlike Substance). *Hesychius*: *Κηρίθου, ἡ λεγόμενη ἐριθάκη ἐστὶ δὲ τροφή, ἣν παρατίθενται ἐαυτοῖς αἱ μέλισσαι*. "Cerinthus, which is call'd *Erithace*, is the Food which the Bees lay aside for themselves." *Menecrates* rather fancies it to be a Flower, and is follow'd in his Opinion by *Virgil*, who describes *Cerinthe* as a Flower or Herb grateful and attractive to the Bees:

Trita Melisphylla, et Cerinthæ ignobile Gramen.

"Bruised *Melisphyllon*, and the ignoble Herb *Cerintia*." And *Pliny* himself, who here censures *Menecrates* on this Account, elsewhere enumerates *Cerintia* among those Herbs and Flowers which are grateful to the Bees; and *Lib.* 21. *Cap.* 12. gives a Description of it. *Theophrastus* likewise, *Lib.* 6. *Cap.* 7. reckons *κηρίθου*, (*Cerinthum*) among the Herbs used in Garlands (*Herbas coronarias*). Nothing hinders from bestowing the same Appellation on an Herb, and on *Cerago*, which others call *ἐριθάκην*, (*Erithace*). This latter is a gluey sort of Gum, with which the Bees conglutinate the extreme Borders of their Combs. Of this speaks *Virgil*, as follows:

----- *tenuia Cera*
Spiramenta linunt, Fucosque et Floribus Oras
Explent, collectumque hæc ipsa ad Munera Gluten,
Et Visco et Phrygia servant Pice lentius Ida.

"They besmear the small Spiracles with Wax, and fill up the Space between the Extremities of their Combs with Fucus and Flowers; and keep in Store, collected for these very Purposes, a Glue more tenacious than Bird-lime, or the Pitch of *Phrygian Ida*." That this Passage must be understood of the *Erithace*, we are taught by *Varro*, *Lib.* 3. where he thus speaks of Bees: *Extra Ostium Alvei obturant omnia, qua venit inter Favos Spiritus, quam ἐριθάκην appellant Græci.* "Without the Door of the Hive they close up all where-ever the least Breath of Air can come between the Combs, with what the *Greeks* call *ἐριθάκην*." With this *Erithace* they smear over and stop up the *Spiramenta*, that is, the small Holes by which the Air can come between the Combs. *Philargyrus* understands this Place of the Poet, as concerning *Propolis*, and takes the *Fucus* to be a kind of Wax, which the Bees use instead of Glue, and is call'd *Propolis*. But of the *Propolis* our Poet in the same Place thus sings:

----- *Et lentum de cortice Gluten*
Prima Favis ponunt Fundamenta, deinde tenaces
Suspendunt Ceras. -----

"They lay the first Foundations of their Combs with the slimy Glue of a Bark, and afterwards erect their tenacious waxen Structure." *Servius*: *Græci πρόπολιν vocant, duriores Cera, quæ vix potest Ferro frangi, quam colligunt de Gummi Arborum.* "The *Greeks* call it *Propolis*; it is harder than Wax, and can scarce be broken with a Hammer. The Bees gather it from the Gums of Trees." The *Sandarac*, or *Erithace*, is also a Glue, and comes from the Gum of Trees, and the red is the best. Thence, we may be sure, comes the *Sandarac* of the *Arabians*; for of *σανδαράχην*, (*Sandarache*) they made *Sandarac*, changing a into u, as they do in other Words. Thus of *σοιχάδου*, they made *Astuchudos*; of the *Greek* *τίμπανον*, they coined *Tambur*, for *Tambar*; for they commonly change n into r, and p into b: Thus they pronounce *φισήκ* (*Phistouk*) for *φισάκ*, (*Phistak*) from the *Greek* *πίσάκιον* (*Pistacion*).

Some will have this *Sandarac* of the Bees to be the *Vernix*, but they are wrong in their Etymology. The *Vernix* is the *βερενίκη* (*Berenice*) of the *Greeks*, by which Name they call'd Amber,

Amber, (*Succinum*) or the Gum of the Poplar. *Pliny*, we know, says, that the Bees gathered Piffoceros from the Gum of Poplars, but the Erithace, or Sandarac, from the Gum of the Almond-tree. I suppose it is called Sandarac for no other Reason but its sandarachine Colour. *Pliny* says, it is blacken'd by a South Wind; and perhaps this is the black Mum of *Avifena*, by which Name he expressed the Propolis of *Dioscorides*. But they confound Things; nor is it so strange, that there is a Permutation of Names in this Case. *Karabe*, as I said, with the *Arabians*, signifies Amber, or the Gum of the Poplar; and they say it resembles the Sandarac, or Veriix, which is properly the Gum of the Juniper. The Sandarac of the Bees is from the Gum of the Almond-tree. In an old Expositor of *Arabic* Names, *Karabe* is noted to be the Gum of a Tree called the *Roman* Walnut-tree. The Author followed the Reading which you every-where meet with in *Avifena*, of *Giauz* for *Haur*. But *Avifena* distinguishes that Tree from the Walnut-tree by the Adjective *Rumi*; for he calls the Poplar; not the Walnut-tree, *Giauz Alrumi*; tho' if it be render'd literally Word for Word, it signifies the *Roman* Walnut-tree, which was the Name he used for the Poplar. Others call it *Haur*, and, with the Addition of a *Nun*, *Hauron*, which is the Poplar.

This *Haur* and *Hauron* the *Barbarians* corrupted into *Abrum* and *Abrum*, and from thence, in a little time, into *Ambram*, to signify the Tear of the Poplar, or Amber.

As for *Hambar*, or *Ambar*, as it is a different Name, so it signifies another thing. The *Greeks* of the latter Ages, as *Nicetas Choniates*, *Simeon Sethi*, and others, write *Ἀμπαρ* (*Ampar*). *Aetius* also mentions it, and calls it *ἄμπαρ* (*Ampar*) in the antient Copies, not *ἄμπα*, (*Ampa*) as it is in the Editions. We call both sorts *Ambra*, but that which is not the *Succinum* we commonly distinguish by an Adjective signifying the Colour.

I don't remember, that I have read *Ambra* to mean *Succinum* in later *Greek* Authors, nor do the *Arabians* call it by that Name. For which Reason I can't but suspect a Remark of *Fuchsius*, in *Myrepsus*, on the Composition of the seventy-fourth Plaister, concerning the Difference of the *Ambra* and *Ambra*, in these Words, "*Ambaris*, *Exag.* 2. *Moschi* "*Scrup.* 2. *Ambrae*, *Exag.* 3." I don't find this Composition in the original *Greek*, and *Fuchsius* seems to have fallen upon a bad Copy, or not to have fully comprehended the Meaning of the Writing, which he had the Misfortune not to do in almost an infinite Number of Places. *Leo Africanus* tells us, That the Whale is called *Hambara* by the Inhabitants of *Fez* and *Morocco*; which perhaps gave Rise to a received Opinion among most of the *Greeks* and *Arabians*, that *Ambra* was the Dung or Spawn of the Whale. Hence it is, that in the Medical Glosses of the later *Greeks*, we every-where find it thus interpreted, *Ἀμπαρ μυρμηκίου κόπρος ἰχθύος*, "the odoriferous Amber is the Dung of a Fish;" and *ὀσμὴν ἀποδύμενη*, "the Excrement of a Whale." The same way of Reasoning induced Multitudes to believe, what many also wrote, that Frankincense grew on Mount *Libanus*, because the *Greeks* called Frankincense *λίβανος*, (*Libanos*) which is the Name of a Mountain in *Syria*; and some even at this Time would fain persuade us, that this Mountain is at this Day called *Lebnon*, from the *Syriac* Word *Lbunto*, which signifies Frankincense; whereas the *Syriac* *Lbunto* for Frankincense is plainly a Corruption of the *Greek* *λίβανος* (*Libanotos*). If Frankincense had been of the common Growth of *Syria*, the Antients had not differ'd so much about the Shape of that Tree, which was hardly known to them. 'Tis certain, that it grows no-where at this Day but in *Arabia*; and *India* does not produce it, though the Antients make mention of *Indian* Frankincense. *Συρίας λίβανος καπνός*, "the Smoke of Syrian Frankincense," is mention'd in the *Bacchæ* of *Euripides*, but after the same manner as *Malabathrum Syrium*, *Myrrha Syria*, and other things, which we are well assured, were never of the Growth of *Syria*.

Antient and modern Authors are not agreed about the kinds of *Ambar*, nor about its Colours, Differences, and Marks of Goodness. The *Portuguese* Writers make three Species; the *Porabar*, which is the white; the *Puabar*, which is white mix'd with black, or, the brown; and the *Minabar*, or Black, which, they say, is devour'd by the Whale. The first kind is the best, the second next, and the third worst of all. *Simeon Sethi* describes the best Sort as red and fat, the next in Goodness is the brown, and the worst Characteristic is that of the black, which is gather'd of the Whales that have been sucking at the Springs of *Ambar*. *Καὶ τὸ μὲν κρεῖττον*, says he, *ἐστὶ καὶ κίρρον καὶ λιπαρὸς ἀναδιδέσθαι δὲ ἐν τινὶ πόλει Σιλαχὴν ὀνομαζομένην τὸ δὲ ὑπόλευκον ἐν τινὶ παραλίᾳ πολυχνίᾳ τῆς ἐνδ' αἰῶνος Ἀραβίας Σίχνη ὀνομαζομένην τὸ δὲ ὑποδύεσσον καὶ μέλαν συνάγεται ἐξ ἰχθύων ἀπογευσσάμενων τῶν τῷ ἄμπαρ πυγῶν.* "The best is the red and the fat, which is exported from a City called *Silachet*; the whitish comes from a little maritime City of *Arabia Felix*, called *Sichne*; and the poorest sort, which is the black, is gathered from Fishes which

"have been tasting of the Springs of *Ambar*." The best, he says, is brought from *Silachet*, a City of *India*, where it rises out of Springs. *Avifena* also calls the highest-prized *Ambar* *Alselebetii*, that is, which comes from the City, or Country, *Selebet*, which is the very same that the *Nubian* Geographer places in the ninth Parallel of the first Climate, calls *Selebet*, and makes an Island of *India*. This is *Simeon's* *Σιλαχὴν* or *Σελαχὴν*, (*Silachet* or *Selachet*) for the *Greeks* commonly express the *Arabic* He by X (*Ch*); as *Ταμαρχήσι* (*Tamarchenti*) in the *Græco-Arabic* Lexicons stand every-where for *tamar Hendi*. What bears a lower Rate, but next to the best, *Simeon* tells us, springs up in a City of *Arabia Felix*, called *Σίχνη* (*Sichne*). In other Copies I find it written *Σόχνη λεγομένη*, "called *Suchra*"; and some cite it, *ἐν Σενχρί Felicis Arabiæ*, "from *Senchri* in *Arabia Felix*." I know not whether it be the Place which *Serapion* calls *Zing*; only he places it in the West, far enough from *Arabia Felix*, viz. in *Terris Zing in Occidente*, "in the Territories of *Zing* in the West." He must not however be understood to mean *Africa* or *Barbary*, but a maritime Tract of *Ethiopia*, where *Mosambique* lies, which abounds with *Ambar*, and is situate West of *India*; now the *Arabians* call the *Ethiopian* *Zing*. *Simeon* calls the maritime City of *Arabia Felix* *Σίχνη* (*Sichne*); the *Zengi* in *Alpagus* are the western *Ethiopian*s. But *Serapion* differs from others in his Characteristics of the best *Ambar*, which, he says, is of a Sky-colour, and makes the white to be the cheapest and worst of all, tho' others prefer it to the rest. But, in Truth, there is no *Ambar* of a sky-blue or azure Colour; and it seems a Fault of the Translator. The *Arabic* is *azarac*, which they render sea-green, (*glaucus*) grey, (*cæsius*) and azure, (*cæruleus*) of the Colour of the Firmament. According to *Alpagus Zarach* is the Colour of the Heavens; however it can have nothing to do here, when we talk about the Colours of *Ambar*: They also take notice, that it signifies changeable and pale. Hence comes *zaracha*, *paleness*; and this is the true Signification of the Word in this Place. *Simeon* terms it *ὑπόλευκον* (*hypoleucon*); we commonly call it a grey or grizel. *Avifena* calls it *Alazarac*, which his Translator rightly renders of *Ash-colour*. *Avifena* gives the Preference to *Selebetican* *Ambar*, which has its Name from an Island of *India*, which *Garcias* wrongly supposes to be *Zeilan*. The second Place in point of Goodness, he says, belongs to the *Ambar alzarac*, that is, the *Ash-colour'd*. As to the *Selebetican*, which is most esteemed, he does not tell us of what Colour it was, at least in the *Latin* Edition. And it is observed by *Alpagus*, in his Exposition of *Arabic* Names, that the *Arabian* Interpreters are ignorant of the kind of the *Ambar* *Alseleheti*, as well as its Colour; at which I can't but wonder. If there were no more in the *Arabic* Copy, than in the *Latin* Version of it, yet it might easily be guess'd; from what others have related, that the *Selebetican* *Ambar*, to which *Avifena* assigns the Preference, was white, since most set the highest Value upon *Ambar* of that Colour, tho' *Avifena* does not mention it. We might also conjecture, that it was red, as well as *Simeon*, who makes the *τὸ κίρρον*, "red," the most valuable. Nor is *Avifena* against it; for he only assigns the third Place to the *Citron-colour'd*, which in *Arabic* he calls *Alasafar*, that is, *χαλκόχρουν*, *Copper-colour'd*. The *Citrine* is a very watery Colour, but the *κίρρον* (*cirrus*) is ruddy or red. *Avifena*, among the Characteristics of the best and choicest *Ambar*, does not only name *Selebetican*, which was all that his Translator observ'd, but prefix'd two other Words expressing the Properties it ought to have, viz. *alasciheb*, and *alkavi*, to which he adds as a third *Alseleheti*. This last Epithet is taken from the Country, the two former signifying other Qualities which belong to it. *Alkavi* imports firm and robust, which I understand of that *Ambar* which is least friable, and most resists a Separation; such is that which is endu'd with a fat sort of Viscidity. This is the *λιπαρὸς* (*lipodes*) of *Simeon*, which he sets down as a Mark of the most valuable *Ambar*. *Garcias* commends that for the best, which, pierced with a Needle, sheds out a good deal of an oily Liquor; this is the *λιπαρὸς*, "fat;" what is easily broken cannot be such. I take *alasciheb* for ruddy, according to the same *Simeon*, who calls it *κίρρον* (*cirrus*). The Word is derived from *Seiheb*, which signifies a Flame or Lamp, and in the *Alcoran* is put for a Star. It might also be taken for white, as it expresses the *τὸ λευκόν*, "lucid," which the *Greeks* also put for white. But *Simeon* has handsomely expressed *Avifena's* two Epithets of the best *Ambar* by those other two, *κίρρον* καὶ *λιπαρὸς*, "ruddy and fat." If he took them from the *Arabians*, 'tis plain that he understood *alasciheb* to signify *rutilus*, "ruddy." Among modern Writers, *Manardus* informs us, that in chusing the best *Ambar*, we are to take such as borders a little upon the red, and that the white is not so good. But I suppose he had this from *Simeon*, whose *ὑπόλευκον*, whitish or grey, *λευκόφατον*, (*leucophæon*) he did not rightly express by *album*, "white." This is the *azarac* of the *Arabians*, which properly signifies party-colour'd, or sprinkled with black and white, and is from the *Hebrew* זר, *Zarac*, "to sprinkle." So the *τὸ ποικίλον*, (*various*)

(various) is by the Greeks called *παρσέν*, ἀπὸ τοῦ παρσέν (sprinkled, from the Verb signifying to sprinkle). The Latins say *sparsum*, (sprinkled) whence *Sparso ore* in the Comic Poet. And in the Glosses: *Aspersus*, ἐξ ὧν καὶ ἀσπίς (the *Aspersus* is a kind of a spotted Fish); and *sparsa Tempora*, *sparsum Caput*, "sprinkled Temples, sprinkled Head," denote τὸν μισοπέλιον (a Man whose Head is sprinkled with grey Hairs); in which Sense also we read the Verb *zarac* in *Hosea*: They are mistaken then, who render it azure or green.

Serapion taken Notice of but two Kinds of Ambar, viz. that which his Translator calls sky-colour, (*cælinus*) and the white, of which the first was the best. Perhaps the Word in *Arabic* for Sky-colour was *alaxiheb*, as it is in *Avifena*, and the old Translator rendered it *stellinum*, from the Colour of the Stars, or *cælinum*, as we have it. As for the white, I doubt not but it was the same with what *Simeon* calls *Hypoleucum*, (*ὑπόλευκον*), and *Avifena* *azarac*, that is, an ashy white; for *Garcias* is mistaken, when he writes, that the whitest Ambar is condemned by *Serapion*, who says simply white, not whitish, or inclining to white.

But we are, in a manner, forced to render the *Arabic* Word *alaxiheb* white, by the later Accounts of three different Species of Ambar, under as many different Names, viz. *Perambar*, *Puambar*, and *Penambar*. The first of these is the white, and the best of all; the second is the ashy-coloured, which is next in Goodness and Price; and the third Sort is the black, which is the cheapest, and worst of the three.

We meet with *candida Sidera*, and *candida Flamma*, "white Stars, and white Flames," whenever we read the Poets; and this is literally true. But *candens*, "shining," for *candidus*, "white," is also usual, and from thence *Candela*, ἡ λαμπάς, (a Candle) takes its Name. So also, in the Greek, λαμπρὸν (*lucid*, or *shining*) is used for *candidum* "white," as λαμπρὰ εἶδος, (a shining white Garment) and λαμπροίμοις (*Candidates*). The *Arabic* Word signifies a Star, or Lamp, from whence comes the Term for a white Colour. They who understood it, as *Simeon* did, of a ruddy, (*rutilus*) presented us with an Ambar dressed up in Red, of which there is none extant at this Day, from a Misunderstanding of the Word.

Brassavolus takes the yellow Amber, out of which Handles for Knives are made, for *Succinum*. Another learned Physician, in his Definitions, under the Word ἤλεκτρον, (*Electrum*) cites *Serapion*, where he treats of Ambar, as tho' there were no Difference between this Ambar and the *Electrum*, which they call the Ambra of the Shops. *Scaliger* also, in his Notes upon *Garcias*, does not scruple to call *Ambarum* by the Name of *Succinum*.

They are all of them most grossly mistaken: The two Ambras are both of a different Nature, and derive their Names from a different Original. In one thing they agree, viz. in that they are said to rise out of Springs after the manner of Bitumen. The *Succinum* also is of a fragrant Smell, and the white Sort extremely fragrant, according to *Pliny*; for there is the white, the yellow, and the waxen: Yet, for all this, the *Ambarum* is a quite different thing from the *Ambra*, which is called *Succinum*. Nor must we imagine, that *Avifena* and *Simeon Sethi*, when they mention the yellow or citron-coloured *Ambarum*, confound it with the common *Ambra*.

We have already shewn, that the Name *Ambarum*, to signify *Succinum* or *Electrum*, is not extant in any Greek or Arabian Author of considerable Antiquity. Moreover, all the Moderns, who have given us Relations of Voyages to the new World, mention only three Sorts, and as many different Colours of *Ambarum*, or *Ambar*, which are, the white, the ashy-colour'd, and the black; of these the white is the most valued, and the black the least esteemed. *Simeon Sethi*, instead of the white Ambar, makes the *ρίππος*, (ruddy, or gold-coloured) to be the most precious; as to the rest, he agrees with the others; for his second Sort is the *ὑπόλευκον*, (whitish) and his third and last Sort is the *μέλαν* (black). *Ferdinand Lopez*, as well as the rest, reckons three Sorts of Ambar, but differs a little in their Names, of which he gives an Explication. They are the *Ponahambar*, the *Coambar*, and the *Maniambur*; the *Ponahambar* is the white, which is in highest Esteem; the *Coambar* is the ashy Ambar, and this Sort bears a greater Price than the others, being very scarce, and gathered with much Difficulty: This is plainly the *Κίρρον ἄμπαρ* (the red Ambar) of *Simeon*, and is called *Golden*, I suppose, not from the Colour, but the Price, as *Lopez* clearly hints, and as it is expressed in the Language of the Natives by *Ponambar*; and perhaps this deceived *Simeon*, who might understand *Golden* to mean the Colour: Some call it *Porambar*, and interpret it of white Ambar: So, again, what others call *Puambar*, is by *Lopez* called *Coambar*, which he interprets *Water-Ambar*; because, by its long and violent Agitation on the Waters, it has lost much of its Virtue; this is of an Ash-colour. The third is the *Maniambur*, which signifies *Fish-Ambar*; for it is devoured by Whales, and after some time brought up again by them, unconcocted, whence its Blackness is contracted: And this agrees also with *Simeon's* Opinion, who

says, that the Fishes which drink of the Fountains of Ambar, cast it up again coloured black.

There is mention made of *κακάμπαρ* (*Cacampar*) in *Myrrisus's* Plaisters, *Compos. 3.* *ἐνλαλὴς, κακάμπαρ, ἐνλεβαλοαίμα, ἐνλονασίας, &c.* — of *Lignum Aloes, Cacampar, Xylabalsamum, Cassia Lignea, &c.* What Reason *Fuchsius* had to translate *Cacampar*, *Betony*, I cannot so much as guess; but how is it likely, that the Author would put *Betony* among exotic Aromatics? But I have observed of *Fuchsius*, that he every-where takes the Liberty of changing what he does not understand; which is a Practice scarce tolerable in a Man of Letters, but most unpardonable in a Physician, on account of the Mischief which usually result thence to the infirm Part of Mankind. I am apt to suspect, that we are to understand by it some kind of Ambar; and perhaps it is what *Lopez* tells us the Natives called *Coambar*. The Greeks seem to have pronounced *κακάμπαρ*, (*Cacampar*) instead of *καάμπαρ*, (*Caambar*) or *καάμπαρ*, (*Coambar*). We must, however, acknowledge, that *κακάμπαρ* (*Cacamparis*) is a Word that often occurs in *Myrrisus*, with an Interpretation that will hardly agree with any Species of Ambar: For in his Antidote *ἐκ τοῦ ὀνίου*, (of Quinces) *Cap. 37.* he explains it by *δρυσόβοτανον*, (*Drosibotanon*) *κακάμπαρ* ἢ οἱ δρυσόβοτανον (*Cacampar* or *Drosibotanon*); and *Cap. 79.* in his Antidote against the Dysentery and Colic, *γαστρούλλαν, κακάμπαρ* ἢ οἱ δρυσόβοτανον (*Cariophylli, &c.*) In the Antidote of *Castor*, which is the twentieth in *Fuchsius's* Edition, and the same with the above quoted, *Cap. 27.* we read, in *Fuchsius's* own Version, *Lauriola Campi, id est, Betonica* (of Laureola of the Field, that is, *Betony*): He had as good have said nothing. The Greek reads, *λαυριόλη, ἢ οἱ κακάμπαρ, ἢ οἱ δρυσόβοτανον* (*Laureola, or Cacampar, or Drosibotanon*). The Word *Laureola* wants to be explained in the Greek: Some take it for the Mezereon of the Arabians, which is something very different from *Betony*: *Drosibotanon* is, properly, the Herb of Dew; for Dew, in vulgar Greek, is called *δρυσία* (*Drosia*). I find, indeed, *Betony* so called and explained in medicinal Lexicons; and a very antient Copy of *Dioscorides* informs us, that it was called, by the Romans, *ροσμαρίνα* (*Rosmaria*). The antient Greeks called it *ψυχροτρόφος* (*Psychrotrophos, nourished with Cold*); because it loves to grow in cold Places: Later Ages called it *δρυσόβοτανον*, from Dew, whence came the Latin Name *Rosmarinus*. But why the same later Greeks gave it also the Name of *Cacampar*, I know not; and it seems to be an Arabic Word. However, it does not appear worthy of a Place among the Aromatics and Exotics in Plaister the third; and it stands there without any Exposition, which *Myrrisus* never omits; for where-ever you read *κακάμπαρ* (*Cacampar*) in him, you meet with its Explication adjoined, with an ἢ οἱ δρυσόβοτανον (that is, *Drosibotanon*).

There is, in the same Author, another Word, which is *κικέμπαρ*, or *κικέμπαρις* (*Cicampar, or Cicamparis*); which is always mentioned among the Aromatics, as in the first Antidote of *Castor*: *στύραμιθ, καλαμίτη, κικέμπαρ, κινάμων* (of *Styrax Calamita, Cicampar, and Cinamon*); and so, also, in his Antidotus plenus Archenticus, *κινάμων, γαστρούλλαν, ἐνλαλὴς, κικέμπαρις* (*Cinamon, Cariophyllum, Xylaloes, Cicampar*). The same Author often uses *ἄμπαρ* for Ambar. The Question now is, What is meant by this *Cicampar*?

As for *Fuchsius*, he always passed over what he did not understand, with great Assurance: But, concerning the Original of Ambar, *Simeon* speaks thus, *τὸ ἄμπαρ ἐκ διαφόρων βλάσκει τόποις, καθάπερ πηγαὶ ἐλαίου τε καὶ ἀσφάλτου* (*Ampar gushes out in several Places, like Springs of Oil, (ἐλαίου) or Asphaltus*). The Passage is commonly cited, *πηγὴν ἐλαίου καὶ ἀσφάλτου*. Hence a learned Author took Occasion to augment his Lexicon with the Addition of the Græco-barbarous Term *Πηγέλιον*, (*Pegelium*) of which he gives no Explication, and 'tis no Wonder he did not. In some Copies I found it written *καθάπερ πίστις, ἐλαίου τε καὶ ἀσφάλτου* (like Pitch, Oil, &c.). The Greeks often called liquid Bitumen by the Name of Oil; yet I don't doubt but the Place might be better read *πείρελαι τε καὶ ἀσφάλτου* (*Petrelæum and Asphaltus*). The later Greeks called *Naphtha* by the Name of *Petrelæum*, of which there are Springs as of the *Asphaltus*, which is a Sort of liquid Bitumen.

The Nubian Geographer is of the same Opinion concerning Ambar, who says, that under the seventh Parallel of the first Climate there lies a native Vein of Ambar, which bubbles up from Springs in the Bottom of the Sea, as the Naphtha does in the Country of *Babylon*; and that they sometimes find Fragments of it a hundred Pound Weight, which is the Import of the Arabic Word *KINTHAR*, from the Latin *Centarius* for *Centenarius*. *Garcias* relates, that they once found a Fragment that weighed three thousand Pounds.

The aforesaid Geographer calls the Fountains, whence the Naphtha works out, *Hit*, and says it is a Place in the Territory of *Babylon*. Here, by the way, we may take Notice of a Mistake of *Avifena*, in translating *Dioscorides*: The Greek Author defines *Naphtha*, *βαρυλάνης ἀσφάλτου πρεσβύτημα, τὸ χεράμει λένον* (a Percolation of Babylonian Asphaltus, of a white Colour). He

He adds, that they find also a black Sort: Here *Avifena* makes strange Interpolations, for want of taking the true Sense of his Author. "The white Naphtha, he says, is a Species commonly known; but the black is the *Babylonian*; or some other Sort of Pitch, passed through a Strainer." But the Meaning of the Greek Author is, that the Naphtha is a *Babylonian* liquid Bitumen, melted down in a manner, and strained through the secret Canals of the Earth, and flowing out of Fountains, Wells, or Caverns. *Avifena* himself expressed the same thing, when he said, that the black Naphtha was *Sasua albor alabeli vageirohe*; which the Translator rightly rendered, a Percolation of Babylonian; and other Sorts of Pitch. But this cannot be the Meaning of *Dioscorides*, who, by περιεθνημα ἀσφαλτος, simply intended liquid Bitumen; as Things which are squeezed and passed through a Strainer, become the more liquid; for nothing goes through but the most liquid Part, the thick and feculent remaining behind. This the Greek Author affirm'd as well of the black as the white. Besides, it is to be observed, that *Dioscorides* did not say διαθνημα, (*Diathema*) but περιεθνημα (*Periethema*). Things which are simply transmitted through, are said περιεθνημα (*Periethema*); but περιεθνημα (*Periethema*) is another Thing: That whole Country was bituminous; he would therefore indicate, that this Bitumen was dispersed all around that Territory, in a loose and indeterminate manner, and strained through the Veins of the Earth; and in some certain Places was liquefied, and did bubble and work out; and this was the Naphtha. Thus we are to suppose, as I may say, a *Periethema*, (a straining all around) or Vent-holes all over the Country for this *Babylonian* Bitumen.

But *Avifena* thought, that the white Naphtha proceeded from a natural Vein; but the black was the *Babylonian*, or some other kind of Pitch, defecated by passing through a Strainer: Whereas *Dioscorides* spoke this peculiarly of the white Kind, that it was a *Periethema* of the Asphaltus, and particularly of the *Babylonian*. The Greeks called this Sort of Bitumen ἐλαϊον Μεδέας (*Oil of Medea*). *Socion*, on Fountains, says, Τὸ δὲ κατὰ τὴν Σουανὴν ὕδωρ φασὶν εἶναι Μεδέας, ἢ περὶ ἀπὸ τῶν ναυσιπόρων φασφάκων; ὃ δὲ μὲν ἐν τῇ τῆς τινος (They say, that about *Sufiana* is the Water of Medea, which is medicated with caustic and inflammable Drugs; it flows out of a Spring). He says it is called ἀφθα (*Aphtha*); and so it is read in the Epitome of *Strabo*, comprised in *Constantine de Imperio*, viz. πρὸς αἰσθῆς (Springs of *Aphtha*).

Most of the Antients were of Opinion, that there are Springs in the Bottom of the Sea, like those of Naphtha, which throw up Ambar; and this, as it is the most common, is also the most probable Opinion, and best accounts for those Fragments of the Shells of Oysters, and other testaceous Fish, which are so often found inclosed in it, having stuck to it before its Humour was condensed, just after the same manner that you see Ants, and other Reptiles, in Succinum, which were caught and detained by the tenacious Humour before it was congealed; for this also is found to rise out of Springs, as well as the Naphtha, Bitumen, and Ambar. And so much for the Difference between Ambar and Ambra, which does not consist in Names, (for we call them both Ambra) but in the Things themselves, which both differ in their Natures, and derive their common Name from different Originals. *Salmasius de Homonymis Hyles Iatricæ*, Cap. 101.

Of AMBERGRIFE. — Ambra Grisea.

We see, by the preceding Dissertation, that, with respect to Ambergrife, as it has also happened in most other things, the Antients have made few Mistakes, but what have been adopted by the Moderns, and broached with an Air of discovering something new, with very little Variation. Thus Ambergrife is, in an Account from *Batavia*, printed in the *Philosophical Transactions*, said to be the Product of a certain unknown Tree, from whose Roots it flows into the Sea. In another Dissertation it is said to be the Combs of a Sea Insect, somewhat like a Bee. Nor is the Supposition of its being produced by a Whale so modern as the Author of the following Memoir seems to imagine.

It is now found out, that this Ambergrife is an Animal Production, and bred in the Body of the *Sperma-Ceti* Whale, analogous to what is found in some Animals of the Land, as the Musk-hog, or *Taiacu*, the Musk-deer, the Bezoar-sheep, and some amphibious Animals, as the Musquash, &c. who have their valuable Scent in a particular *Cystis*, or Bag. I am apt to think, that which first gave Occasion to the Notion of Ambergrife being the Production of the Whale, was, because it was found in considerable Quantities on the Shores of the *Summer-Islands*, and among the *Bahama's*, where the dead Whales are frequently wrecked and broke up with the Sea, and the Ambergrife found floating, or on the Shore; but here again, the Ingenious, until very lately, were at a Loss, and divided in Opinion; for though they agreed it to come from the Whale, yet some took it to be the true and proper Semen, being found only in the Bull, at the Root of the *Penis*, near the Testicles; others again thought it was the Ordure or Excrement of the Whale.

The best and most exact Account of Ambergrife, that I have been able to procure, I very lately received from one Mr. *Atkins*, now an Inhabitant of *Boston* in *New England*, who used the Whale Fishery for ten or twelve Years together, and was one of the first that went out a-fishing for the *Sperma-Ceti* Whales, about the Year 1670, and then began to discover the Ambergrife; and being a sober ingenious Man, what he says may safely be depended on; though, for Substance, I have had it from several of the Whale-men.

His Relation, which was taken a few Days since from his own Mouth, is as follows:

The Ambergrife is found only in the *Sperma-Ceti* Whales, and consists of Balls, or globular Bodies, of various Sizes, from about three Inches to twelve Inches Diameter, and will weigh from a Pound and an half to twenty-two Pounds, lying loose in a large oval Bag, or Bladder, of three or four Foot long, and two or three Foot deep and wide, almost in the Form of an Ox's Bladder, only the Ends more acute, or like a Blacksmith's long Bellows, with a Spout running tapering into and through the Length of the *Penis*, and a Duct, or Canal, opening into the other End of the Bag, and coming from towards the Kidneys; this Bag lies just over the Testicles, which are above a Foot long, and is placed lengthways at the Root of the *Penis*, above four or five Foot below the Navel, and three or four Foot above the Anus. This Bag, or Bladder, is almost full of a deep orange-coloured Liquor, not quite so thick as Oil, and smelling strong, or rather stronger of the same Scent with the Balls of Ambergrife, which float and swim loose in it; the Inside of the Bag is very deeply tinged with the same Colour as the Liquor, which may also be found in the Canal of the *Penis*; the Balls seem to be pretty hard while the Whale is alive, inasmuch as there are many times found, upon opening the Bag, large concave Shells, of the same Substance and Consistence, that have scaled off from them, and the Balls themselves seem to be composed of several distinct Coats, inclosing one another, something like the Coats of an Onion.

As to the Number of Balls, Mr. *Atkins* never found above four in a Bag, and in the Bag, where he found one that weigh'd twenty-one Pounds, which was the largest he ever saw, there was no other.

He further says, that to one *Sperma-Ceti* Whale that has any of these Balls, there are two that have nothing but the deep orange-coloured Liquor, aforesaid, in their Bags. This Remark confirms what another Whale-man told me, That the Ambergrife was found only in such *Sperma-Ceti* Whales as are old and well-grown. It is the general Opinion of the Whale-men, that the Ambergrife is produced only by the Male, or the Bull *Sperma-Ceti* Whale. As to this Particular, Mr. *Atkins* says, he never saw, nor certainly heard of, a *Sperma-Ceti* Female taken in his Life, the Cows of that Species of Whales being much more timorous than the Males, and almost impossible to be come at, unless when haply found asleep on the Water; or detained by their Calves. This is certain, the Boats can never come near them, when they are awake, they are so very shy and fearful.

Mr. *Atkins's* Method of getting the Ambergrife out of the Whale, was thus; after the Fish is killed, he turns the Belly upwards, and fixes a Tackle to the *Penis*, then cuts a Hole round the Root of the *Penis*, thro' the Rim of the Belly, till he comes to the Entrails, and then searching for the Duct or Canal at the further End of the Bag, he ties it pretty near to the Bag, and cuts the Duct off beyond it; upon which he draws forth the *Penis* by the Tackle, and the Ambergrife Bag entirely follows it, and comes clean and whole out of the Belly.

The Rev. Mr. *Prince* of *Boston*, who took the preceding Relation from Mr. *Atkins*, apprehends the Bag aforesaid to be the urinary Bladder, and the Ambergrife Ball to be a certain Concretion, formed out of the greasy odoriferous Substance of the Liquor aforesaid contained within it. As for my own Part, I dare not pretend to give any Opinion upon the Point, but content myself with relating Matter of Fact. *Phil. Transf.*

This Account embroils the Origin of Ambergrife very much; for it makes it nearly certain, that Ambergrife, or something very like it, is an Animal Substance; and yet, by the best Inquiries that have been made, it appears; that Ambergrife must belong to the Mineral Kingdom, which the following Observations from *Hoffman* put beyond Dispute.

The Origin of Ambergrife is a Point that has been long debated amongst Physicians and Naturalists, some maintaining it to be the Product of the Animal, others of the Vegetable Creation.

Some assert that it is the Dung of some Oriental Bird; and as a demonstrative Proof of their Opinion, shew the Claws and Fragments of the Beaks of Birds, that are often found inclosed within its Substance, which, being committed to the Fire, emit the Odour of an empyreumatic volatile Salt; which Sort of Smell is almost peculiar to Bodies that derive their Origin from the Animal Kingdom.

Others, on the contrary, attempt to prove, that Ambergrife is a kind of Honey, which is made by the Bees in the Rocks by the

the Sea-side; and being afterwards attenuated and digested by the Heat of the Sun, becomes a Substance of that Fragrance as we find it.

But these Errors may be soon detected by plain chymical Experiments; for all Dung of Animals, and Honey too, admit of a Solution in aqueous Menstruums; but obstinately resist the most highly rectified Spirit of Wine.

Some of the Moderns have thought it to be a peculiar kind of Resin, or Tear, distilled from some Tree, as yet unknown to us, in the *Eastern* Parts of the World, and afterwards transferr'd to the Sea, where, acquiring a more perfect Digestion by the Heat of the Sun, and by the Sea Salt, it constitutes a resinous Body of that Nature.

But, besides many other Reasons, what directly thwarts and overthrows this Opinion, is, that all resinous Bodies of Vegetables will admit of an easy Solution and Extraction, in the highly rectified phlogistic Spirit of Wine; whereas the contrary is true of Ambergrise, which is very difficult to be dissolved in such a Spirit. Besides, it is observed, that inflammable Bodies, produced from the Earth, as Amber, Bitumen Judaicum, and Sea Coal, are also difficult of Solution, and are by no means readily united with a very spirituous Liquor.

These things considered, we agree in Opinion with those who hold, that *Ambergrise* is to be reckoned among the Species of Bitumens, and owes its Rise to the Earth, out of whose Bowels it is torn, and washed away by the Violence of the Waves, and carried into the Sea; for it is found in greatest Quantities in the Sea about the Island of *Madagascar*, where the subterranean Parts are believed to be pregnant with that kind of Bitumen.

Since it is so difficult, as we have observed, to make a Solution of Ambergrise, for this Reason we have never yet met with any genuine Solution of it in the Shops; for it is generally prepared with Musk, or Oil of Cinnamon, or Oil of Roses, or even with Civet; by which means we are, indeed, furnished with an Essence of a very grateful Smell, which also has its Virtues and Use; yet participates but little of the Ambergrise, which remains in a manner untouched: For these Reasons we think ourselves obliged to lay down some Characters of the genuine Essence of Ambergrise, as follows:

First, It ought to be prepared only of Ambergrise, and not mixed with the Solution of any other thing.

Secondly, It must undergo an almost entire Solution by the Menstruum.

Thirdly, If this Essence be dropped into an aqueous Liquor, it will, of necessity, turn milky, after the manner of all Oils and Refins that have been dissolved.

Now it is prepared in the following manner: Let the Spirit of Roses, perfectly dephlegmated, be, not only once, but twice at least, drawn off from Salt of Tartar, which is burnt and calcined in a vehement Fire. By this means there is produced a Spirit, which, by its penetrating Quality, enters into the inmost Substance of the Ambergrise, and so separates and resolves its oleous Contexture.

This Solution, or Essence, of Ambergrise, is deservedly placed at the Head of strengthening Remedies, and such as corroborate the debilitated System of the Nerves; and, of consequence, has the Preference of all such Medicines as are appropriated to Distempers which proceed from a Decay of Strength in the nervous Parts. For it does not so fill the Head with Vapours, or excite Commotions and Agitations in a weak Body, as does the common Preparation of Ambergrise, which is made with a Mixture of Musk or Civet, whose Fragrance is found, by Experience, to be of such a Nature as to incommode weak Persons of both Sexes, who are subject to spasmodic Affections. *Hoffman. Observat. Physico-Chym. Lib. 1. Cap. 18.*

This has the Appearance of being, by much, the best Preparation of Ambergrise I have met with, and is very likely to be possessed of the Virtues which the illustrious Author attributes to it.

It is observable, that as Ambergrise and Amber have much the same Origin, and are both remarkable for their friendly Influences upon the Nerves, it is possible they may be nearly allied to each other.

Ambergrise is thus distinguished:

AMBRA-GRISEA, Offic. Mer. Pin. 219. Park. Theat. 1566. Sibb. Phalain. 42. *Ambra*, Aldrov. Musf. Metal. 430. Wormi. Musf. 33. *Succinum griseum*, *Ambra-grisea vulgo*, Charl. Foff. 15. *Ambra-grisea*, seu *ex albo grisea*, Dougl. Ind. 6. *Ambra-grisea*, Monf. Exot. 12. *Ambra cinerea*, Ind. Med. 7. AMBERGRISE. Dale.

It is a solid, sebaceous, or fat Substance, not ponderous, of an Ash-colour, variegated like Marble, and marked often with white Specks.

There are two Kinds of Ambergrise, the Ash-colour and Black. The first is to be preferred, when cleared of all Filth, with a strong Smell, and light, and which, being pricked with a hot Needle, drops a fat odorous Juice. The Black is less esteemed, as being mixed with Earth or Mud, or adulterated, according to some.

The Glebes of Ambergrise are sometimes found so big, as to weigh above two hundred Pounds. It is gathered in great Quantities about the *Molucca* Islands, in the *Indian* Sea, and is frequently found on the Shores, both in the *East-Indies*, and in *Africa*. Pieces of it are likewise met with on the Northern Coasts of *England*, *Scotland*, *Norway*, and *Ireland*, being thrown ashore by the Tide.

Ambergrise melts by Fire into a gold-colour'd or yellow Resin.

In distilling Ambergrise, we get first an insipid, then an acid Liquor or Spirit, and a yellow Oil of a most penetrating Smell, with a small Portion of acid volatile Salt, like Salt of Amber, a black, shining, bituminous Matter remaining in the Retort. From whence it is plain, that Ambergrise consists of fine volatile Parts, intangled in other thicker Parts, both saline and bituminous.

This Drug is very much used by Confectioners and Perfumers, in giving a fine Smell to their Preparations; and is recommended by Physicians as proper to raise the drooping Spirits, to supply the Defect thereof, and to accelerate their Motions. Hence it is both a cephalic and cordial Medicine, enlivens the Senses, and is very effectual in Faintings, and all other Affections of the Head and Nerves. It is thought to be very instrumental in prolonging Life, and in producing such Effects, as are necessary for Generation. This Opinion prevails chiefly among the Eastern Nations.

It is used both outwardly and inwardly. The Dose, in Substance, is from one to four Grains, taken in a poached Egg, or in a Glass of Wine with Sugar and Spices. The Tincture, extracted with Spirit of Wine, is given from one to ten Drops. This Tincture is either simple or compound. The simple Tincture is made by only dissolving the Ambergrise in Spirit of Wine, and then separating the Solution from the Fæces. The compound Tincture is very fragrant, and is prepared in this manner:

Take Ambergrise and Sugar-candy, of each two Drams; Musk, twelve Grains; Civet, two Grains; Spirit of Wine, four Ounces: Digest them in a Glass Vessel for some Days, and then decant the Liquor, and keep it for Use. The Dose is from one Drop to eight or ten, taken in *Spanish* Wine, Cinamon-water, or any other Liquor.

Riverius commends Ambergrise as a Strengtheners of the Stomach, and as a Specific in the *Fames Canina*; and he likewise orders it in hypochondriacal Melancholy, after Purging, and a due Use of diluting Liquors, for reviving the native Heat, and exhilarating the Spirits. It is however to be observed, that all Perfumes, and strong Smells, are hurtful to hysterical Women, and those in Child-bed; and the same thing is remarked in many hypochondriacal Men; for at this time, few People can bear Perfumes, or strong fragrant Smells; and for that Reason, the Compositions used by former Physicians, in which Ambergrise was an Ingredient, either alone, or joined with Musk, are now almost quite laid aside. Sweet Smells, though offensive to hysterical Women, are, nevertheless, of great Service to them, applied by way of Fumigation to the Uterus. Ambergrise is an Ingredient in the *Pulvis Diambrae* of *Mesue*, the *Pulvis Aromaticus Rosatus* of *Gabriel*, the *Pulvis Latificans* of *Nicolaus Praepositus*, the *Pulvis contra Pestem*, or *Bezoarticus*, of *Renaudus*; in the *Electuarium Diasatyrion* of *Cbaras*, in the *Tabella Magnanimitatis*, and *Apepleetic Balsam* of that Author, and in the *Confectio Alkermes* and *Hyacinthi*, when they are complete; for in these Compositions, both the Ambergrise and Musk, are often ordered to be left out. *Geoffroy*.

Ambergrise is sometimes counterfeited by mixing a little Musk and Civet, with Storax, Labdanum, and Aloe Wood.

And sometimes it is adulterated, by mixing with it some of the above-mentioned Perfumes; and a great deal of Bull's Blood dried.

Of AMBER, properly so called.

The Accounts we find of the Origin of Amber in the Memoires and History of the Royal Academy of Sciences, are thus:

'Tis commonly believ'd, that the yellow Amber, found in the Sea of *Dantzic*, [the *Baltic* Sea] is the Gum of some Trees, that grow on the Shores of that Sea, from which it falls into the Water. But *M. Tournefort* has a Letter from *Aix*, with an Account, that yellow Amber is found in the Clefts of the most naked and barren Rocks in *Provence*. This gives us Reason to believe, that this Gum is not a Vegetable, but a Mineral; and that the Amber of the Sea of *Dantzic* does not fall from Trees, but is carried thither by the Torrents. *Histoire de l'Acad. Roy. des Scienc. 1700.*

M. Galland, of the Academy of Inscriptions, confirms the foregoing Account. For he found yellow Amber at *Marseilles*, on the Sea-shore, in a Place where nothing of a Tree grows, and where the Sea is bounded by nothing but very steep Rocks, which are dash'd upon the Sea in foul Weather. This yellow Amber then must have been loosen'd from the Clefts of these Rocks, and so have fallen into the Sea. *Ibid. 1703.*

The Marquis of *Bonnac*, the French Envoy extraordinary to the King of *Sweden*, having seen, in a Piece of Ground near *Dantzic*, belonging to M. *Grata*, Post-master General of *Prussia*, some fossile yellow Amber, of the same Nature with what is found on the Sea-shore, began to consider it more attentively than before, and to question whether it were formed of the Froth of the Sea, as it was commonly thought. The Cardinal Primate of *Poland*, who was with him, had the same Curiosity, and told him, it would be good to know the Opinion of the Academy of Sciences upon the Matter. M. *de Bonnac* wrote to *Paris*; and immediately the Academy took care to collect all the Discoveries, that had been made in the Affair; and after they had done all that lay in their Power, sent the Result of it in the following Memoire.

Memoire concerning yellow Amber.

As the finest yellow Amber, and in the greatest Quantities, comes from the two *Prussias*; the Academy Royal of Sciences may possibly be less acquainted with the Subject than they who do them the Honour to consult them. They will, however, communicate what they know, and add thereto some Reflections: They won't trouble themselves with what Authors have written about it; supposing it to be well known, and that it is not a Compilation which is requested of them.

Mess. *Cassini* and *Maraldi*, having in 1700. travell'd into the Southern Provinces of *France*, in order to employ themselves about the Prolongation of the Meridian of *Paris*, discovered some Mines of Jet, and a kind of yellow Amber, in a Mountain of *Languedoc*, called *Bugarach*, distant from the Sea twenty-seven thousand six hundred Toises, [about two and thirty Miles] and separated from it by other very high Mountains. Some take Jet, as well as yellow Amber, to be a Species of *Succinum*. The Inhabitants of *Bugarach* use their yellow Amber to burn in their Lamps. It is pretty like a Refin, and not so hard as that of *Prussia*. Near the Mines of *Bugarach*, are Springs of Salt-water, which form a little River. We are very credibly assured, that yellow Amber is also found in *Sicily* on the Sea-shores, along the Coasts of *Agrigentum*, *Catania*, and *Leocata*; and in the Isle of *Corfica*, and also at *Bologna* in *Italy*; about *Ancona*, and in *Umbria*, in the open Fields, and at a great Distance from the Sea.

This, consider'd with what the Marquis has written, that he has seen himself taken up, on the Grounds of M. *Grata*, which are separated from the Sea by great Woods and Heights, Amber in all respects like that which is found on the Sea-shore, seems decisive in the Case, and a sufficient Reason to conclude, that this Substance is always produced by the Earth.

Besides this, we see small Animals inclosed in Amber, and these are always terrestrial Animals, as Flies, Ants, &c.

However to be better assured, it might be proper to examine, whether the terrestrial Amber have all the Characters and Perfection of the Amber found on the Sea-shore; for it might not be impossible, that the Sea, by its Salt, might give a finishing Stroke in the Formation of this Matter, and lend it the last Degree of Concoction.

Supposing then, that Amber was always produced by the Earth, the Question is, Whether it be a vegetable or a mineral Substance.

We never heard it said, that in *Prussia* there are any Trees from which *Succinum* distils in form of a Refin, or something like it. And yet it seems more natural, that Ants and Flies, which are sometimes seen in it, and are a certain Sign, that it was once liquid, should be inclosed in a Refin, that distils from a Tree, than in a Mineral formed in the Earth. To solve this Difficulty, we must suppose, that *Succinum*, like Petroleum, trickles from a Rock, or at least, that the Amber in which these little Animals are envelop'd, has continued liquid for some time upon the Surface of the Earth.

Whether we believe Amber to be a Vegetable or a Mineral, we have none to attest, that ever they saw it liquid, or so much as soft. It must however have been in that State, and even exposed to Sight, at the time when these little Animals were caught in it.

The Analysis of this Compound by the Chymists of the Academy, does not entirely determine to what Kind it belongs. They always find a very small Quantity of aqueous Liquor, which smells like Amber when 'tis rubbed, a good deal of acid volatile Salt, and the like of Oil, which is partly white like the Water, partly red, and partly very black, according to the Degrees of Fire given it in the Distillation. The Caput Mortuum is light, spongy, black and shining, which being calcin'd in an open Fire, goes away almost entirely in Smoke, without affording any fixed Salt.

The only Difference in the various Kinds of Amber is, that the most transparent, or the whitest, afforded more Oil, and volatile Salt, and a less Caput Mortuum, than the muddy or black; but these last never afforded any fixed Salt, tho' they left more of a Caput Mortuum.

The Oil of Amber smells like a bituminous Oil, which seems to shew, that Amber is a Bitumen; but there are Resins which

have the same Smell, and some, as Benzoin, which yield an acid volatile Salt; but we know of none from whence we can, at the same time, obtain a fixed Salt, and an Oil of a bituminous Odour. Hence the Academy is inclined to believe, that Amber is a Bitumen, and consequently a Mineral.

It appears from what has been said, how far the Academy stands in need of Information, before they can presume to determine more precisely in all that respects Amber. It will be proper to know in particular,

1. Whether there be any Salt-water, or vitriolic Water, near the Places where they take up Amber.

2. Whether it be usually envelop'd or mixed with any Earth, or particular Substance.

3. If there be any Marks to distinguish the particular Places in the Earth, where the Amber is to be found.

4. Whether the fossile Amber be any way different from what is taken up on the Sea-shore.

5. Whether they gather white from the Earth as well as yellow; and, whether it be the Air, or the Heat of the Sun, that changes the Yellow into Black.

6. Whether black and yellow Amber are ever both found in the same Place.

7. Whether we can be certain of what we are told by *James Hartman*, in his Account of the Amber of *Prussia*, and by *Bartholinus* concerning that of *Denmark*, that it is found under a kind of foliated Earth, like the Barks of Trees, and is accompany'd with a sort of fossile Wood, in which, however, neither Pith nor Fibres, Joint nor Bud, can be distinguished. *Histoire de l'Acad. Roy. des Scienc. 1705.*

But the following Observations on Amber from *Hoffman*, a Physician who had very good Opportunities of examining the Subject, put the Origin of Amber beyond Dispute.

The Earth, that rich Storehouse of Nature, contains in its Bowels not only Metals, Minerals, Stones, Earths and Salts of various Kinds, but also cherishes within its Bosom Bodies of a sulphureous, fat, unctuous, and tenacious Substance, which pass under the general Name of *Bitumen*.

The Nature of Bitumen does no way belong to the common and mineral Sulphur; for this will by no means be resolved into Oil or Spirit, by Distillation; but Bitumens distilled in a Glass Vessel afford Oil and Spirit, besides an exhausted and sluggish Earth. Even the Vapour, as well as the Smell, emitted by mineral Sulphur, are manifestly unlike the Exhalations from bituminous Bodies.

The principal Distinction of Bitumens is into the noble and ignoble Kinds, and both these are either dry or fluid. Within the Class of the noble Kind, are comprehended *Ambergrise*, and *Succinum*, or Amber; among those of the other Kind, are Stone-coal, Pit-coal, Terra Ampelitis, and Asphaltum, which however are very different from one another, both in Consistence and Goodness. To this Class also belong Naphtha and Petroleum, which are a fluid Substance, by which Property they are distinguish'd from the rest, which form a solid Mass.

As to Amber in particular, it is produced plentifully in *Prussia*, which is famous for being the proper and native Country of it. Though this Bitumen be generated in the Earth, there is plenty of it found in the *Baltic* Sea, by the Shore of *Sudwic*, where it swims on the Water, and is carry'd along by the Waves, whence it is taken up in Nets. The Places most remarkable for Amber, are the Villages of *Fisch-hausen*, *Gross-duckstein*, *Wernichen*, and *Palmoniet*. Nor even is this Amber produced from the Sea, but, in tempestuous Agitations of the Waters, is washed out of the Bowels of the Earth by the Waves, and at last thrown towards the Shores. Very properly then may this bituminous Body be reckon'd in the Class of Minerals; for it is a Product of the Earth, and is contained within its proper Veins, as well as Pit-coal, or other Minerals.

The Courses of these Veins were discovered some Years ago, by Order of King *Frederic*, in the following manner: In digging they first met with Sand, which being removed, the next thing that offer'd, was a Stratum of white Clay; digging under this, they opened a ligneous Stratum, that seem'd to be compacted of old Wood, which, however, could be set on flame. Under the Bottom of this Stratum, in most Parts, they found Ore of Vitriol, which being exposed to the open Air, shot forth in Flowers of Vitriol, free from the least Tincture of Copper, and like those which proceed from the *Hessian* Iron Ore.

At last digging still deeper, they came upon a Stratum of Sand, which proved very fortunate; for out of this, in several Places, with convenient Instruments, they extracted Abundance of choice Amber. For it is a thing worthy Observation, that Sand is usually the Matrix of Amber; so that where they find a great Bed of Sand in the Bosom of the Earth, they are not without Hopes of meeting with Amber. After the same manner do they get it out of the Sand in the Marquisate, near *Kustrin*; and in the Territories of *Stolpen* and *Dantzic*, it is also found in Lumps.

Hence appears the Falsity of the old Fable, which would have us believe, that Amber is the Refin of Trees, which distils from their

their Bark into the Sea, and is there digested by the Heat of the Sun into a Body of that Kind.

The Manner in which this Bitumen is generated, seems to be this: From that bituminous fossile Wood, which we just now mentioned, by the Accession of the subterranean Heat, there distills an Oil much like Naphtha or Petroleum, which in penetrating the subjacent Strata, passes through the Vitriol Ores, where by mixing with its Acid, it is coagulated into a Substance of a resinous Form. The Reasonableness of this Opinion will appear from the following Considerations:

1. That Amber at its first Growth was liquid, may be proved from its being often seen conglobated by Nature itself into a round Form.

2. Sometimes Insects of various Kinds stick and are included in Pieces of Amber, which they could never have been, if the Matter in which they are circumvolved, had not been liquid.

3. We may conclude, that Amber is a Concretion of an Oil much like Petroleum, because Oil of Amber comes near to Petroleum, both in Smell and Virtue, and both of them are equally difficult to be dissolved by the most rectify'd Spirit.

4. *Charlton*, a very sagacious Observer of Nature, in his Treatise of Fossils, affirms, Pieces of this Bitumen have been frequently found, which have held Naphtha and Petroleum included within them.

5. The acid Salt of Amber is of a very fixed Nature, and not inferior in Virtue to the Acid of Vitriol.

6. What will afford great Light in this Affair, is that physical Experiment, in which it is observed, that all distilled Oils, scarce one excepted, and amongst them aromatic Oils, being mixed with Oil of Vitriol, or pretty strong Aqua-fortis, condensate into a resiniform Mass, which, held to the Fire, is readily set on Flame.

7. Besides, fossile Woods and Coals, by Distillation and Rectification, yield an Oil, very like Oil of Amber and Petroleum.

8. Lastly, the very Disposition of the Strata, which we have related, is a good Proof in this Matter. The first of these is ligneous, the second vitriolic, and the last composed of Sand, at the Bottom of which lies the Amber, scattered here and there in Bits.

There is most Plenty of Amber along the Shore of the *Sudwic* Sea, especially when a tempestuous North Wind blows; for it seems probable, that the Sea penetrating by some secret Passages into those subterranean Places where the Amber is nourished, by violent dashing and breaking against them, separate from time to time Pieces of this Bitumen, and carry them away with it.

Amber is of various Colours; the best is reckon'd the pellucid, quite free from Spots, and which bears the highest Price. For this the *Chinese* give its Weight in Gold, and make their Idols of it after an elegant and master-like Manner. I lately saw a convex burning Speculum, made of this pellucid Amber, in the manner of one made of Glass, which the Landgrave of *Hesse* keeps in his Cabinet of Curiosities. Next to the pellucid is the white, after that the yellow, and lastly, the brown, which is the worst Amber of all. No less various are the Prices; for the larger and purer, so much the dearer are the Pieces; and the more pellucid they are, the more are they valued.

They talk much of a black Sort of Amber, which yet is no-where to be met with, and so is only believed upon common Report. Instead of this, they sell a black and solid Fossile, which is a kind of Asphaltum, and dug out of the Coal-mines in *England*, and made into several Utensils for the Use of the Inhabitants.

If Amber be pulverized, and mixed with an equal Quantity of Sand, it will afford by a Sand Distillation, in a Glass Retort, an extraordinary Quantity of Oil, inasmuch that at least six Ounces of Oil may be had out of one Pound. If the Fire be augmented to an intense Degree, towards the End of the Operation, a Salt of an acid Taste will be left in the Neck of the Retort, which being separated from the Oil, and again sublimated, is what we commonly call the volatile Salt of Amber, tho' it be not of a remarkably volatile Nature, since it cannot be raised but by a vehement Fire. Perhaps it obtained that Name from its Subtlety, which it has in common with the volatile Salt distilled from the Parts of Animals, by augmenting the Fire, after the Oil has been exhausted.

It is observable of this Oil of Amber, that it does not so intimately unite with the most rectify'd Spirit, as do other distilled Oils, since it is never entirely dissolved, but only some of the more subtil Parts of the Oil pass off into Spirit, which is a Sign of its being mixed with a good deal of mucilaginous Substance, which after a gentle Evaporation, and stirring with a Stick in an open Vessel over the Coals, presents itself in View. If Oil of Amber be mixed with Water, and distilled over again in an Alembic, it becomes much more penetrating; and being made into a Plaster with other Ingredients, has been more than once, by our own Experience, found efficacious in discussing hard and inveterate Tumours of the Glands. What

remains in the Vessel after Distillation, is a crude and mucilaginous Mass.

We ought to say something too of the Solution of Amber. Indeed I could wish, that we knew a Method, which some boast of, to reduce small Pieces of it by Melting, to a bulky Mass, without destroying its Contexture. But since I have Reason to doubt, whether there be any such Method of Preparation, I shall here endeavour to explain what we know by Experiment, with respect to this Solution.

In the first place, Amber is almost totally dissolved by a strong Lixivium boiled with it. This Lixivium is prepared of the caustic Salt of Regulus of Antimony, which is made by melting two Parts of Nitre with one Part of Regulus of Antimony, in a Crucible over a strong Fire. This Salt mixed with Amber in equal Quantities, by a moderate Decoction in a sufficient Quantity of Water, almost entirely dissolves it; and, what is worth Observation, the Lixivium, which was before of a very caustic Savour, loses much of its Acrimony, and becomes more temperate; the Reason of which perhaps may be, that the lixivious Salt is broken and tamed by the Acid lodged within the Amber, which, being by this means reduced to a Liquor, becomes an excellent Medicine in Obstructions of the Viscera, and for Promoting Excretions of all Kinds, and consequently for chronic Disorders.

Some Notice must also be taken of the Solution of Amber for mechanical Purposes, that is, for preparing a most excellent Vernish, which the Artificers make a great Secret of.

They take one Pound of powder'd Amber, which they melt in a proper unglaz'd earthen Vessel over a Charcoal Fire, and pour it, whilst fluid, upon an Iron Plate; then they powder it again when concentered, and afterwards dissolve it entirely in an unglaz'd earthen Vessel, adding to it first Linseed Oil, prepar'd and boil'd with Litharge, and afterwards Spirit of Turpentine. With this they incrust Vessels of Wood and of Metals, and afterwards polish them, being first carefully and artfully dried.

From this Process it readily occurs, that Amber contains much aqueous and mucilaginous Humidity, of which it must be depriv'd by Liquefaction; and after this, the Linseed Oil and Spirit of Turpentine find an easy Ingress into the Gum-resinous Mixture remaining. Nor is a subtil distill'd Oil alone adapted to dissolve the Amber, without being temper'd with an express'd Oil, which evidently shews, that the Substance of Amber, besides its resinous Particles, has some which are mucilaginous.

Lastly, I cannot excuse myself from relating a very curious Experiment, which I some Years ago made with Amber. I put some powder'd Amber in a Glass Vessel, and pour'd upon it twice the Weight of Oil of Almonds; I then placed the Glass in one of *Papius's* Digestors accurately made, which was one third full of Water, and placed on its Cover very exactly, and then put under it a moderate Fire for above an Hour; I took the Vessel out, when it was cool, and found the Amber dissolved into a gelatinous, pellucid Mass, with a small Quantity of fluid Oil upon it.

By this Experiment we discover clearly, that express'd Oils can do a great deal towards dissolving the firm Texture which we find in Amber; and this is principally brought about, when the Elasticity of the included Air is increased, and the Corpuscles of Oil are violently forced into the smallest Pores of the Amber, by the Heat of *Papius's* Machine. *Hoffman Observat. Physico-Chym. L. 2. Obs. 23.*

Many great Virtues are ascribed to Amber, especially when taken inwardly, in a cold State of the Brain, and in Catarrhs, in the Head-ach, sleepy and convulsive Disorders, in a Suppression of the Menfes, hysterical and hypochondriacal Affections, in a Gonorrhoea, Fluor Albus, and Hemorrhages. The Dose is from a Scruple to a Dram, in a poached Egg, or any other proper Vehicle.

Take, for Instance, of Amber finely powdered, or reduced to an Alcohol on a Porphyry, Conserve of red Roses, and Rosemary Flowers, of each half a Dram; Syrup of Stoechas, a sufficient Quantity for a Bolus; to be taken in the Morning, to check the Flux of Rheum, and blunt its Acrimony in Colds in the Heads, Catarrhs, and Running at the Nose.

Take prepared Amber, Camphire, and Dragon's-blood, of each a Dram; Syrup of dry'd Roses, a sufficient Quantity to make an Opiate; of which, the Quantity of 2 Dram is to be taken every Morning, in a Gonorrhoea, after due Preparation of the Body.

Take prepared Amber, and prepared Millepedes, of each two Drams; Myrrh, half a Dram; Conserve of the Flowers of white Dead-nettle, one Ounce and half; Syrup of common Yarrow, a sufficient Quantity for an Opiate; to be taken in the Quantity of two Drams twice a Day in the Fluor Albus.

Take

Take of prepared Amber, a Scruple; Sperma-ceti, and Terra Japonica, of each fifteen Grains; Syrup of Ground-ivy, or of Diacodium, a sufficient Quantity to make a Bolus, in a Spitting of Blood, or an habitual Cough, proceeding from an acrid Phlegm.

Take of Amber, half a Dram; Castor and Myrrh, of each twelve Grains; Saffron, six Grains; Conserve of Wormwood, or Extract of Rue, a sufficient Quantity to make a Bolus, in hysterical Suffocations, and in a Suppression of the Menfes.

Externally, Amber is used as a Fumigation, in Cataplasms, and Cucuphæ, in Disorders of the Head or Brain. The Fumes of it, received at the Mouth, are often found successful in beginning Quinsies, a Falling-down of the Uvula, or Swelling of the Tonsils from a Catarrh.

PREPARATIONS OF AMBER.

The Preparations of Amber are, first, prepared Amber, properly so called, which consists in reducing it to an impalpable Powder upon the Porphyry; and this Powder is much preferable to the Magistery of Amber. Secondly, the Tincture of Amber, with tartariz'd Spirit of Wine, which may be taken from a few Drops to a Dram. With this Tincture is made the volatile oily succinated Salt; by mixing equal Parts thereof, and of the common volatile oily Salt, and then digesting them in a gentle Heat. This new Tincture is cordial and diaphoretic, and of surprising Efficacy in sleepy Affections, Catarrhs, hysterical Disorders, Palpitation of the Heart, Fainting, Obstructions of the Menfes, and Palsies. The Dose is from a few Drops to a Dram, in Tea, Wine, or any other convenient Liquor.

Externally, the Sutures of the Cranium, the Nares and Temples, are anointed with it, in Catarrhs; the Scrobiculum Cordis, in Faintings and Palpitations; and the umbilical Region, in hysterical Affections. *Geoffroy.*

Hoffman's TINCTURE of AMBER.

The fragrant Oil of Amber, which is very agreeable and friendly to Nature, and endued with a strengthening and balsamic Virtue, is so firmly and closely united and connected with its terrestrial and acid Parts, as it is a subterraneous Resin, that it cannot, without great Difficulty, be separated from them. We have need then of a Key to open those Cloisters, in which the sulphureous Parts are confin'd, and to release them from these heterogeneous Corpuscles with which they are fetter'd. And the most convenient Instrument for this Purpose is an alkaline Salt strongly calcin'd.

Mix therefore, very exactly, Salt of Tartar, with an equal Portion of choice Amber reduced to a very fine Powder, and pour thereon a sufficient Quantity of Spirit, to the Height of four Fingers above it. After a previous Digestion, let a Distillation be made out of a Glass Cucurbit with a Sand Heat, and there will be drawn off a Spirit impregnated with the most subtle and fragrant Oil of Amber, which, though it be in itself endued with an extraordinary strengthening Virtue, will yet serve to much better Purposes, by contributing towards furnishing us with an excellent Tincture.

The transparent Amber is to be chosen before that which is brown, or dark-colour'd, as consisting of a softer sulphureous Matter. Let this be bruised and levigated in a Mortar to a very fine Powder, into which, being placed on a Marble Stone, drop Oil of Tartar per deliquium, and mix them very carefully till they come to a Paste, which must be dry'd gently. This done, pour thereon a sufficient Quantity of the Spirit prepared as above, and then digest them in a Glass Vessel, or Vial close stopp'd with a gentle Heat.

By this means we obtain the most generous and efficacious Essence of Amber; a Remedy highly to be valu'd, were it only on account of its most grateful Taste and Smell.

The most convenient way of taking it is by instilling some Drops of it into Sugar, or Syrup of Pink, or of the acid Juice of Citrons. The Morning is the usual time when Persons take it, for corroborating the Stomach, Head, and a weak nervous System, drinking afterwards some Cups of warm Liquor, as Coffee or Chocolate; it may also be taken at Dinner in sweet Wine. It provokes the Menfes, but restrains the Fluor Albus, and is an excellent Medicine in rheumatic Disorders.

It is remarkable, that this Essence dropp'd into Water, is not precipitated like other Essences or Solutions of Oils and Resins; and, that a few Drops of it, instill'd into a large Quantity of Water, impregnate the Whole with the grateful Odour of Amber; which is a strong Proof, that a Medicine of this Nature, which so amply diffuses itself through the least Corpuscles of Water, is of very fine Parts, and by Consequence can make its Way into the very innermost Fluids and Solids of our Bodies; so that a small Dose may be expected to produce a considerable Effect. *Hoffman. Observat. Physico-Chym. Lib. I. Obs. 17.*

Somewhat different from this is Boerhaave's Tincture of Amber.

Reduce the best transparent yellow Amber to fine Powder, in order to increase its Surface; grind this Powder in a Glass Mortar, with the alkaline Oil of Tartar per deliquium, the longer the better, that it may become a thin, well-wrought Paste; put it into an urinal Glass, dry it in a warm Furnace, and resolve it in the open Air for several times; for it is hard to be penetrated. At length the Matter being well dried, put it into a tall Bolt-head, with a very long and slender Neck; pour pure Alcohol thereon, to the Height of three Inches above it; shake them together, and simmer them on the Furnace for some Hours, as may thus be commodiously done. The Tincture will become red, and when cool, and grown clear by standing, should be carefully decanted from its Fæces, into a clean Glass, kept close stopp'd. In other respects proceed as before, till almost the whole Body of the Amber be taken up in the Tincture. This may also be prepared in the same manner by the means of Alcohol alone, without Alkali, though to better Advantage with it.

REMARKS.

Hence we see, that Alkalis have a Power of gaining Entrance for Alcohol, into a Body brittle like Glass, whose wonderful, resinous, and particular Nature, no one has hitherto particularly explained; but in the Composition thereof, a fossile Acid, and a Petroleum, or something like them, seem to concur; whence it is difficult to dissolve. Its Tincture, however, is neither acid, alkaline, nor oily, but holds the whole Substance of the Amber dissolved. It is of a bitterish aromatic Taste, wonderfully refreshing, having a perfectly restorative Fragrance, and some Degree of Stypticity. When well made, it in the Winter-time grows thick, and deposits a kind of mealy or somewhat resinous Substance, which shews how richly impregnated it was with the dissolved Amber; but when warm Weather returns, it again grows clear, and takes up the Powder it had let fall. If one half of the Alcohol be drawn off from this Tincture, the remaining thick Part deposits a kind of powdered Amber, which, being collected separate, is of a highly aromatic Taste, and Odour. It is very surprising, that this Substance should be so equally, and almost totally, dissolved in Alcohol, without any observable Separation of its Principles; yet at the same time acquire such noble medicinal Virtues, as were not before found in the entire Amber; especially, as by Distillation it is divided into such different Parts, each of them of a different Virtue and Nature, as we find by its Analysis.

And hence again we see, by a manifest Example, that chymical Productions may differ incredibly, as they are obtained or prepared with a different Menstruum, or in a different Manner. And hence also we see how very different Principles may lie concealed in a certain Compound, without giving any Sign of their being there, or of manifesting their own Nature; and this, though the Compound be very subtilly divided, either by Trituration, or a Menstruum. And hence again it appears, how much a simple Division, made by a Menstruum, without any Extraction of the Principles, may produce new Virtues.

This Tincture has an incredible Efficacy in all those Distempers, which proceed from too great a Mobility of the immediate Instruments of the human Affections, Spirits, and nervous System; and particularly from a Relaxation of the Parts, through Weakness. And hence it proves of wonderful Service in hypochondriacal, hysterical, languid, cold, watery Cases, and Convulsions often proceeding from them. So that Mr. Boyle and Helmslet have for this Reason placed it among the noblest Anti-spasmodics, and Anti-epileptics, when the Disorder proceeds from those Causes. The Dose is from ten to eighty Drops, three times a Day, in Spanish or Canary Wine.

The Method of making the Oil, volatile Salt, and Spirit of Amber.

Take of coarse Amber in fine Powder, one Pound; of Tobacco-pipes, Bricks, Sand, or Bole, also in fine Powder, three Pounds; mix them well, and with the Mixture fill a Retort half full, set it in a Sand Furnace, fit to a Receiver, (not luted) make to it a Fire of the first Degree for one Hour, increase it to the second; and so keep it two Hours; then to the third, in which keep it four Hours. In the first Degree, some of the acid Water, we call Spirit, with a little of the finest Oil, will distil. In the second, the Spirit and Oil will continue dropping, and some of its volatile Salt will rise into the Neck of the Retort. The third will elevate more Salt, with a grosser Oil; and if the Fire be enlarged to the fourth Degree, it will raise a thick Balsam. As the Salt rises into the Neck of the Retort, it ought to be scraped out with a clean flat Stick, and put upon brown Paper to suck up the

A M B

the Oil: The Salt by this means will be white; and if it be desired more fine, it may be dissolved, filtered and evaporated, and it will leave a very white Salt. When the Distillation is over, and all cool, separate the Oil and Spirit by a Funnel, or other separating Glass. If the Oil is desired to be rectified, it may be put into a long-bodied Retort, and placed in Sand, and by gradually raising the Fire to the second Degree, there will distil a fine yellow, and clear Oil: But if a pure white and ethereal Oil be desired, it must be put into a Cucurbit, with three times the Quantity of Water to that of Oil (with which the Vessel must not be quite half full); and then fit on the Head and Receiver, and gradually bring the Fire to the second Degree, or so as to make the Oil and Water bubble; and there will distil a pure ethereal Oil, which must be separated as before. Separate the Water from the Oil that is left in the Retort; and because it will be impregnated with some Salt, put it into the Receiver, into which was made the first Distillation, and shake it well to rinse out the Salt. Then pour all into a Cucurbit, fit to it a Head and Receiver, give a gentle Fire to evaporate the Water, till the Drops fall a little acid; then let it cool, and put to it the Spirit, which, separated in the first Distillation, rectify them together, and there will be a Spirit of Amber.

We have included three Medicines in one Process, because they so naturally arise out of the same. The rectified Oil is sometimes internally prescribed in nervous Cases, joined with Spirit of Sal Ammoniac, or of Lavender, or other Liquors, from five to fifteen Drops. The thicker Oil is most used externally in fixed rheumatic Pains and Aches, as also to paralytic Limbs; but some commend it inwardly in old Gleet, and say it answers even when the best Turpentine Balsams fail. The Spirit is used much to the same Purpose, both internally and externally, from ten Drops to one Dram in any convenient Vehicle, inwardly; and outwardly, rubbed in by itself, or mixed with other suitable Liquors. But the volatile Salt is the main Part, and so much in use, that the other are of little Value with respect to it; the Demand for this being vastly greater than for the other, in proportion to what every Process necessarily produces of each. This is a most admirable cephalic Detergent. It extremely attenuates, cuts and penetrates into the most remote and minute Recesses, whereby the whole nervous System is, as it were, new scoured. Its chief Tendency in Secretion, and what it carries along with it, is by Urine. In the convulsive Deliriums of Fevers it is mightily prescribed, and is reckoned not inferior to any thing in such Intentions; because, besides its peculiar Efficacy upon the Nerves, it also conduces much with Alexipharmacs to promote a Diaphoresis: In all chronic Cases likewise, as Epilepsies, Palsies, and the like, it is scarce ever left out of Prescription: The Dose is usually from three Grains to fifteen. This Salt has further one useful Property, which seems attended to but by few, and that is, quickening the Operation of some Cathartics, especially of the aloetic and resinous Kind. A few Grains, with any of the milder officinal Pills, as Ruffi, and the like, will make them brisker by much in Operation, and yet rather milder; and this it seems to do, by dividing the Parts of those Medicines so readily in the Stomach, that they begin to exert themselves sooner than they otherwise would.

The great Consumption of this Medicine, in Comparison to what the Amber produces of it, and the Price, upon that account, it bears, is so tempting to the Avarice of the present degenerate Race of Chymists, that it is most abominably adulterated; and therefore not to be trusted to from any Hands, but those who make it for their own Use. Some of these, once otherwise inspired Philosophers, sophisticate it with Sal Ammoniac, with Nitre, some with Cream of Tartar, and others, with Salt of Coral.

The first of these Cheats may be discovered by a strong urinous Scent, if it be rubbed with Salt of Tartar; the second by its nitrous Taste; the third by Solution in clear Water: For the Salt of Amber will much sooner dissolve than the Tartar, and therefore manifestly leave that behind to View; and the last is discoverable by trying it upon a red-hot Iron; for the genuine Salt will fly away, the Vinegar, which the Coral had absorb'd, will be destroy'd, and nothing but an insipid Earth be left upon the Iron.

This Salt much best fits the Forms of Boles, Pills or Electuaries for taking; because in Juleps and Draughts, in which sometimes it is inadvertently order'd, it is extremely nauseous; the genuine Salt having a mixed Relish of Salt and Sulphur, which in a liquid Form lies so naked to the Palate, that it often urges the Patient to reject it by Vomit immediately after taking. *Quincey's Dispensat.*

Many Chymists endeavour to recommend their Salt of Amber, by its extraordinary Whiteness, and this is generally a Sign of its being adulterated; but if genuine, it is much the worse for being depriv'd of all its Oil, which makes it look brown.

A M B

The volatile Salt is diuretic, and esteemed a Specific in hysterical, convulsive, and spasmodic Complaints, taken from ten Grains to half a Dram; and with that is prepared the succinated Liquor of Hartshorn of *Michael*, very much recommended in the epileptic Fits of Children. This Liquor is made by dissolving as much Salt of Hartshorn and Salt of Amber in Spirit of Hartshorn, as the Menstruum will take up. The Oil is useful in hysterical, cephalic, and nervous Complaints, taken inwardly, from two to twenty Drops. Externally, it is used in the Gout, Palsy, and Catarrhs, by rubbing it into the Part affected; with it is prepared the succinated Balsam of Sulphur; and it is an Ingredient in the *Emplastrum Magneticum* of *Angelus Sala*.

Amber is an Ingredient in the *Trachisci de Carabe*, in *Crato's Pilule de Succino*, in *Charas's Stomach Plaster*, and in his diaphoretic and styptic Plaisters. *Geoffroy*.

Succini Potestates. Powers of Amber.

Take Oil of Amber, one Ounce; volatile Sal Ammoniac, half an Ounce; grind the Oil and Salt well together in a little Mortar; pour to them Spirit of Wine tartarized, half a Pound; and put them afterwards into a Bolt-head; invert a little Glass to make it fit for Circulation. Lute well the Joint, and put it in warm Sand, to stand in Digestion for four or five Days, shaking it two or three times every Day, in which time the Spirit of Wine will have imbibed the Oil and Salt; set it by, and when it is cool, put it in a Phial well stopp'd, for Use.

This has the Virtues of the Oil, and is fitter for Prescription internally, because it better mixes with any Vehicle for the Convenience of taking. Its Dose is from ten Drops to thirty or forty. *Quincey's Dispensat.*

Boerhaave's Analysis of Amber.

Take a capacious Glass Retort, with its Neck cut off, so as to leave an Orifice two Inches wide or more; put into it Pieces of common Amber, well cleansed from Sand, Dust, or other Foulness, so that it may fill two thirds of the Cavity. Apply a large Receiver, and lute the Juncture with the common Luting; distil in a Sand Furnace, with a Degree of Heat a little greater than that of boiling Water; thus there will come over a copious, thin, limpid Oil: Continue this Degree of Heat, so long as any Oil comes over, and keep it separate. Then apply the Receiver again, and cautiously raise the Fire, till a second Oil begins to rise, which will be yellow, large in Quantity, and still transparent: Proceed patiently with the same Degree of Heat, so long as this Oil comes over, which it continues to do for a considerable time; but for the Elegance of the Operation, this also might be kept separate. Now, again, raise the Fire gradually, till a white, saline, woolly Matter appears in the Receiver, but particularly in the Neck; then gradually raise this Fire a little, and continue it increasing, till no more of this Matter comes over; but the Fire must not be increased too quick, otherwise the volatile Salt would mix with the gross Oil, that should follow after, and thus be in a great measure lost therein. It is best to remove the Receiver, take out the Productions, and keep them separate; but during the whole time, that this volatile Salt runs, a red Oil also comes over, still almost transparent. The Fire being now increased to the utmost, there comes over a gross, viscous, fat Oil, thick like Turpentine. When this is risen, if a Fire of Suppression be given, the whole black Matter now becomes stultent, rises into the Neck of the Retort, and thus comes into the Receiver, in form of a hard, black Mass; so that if the Neck of the Retort is not left wide, it will be thus blocked up, and the Glass be burst in a dangerous manner, with a loud Noise, and often a firing of the Matter. But if, before the Fire of Suppression was used, a large Quantity of Sand were thrown upon this last Remainder, it will divide the Matter, and cause it to come over, without Danger, in a black and dry Form. There remains at the Bottom of the Retort, a very small Quantity of brittle Fæces, of scarce any Significance, so that the whole is volatile. If the Operation be carefully performed, so many different Productions are obtained, which may be purified by a new Distillation, and be rendered thin and limpid; but the volatile Salt, collected by itself, is perfectly acid. And this is the only Method, that I know, whereby a true Acid is obtained in a solid saline Form; for we have no Instance thereof in any other vegetable, animal, or fossil Substance. Tartar indeed is acid, but as it is scarcely dissolvable in Water, does not deserve the Name of a Salt. Oil of Vitriol, brought to an extreme Degree of Purity, shoots, in Winter-time, into transparent solid Crystals; but immediately dissolves again, and appears fluid as soon as the Cold is a little diminished; but the Salt of Amber long continues the same.

R E M A R K S.

Amber thus appears to be a very particular Body; its Oil resembles the fossil Oils of Petroleum, Naphtha, and the like; Parts,

but the Remainder, after the first or second is come over; nearly resembles Jet, and the acid Salt seems somewhat vitriolic. But the same thing, concreted, wonderfully differs from those Parts, into which Chymistry resolves it. Who would think, that Amber, its Powder, its liquid Solution in Alcohol, the Powder precipitated from its Tincture with Water after Distillation, and then washed; the Oils, Salt, and Colophony after Distillation, proceeded from the same Matter? Who could know the proper Virtues of each; and who, by joining them together again, could recombine Amber? The Oils, being purified by a repeated Distillation, have a sharp, balsamic, exciting, diaphoretic, diuretic, emmenagogic, and anti-hysterical Virtue, and when externally used, by way of Liniment, are very serviceable in restoring contracted, weak, paralytic, torpid Limbs: The volatile Salt is gratefully acid, balsamic, unctuous, penetrating, preservative, and stimulating to the Nerves and Spirits, being a true, volatile, acid, oily Salt, and therefore a capital Anti-hysterical and Diuretic; especially, if purified by a second Distillation. *Boerhaave's Chymistry.*

There is a Drug very different from those above-mentioned; which is called *Liquid-Ambar*. It is thus distinguished:

LIQUID-AMBAR, *Offic. Clus. Exot. 302. Jonsf. Dendr. 353. De Laet. Ind. Occid. 222. C. B. Pin. 502. Park. Theat. 1509. Raii Hist. 2. 1848. Liquid-ambar refina arboris Ocofolt dicta, foliis hederæ, odore Styracis liquidæ, J. B. 1. 323. Liquid-ambari arbor fructu Styracifera, aceris folio, fructu tribuloide, (i. e.) pericarpio orbiculari ex quamplurimis apicibus coagmentato semen recondens, Pluk. Almag. 224. Phytog. Tab. 42. Xochicotlzo Quahuil, seu arbor Liquid-ambarum Indicum, Hern. 96. Styrax aceris folio, Raii Hist. 2. 1848. Styracem fundens, vel Styrax arbor Virginiana, aceris folio, Breyn. Prod. 2. 84. Platanus arbor Virginiana, aceris folio, potius Platanus Virginiana Styracem fundens, Ejusd. 2. 1799. Platanus Virginiana Styracem fundens, Herm. Par. Bat. Prod. 366. Acer Virginianum odoratum, Herm. Cat. Hort. Lugd. Bat. 641.
LIQUID AMBER.*

It grows in *Virginia*, *New-Spain*, and other Places of the *West-Indies*. The Part used is the Resin, which is a fat liquid Substance, of the Consistence of *Venice Turpentine*; yellow inclining to red, of an acrimonious Taste; aromatic and fragrant.

It heats and moistens, resolves and opens Obstructions, and is an Emollient and Ripener. Its principal Use is in Obstructions and Hardness of the Womb; in hard Tumours, &c. in Suffumigations, and the like.

Hernandez says, that this Balsam distils from a Tree, either spontaneously, or from a Wound. Some break up the Branches into small Bits, and, boiling them, skim off the Oil that rises on the Liquor, which they sell for the true Balsam; and this Liquor is thought by some to be the liquid Storax commonly sold by the Apothecaries and Druggists.

AMBROSIA. The Ambrosia, which some call Botrys, others the Artemisian Botrys, is a small Shrub, three Spans high, very much branched, with small Leaves at the Bottom of its Stem, like those of Rue, and its Sprays thick set with small Seeds, like little Clusters, which never flower. The Plant has a vinous and grateful Smell. The Root is slender, and two Spans in Length. In *Cappadocia* they weave it into Garlands.

It has the Virtue of restraining and repelling the Course of the Humours from any Part; and, used in a Cataplasm, is a good Astringent in the like Case. *Dioscorides, Lib. 3. Cap. 129.*

The Ambrosia of the later *Latins* is different from the Ambrosia of Antiquity, as *Strabus* himself acknowledges in those Verses of his *Hortulus*:

*Haud procul Ambrosiam, vulgo quam dicere mos est,
Erigitur, laudata quidem; sed an ista sit illa,
Cujus in antiquis celeberrima mentio libris,
Fit dubium ex multis.*

“Not far off is erected Ambrosia, as 'tis commonly called, an Herb of good Value; but whether it be the same with the Ambrosia so much celebrated in antient Books, is doubtful on many accounts.”

Pliny says, that Ambrosia is a Name of no fixed Signification; but applicable to more Plants than one. Some called the Botrys (Oak of Jerusalem) by this Name. *Dioscorides* reckons Ambrosia among the *σεφανομαλινά* (*Coronarian*) Plants; and writes, that the *Cappadocians* used it to make themselves Garlands; *καταπλέσαι δὲ ἐν Καππαδοκίᾳ σεφανούς* (in *Cappadocia* they weave it into Garlands). But *Nicander* tells us, that the Appellation of *Coronary Ambrosia* was by some bestowed on the Lily, thus:

*“Α κρίνα, λείρα δ' ἄλλοι ἐπιθέσθοντες αἰνέων,
Οἱ δὲ τὴν ἀμβροσίην.”*
Vol. I.

“Lilies, which some of our Poets call *Liria*, and others “*Ambrosia*.”

Athenæus himself puts the same Interpretation upon ἀμβροσία (*Ambrosia*) in the historical Commentaries of *Carystius*; thus: *Καὶ ἀμβροσίαν δὲ ἀνθὸν τι ἀναγράφει Καρύσιος ἐν ἱστορίᾳ ὑπομνήμασι γράφων ἔτως. Ὁ Νικάνδρος φησὶν ἐξ ἀνδριᾶτος τῆς κεφαλῆς Ἀλεξάνδρου τὴν καλεσμένην ἀμβροσίαν εὐεσθαι ἐν Κῷ* (*Carystius, in his historical Commentaries, makes Ambrosia to be a Sort of Flower, when he writes, that Nicander affirms, that what they call Ambrosia grows out of the Statue of Alexander's Head in the Island of Coos*). The *Coronarian Ambrosia* of *Nicander*, in the *Georgics*, is a Lily; but I don't know whether we ought to understand the fore-mentioned Passage as relating to the same Flower.

The greater House-leek, or *Sempervivum*, is also called Ambrosia, as *Dioscorides* assures us in the following Words, which, on the Authority of a very antient Manuscript, are thus to be read, rejecting all other homonymous Terms, which are certainly spurious: *Ἀεὶ ζῶον μέγα ἀνθάσσει διὰ τὸ ἀειθαλὲς τῶν φύλλων οἱ δὲ βυθθαλμὸν, οἱ δὲ ζωεθαλμὸν, οἱ δὲ ἀμβροσίαν καλεῖται* (The great *Sempervivum* is so called because its Leaves are always green; some call it *Buphthalmus*, some *Zoophthalmus*, and others *Ambrosia*). *Salmasius de Homonym. Hyl. latr. Cap. 62.*

The modern Ambrosia is thus distinguished:

AMBROSIA, *Offic. Ger. 950. Emac. 1108. Raii Hist. 1. 164. Chab. 376. Ambrosia hortensis, Park. 88. Ambrosia hortensis lanuginosa, Hist. Oxon. 3. 4. Ambrosia maritima, C. B. 138. Tourin. Inst. 438. Boerh. Ind. A. 2. 102. Ambrosia quibusdam, J. B. 3. 190. Ambrosia foliis Absynthii odoratis, humilior, Herm. Hort. L. Bat. 32. OAK OF CAPPADOCIA.*

It is a Plant which puts forth a single Stalk about a Foot high; dividing itself into many Branches; in form of a little Shrub: Its Leaves are cut like those of Wormwood; and are whitish; its Flowers are ranged along the Branches; every one of them is a Sort of Noddy, consisting of many yellowish Florets; which produce no Seed; the Fruit grows upon the same Footstalks as the Flowers; but separately; and every one of them contains an oblong blackish Seed: Its Root is as long as one's Hand; woody and small. All the Plant yields a sweet Smell, and an aromatic Taste; a little bitter, but agreeable. They cultivate this Plant in Gardens; it contains a great deal of exalted Oil; and but little Salt and Phlegm.

It revives the Heart and Brain; it stops Fluxions, it resolves and fortifies; it is prescribed internally and externally. *Lemery de Drogues.*

The Herb is in Use, which is of a repelling and restraining Quality, *H. Ox.* It has an astringent Virtue, says *Galen*. It is a Plant of a very fragrant Scent; hot and aromatic. *Boerh. Hist. Plant. 569.*

The Shortness of the Description *Dioscorides* has left us of Ambrosia, has given no small Occasion for Dispute and Controversy among Authors. *Nicander*, as is observed above, takes it for a Species of Lily; *Coradus*, for Southernwood; *Tabernaemontanus*, for Mugwort; *Matthioli*, for a kind of Nasturtium; *C. Bauhin*, and his Followers, with whom we agree, to the Plant above-mentioned. *N. B.* The Catalogue prefix'd to the *London Dispensatory*, does not distinguish Ambrosia from the Botrys, but makes them both Synonymies of the same Plant. *Dale.*

Ambrosia, with the Antients, was called τὸ τῶν θεῶν βρῶμα (the Food of the Gods); either because Mortals did not eat of it, or by eating became immortal; its extraordinary Fragrance recommending it to the Gods themselves. *Raii Hist.*

Besides the common Sort described by *Lemery*, *Ray*, in his Appendix, mentions a second Sort from *Herman. Cat. Lugd. Bat.* which he distinguishes by the Denomination of,

Ambrosia foliis Artemisiæ inodoris, elatior, and gives it the following Description:

It shoots up with Stalks, three or four Feet high; bearing Leaves less than those of the common Sort; and nearly resembling the Leaves of Mugwort, deeply jagged, green on the upper Part, but pale on the lower; and of no sensible Smell. The Flowers on the Tops of the Spikes, or Ears, appear very small, are greenish on the Outside, but blackish within; and are, every one, succeeded by a single striated Seed, very like that of the common Sort. It is propagated by Seed sent from *Venice*. *Raii Hist. Append.*

Another Plant also called Ambrosia is the following, which happens to be an Ingredient in *Mrs. Stevens's Remedy* for the Stone.

AMBROSIA CAMPESTRIS, *Offic. Ambrosia campestris repens, C. B. Pin. 138. Coronopus Ruellii, Ger. 346. Emac. 427. Mer. Pin. 30. Raii Hist. 1. 843. Coronopus recta vel repens Ruellii, Park. Theat. 502. Coronopus sylvestris, fructu Nasturtium verrucarium, Cod. Med. 41. Coronopus Ruellii, seu Nasturtium*

sturtium verrucosum, J. B. 2. 919. Rupp. Flor. Jen. 67. *Coronopus Ruellii*, *Cornu cervi alterum vulg.*, Merc. Bot. 1. 31. Phyt. Brit. 31. *Nasturtium verrucosum*, *Coronopus Ruellii*, Chab. 290. *Nasturtium verrucosum*, *capsula bivalvi, aspera, seu hirsuta*, Hist. Oxon. 2. 302. *Nasturtium sylvestre, capsulis cristatis*, Tourn. Inst. 214. Elem. Bot. 183. Boerh. Ind. A. 2. 12. *Nasturtium supinum, capsulis verrucosis*, Raii Meth. A. 98. Synop. 3. 304. Dill. Cat. Giff. 162. *Nasturtio affinis monospermos, capsula verrucosa*, Pluk. Almag. 262. SWINES CRESES. Dale.

Ruellius's Buckthorn, or Swines-creffes, hath many small and weak straggling Branches, trailing here and there upon the Ground, set with many small cut or jagged Leaves. The Flowers grow among the Leaves, in small rough Clusters, of a whitish Colour; which being past, there come in its place little broad and flat Pouches, in which the Seed is contained. The Root is white, thready, and in Taste like the Garden-creffes. *Gerard.*

AMBULATIO, Walking. Reckoned by *Celsus* among other Exercises which are serviceable in an Imbecility of the Stomach, such as reading with an audible Voice, Exercises at Arms, or with the Ball, and Running. Concerning Walking, he says it is better when diversify'd by ascending and descending, than in a smooth and even Plain, because it stirs the Body more, except it be very weak. It is better also to walk in the open Air, than under Piazzas; and better in the Sun, if the Head will bear it, than in the Shade; better in the Shade of Walls and green Hedges, than under a shady Roof; and, lastly, better strait forward, or in a right Line, than winding about. *Celsus*, Lib. 1. Cap. 2. Elsewhere (Lib. 6. Cap. 6.) he recommends much Walking in Dimness of the Sight.

It is generally said, that Riding is a more healthful Exercise than Walking, which appears to me an Assertion a little too general. For Walking is much more effectual in promoting an Increase of muscular Strength, and in imparting to the Fibres a due Elasticity, than Riding. But where any of the Viscera are much obstructed, and a Patient is too weak to support sufficient walking Exercise, there Riding may be more beneficial. Upon the Whole, it may be said, that Walking is best for the Preservation of Health, but Riding for the Cure of Chronical Distempers; for in those that are acute, neither is advisable.

AMBULO. This is the Name of a Disease, which has the Epithets *Flatulentus* and *Furiosus* bestowed upon it. It is likewise called *Flatus furiosus*. It is an Inflation or Distention, attended with Pain, and variously periodical. It takes its Rise from subtile Vapours, forcibly shooting themselves up and down through the various Parts of the Body, as it is described and proposed, in a particular Case, by *D. D. Job. Michael, Prax. Clinie. Special. Case 19. Castellus.*

AMBULON, called by *Ray*, in his History of Plants, the *Ambulon* of *Scaliger*. This is the Name of a Tree growing in the Island *Aruchit*, the Bark of which sends forth a Fruit resembling Sugar, and of the Bulk of a Coriander-seed. *Raii Hist. Plant.*

AMBUSTA, Burns. These require Remedies that are detersive, in a moderate Degree, without a manifest heating or cooling Quality. For this Reason, Earth of Chios, white Lumberstone, Earth of Candy, and any Sort of light Earth, moistened with Vinegar, not very acrid, or Water, and applied to the affected Part, are very proper Medicines, and prevent the Eruption of Pustules. A whole raw Egg, immediately applied, is also very good in such a Case; for it moderately refrigerates, and dries without Mordacity. Anoint also the Place with Ink, (it is not known what Sort of Ink the Author means) or Frankincense, diluted with Water, or spread it over with boiled Lentils bruised, or bitter Vetches.

For Burnings by hot Water, before Blisters arise, wash them with the Water of pickled Olives, and apply the Olives themselves, bruised, with Polenta; or anoint the Place with plums Alum pounded with Vinegar, or with Bull's Gall infused in much Water; or wash it with Lye, Garum, or Brine; or anoint the same with the Roots of Lily, Hyacinth, or Narcissus, bruised with Oil of Roses, and reduced to a strigentitious Consistence.

Marcellus has left us the following Prescription for such Cases:

Dip a Woollen Rag in Honey, and, covering it with Barley, burn it; then, with eight Drams of the Ashes, mix four Drams of Cerufs, eight Drams of Butter, of Wax, Fat of a Goat, and Oil of Roses, each sixteen Drams. But if the Blisters are risen, apply Sumach, and Polenta bruised; or Quick-lime, mixed with Cerate, and tied up in Linen. If the Part be ulcerated, cover it with bruised Leeks, or apply Parslane bruised with Polenta; or burn Pigeons Dung, wrapped in Linen, and use the Ashes diluted with Oil; this is an admirable Remedy. The Bark of the Pine or Fir Trees, dried Maidenhair, and burnt Myrtle-leaves, pulverized, are good to strew on the Place.

Either of these is proper also, in Composition with Cerate.

The following are good Remedies:

Take of the dried Root of Alkanet, pulverized, four Ounces, white Wax nine Ounces, Oil of Roses eighteen Ounces; mix them. Or, prepare Cerufs, with a moderate Quantity of Stags Marrow. *P. Egineta, Lib. 4. Cap. 11.*

A Cerate for Burnings and Erysipelas is prepared of four Ounces of white Wax, three Ounces of Oil of Roses, and four Ounces of Pellitory of the Wall. After the Inflammation is gone, or, if it continues long, before the Part becomes livid, apply a Cataplasim of crude Barley-meal. If the Place be turn'd livid, let it be scarified, and the Cataplasim the longer used, and the Part washed with fresh Water, and sometimes with Sea Water, and Brine; and these may be sometimes mixed with the Cataplasim. *Idem, Lib. 4. Cap. 21.*

Whenever this Misfortune happens make no Delay, but take the first Earth that comes to Hand, and apply it moistened with Water, and afterwards wash the Place with warm Posca; then take Verdigrise, and Spuma Argenti, of each an equal Quantity, bruised, with Wine and Oil, and anoint the Part with a Feather, not touching it with your Hand, but laying over it a Piece of fine Linen Cloth. If Blisters arise, break them in the Beginning; but if they have been suffered to harden, break them, and apply a Cerate. For this Purpose, the following Pastil may be prepared, and reserved for Use on Occasion:

Take of Alum four Drams, Frankincense two Drams; bruise them, and make them up with Water into Pastils: Or, take of white Lumberstone two Ounces, Bark of Frankincense, burnt Misy, each six Drams; make them up as the foregoing, and use them both with Posca. If Blisters arise, apply Sumach and Polenta, bruised in Vinegar, or Hog's Gall boiled; or anoint the Place every Day with the Juice of Henbane, and the Blisters will wither away. If the Part be exoriated, and ulcerated, apply the Leaves of Beet, boiled in Wine and bruised, or infill the Juice of Beet into liquid Cerate of Oil of Roses, as much as it will imbibe: The just Proportions are, three Parts of Oil to one of Wax, and as much Juice as is sufficient. Use this, and you will admire the Effects.

The following speedily cicatrizes the Sore:

Take of Cerufs, Spuma Argenti, Barley burnt and bruised, each one Ounce; Wax four Ounces, Oil of Roses, or Oil of Myrtle, nine Ounces; mix the Barley with the liquid Cerate, and add thereto the Spuma Argenti, and Cerufs, bruised in a Mortar with Wine. *Aetius, Tetrab. 4. Serm. 2. Cap. 64.*

To make Hair grow on the burnt Place,

Roast Fig-leaves in an earthen Pot, and apply them with Cerate, in the manner of a Plaister. *Aetuar. de Meth. Med. Lib. 6. Cap. 8.*

It may not be thought improper, that we account Burns, or Ambustion, a kind of Inflammation; for not only the same Signs and Symptoms, but generally the same Events, attend on both. We call that Hurt which the Body receives, either from Fire itself, or from Bodies put in a violent Heat and Effervescence by the Fire, *Ambustion*, *Ustion*, or *Adustion*; so that among the Causes of Ambustion, we are to reckon not only Fire itself, but every heated Body, as well hard Bodies, for Instance, glowing Coals, hot Iron, or other Metals, heated and liquified by the Fire, as Gunpowder, and fervid Liquids, such as hot Water, Beer, Wine, Oil, Spirit of Wine, and the like.

As soon, then, as any thing of this Nature is applied to the Body, there follows of necessity a Corrugation and Rupture of the Fibres and little Veins, with an Effusion of the Blood and Humours into the adjacent Parts, where they stagnate and corrupt. But as Ambustions, caused by solid Bodies, are almost constantly more grievous than what are received from Liquids; so the Mischief is universally proportioned to the Degree of Vehemence of the Combustion, just as it is in all Inflammations.

Now Burns may, not improperly, be divided into four Kinds: The first and least seems to be, when the Part affected feels a Pain attended with Heat and Redness, and succeeded in a short time by a Pustule. The next Degree is, when, after Ambustion, there is an immediate Eruption of Pustules, with a grievous Pain. The third Degree is, when the Skin and subjacent Fat are burnt in such a manner, that they presently turn to a Crust. The last is, when the Ambustion is so vehement, that it penetrates and destroys almost every thing before it, to the very Bone. The third Degree resembles a Gangrene, the last

last a Sphacelus: Whence it also appears, that Ambussions very much resemble Inflammations, and are known, in their respective Degrees, by nearly the same Signs.

The Event of Ambussions depends partly on the Degree, partly on the Use and Excellency of the Part affected. For the more grievous the Ambussion, or the more noble the suffering Part, the more is the Danger to be apprehended. Therefore it is thought a lighter Evil, if the Hand or a Finger contract a Pustule from a Scald by Fire, than if the Eye be thus affected, tho' in a slighter manner; for so tender and noble a Part of the Body can hardly bear Ambussion, without Danger of losing the Sight. We are, besides, to estimate the Mischief by the Inveteracy and Extent of the Ambussion; for the deeper the Fire has penetrated the Body, or any Part of it, or the wider its Compass, the greater is the Evil to be accounted. Thus when the whole Body has, tho' but slightly, felt the Flame of a Fire, or of Gunpowder, or boiling Liquor, it is a very bad Misfortune; for the miserable Patients being unable to sit, or lie, or sleep, by reason of their most acute and intolerable Pains, a Weakness must necessarily come on, with a febrile Disorder, succeeded at last by a Sphacelus, which terminates in Death; and this so fatal an Event is rather to be expected in Infants than Adults; for the first are destitute of Strength and Patience, as well as Sagacity to chuse the most commodious Situation. Moreover, the deeper the Ambussion reaches, the more threatening is the Danger. Ambussions of the Face are very much to be dreaded, not only on account of Deformity by Eschars, but principally as they often cause the Eyelids to grow together. If the Neck happens to be burnt, the Patient is almost sure to come off wry-necked, without convenient Assistance. As to other Ambussions, it will be easy to pass a Judgment on them from what has been said, after thoroughly considering the Nature of the affected Parts.

As an Ambussion is not unlike an Inflammation, with respect to Degrees, so the Method of Cure in both is much the same. When there happens a slight Ambussion, or one of the first Degree, the most proper Medicines, on all accounts, are Resolvents; of which there are two Kinds principally to be observed, the *astringent*, and the *emollient*. Mild Astringents are, Spirit of Wine, either the common Sort, if good, or rectified, or also camphorated; let the Part affected be immersed in this Spirit, or be carefully fomented with Linen Cloths, wet therein. This is much recommended by Sydenham.

Of almost the same Efficacy are Vinegar lithargirised, and Brine of pickled Cabbage, or Oxycras boiled with Salt, and used warm in the same manner as Spirit of Wine, before directed. Oil of Turpentine also is to be had in Readiness, with which the Part is to be timely and frequently anointed. In short, it would not be improper, in such a Case, to hold the burnt Part, suppose a Hand, or a Finger, to the Flame of a Candle, or to the Fire, and to keep it as near, and as long, as the Pain can be suffered; or alternately to present and remove it, till the Sense of the Pain and Heat be remitted. For by this means not only the stagnating Blood, by the mere Vehemence of the Fire, is reduced to its former State, but also Pustules, and other grievous Symptoms, are very seasonably prevented; and so the first Degree of Ambussion is, for the most part, with no great Difficulty, healed; especially if the Medicines above advised are, at the same time, applied.

Contrary almost to this, but equally proper and efficacious, is the Method of Cure by *Emollients*. By this means whatever is contracted, or corrugated, among the smaller Veins and Fibres, is mollified, and consequently the natural and free Circulation of the Blood through the same is restored, and thereby those grievous Symptoms, which might otherwise have happened, are prevented. Water of a moderate Degree of Heat, and accommodated to the Sensation of the afflicted Part, is of no small Service in this Case, by dipping a folded Linen Cloth therein, and applying it to the Place, and now-and-then moistening it afresh, till the Sensation of the Heat and Pain wears off by Degrees; but this warm Water uses to be more effectual when boiled with Marsh-mallows, or Mallows, or Mullein, Linseed, Fenugreek, Seeds of Quinces, and other such emollient Medicines. After this, some of the most proper emollient Cataplasms, which are either prepared with the before-mentioned Herbs, or made up of any other common Pulp, are to be provided, and frequently applied as hot as the Patient can bear; for most Pulp have a mollifying Virtue. Besides these, there are emollient Oils (a) of known and sufficient Virtue; such as Oil of Linseed, Oil of sweet Almonds, of Olives, of white Lilies, of Henbane, and others of the like Kind. These are spread upon Linen, and so applied; or by frequently anointing the Place by means of a Feather, when they grow dry. And, lastly, we must not omit taking Notice of *Mynsicht's* Ointment for Ambussions, which is an excellent Lenitive, and prepared of the Oil of Olives, or Linseed, mixed with the White of an Egg, and applied in the same manner as the rest; the Mucilage of Quinces is very good also in this Case. But it is to be observ'd, once for all, with respect to the Medicines hitherto pre-

scribed, that they are of little or no Service, unless frequently renewed: And if the Burn happens to be in the Face, it will be convenient to wear a Sort of Linen Mask, well fitted, for the more commodious Application and Retention of the Medicines upon the Part, and to keep it always moist. If the Misfortune happens in the Neck, to prevent a Wryneck, you must have recourse, by way of Precaution, to a peculiar Sort of Bandage, called by the Surgeons *FASCIA DIVIDENS*. See *FASCIA*.

In the second Degree of Ambussion, which is attended with a Blister, it seems improper to open the Vesicles, or cut the Skin already lacerated, because of the vehement Pain to which it usually puts the Patient: But the best way, in these Cases, for the most part, is, with all the Haste possible, to apply one or other of the before-mentioned Medicines, which of them comes first to Hand, as warm Water, burnt Wine, or Spirit of Wine, and to be very frequently renewing of the same. For by this means not only the Heat and the Pain are mitigated, but the Skin, tho' separated from the Cuticula, or Scarf-skin, is preserved almost without any Blemish. If the Pain continues, lenitive Remedies are to be used: Here the most celebrated Topics are Oil of Linseed, *Mynsicht's* Ointment for Ambussions, Unguentum Nutritum, Ointment of Litharge, or Diapompholyx; with these you must very often anoint the Place, or spread them on Linen, and bind them to the Part affected. As the Pain and Heat gradually decrease, some proper Plaster, as that of red Lead, ought to be applied, in order to smoothe the Skin, and restore the Cuticula. If this second Degree of Ambussion be more intense than ordinary, and affects a great Part of the Body, it will be necessary forthwith to take away some Blood, in proportion to the Measure of the Ambussion, even till the Patient faints, in order to prevent Exulcerations, Deformities by Seams, and perhaps a Gangrene; after which a strong Cathartic must be administered. Outward Topics are such as have been already prescribed: For Infants, where Bleeding is not so convenient, Purging must be iterated, for the sake of Revulsion. As to the rest, a very strict Regimen of Diet is to be observed in Ambussions, as well as in other painful or dangerous Wounds and Inflammations; wherefore the thinnest and smallest Drinks, and forbile Liquors, are highly proper in such a Case; for whatever is heating, or taken to Intemperance, has very pernicious Effects, as it increases the Pain and Heat. The celebrated *Digby* thought nothing more effectual in asswaging the Heat arising from Ambussion, than Spirit of Salt, taken to the Quantity of ten or fifteen Drops, either alone, or instilled in some Liquor. All these Things being readily and carefully provided and administered, as before directed, it is surprising with what Success the affected Parts are comforted, cherished, and restored, and all the mischievous and threatening Consequences avoided.

As to the third Degree of Ambussion, in which a Crust or Eschar immediately overspreads the burnt Part, it can hardly, or rather not at all, be cured without a Suppuration. If the Misfortune happens to the Face, our principal Care and Concern should be to preserve that Part from unseemly Blemishes remaining after the Cure. In this Circumstance, therefore, we are to avoid almost all Kinds of Ointments and Plaisters, however they come recommended as the rarest Secrets, and the most powerful Medicines for Ambussions. For it is to be fear'd, that, while they dry the Wound more than is requisite, they should contract the Skin and Fibres, and by that means induce a very deforming, or, at least, an unseemly Eschar. Wherefore there is nothing for which we should be more careful, than, with all the Speed we can, to remove that corrupt Crust, and the Matter included under it; but how to effect this, in the most commodious way, is a difficult Point to hit. To tear them off by Violence with the Hands, or cut them away, is far from being beneficial to the poor Patient: But if there be any Remedies at all, which are qualified to work a happy Cure upon an Ambussion, there are none, within the Compass of my Observation, that are more proper for the Purpose than such as are composed of Emollients. Whatever therefore of this kind, among those we have advised, can soonest be got ready, is to be spread upon folded Linen, and applied hot to the Place, and very often renewed, till the hard Crust, loosening by Degrees, be at length severed from the quick Flesh. If any thing be separated, and lie loose, it must be removed and taken off by the Volsella, as often as the Place is dressed, which must be two or three times a Day, and the remaining Part of the Crust must be anointed with Butter: Fomentations also are, upon no Account, to be omitted. This Part of the Cure takes up two, and sometimes three or four Days. All the Crust being resolv'd in the manner prescribed, our next Care is to cleanse and agglutinate the Wound. The first Intention is answered by some mild digestive Ointment, together with Honey of Roses; and the agglutinative Part is performed by the Ointment of Diapompholyx, or of Litharge, or the Emplastrum ad Ambusta, which are the most common and celebrated Medicines for this Purpose. But if any Plaisters, or Ointments, are applied upon

(a) Pliny, Lib. 23. Cap. 4. recommends Oil of Myrtle for Ambussions.

pretty hard Crusts, it is very much to be feared, that, by reason of the Constriction of the adjacent Parts, and an Exasperation occasioned by the Acrimony of the Matter, or Sanies, some considerable and deforming Eschar will remain. However, if any Person shall undertake the Cure after this Method, which is the common way of Surgeons, he ought to be advised, that, except the Crust shall fall off the second or third Day, he is to make frequent Incisions in it, as in Gangrenes, in order to let out the Matter that lies under it; and, after Bleeding and Purging, which are necessary in the first Place, the Fomentations, before recommended, are to be carefully used, in order to mollify and totally resolve the Crust. An exact Regimen of Diet is found to be more necessary in this than in the former Method of Cure. To restore the Skin to its pristine State, there is no Remedy to be compared with frequently fomenting the Part affected, as it grows well, with the Steam of hot Water. If the Restoration of the Skin goes on but slowly, it will not be amiss to promote the same by the Application of Wax, and the Oil of Eggs.

As to the fourth, which is the highest and most desperate Degree of Combustion, where the Burning has penetrated to such a Depth as to corrupt and mortify all before it, almost to the very Bone, all Remedies are vain and useless; and there is no way left to assist the Patient, but by speedily cutting off the affected Limb, as is done in a Sphacelus. *Heister, Lib. 4. Cap. 15.*

The following Method of curing Burns is recommended in the *Philosophical Transactions*.

I can affirm, that in all Burnings, by Fire or otherwise, and the Pains occasioned thereby, I have not yet met with any better and surer Medicine than this following:

Take Spirit of Earth-worms, with rectified Spirit of Wine, twelve Ounces, mixed with two Ounces of Camphire.

No sooner is a Bandage, or Compress, dipped into this Spirit, applied to the affected Part, but it will give instant Relief, and so effectually check the Inflammation, that it will creep no farther: But the Application of it must be continued till the Pain is quite gone, and the Ulcer, if there hath been any, is dried up. If the Exulceration is got deeper, and the Wound must be kept open, two Ounces of Camphire, dissolved in Oil of St. John's-wort, mixed with a Pound of the common Unguentum Cerussæ, applied according to Art, will quickly and effectually heal it, as I have often experienced.

There are, in the *History of the Royal Academy of Sciences*, two remarkable Instances of Cures performed by accidental Burns, which must not be omitted.

Of Cures performed by Burning.

CASE I.

Some violent Pains of the Head have been suddenly and unexpectedly cured. A Lady of thirty-five Years of Age, and of a good Constitution, laboured under a continual Head-ach, and was seized with severer Paroxysms, which returned regularly once in eight or ten Days, and lasted ten or twelve Hours with such Violence, that she sometimes appeared stupid, and sometimes furious. The Seat of her Pain was principally in her Forehead, and her Eyes, which were now become very red and sparkling. Her grand Paroxysms were accompanied with a Nausea, and terminated by vomiting up a viscid Matter, white, soft, and insipid, which, in the very Conclusion of the Fit, was followed by a green, but very bitter Water. During the Paroxysms she could eat nothing, but had a very good Appetite at other times; and had not lost her natural good Plight of Body, notwithstanding the long Continuance of her Indisposition.

Mr. Homberg, in vain, prescribed a vast Quantity of Medicines for three Years successively. Opium was the only one which could, for a few Hours, relieve her ordinary Head-ach; but her Paroxysms were entirely Proof against its Virtues.

One Night, when she felt a Fit coming upon her, and was going to Bed, she had an Inclination, before she lay down, to see whether her Eyes were much inflamed or not. Accordingly as she was looking at herself in a little Pocket Looking-glass, the Flame of a Wax-candle, which stood by her, set Fire to her Night Head-dress, which was made of pretty thick Cloth; being all alone, and not adverting to what had happened, the Fire burnt all her Forehead, and a Part of the Crown of her Head, before she could call People to extinguish it. Mr. Homberg, who was forthwith called, ordered some Blood to be instantly taken from her, and treated the Burn in the ordinary manner, the Pain of which ceased in a few Hours: But the Paroxysm, which was expected, did not seize her; even the ordinary Pain of her Head disappeared almost from that very Moment, without the Help of any other Medicine than the Burning; and ever since that Accident happened, which is now about four Years, the Lady has enjoy'd a perfect State of Health.

CASE II.

A Physician of Bruges has communicated to Mr. Homberg a Case of the like Nature, of which he himself was a Witness. A Woman who, for many Years, had her Legs and Thighs extraordinarily swelled, and very painful, found Ease by rubbing them with Brandy before a Fire, every Night and Morning: One Evening the Fire accidentally caught the Brandy, with which she had rubbed the Parts affected, and burnt her very superficially; upon which she applied some Ointment to the Burn, and all the Waters, which distended her Legs and Thighs, discharging themselves by Urine in the Night-time, the Swelling returned no more. 'Tis great Pity that Chance should not more frequently act the Part of a Physician (and I may add, still a greater, that Physicians will not attend to the Lessons taught them by Chance). Accident has, undoubtedly, taught this Sort of Remedy to many barbarous Nations, who use it with Success; and, perhaps, the rather, that being severe, it affords them an Opportunity of shewing their Courage. Mr. Homberg, who was born in the Island of Java, says, he remembers that when the Javans were afflicted with a certain Colic, or painful Flux of the Belly, which ordinarily proved mortal, they used sometimes to cure themselves by burning the Soles of their Feet with hot Irons. If they have a Panaris, which is a Species of Paronychia, a Disease incident to the Fingers, they cure themselves by soaking the Finger affected in boiling Water several times, and letting it remain in the Water for an Instant only at each Immersion; and Mr. Homberg himself, following in some Cases the Customs of his native Country, cured himself of a Panaris in this very manner. In the Relations of Travellers, we have Accounts of a great many Maladies which the Savages cure by Burning; and, without going so far, we ourselves apply this Remedy to Horses, Hounds, and Birds of Prey, &c. But it must be owned, our Delicacy will not allow us to use it on ourselves, which is perhaps the Reason why we labour under lasting Disorders, which, by this means, might become very short.

The Delicacy of the Europeans could not long permit them to use that kind of Down, brought by the Spaniards from America, which cured the Gout when burnt on the Part affected. Mr. Homberg, nevertheless, saw a Burgess of Amsterdam, who, by the Use of this Medicine, freed himself of a Fit of the Gout in seven or eight Days, which used to last two or three Months, and the Returns of his Paroxysms were rendered less frequent.

Mr. Homberg thinks, that Burns may perform Cures in three different manners; either by putting the peccant Humours into a quicker Motion, which makes them fly off through new Roads; or by rendering them more fluid, which, in Effect, is the same with the former; or, thirdly and lastly, by destroying a Part of the Canals which bring the Humours, in too great Abundance, to the Part affected. *Hist. de l'Academie Royale des Sciences, An. 1708.*

AMEDANUS. The *Alnus vulgaris* is thus called by *Crescentius*.

AMELANCHIER, a Name for a sort of Bilberry, call'd by *Parkinson, Vitis Idæa tertia Clusii*. THE FRENCH HONEY SWEET WHORTS. See VACCINIUM.

AMELLUS: This is the Name of an Herb which takes its Name from the River Mella in France, on the Banks of which it grows in great Plenty.

Virgil numbers this amongst the Plants which are very agreeable to Bees. *Georg. 4.*

*Est etiam flos in pratis, cui nomen Amello
Fecere agricolæ, facilis quærentibus herba.
Namque uno ingentem tollit de cespite sycom
Aureus ipse: Sed in foliis, quæ plurima circum
Funduntur, violæ subluet purpura nigra.
Sæpe Deum nexis ornata torquibus aræ.
Aper in ore sapor: Tonsis in vallibus illum
Pastores, & curva legunt præpe flumina Mellæ.
Hujus odorato radices incoque Baccho,
Pabulaque in foribus plenis appone canistris.*

Some Botanists say, it is the *Caltha Palustris*. Others, that it is a Species of the CONYZA, or of the ASTER MONTANUS. According to *Dale*, it should be the *Aster Atticus*.

AMELPODI, a Name given to four different Trees, which grow in the Indies.

The first is the *Amelpodi*, H. M. or *Arbor Indica ἀναρτος, floribus umbellatis tetrapetalis*.

The Root of this is esteem'd by the Inhabitants of Candanate where it grows, to be an Antidote against the Bites of Serpents, if worn about them.

The second is the *Belutta Amelpodi*, or *Frutex Indicus ἀναρτος, foliis binis adversis, floribus pentapetalis candidis, unguibus luteis*.

The Root of this, bruised, and taken with Water, is good against the Bites of Serpents; and is esteem'd a good Topic in the Gout.

The third is the *Sjouanna Amelpodi*, or *Frutex Indicus Pentapetalos, gemina Bacca, Calyce excepta*.

The Root of this is recommended against the Bites of Serpents and Scorpions.

The fourth is the *Karetta Amelpodi*, or *Baccifera Indica floribus umbellatis, Fructu rotundo tricoeco*.

A Decoction of the Leaves of this Tree are esteem'd a Remedy for the Colic.

The Root, if only worn in a Purse, is said to be an Antidote against the Bites of Serpents.

From the Leaves and Roots boil'd in Oil of Olives, a Liniment is prepar'd, which is said to be excellent for resolving large Tumours. *Raii Hist. Plant.*

AMENE, common Salt. *Rulandus*.

AMENENOS, ἀμενεος, from α Negative, and μεν Strength, weak, feeble. It is frequently us'd by Hippocrates in this Sense.

AMENTIA, Madness. See MANIA and DELIRIUM.

AMENTUM, Scissile Alum. *Rulandus*.

AMERI, Indigo. See ANIL.

AMETHODICUM, Immethodical. *Blancard*.

AMETHYSTA PHARMACA, ἀμethystα φάρμακα, from α Negative, and μεθυ Wine. Medicines which either prevent, or take away, the inebriating Effects of Wine. *Galen de Compositione Pharm. L. 2.*

AMETHYSTUS, a precious Stone, thus distinguish'd:

Amethystus, Offic. Kentm. 48. Boet. 162. Charlt. Foff. 35. Worm. 99. De Laet. 24. Aldrov. Mus. Metall. 966. Schw. 362. Calc. Mus. 189. Geoff. Praelect. 84. Mont. Exot. 14. THE AMETHYST.

It is a precious Stone, of a violet Colour, which arises from a Mixture of red and azure; and it is found in India, Arabia, Armenia. *Dale*.

A hard, beautiful, shining, transparent, precious Stone, of which there are several Species; some are white, others red, others of a violet Colour: It comes from the Indies. 'Tis pretended, that it prevents Drunkenness, being worn on the Finger, or bruised and drank in Powder; but this Virtue is only imaginary. However, hence it receives its Name. See AMETHYSTA.

It is good to stop a Looseness, and to absorb the acid Particles when too much abounding in the Stomach, which Virtue it has in common with other alkaline Substances.

Geoffroy adds, that the Chymists have endeavoured to extract Tinctures from these coloured Gems; but it is not certain whether ever they succeeded; or if they did, what the Use of these Tinctures is. *Geoffroy*.

AMETRIA, ἀμετρία, among the Greek Physicians, was used in the same Sense with the Latin Words *Immoderantia*, and *Immoderatio*. It is in general a Receding in any Degree from a due Temperament. *Galen*.

AMIA, the Name of a Fish, reckon'd by *Aetius* among such as are of a hard Flesh. *Aetius, Tetr. 1. Sermon. 2.*

Pliny says, it grows so fast, that you may perceive it every Day. *Nat. Hist. Lib. 9. Cap. 13.*

AMIANthus

Offic. Boet. 382. Gesn. de Lap. f. 6. Aldrov. Mus. Metall. 657. *Amianthus*, Worm. 55. Calc. Mus. 286. Schrod. 346. Charlt. Foff. 23. *Lapis Amianthus*, Matth. 1387. Laet. 118. *Amianthus, sive Asbestus*, Ind. Med. 8. EARTH-FLAX. *Dale*.

The Amiantus Lapis is generated in Cyprus, and is a Stone like Scissile Alum. As it may be drawn into Threads fit to be woven, they work it into Cloth, only fit for Show, which, cast into the Fire, takes indeed the Flame; but instead of being consumed, comes out the purer and brighter. *Dioscorides, Lib. 5. Cap. 156.*

It is used as an Ingredient in Psilothra, [Medicines to take off Hair] *Paul. Aeginet. Lib. 6. Cap. 3.* And *Myrseus* makes it enter the Composition of his Citron-ointment for Blemishes of the Skin. *Seft. 3. De Unguentis, Cap. 42.*

It is believed to be effectual against all manner of Witchcraft, especially such as proceeds from Women. *Schroder in Dale*.

Pliny says it has a particular Prevalence against the Sorceries of Magicians. *Lib. 36. Cap. 19.*

It is also said to resist Poisons, and to cure the Itch.

The Nature of the Amianthus will appear from the following Dissertations, collected in the Abridgment of the Philosophical Transactions.

Signior Marco Antonio Castagna, Superintendent of some Mines in Italy, hath lighted, in one of them, upon a great Quantity of that lanuginous Stone called *Amianthus*, which he knows so to prepare, as to render it like either to a very white Skin, or to a very white Paper, both which resist the most violent Fire. The Skin was covered with kindled Coals, whence it took Flame; but being taken out, after it had been left there a while, the fiery Colour presently disappeared, and

VOL. I

it became cold and white again as before; the Fire, it seems, passing only through, without wasting or altering any thing of it; whereas some of the hardest and solidest Metals, as Iron and Copper, reduced to very thin Plates, and kept as long in the Fire as this Substance was, would cast Scales. Again, this Skin, being made as thin as Paper, doth not only yield that ancient and so much admired *Amianthus*, but is also perfecter than that which comes from Cyprus, and not inferior to that which sometimes, though but seldom, comes out of China. This Paper was also try'd in the Fire, and there it remain'd likewise without any visible Detriment, or without the least Change of its first Whiteness, Fineness, or Softness. Of the same Matter this Artist hath wrought a Wick, never to be consumed as long as 'tis fed, nor altering its Quality after the Aliment is wait'd away.

The *Lapis Amianthus*, or *Linum Fossile Asbestinum*, is found in no small Quantity in *Llan-Fairryg-Hornwy*, in the Northern Part of *Anglesey*; where it runs in Veins through a thick Stone, in Hardness and Colour not unlike Flint. These Veins are generally a Quarter of an Inch deep, which is the Length of the *Amianthus*; and is seldom longer, but often shorter. It is composed of a lanuginous Matter, exactly resembling that of pappous Plants; but so closely compact, that till you draw a Pin, or any such sharp thing, cross the Grain of it, it appears only a shining Stone, there being not the least Filament of Lint to be perceived in it. In its natural Form, some of it looks whitish, and some straw-coloured, but all shining; but if pounded in a Mortar, the Brightness disappears, and the Whole becomes whitish. Note, that above and beneath the Veins there is a very thin Septum of terrene Matter, betwixt the *Amianthus* and the Stone whereto it adheres. I put a small Quantity of the Lint in the Fire, which grew red-hot; but tho' it remained there a Quarter of an Hour, I could not perceive that it was any thing consumed. I twisted also some of it in the Form of a Wick, and dipping it in Oil, it gave as good a Flame as other Wicks, till the Oil was consumed; the Wick remaining of the same Proportion as at first. Being satisfied it was incombustible, I pounded some Quantity of it in a stone Mortar, till it became a downy Substance; then I sifted it thro' a fine Searce, by which means the terrene Parts (being reduced to a Powder) came thro' the Searce, the *Linum* remaining. I then brought it to a Paper-mill, and putting it in Water, in a Vessel just capacious enough to make Paper with such a Quantity, I stirred it pretty much, and desired the Workmen to proceed with it in their usual Method of making Paper, with their Writing-paper Mould, only to stir it about ever before they put their Mould in, considering it as a far more ponderous Substance than that they used; and that consequently, if not immediately taken up after it was agitated, it would subside. Paper thus made of it, proved but very coarse, and too apt to tear. But this being the first Trial, I have some reason to believe it may be much improved.

I here send you the Account of the incombustible Linen-cloth, which I received from one *Conco*, a natural Chinese, resident in the City of *Batavia*, in the North-east Parts of *India*, who by means of *Keayarear Sukradana*, (likewise a Chinese, and formerly chief Customer to the old *Sultan* of *Bantam*) did, after several Years Diligence, procure from a great Mandarin in *Languin*, (a Province of *China*) near three Quarters of a Yard of the said Cloth; and declared, that he was credibly informed, that the Princes of *Tartary*, and others adjoining to them, did use it in burning their Dead; and that it was said; and believed by them, to be made of the under Part of the Root of a Tree growing in the Province of *Sutan*; and was supposed, in like manner, to be made of the *Todda-trees* in *India*; and that of the upper Part of the said Root near the Surface of the Ground, was made a finer Sort, which; in three or four times burning, I have seen diminish almost half. They report also, that out of the said Tree there distils a Liquor, which not consuming, is used with a Wick made of the same Materials with the Cloths, to burn in their Temples to Posterity.

A Handkerchief, or Pattern of this incombustible Linen, which was shewn the *Royal Society*, was a Foot long; and just half a Foot broad.

There were two Proofs of its resisting Fire given at London; one before some of the Members of the *Royal Society* privately, Aug. 20. 1684. when Oil was permitted to be poured on it whilst red hot, to enforce the Violence of the Fire. Before it was put into the Fire this first Trial, it weighed one Ounce six Drams sixteen Grains; and lost in the Burning two Drams five Grains.

The second Experiment of it was public Before the *Society*, November 12. following, when it weighed (as appears by the Journal of the *Society*) before it was put into the Fire, one Ounce three Drams eighteen Grains: Being put into a clear Charcoal-fire, it was permitted to continue red-hot in it for several Minutes: When taken out, though red-hot, it did not consume a Piece of white Paper, on which it was laid. It was

X x x x

presently

presently cool; and upon weighing it again, was found to have lost one Dram six Grains.

December 3. Mr. Arthur Baily, one of the Fellows of the Royal Society, presented them with a Piece of this Linen, in the Name of Mr. Waite. At the same time, the same Mr. Baily presented Dr. Plot with another Piece of it, which being brought to Oxford, the Experiment was again repeated on it, December 16. it being put into a strong Charcoal-fire, in the Natural History School, in a full Meeting of the Philosophical Society of that University; where after it had continued red-hot for some considerable Time, it was taken forth again little altered when cold, saving that it seemed a little whiter and cleaner than before.

This kind of Linen-cloth was esteemed by the Antients, though then more common, and perhaps better known, than 'tis yet amongst us, equally precious with the best of Pearls.

Nor is it now of mean Value even in the Country where made, a China Coveit (that is a Piece twenty-three Inches and three Quarters long) being worth eighty Tale, that is thirty-six Pounds thirteen Shillings and Four-pence.

The Reality of such a Being has been doubted or deny'd by very good Authors; who, though they owned such a Mineral as *Amianthus*, out of the woolly Part whereof this sort of Linen was always antiently said to be made, yet questioned the Possibility of its having been actually done. But *Pliny* says expressly, (and I dare believe him in any thing he speaks of his own Knowledge) that he himself had seen Napkins thereof, which being taken foul from the Board at a great Feast, were cast into the Fire; by which means they were better scoured; and looked fairer and cleaner, than if they had been wash'd in Water.

And besides the Testimony of several curious Persons in all Ages, we have now seen a Piece of this Linen pass the fiery Trial both at London and Oxford.

This lanuginous Mineral is called from its strange Qualities, sometimes *Amianthus*, quod in Ignem injectus non uritur; the Fire being so far from defiling it, that it rather gives it a Lustre.

It is called *Asbestos*. And, *Salamandra*; in English, Salamander's Wooll. I suppose from the *Thryalides*, or Candle-wicks, said to be antiently made of it, which being put into Lamps of incombustible Oil, would never waste, or go out; which I take to be the true Reason of the Imposition of these Names upon it, whether there ever were any such Lamps or not.

From a pungent Quality, *Agricola* says, it has on the Tongue without Astringency, it is called *Alumen*, having the distinguishing Epithet *Plumeum* added to it, taken from its downy Filaments, to discriminate it from all the rest of the *Alums*. This is however a Mistake; for the *Alumen Plumeum* is a very different thing.

From the light-grey Colour of its lanuginous Parts it is called by some *Polia*; by others *Corfoides*; and, from its Likeness to the hoary Fibres of some sort of Matweed, *Spartapolia*.

From the Capacity it has of being spun into Thread, it is also called *Linum*, with some distinguishing Epithet taken either from its Quality, such as *Asbestinum*, or *Vivum*; or from the Place where found in general or particular: It being called in general *Linum Fossile*; in English, *Earth-flax*; and in particular, *Linum Indicum*, *Creticum*, *Cyprium*, and *Carpasium*, or *Carystium*. But beside the Places that have given these Epithets to it, it is also found in *Tartary*, at *Namur* in the *Low-Countries*, at *Eisfeld* in *Thuringia*, amongst the Mines in the old *Noricum*, somewhere in *Egypt*, and in the Mountains of *Arcadia*; also at *Puteoli*, and lately in some other Mines in *Italy*; and it has been yet lately met with in a small Island, and belonging to *William Robinson*, Esq; called *Ynis Molromiad*, that is, the Island of *Sea-Calves*, in the Parish of *Llanfairing Hornwy* in *Anglesea* in *Wales*.

It is commonly by the *Lithographers* reckoned among Stones; but I rather should judge it a *Terra Lapidosa*, or middle Substance between a Stone and an Earth. But whether the one or the other, it is made of a Mixture (I guess) of some Salt or other, a pure Earth without Sulphur, coagulated in the Winter, and hardened to Perfection by the Heats in Summer; which Salt *Johannes Hessler* proves by a very cogent Argument to be *Alumen Liquidum*, describing it, as *Matthioli* also does, to be of a whitish lacteous Substance, somewhat inclining to yellow, that sweats out of the Earth, and smells like rotten Cheese; whereof having gathered a Quantity at *Puteoli*, together with the other Species of *Alum*, and kept it a while by him, when he came to look on it again, he found it to have lost the Smell, and a great Part of it changed into *Alumen Plumeum*, the saline Part, I suppose, shooting into Threads, and the pure Earth uniting them, as found in the Places where-ever generated, whether sweating from the Earth, as *Pliny* and *Matthioli* would have it, or percolated through Rocks, as we find it in *Wales*, the Veins of it there running through a Rock of Stone, in Hardness and Colour not unlike Flint, and

yet seems to be made of such *Alum*, as that of *John Hessler* at *Puteoli* was, some of it being straw-coloured, as if it still retained the Yellowness that his liquid *Bitumen* was said to have, which is a Colour not given to it by any Author, most of it being said to be white, or cineritious, some of it red, and some of an iron Colour, as *Agricola* tells us; and I have some of the *Cyprian* by me, sent from *Aleppo*, by Dr. *Robert Huntington*, whereof some is of a light-blue or pearl Colour, and some of it has a Cast of Sea-green.

But however the whole mineral Substances found at several Places may differ in Colour, yet I do not find but the woolly Part of them all seems to be much the same, viz. of a white silver Colour, the Threads very fine and slender, yet very ponderous, the smallest Particles of them thoroughly wet, sinking in Water, as I also found a very slender Thrum of the incombustible Linen given me by Mr. Baily, which Mr. Waite brought from *India*, would also do; which renders it very probable, that it is not a Vegetable, but a mineral Substance, notwithstanding the Informations of *Conco* and *Keayarear Sukradana*, mentioned in Mr. Waite's Letter; I say, render it probable, there being several Woods, such as *Box*, *Red Wood*, *Perjain Wood*, &c. that will sink in Water.

Marcus Paulus Venetus acquaints us, that it is found in *Tartary*, in a certain Mountain, in the Province of *Chinchimbals*, and made into Cloth, as he was informed, by one *Cursicar*, a Turk, who was Superintendant of the Mines in that Country; after this manner: The lanuginous Mineral, or *Amianthus*, being first dried in the Sun, is next pounded in a brass Mortar, and the earthy Part separated from the woolly, which is afterwards washed from all Filth whatever, that may stick to it; so, being thus purged, is spun into Thread like other Wool, and after wove into Cloth, which, if foul or spotted, they cleanse, he says, by throwing it into the Fire for an Hour's time, whence it will come forth unhurt, as white as Snow: Which very Method (as *Strabo* describes it) seems also to have been used in ordering the *Cretan Amianthus*; only with this Addition, that after it was pounded, and the earthy Part shook from the woolly, he says it was combed, and so does *Agricola*, which argues there was some of a greater Length than any I have yet seen.

Of this Linen, as *Pliny* informs us, Shrouds were antiently used at the Royal Obsequies, to wrap up the Corps in, so that the Ashes of their Bodies might be preserved distinct from those of the Wood, which made the Funeral Pile: And the Princes of *Tartary*, as *Keayarear Sukradana* was credibly informed, (and I have it well confirm'd from other Hands) do use such at this Day for burning their Dead. It must be acknowledg'd, it must diminish every time it undergoes the Violence of the Fire; yet this hinders not, but it may and will do that Service divers times before it be render'd altogether useless. Some of the Antients are said to have made themselves Cloaths of it, particularly the *Brachmans* amongst the *Indians*. The Wicks for the perpetual Lamps of the Antients were also made of this Substance; and we are told, that *Septella*, Canon of *Milan*, had Thread, Ropes, Net-works, and Paper, of it. *Marcus Antonio Castagna*, who lately found this Mineral somewhere in *Italy*, knows how to prepare and render it tractable and soft, which he can thicken, and make thin, to what Degree he pleaseth, and maketh it thereby like either to a very white Skin, or a very white Paper. We have also made Paper of our *Welsh Amianthus* lately here at *Oxford*, which will both bear Fire and Ink well enough, the Ink only turning red by the Violence of the Fire.

Signior *Campani*, after some Account of the Name of the *Asbestos* Stone, mentions four Sorts, of which he has Specimens in his Museum. The first sent from *Corfica* or *Corfu*, long, of a woody Form, of half a Palm Length and more, of a whitish Colour, something inclining to a reddish. The second of a silvery lead Colour, softer, and shorter about three Inches; this was from *Sestri di Ponente* in *Liguria*. The third (which is the worst of all) is like Scales or *Laminae*, one upon another, (as he represents it like an Onion) of a blackish Earth-colour, with some white, black, and dark-red Veins interspersed, scarce two Parts of an Inch Roman long, therefore fitter for making of Paper, than spinning or weaving. The fourth Sort, giving him by Signior *Boccone*, found in the *Pyreneans*, some whereof were a Roman Palm long; its Filaments, tho' longer, were yet thicker and rougher: He says also, That he heard of another sort in the *Volaterranean Mountains*. Next he tells us, He kept it for three Weeks in a Glass-house Fire, but found it unaltered; but it would not preserve a Stick wrapt in it from the Fire; whence he concludes the *Amianthus* loses nothing in the Fire, because it does not burn nor flame; but in the handling it wastes, though not much, as he found by an exact Balance. Lastly, He proceeds to shew the manner of spinning it, which he tried thus: First he laid the Stone in Water (if warm the better) for some time to soak; then it is opened and divided with the Hands, that the earthy Parts may fall out of it, which are whitish like Chalk, and hold the thready Parts together; this makes the Water thick and milky; this

this is repeated six or seven times with fresh Water, where it is again opened and squeezed, till all the heterogeneous Parts are washed out, and then the flax-like Parts are collected, and laid in a Sieve to dry.

Of his four Sorts of *Amiantus*, he found that from *Corsica* best; being long and soft; and the *Cyprian* worst; where, by the way, he doubts whether his was of the best Sort, since the *Cyprian* was commended by *Pancirollus*, and others which he quotes. But to come more close to the way of spinning it; he first shews a Method discovered to him, which was thus: Lay the *Amiantus*, cleaned as before; between two Cards, such as they card Wool with; where let it be gently carded, and then clapt up in between the Cards fast upon a Table or Bench; take a small Reel, made with a little Hook at the End, and a Part to turn it by, so that it may easily be turned round; this Reel is to be wound over with fine Thread; then having a small Vessel of Oil ready, with which the Fore-finger and Thumb are constantly to be kept wet, both to preserve the Skin from the corrosive Quality of the Stone, and render the Filaments thereof more soft and pliant: Thus by twisting the Thread upon the Reel about, with the *Asbestos* hanging out of the Cards, some of it will be worked up together with it; by little and little, this Thread may with Care be woven into a coarse Sort of Cloth; and by putting it into the Fire, the Thread and Oil will be burnt away, and the incombustible Cloth remain. But finding this way of uniting the Stone with the Thread very tedious, instead of the Thread he put some Flax upon a Distaff; and by taking three or four Filaments of the *Asbestos*, and mixing them with the Flax, he found they might easily be twisted together; and the Thread thus made much more durable and strong; so that there is no Need of carding, which rather breaks the Filaments, than does any good: Open only, and separate the Filaments, after washing, upon a Table, and take them up with the Flax, which is sufficient. As to the making of Paper, he says, in the washing the Stone, there will remain several short Pieces in the Bottom of the Water; and of these, after the common Method, Paper may be made. He concludes with the best way of preserving the Cloth, or any other thing made of the Stone, when made; for by reason of its exceeding Dryness, it is very apt to break and waste; this is by keeping it always well oiled, which is the only Preservation for it; and when the Cloth is put in the Fire, the Oil burns off, and the Cloth comes out white and purified.

In the Ground of *Francis Gordon of Altundore*, in the Shire of *Aberdeen*, near the *Highlands*, on the Side of a Hill of a Heath-kind of Ground, somewhat inclining to what we call Moss, in a very small Brook, and hard by it, in the Bounds of ten or twelve Yards, I found a great many of these Stones, some a Foot in Length, which appeared plainly like Wood; but because I could not perceive any Foot-steps of Wood thereabout, neither could any of them be found, except in that very Spot of Ground, I could not be persuaded they were petrified Wood. Then I went to cut up the Ground about the Place with my Knife, where I found likewise some Pieces of the Stone; and, very near the Surface, I got several Pieces of a fibrous Matter, which my Knife could not cut; this I immediately judged to be an incombustible Matter, as it proved afterwards, when I tried it by the Fire. And, because I thought it had been always esteemed certain Filaments that came off the *Lapis Amianthus*, I resolved to observe more narrowly the Production of it.

When I found some Pieces of the Stone very hard in the Middle, and the fibrous Matter on the Out-sides and Ends, I was inclined to believe, that the Flax came from the Stone; but then finding several Pieces of the Flax so condensed and pressed together, that, at first, they appeared to be hard Stones; but being a little wet, the Filaments were easily parted from one another; many more I got, some less, and some more, condensed into the Nature of a Stone; and all of it, both that which was condensed together, and what was not, was lying about an Inch within the Ground, parallel with the Surface, so interwoven with the Fibres of the Roots of the Grass, that it seemed to me much more probable to believe, that the Lint turned into the Stone, than the Stone into the Lint; especially seeing most Part of the Stones appeared so tender and brittle on the Outside, that it's hard to believe how they could turn into that tough Substance of Flax. The Stones are of different Sorts; some are white, the Colour of the Lint, and of a very soft Substance, so that they may be easily cut with a Knife without blunting it; others are much mixt with a whitish Talc; but most of them are of a greyish Colour, and very hard.

As for the Production of the Flax, I think it's hard to determine in this Place; because the greatest Quantity I found of it, was lying, as I said before, about an Inch at most within the Ground, parallel with the Surface, interwoven with the Roots of the Grass, without any Root of itself, but alike at both Ends, as if it were cut with a Knife. The Ground wherein it is found is of a greyish Colour, about one Inch or

two thick; under which there is a black Earth, for a Foot in Depth: So that I could find nothing, in the Places where most of it was got, that I could rationally conclude to produce it. But in some other Spots I found much of a talkish Sand, and some Pieces of Flax near to it; as also Pieces of the Stone much whiter than the rest, and very like Talc; which would incline one to believe, that it was produced of it: Yet there being no Appearance of any Talc in the other Places, where most of it was found, I can scarce conclude any thing about the Production of it.

But whatever way it is produced; though I have not examined what has been writ and said of that *Linum* by many, yet it seems to me, by what *Pliny*, *Aldrovandus*, and *Olaus Wormius* write concerning it, that this which I found in *Scotland*, is not inferior to any they speak of; for, generally, they make it very short; whereas some of this I found five, six, seven, and some eight Inches long.

As for the making of it into Cloth, they all conclude it very hard, which I confess is true; yet it may be seen, by the Experiment I have shewn, in making Yarn of it, that Cloth may be made of it also; for the Difficulty is much greater in one than the other.

A singular kind of Stone was dug out of a Quarry in the *Highlands* of *Scotland*, which, after the Rubbish, which lies not very deep, is done away, lies horizontally in a Bed endued with parallel Fibres; with few Interstices, soft at the Beginning, and easy to be smoothed and polished without any Tool, but rather with Sand, or another hard Stone of a bluish Colour, which afterwards hardens so, that it resists the Injuries of the Air, or Prejudice of Fire. When first the Quarrier began to dig it, he was at a mighty Loss; for endeavouring to cut and raise it, after the ordinary manner, with Wedges, and other usual Instruments, it broke and crumbled all to Pieces: But afterwards observing more narrowly the Duct of its Fibres, so to speak, he endeavoured to cut it with Spades lengthwise; and by this means he procured Stones as big as he had a mind, which smoothed very easily along the Tract of their Fibres; but when cut transverse, no Means nor Methods could render them smooth, but their Surface remain'd unequal as the Extremities of a Piece of Wood. Altho', as I said, this Quarry has but few Interstices, yet in those it has the true *Asbestos*, of a whitish silver Surface, consisting of several *Fasciculi* with parallel Fibres, like to those of the muscular Fibres of salted Beef, easily separable from each other, pure white, till it becomes so small as the finest Flax, and so ductile, that it may be spun into the finest Thread, wherof it were easy to make the incombustible Cloth, so famous for Shrines among the Antients: In other Places of those Interstices, was likewise to be observed a reddish Substance, near to the Colour of *Sanguis Draconis*; but whether fibrous or not, I cannot inform you, since the Gentleman could not shew me any of it; but added, he believed it might be good for Dying. I got a small Parcel of the *Asbestos* from him, and he told me, if he had known its Value, he could have preserved some Pounds of it. I am ready to think the second Kind was fibrous too, which might make a very beautiful Cloth, being striped with the other. This whole Quarry may be said to be *Asbestos* of different Colours, the bluish being of a much coarser, and the white and red of a finer Grain. *Phil. Transf. Abr. Vol. 5.*

AMICULUM, this was a kind of Covering used by the Boys for concealing their *Pudenda*, when going through their Exercises naked in the *Gymnasium*, or Place appointed for that Purpose, *Rhodius Dissert. de Acia*. It is also used in the same Sense with the Word *AMNIOS*, which see.

AMIDUM, the same as **AMYLUM**, which see.

AMINÆUM VINUM, Wine of *Aminæ*, called afterwards *Falernum*, in *Italy*. Polenta, prepared of roasted Barley, and drank in austere *Aminæan* Wine, is said by *Ætius*, to dry the Belly. *Tetr. 1. Serm. 1.*

Among Wines, the *Aminæan* claims the Preference, on account of its Strength, and the Spirits and Generosity it acquires by Age. *Pliny Nat. Hist. Lib. 14. Cap. 2.*

Columella says, the *Aminæan* Vines were the most antient, that is, the first taken Notice of; and the *Italians* were probably first acquainted with these Vines; for *Italy* did not originally produce Vines; the Inhabitants were therefore obliged to transplant them from the Country of the *Ammineî*, a People of *Thessaly*. According to *Macrobius*, the *Falernum* was antiently called *Aminæan* Wine; but it should rather seem, that the *Falernum* was of the Vintage of a particular Place; and that the *Aminæan* Wine was that made from the *Aminæan* Grape, in whatever Part of *Italy* it was produced; though the *Falernum* seems to have been made from this Sort of Grape, which the Soil of that Place might probably agree with better than any other. In Confirmation that the *Aminæan* Wine was not the Produce of any particular Place, but a Wine made of a particular Sort of Grape, it must be remark'd, that *Galen* takes Notice of *Aminæan* Wine, which was produced in *Naples*, in *Sicily*, and in *Tuscany*.

It was the Character of the *Aminæan* Wine, that it was, when new, austere, acid, and rough, but that it improv'd prodigiously by Age; for, when old, it was remarkable for its Spirit, Strength, and Generosity; and consequently, it was then excellent in Imbecilities of the Stomach, as *Galen* observes.

Virgil distinguishes the *Aminæan* Wine from the *Falernum*, in the second *Georgic*:

--- Quo te Carmine dicam,

--- *Rhetica*? Nec cellis ideo contende *Falernis*.

--- *quæ sunt etiam Aminææ Vites, firmissima Vina.*

This Sort of Wine and Grape, were by most of the *Latin* Writers called *Aminæa* and *Amminium*, as in *Virgil*, not *Aminæa* and *Aminæum*.

AMINÆUM ACETUM. *Rulandus*, and his Transcriber *Johnsin*, seem to think this White-wine Vinegar; but it should rather be Vinegar made of the Wine described above, or strong Vinegar in general.

AMINIA, the Name by which the Natives of *Brasil* call the *Hylon Brasilianum* of *J. B.* and which the *Portuguese* call *ALGODON*. *Margrav.* It is a Species of Cotton-tree.

AMMA. See **HAMMA**.

AMMI, Bishops-weed, of which there are two Sorts, the Modern, and the Antient. The Modern is thus distinguish'd:

Ammi vulgare, Offic. Ger. 881. Emac. 1036. Raii Hist. 1. 455.

Ammi vulgatus, Park. Theat. 912. *Ammi majus*, C. B.

Pin. 159. Tourn. Inst. 304. Elem. Bot. 254. Boerh. Ind. A.

57. *Ammi vulgare majus, latioribus foliis, semine minus odorato*,

J. B. 3. 27. Hist. Oxon. 3. 295. *Ami*, *Ammi*, *Amium* &

Amminium, Chab. 285. **COMMON BISHOPS-WEED.**

Dale.

This Plant grows about two or three Foot high, with strait, round, channel'd Stalks, on which grow long-winged Leaves, encompassing the Stalk at Bottom, composed of three smaller Divisions, of long, narrow, crenated *Pinna*; on the Tops of the Stalks grow pretty large Umbels of small white Flowers, consisting of five Leaves apiece, whereof two or three are usually bigger than the rest. The Seed is small, about the Bigness of Parsley-seed, of a hot fragrant Taste. It grows not wild with us, though *Parkinson* affirms, that it grew wild about *Greenbith*, in *Kent*; but it has been found by nobody since his Days: In the warmer Countries it is common enough, flowering in the Summer, and dying after it has perfected its Seed, which is the only Part of the Plant in Use.

The Seeds of Bishops-weed are of a drying warming Nature, good to expel Wind from the Stomach and Intestines, and prevent the Colic; they are diuretic, provoke Urine and the Menfes. *Mill. Bot. Off.*

It is cultivated in Gardens, and flowers in *June* and *July*. The Seeds are small, striated, less than those of Parsley, of a light Red inclining to an Ash-colour; of a bitterish, acrid Taste, and of a fragrant Smell; they are sold in our Shops instead of those of the true Bishops-weed. It is one of the four lesser hot Seeds. *Dale.*

The *Ammi* of *Dioscorides*, and the antient Authors, is thus distinguished:

Ammi verum, Offic. *Ammi Creticum*, Ger. 881. Emac.

1036. Park. Theat. 912. *Ammi alterum, semine apii*, C. B.

Pin. 159. *Ammi odore origani*, *J. B.* 3. 27. Raii Hist. 1. 455.

Hist. Oxon. 3. 295. Chab. 385. **TRUE BISHOPS-WEED.**

Dale.

Ammi is by some called *Ethiopian Cummin*, by others *Royal Cummin*; but some tell us, that *Ethiopian Cummin* is of a different Nature from that of *Ammi*. The Seed of this Herb is well known to be much less than Cummin-feed, and of the Taste of *Origanum*. Chuse what is clean, and free from Bran.

It is of a heating, caustic, and drying Quality. Drank in Wine, it cures Gripings of the Intestines, Difficulty of Urine, and the Bites of venomous Creatures; it also provokes the Menfes. It is mixed with Vescatories of *Cantharides*, in order to prevent the Strangury. Apply'd in a Cataplasm with Honey, it takes off the livid Marks of Blows in the Face. Drank, or the Skin anointed with it, it causes a pale Colour. Used in a Suffumigation with dry'd Raifins, or Rosin, it purges the Uterus. *Dioscorides*, Lib. 3. Cap. 70.

Pliny says the same, and adds, that *Hippocrates* called it *Royal Cummin*, because he thought the best grew in *Egypt*. The *Alexandrians* used it in their Bread, and in Sawces. It asswages Inflammations of the Eyes. Mixed with Linseed, and the Quantity of two Drams drank in Wine, it cures the Sting of a Scorpion; and taken with an equal Quantity of Myrrh, is particularly serviceable against the Bite of the *Ceraftes*. They say the Smell of it, at the time of Coition, promotes Conception. *Nat. Hist. Lib. 20. Cap. 15.*

This is rarely to be met with in the Shops, the former supplying its Place: It used formerly to be brought from *Turkey*; the Plant which bears it is smaller, the Leaves narrower, and more divided; it bears Umbels of white Flowers, and Seed

somewhat like the common, but less; of a more pleasant and aromatic Smell and Taste, somewhat like *Origanum*; and is esteem'd to have greater Virtue and Efficacy than the former. *Miller. Bot. Off.*

It is brought from *Alexandria* in *Egypt*. The Seeds are small, striated, less than those of Parsley, of a Yellow inclining to Red, of an acrid aromatic Taste, and of a fragrant Smell. It is seldom or never found in our Shops. It is Incisive, Aperient, and a Drier; is effectual in Pains of the Colon and Uterus, Inflation of the Stomach, and Obstructions of the Urine and Menfes. *Dale.*

These Seeds afford a great deal of essential Oil, and volatile Salt.

They are Anti-hysterick, Carminative, and Cephalic; resist Poison, and are one of the four lesser hot Seeds. *Lemery des Drogues.*

AMMION, *ἀμμιον*, Cinnabar. See **CINNABAR**, and **MINIUM**.

AMMITES, *five* **AMMONITES**, is a sandy Stone, which is found in different Sizes; for there are some as large as a Nut, some as big as Peas, some the Size of Vetches, and others of the Seeds of Poppy or Millet. These little Stones resemble the Eggs or Spawn of Fish; some are called *Cenchrites*, and others *Meconites*. Those which are as big as a Pea, are called by some *Mineral Bezoar*, because they are formed in Shells, or little *Lamina*, like the Bezoar; and they are of the same shining Colour, or a little redder; they are found upon the Mountains near *Bern*, in *Switzerland*.

They are soon resolved into Sand, of which they consist: They are called *Ammites*, from *ἀμμς*, Sand. *Lemery des Drogues.*

AMMOCHOSIA, *ἀμμοχυσία*, a kind of Remedy for drying the Body, which, for that Purpose, must be laid upon the Sand, which must be heaped upon it. The Sand ought to be very hot, and of the Sea; if it can be had; for River-sand is more humid.

But Salt is more efficacious for the same Purpose than Sand, and better for the Patient to lie down in, with some thin Substance spread under him. But the Salt must be no less than three Palms in Depth; for otherwise its Virtue would easily be dispersed.

It has also the same Effects as *ἀλυσία*, **INSOLATION**, which see.

Oribasius, Lib. 10. Cap. 8. *Coll. Med.* tells us, that this Fomentation with Sand is accommodated to such as labour under the Colic, Asthma, Gout, Cachexy, Dropsy, and all those who are afflicted with chronical Distempers; and that all, except Infants, are fit Subjects of this Fomentation: He says further, that it ought to be administer'd in the hottest Days of the Summer, at Sun-rising, on the Shore, in the most fervent Sand, which has deep Pits sunk in it, where the Patient may roll himself, and lie with his Head covered from the Sun-beams, a Covering before his Eyes, and a Sponge, dipp'd in cold Water, held to his Face.

Ætius also mentions this *ἀμμοχυσία*. *Tetrat. 1. Serm. 3. Cap. 9.* as does *Celsus*, Lib. 3. Cap. 21. for the Cure of a Dropsy. *Dioscorides*, Lib. 5. Cap. 167. says, that the Sand on the Sea-shore, heated with the Sun, dries the Bodies of those who are hydropical, if they are covered with it, all but the Head.

Galen made use of this *ἀμμοχυσία*, for the Wife of *Boethus*, labouring under a Fluor Albus, as he writes, *Lib. de Præcog. ad Posthumum*. And *Pliny*, Lib. 22. Cap. 25. tells us, that *Sextus Pompeius* used the same kind of Remedy for the Gout. "He stood, says he, above his Knees in Wheat; and his Feet being thus dried, he found himself wonderfully relieved; from which time he used no other Remedy."

Hen. Stephanus, instead of *ἀμμοχυσία*, reads *ἀμμοχυσία*: it is also called *λαμμοχυσία*. *Goræus.*

AMMOCHRYOSOS, *ἀμμοχρυσός*, from *ἀμμς*, Sand, and *χρυσός*, Gold.

AMMOCHRYSUS, is a Stone sometimes hard, but which generally crumbles betwixt the Fingers like Sand; its Colour is sometimes red, sometimes yellow, intermixed with Spangles of Talc, the Colour of Gold; so that it seems to be mixed with Gold in Powder. This Stone is found in *Bohemia*, and in many other Places. It is only used to put on Writing. *Lemery des Drogues.*

AMMOCHRYSOS is also a Name given to a kind of Mud of a golden Colour, found in the Chanel of certain warm mineral Waters, in *Friseland*. *Castellus.*

AMMODITES, a venomous Serpent, a Cubit in Length, which is its utmost Size, being never described larger. It is of a sandy Colour, and marked all over the Body with black Spots; its Tail is extremely hard, and divided in the upper Part. Some give it the Name of *Cenchria*, that is, *Millet*, because its Tail is hard like Millet. It has wider Jaws than the Viper, and though it resembles that Reptile in many other respects, is easily distinguished by the Colour; for the Viper is yellowish.

The Bite of the Ammodytes is generally followed by speedy Death; but if this does not happen, Blood comes from the Wound, and the Part swells. Soon after Sanies works out, which is succeeded by Heaviness of the Head, and Swooning. Where the Symptoms are most favourable, the Patient does not live above three Days, tho' there are Instances of some who have survived till the seventh Day. The Bite of the Female causes the quicker Death.

Help, in such a Case, is to be sought, first, from the common Remedies, as Cupping and Scarifying the Places all about the Wound; Constriction of the Parts above it, and laying open the Wound with the Knife. Proper Medicines are, Mint drank in Hydromel; Castor, Cassia, and the Juice of Mugwort, taken in Water. Theriaca also is to be taken, and applied to the Hurt; drawing Plaisters are to be used; and after these, such Cataplasms as are proper for the Cure of eating and spreading Ulcers. *Etius, Tetr. 4. Serm. 1. Cap. 25.*

AMMONIACUM, ἀμμωνιακόν. Ammoniac.

The *Arabians* call the *Chrysocolia*, *Lezac Aldeheb*, which signifies the same as the Greek χρυσόκολλα, that is, a Ferrumination [Soldering] of Gold. They gave this Name also to Gum Ammoniac, as *Avicenna*, on the Word *Affac*, assures us; the Reason he shews for it is, because Books and Papers are gilt with it; for it gives a gold Colour to Books and Papers on which it is laid, or is useful in the gilding or laying on of Gold upon the same. This is *Avicenna's* Sentiment; the Gum itself, or Drop, of Ammoniac, he calls *Affac*; or *Azac*. *Alpagus* observes, that among the vulgar *Arabians* it goes by the Name of *Uffac*; and indeed, an antient *Arabian* Botanist, in an old *Dioscorides*, renders the Tree of Ammoniac *Seggar Aluffac*, that is, the Tree *Aluffac*. In *Serapion*, *Raxach* is read, by Corruption, for *Haxach*; the *Spaniards* call it *Aguaxaque*.

Avicenna calls the Tree *Altartub*, or *Altartbut*; the *Greeks* say it is called *Agasyllis*; καλεῖται δὲ ἀπὸ τοῦ ὅτι ὁ ἄμυς ἀγασυλλίς, "the whole Shrub that bears it is called *Agasyllis*." *Dioscorides*, *Pliny*, tho' by Mistake, says it is called *Metopium*. Some other of its Names in *Neophytus*, are νεῖος, and ἡλὶς εἰς; the first of which is an Epithet of *Jupiter Ammon*, to whom they gave the Name of νεῖος; "Ram-horned;" and the Reason of its other Appellation, he says, was because its Tear was much exposed to the Influence of the Sun. We commonly call it *Armoniac*, instead of *Ammoniac*. Some learned Physicians have doubted, whether we have the true Ammoniac of the Antients, and not without Reason; for our Ammoniac has not the Characters by which the Antients describe theirs; and 'tis certain, that Kind of it which they call θραύσμα, or θραυσόν, "such as is in Lumps or Fragments," is scarce to be met with in our Days. The Reason of the Name was, because it was broken after the manner of dry Sorts of Gums, whose Parts did not consist of a tenacious Glue. *Dioscorides*, amongst its Characters, would have it to be "like grumous Bits of Frankincense," λιβανίζον τοῖς χόνδεσις, which *Serapion* erroneously understands with respect to Smell. It was pure and dense, without Sordes; and of a yellow Colour; *Dioscorides* says, ὡχρὸν, "of a good Colour." They called another Sort of it οὖμα, of οὖσις, "mixed or blended;" because it was fat and resinous, easy to be made into a Mass; and full of Impurities from Earth or Sand. This is what we now commonly meet with in the Shops, and the *Greeks* had no other in the Time of *Neophytus*, who accommodating the Words of *Dioscorides* to the Age in which he lived, makes two Kinds of one, speaking thus, Ἐγχεῖται δὲ τὸ ἔυχρον καὶ ἄχυρον, λιβανίζον τοῖς χόνδεσις, καθαρόν καὶ πυκνόν, μηδὲμίαν ἔχον ρυπαρίαν. "Chuse what is of "a good Colour, without Chips, &c." This is the θραυσόν Ἀμμωνιακόν, "the brittle Ammoniacum," of the Antients. He immediately adds, καὶ τὸ ψύγιον, τῇ ὁσμῇ σφοδρὸν, πικρὸν δὲ τῇ γεύσει καλεῖται δὲ τὸ τοῖστον ἐρυμαῖδες. "and the "resinous, of a strong Smell, and a bitter Taste; this Sort is "called the *tractile*." He thought that the Ammoniacum of his Times, because it was resinous, and of a viscous, ropy Fatness, was the same as that of *Dioscorides*, which he would have to be λιβανίζον τοῖς χόνδεσις, "in Lumps like Frankincense;" but this is far from being true; for it is one thing to be ψύγιον, "resinous;" and another thing to be λιβανῖδες, "like Frankincense." This is dry and brittle, the former fat and juicy. Such Bodies as have a Ropiness, and can be drawn out like Pitch or Birdlime, may be called ἐρυμαῖδες, "tractile;" but the θραύσα, "the brittle," are properly such as, being broken, are shivered into small Bits and Fragments, and cannot be drawn into Threads. Thus he made one of two very different things; and, on the contrary, made a Distinction where was no Difference; for he immediately subjoins λεῖωδες ἢ γεῖωδες οὖμα, "the Mixed has Earth or Stones in it." The Ammoniacum of *Dioscorides*, which, he says, is called οὖμα, is the same with the fat and resinous, which, on account of its Viscosity, may be easily worked up into a Mass. *Pliny* has it, *Genera ejus duo*, Thrauston masculi Thuris similitudine, quod maxime probatur; alterum pingue ac resinofum, quod Phyrma appellatur. "There are two Kinds of it, the Thrauston, [brittle] which "is like Male Frankincense, and most valued; the other a fat

VOL. I.

and resinous Substance, which they call *Phyrma*, [a Mixture]. The Tear, which is of a pinguious Ropiness like Rosin, being too liquid to stick to the Tree, falls to the Ground, and there gathers Filth, by taking hold of Bits of Woods, and Sand, and incorporating with them into one Mass. This is the λεῖωδες, "stony," and γεῖωδες, "earthy," Ammoniacum of *Dioscorides*, and the fat and resinous Ammoniacum of *Pliny*, which is called *Phyrma*. What concretes on the Tree, like Frankincense, is not only dry, but pure, and free from Filth. *Neophytus*, who saw no other Drop of Ammoniacum used in his Time, more than what we see now, thought the liquid and the resinous were the same with the concrete, and again separated the viscous and fat from the resinous, which was a Complication of Absurdities. The *Greeks* universally call it Ἀμμωνιακὸν θυμίαμα, "Ammoniac Perfume," because it serv'd them for that Use, tho' it be of a strong and rank Scent. *Dioscorides* says, κασέζον τῇ ὁσμῇ, "smelling like Castor;" *Neophytus*, τῇ ὁσμῇ σφοδρὸν, "of a strong Smell." *Galen* says it has καὶ τὴν ὁσμὴν, "the Smell of Coriander." But I think it should be read κασέζον, "of Castor," instead of which they wrote by way of Compendium, καὶ τὴν ὁσμὴν, "of Coriander." *Pliny*, amongst Odours and Spices, reckons Ammoniacum, with the Juncus, and Calamus Aromaticus, and sweet-scented Moss. But 'tis no more strange, that this Gum should have a Place amongst sweet Odours appointed for Perfumes, than that Galbanum should be reckoned among the Spices, that composed the sacerdotal Perfume, *Exod. xxx. 31.* which consisted of Staete, aromatic Onyche, and Frankincense. In *Hebrew* it is called חלבנה, *Chelbena*, whence comes the Greek χαλβάνη. Galbanum was also an Ingredient in Ointments, and especially in the Ointment of Almonds used among the *Egyptians*, which for that Reason was called μετόπιον, "Metopium," a Name for Galbanum. Of the Ointment of Almonds, the *Greeks* thus write: Ἀργύσιον τὸ τοῦ ἁλίου ἐξευκατέτος μετόπιον ἀπὸ πέντε, ἡγρευσαν, ὅτι χαλβάνην λαμβάνει τὸ δὲ οὖλον ἐξ ἑνὸς καὶ χαλβάνη καλεῖται μετόπιον. "The *Egyptians*, who invented "this Oil, called it *Metopium*, because it contained Galbanum; for the Plant whence Galbanum is generated is so "called." Now the Scent of Galbanum is not much different from that of Ammoniac, if it be true, as *Dioscorides* says, that Galbanum uses to be adulterated with Rosin, husked Beans, and Ammoniac. So that *Pliny* changed Names, when he said, that the Tree of Ammoniac was called *Metopium*, which, according to others, is a Name for Galbanum. Some will have the Tree, that sweats Ammoniac, to be an Herb. The Author of *Actuarius* upon *Dioscorides* has it, Ποῦ ἐστὶν, ὅθεν Ἀμμωνιακὸν θυμίαμα. "It is an Herb which produces the Ammoniac "Perfume." This is rashly offering Violence to the Words of *Dioscorides*. *Serapion*, quoting *Dioscorides* by Name, and seeming to speak his very Words, relates, that they make an Incision in the Root of this Plant, and so extract the Tear; where 'tis plain he took it for an Herb. *Pliny* calls it a Tree, and says; that the Tear distils from it after the manner of Rosin; by which he must mean, that it flows spontaneously. *Dioscorides* calls it; δένδρον γαβνικουίδης, "a ferulaceous Tree," and ἄμυς, "a Shrub;" nor indeed do Frankincense and Myrrh distil from great Trees. There is no mention of a Root in a very antient Copy, tho' the Editions have it thus: Καλεῖται δὲ ἅλς ὁ ἄμυς ὅν τῇ ρίζῃ Ἀγασυλλίς, "the whole Shrub, "with its Root, is called *Agasyllis*." There is no need of a Root here, and no such thing is authorized by this excellent Manuscript. And 'tis downright false, that Ammoniac sweats from the wounded Root of an Herb, as *Serapion* maintains. Authors of the greatest Antiquity declare, that it flowed spontaneously.

In the medicinal Lexicons of the *Greeks*, I find γομφίτην and γομφίον, [Compacter or Fastener] to signify this Ammoniac sweet Gum, in the same Sense perhaps with the *Arabic* Appellation, *Lezac Aldeheb*, which, according to *Avicenna*, belongs to Ammoniac, and is properly that, by which Gold sticks to Gold. Now γομφῶσαι, is "to compact," and γομφῶσι σύνδεσμοι, "Gomphi are the Ligaments," by which Wood adheres to Wood. Wooden Pegs were also called by this Name [Gomphi]. The Glossaries, or Lexicons, have it; γομφίτην, λιβανὸν θυμίαμα, "Gomphites is the *Libyan* sweet Gum;" and γομφίον τὸ θυμίαμα, "Gomphiton signifies the sweet "Gum."

Nicander, in his *Alexipharmacs*, puts Ἀμμώνιον, [Ammonium] for Ammoniacum, in the following Verses:

— ἐν τῷ ἐπαρεῖς

Θάλασσαν βαλὼν χύτρω Ἀμμώνιον.

"Throw into the Pot a sufficient Quantity of Ammonium, "and let it heat." It is corruptly read σκαμμώνιον, [Scammonium] and wrongly understood to be Scammony, that is, the Juice of Scammony; but this the same Author a little before called δάκρυ κάμων, "the Tear of Kamon, [Scammony];

— τὸ τε δάκρυ νεοῦ δάκρυ κάμων.

"and the fresh-expressed Tear of Scammony." Κάμων is put

Y y y y

put for σμάμων, as μάργος for σμάργος, [Maragdas for Smaragdus]. The Juice is σμάμωνιον, "Scamonium," the Herb σμαμόνια, "Scamonia." Therefore Ἀμμώνιον, [Ammonium] and Σκαμμώνιον, [Scammonium] are two different things.

Sal Ammoniac, ἄλας Ἀμμωνιακόν, took its Name from the same Place. The Greeks, especially the more modern ones, in their medicinal Lexicons, are very much divided in their Opinions upon this Subject. The *Saracenic Glossary* of Ephodius renders the Arabic ملح, [Milch] by Ammoniacum. ملح, τὸ Ἀμμωνιακόν ἄλας, "Milch is Sal Ammoniac." Milch is an Arabic Word, which signifies Salt. The Greeks change the Arabic Aspiration into a stronger, and express it by their χ, ch. Thus they say, ἀλχάννα, "alchanna," for alhanna, &c.

Some there are who seem to have appropriated the common Appellation of Salt, ἄλ' ἐξοχὴν, "by way of Eminence," to Ammoniac; of which the old Interpreter of *Avicenna* gives a Hint, by thus expressing his Title: *Of Sal Ammoniac, that is, of Salt*. In the Arabic 'tis *Nuxader*, a Word that has its proper Meaning, and is remote from all Signification of Salt. Of all Kinds of Salt, *Dioscorides* approves of the Fossile [Rock-salt] as of most Efficacy, and among the Fossile, of Sal Ammoniac; so that 'tis no wonder it took the proper Name of Salt on account of its Excellency. Others of the more modern Greeks call it ἄλας τζαπαειδόν, "that is, fossitious Salt;" for τζάπα [tzapa] and τζάπιον [tzapium] signify with them an Instrument to dig with, τὸ ὀρύγιον, [Orygium]; with the *Latins*, *Sappa*, which is a Word we yet retain; and hence comes the Verb *Sappare*, "to sap." *Nicomedes*, the Iatro-sophist, in his Lexicon, has: "ἄλας ἐρυλὴν τὸ γαγχευόν. ἄλας Ἀμμωνιακόν τὸ τζαπαειδόν. ἄλας Καππαδοικόν τὸ Ἀρμένιον. ἄλας ταρχευλὸν τὸ θαλάσσιον." The fossitious Salt is "the same as the Gangrinum, Sal Ammoniac is the Tzapiaricum, the Cappadocian Salt is the same as the Armenian, and the Salt for seasoning is the Sea-salt." You see he distinguishes the fossitious Salt from the tzapiaricum, such as he makes Ammoniac to be; tho' *Dioscorides* makes Ammoniacum to be a Species of fossitious Salt; and, to speak the Truth, the Tzapa of the Greeks is not properly an Instrument with which they dig the Earth, but such as they cut Stones with in Quarries. Sal Ammoniac, we are told by *Serapion*, is pulled out of hard and transparent Stones; for which Reason there is need of a Sappa, [a sort of Pick-ax] to get it out, and to cut it, which Instrument the old *Latins* called *Upupa*, because it has a sharp End like the Beak of a Lapwing. The Glossaries have it, *Upupa*, ὀρύγιον [Orygium]. A very celebrated Physician, and well exercised in these Studies, rejects the Opinion of *Serapion*, principally, on account of his making Ammoniac derive its Name from the Sands out of which it is digged, being concreted into Crufts and Laminæ. The Absurdity of this Opinion may be evinced several ways: First, no considerate Person would derive Ammoniacum, ἀπὸ τῶ ἀμμου, "from Ammos," [the Sand] but ἀπὸ τῶ Ἀμμων, "from Ammon," for the same Reason as Gum Ammoniac, which cannot be thought to takes its Name from Sand, tho' *Pliny* be also of that Opinion. Ἀμμων, "Ammon," himself indeed, took his Appellation from the Sands; but *Regio Ἀμμωνιακή* took its Name from *Ammon*, who had a very famous Oracle in those Parts; and whatever was discovered therein worthy Observation, was called Ἀμμωνιακόν, "Ammoniacum." *Pliny* tells us, that the Ammoniac was dug out of large Caverns. *Levisimus intra specus suos, in Lucem universam prolatus incredibili Pondere ingravescit*. "Though it be very light within its own Caverns, it increases in Weight after a surprising manner when it is produced in open Light." And he gives us his Opinion why it was called Ammoniacum: *Nam & Cyrenæici Tractus nobilitantur Ammoniaci, & ipso, quia sub Arenis inveniuntur, appellato*. "The Cyrenean Territories are celebrated for producing Sal Ammoniac, so called, because it may be found under the Sands." A ridiculous Reason! No, it has its Name from being found in the Ammoniac Region, ἐν τῇ κατ' Ἀμμωνα Λιβύῃ, "in Libya, about Ammon," which was a Part of the Country of Cyrene. Nay, sometimes, not only the inland Parts, but all Libya come under this Denomination. Thus *Stephanus*: Ἀμμωνία ἡ μεσόγειος Λιβύη, καὶ ἀπὸ τῆς πᾶσα ἡ Λιβύη ἕως ἐκείνου τοῦ ἀπὸ Ἀμμων, "Ammonia is midland Libya, and sometimes the whole Country of Libya is so called from Ammon." We may conclude then, that Sal Ammoniac has its Name from the Country *Ammonia*, and not from the Sand; for then it would be called ἀμμικὸς or ἀμμίτης, "ammicus or ammites." *Pliny*, in the same Place, tells us: *Quo Exemplo postea inter Egyptum & Arabiam, etiam squalentibus Locis, ceptus est inveniri detractis Arenis, qualiter & per Africa sitientia usque ad Ammonis Oraculum*. "In which manner they began afterwards to discover it in the Deserts between Egypt and Arabia, by removing the Sands, as they do also in the dry and barren Parts of Africa, as far as the Oracle of Ammon." 'Tis certain, that in the Country of Ammon, where the Soil was all sandy, the Caverns, that were dug under the Sands, yielded

Sal Ammoniac; but in other Places, where was no Sand, it was probably dug out of the Earth, or even from Hills. *Pliny*, Lib. 31. Cap. 7. *Effoditur & à Terra, ut palam est Humore densato in Cappadocia. Ibi quidem cæditur Lapidum specularium modo. Pondus magnum Glebis, quas Micæ vulgus appellat*. "It is dug out of the Earth in Cappadocia, as it is well known, being a condensed Humour. They cut it after the manner of the Lapis Specularis. The Lumps, which they call Micæ, are very ponderous." You will say the Cappadocian is not of the same Kind with the Ammonian. I answer, both are reduced under the Kind ἐρυλὴν ἀλόν, "of fossile Salts," which is *Pliny's* Opinion. *Dioscorides* makes three Kinds of Salt, τὸ ἐρυλὸν, τὸ θαλάσσιον, καὶ τὸ λιμναῖον, "the fossile, [Rock-salt] the Sea-salt, and what comes out of Marshes." But this last may be included under the Denomination of Sea-salt. He comprehends Sal Ammoniac under the fossile Kind, tho' it be in some respects a proper Kind of itself, and of a peculiar Nature, according to the Diversity of Sun and Soil. Observe the Words of *Dioscorides*: *Τὸν δὲ ἀλὸν ἐνεργέστερον μὲρ ἐστὶ τὸ ἐρυλὸν τῷ τε καὶ κινῶς μὲρ τὸ ἀλὸν καὶ λευκὸν καὶ διαφανές, πυκνὸν τε καὶ σμικρὸν τῇ συγκρίσει ἰδίᾳς δὲ τὸ Ἀμμωνιακὸν τὸ γένει, ἐρυλὸν δὲ, καὶ εὐθείας τὰς διαφύσεις ἔχει*. "Of Salts, the fossile is of the greatest Virtue, and of this Kind, in general, what is free from Stones, white and pellucid, and of a dense and equable Substance; in particular, that Sort of it called Ammoniac, which is easy to cleave, and has strait Fissures." Amongst the proper Characters of the best fossile Salt, it is requir'd, that it be white and pellucid. Sal Ammoniac had both these. *Pliny* says of Sal Ammoniac: *Similis est colore Alumini quod Schiston vocant, longis Glebis, neque per lucidus, ingratissimus sapore, sed Medicinæ utilis*. "It is like the scissile Alum in Colour, and is in long Pieces, not pellucid, has an unfavourable Taste, but is useful in Medicine." As to its not being pellucid, I question, whether he is to be credited. *Dioscorides* makes Whiteness and Transparency two Properties of the best fossile Salt, and seems to ascribe them both to Ammoniac. And *Pliny* himself, a little after, says, that the perspicuous, [perspicuum] that is, the pellucid, is the most valued: *Probatur quæmaxime perspicuum, rectis Scissuris*. "The most perspicuous, with strait Scissures, is in Esteem." By perspicuous, we understand the τὸ διαφανές, "Pellucidness," as when we say, perspicuus Amnis, perspicuum Vitrum, "a perspicuous Stream, a perspicuous Glass." Thus the Glossaries: *Perspicuum, διαφανές, διαγυγές*. "Perspicuous, that is, diaphanous, pellucid." Whatever transmits the Image, and can be seen through, as was the way of speaking among the Antients, is perspicuous; so that *Pliny* contradicts himself. He dressed up his Account from several Authors; in one he found, that Ammoniac was like scissile Alum in Colour; this is white indeed, tho' not pellucid, nor appears divided into Fragments like grey Hairs. Hence he imagin'd, that it was in long Pieces, but not pellucid. In another Author he read, that τὸ διαφανές, "the diaphanous," was most valued; this he here renders perspicuous, which is the same as pellucid.

Avicenna gives us three Characters of the best Sal Ammoniac, which are, τὸ ἐρυλόν, "Readiness to cleave," τὸ διαφανές, "Pellucidness," and a Colour like Crystal; which last is so render'd by the Translator, from the Arabic *Albeluri*: *Et melior ex eo, qui est ut Borax, clarus, crystallinus*. "The best of it is like Borax, clear, crystalline." There is nothing of Borax in the Arabic, which is the Word the Barbarians use for *Chrysocola*, a Substance which has no Relation or Similitude to Sal Ammoniac.

In the Arabic Edition, there are three Epithets which *Avicenna* gives to the best Sal Ammoniac. The first answers to the Greek ἐρυλόν, easy to be divided; the second is the Word by which *Avicenna* always translates the διαγυγές, diaphanous, of *Dioscorides*; the third is *Albeluri*, which the Interpreter translates *Crystallinum*, with better Reason than others interpret the Arabic *Belur*, *Beryl*.

But they were led into this Opinion by the mere Sound of the Word, as tho' *Belur* was made out of *Beryl*, by a Transposition of Letters; but the Use of the Word shews the contrary. The best Beryls are of a pure sea-green Colour. The *Chrysoberylli* are another Sort, of a glittering Brightness, that has a Cast of the Colour of Gold. *Bilur*, in Arabic, must signify a white Gem; for the Ammoniac λευκὸν and διαφανές, "white and pellucid," is compared to a bilurine Colour; yet it cannot be crystal; for no such thing is generated in India; but the Nubian Geographer writes, that *Bilur* is found in many Places of India; for Instance, in *Sarandib*, an Island of India, under the eighth Parallel of the third Climate, where he says, they find the best and largest *Albilur*. I am not for rendering this Word *Beryl*, as a learned Translator has done, for the Reasons above-mentioned. I rather incline to the Opinion of those who interpret the Hebrew סבא *Sobam* by *Albilur*, which almost all the Interpreters take to be the Onyx Gem, that takes its Name from its Whiteness, resembling that of a human Nail, though it is said to be of several Colours.

There

There is a sort of Marble also, which goes under that Name for the same Reason. *Paulus Sibentarius* :

Ὅσα τ' ὄνυξ ἀνέκε διαγυζομένη μέλαλλον
Ὀχρεῶν ἐστὶ τιμα.

“Such [Rays] as the Onyx, precious in its Paleness, emitted
“from its splendid Body.”

An antient *Arabic* Version renders βήρυλλον “Beryl,” in the *Apocalypse Bilur*. Certainly if *Bilur* be a Beryl, it must be understood of that kind of Beryl, which is one of the last enumerated Stones, and said to be like Crystal. It can be no other than a crystalline and white Gem, that goes by this Name among the *Arabians*; for that kind of Salt which is commonly called *Sal Gem*, is said, by *Avicenna*, to be like *Albilur*. 'Tis certain that this was white and pellucid; for which reason the *Barbarians* called it *Salem Gemma*, “the Salt of the Gem,” whereas they should rather have called it *Salem gemmeum*, “a Gem-like Salt;” so *gemmeus Miles*, “a Gem-like Man,” in the Play of *Chiefs*, in *Martial*; is put for *vitreus*, “one of ‘Glas,’” which Poet often calls *Glas* by the Name of Gem, on account of its Brightness and Transparency. The Word for *Sal Gem* in the *Arabic* Text; according to the Translator of *Avicenna*, is *Darani*; in which Term I see nothing that answers to the Notion of *Sal Gem*. Does it not come from the *Hebrew* דָּרָה *Dar*, which signifies a *Parian* Stone, and white Marble? Indeed this fofile Salt, which they call *Sal Gem*, is of a Marble-like Whiteness and Splendor. In *Myrepsus* you find σαλιζέμε (*Saltzeme*) for the *Latin Sal Gemma*.

In an antient *Arabic* Glossary I find *Callastica*, which I read *Chalastica*; ὁ χαλαστικός. We know what the Physicians mean by *Chalastica*, which are such Medicines as have a mollifying, relaxing, dissolving, digesting, and resolving Virtue. *Avicenna*, in that Place, seems to enumerate and distinguish the Kinds of Salts by their proper Virtues and Faculties, rather than from any other Difference in Nature, or Place of Growth. The first he mentions has an astringent Virtue, such as is in Nitre: Another, he says, (as he is rendered by the Translator) is of a thin brittle Contexture; and a third excavated; these I don't understand, tho' he uses the same Word *excavated* for a kind of Salt throughout the Chapter. *Apagius*, in his Lexicon, interprets it *Imperial Salt*: What it is I can't say: Perhaps it should be an *Arabic* Word which implies a Faculty of seizing and carrying off, from a Verb of the same Import with the *Hebrew* חָטַף *Hhataph*, which signifies to snatch and carry away by Force. By this, perhaps, he understands τὴν σμυκτικὴν δύναμιν, “the absterfve Virtue,” which exerts itself in carrying off, by deterring and absterfing. An antient *Arabian* Interpreter renders the λίθος μολεβδαέντης, *Lapis Plumbarius* of *Dioscorides*, by a Word which leaves us in doubt whether he meant a Salt of an azure Colour, or the *Armenian* Colour, which he had somewhere read was reckoned; by the *Greeks*, among the Kinds of Salt. Indeed *Zosimus Panopolitanus*, by his ἄλσος κυανὴ Ἀρμενικὴ, “of an *Armenian* azure Salt,” seems to speak of a sort of Paint of that Colour: So *Serapion* informs us, that *Chrysocola* was a kind of Salt. There are also purple Salts, and yellow Salts: Let us suppose then, that *Avicenna* calls the azure Salt by this Name; yet I cannot be dissatisfied with my Conjecture, that the Place should be read by a Word implying the σμυκτικὴν δύναμιν, “absterfve Faculty.” What immediately precedes confirms me in it; for what the Translator renders *rare and brittle*, I would have interpreted *biting*, from a Verb which signifies to bite and corrode. *Pliny* says of Salt: *In medendo verò mordens, adurens, repurgans, extenuans, dissolvens*: “In Medicine it is of a biting, caustic, cleansing, attenuating, and dissolving Quality.”

Avicenna next mentions another kind of Salt, which he calls *Darani*, or *Drani*. The Author of the old *Latino-Arabic* Dictionary, renders it χαλαστικός, “relaxing:” Therefore *Avicenna* gives this Name to a Salt that is endued with an emollient and dissolving Virtue, which *Dioscorides* calls διαχυτικὴ δύναμις, “a dissolving Power;” *Pliny*, *dissolvens*, “dissolving;” such especially is the fofile Salt, or *Sal Gem*; for the bitterest is most effectual in dissolving, which is the Opinion of *Avicenna* himself. He goes on to tell us, that there is another Sort, which he calls *Naphthi*: By this is understood *Naphthi* Salt, which takes its Name from *Naphtha*, a kind of liquid Bitumen; the same, they say, which *Galen* calls *Sodomitic* Salt: I question whether they are in the right; and we are to examine if the Words may not bear another Sense. Perhaps the Author intended that kind of Salt which *Dioscorides* calls ἐσχαραστικός, “escharotic;” *Pliny*, *adurens*, “caustic.” The *Arabians* also call by the Name of *Naphtha*, a Vesicle, Bladder, or Tubercle, from the *Greek* ἀφθα, “*Aphtha*,” which is explain'd τὰ ἐν στήθεσι ἔλκυσ, and φθοῖν, “Ulcerations in the Mouth.” 'Tis certain that the *Greeks* put *Aphtha* for Bitumen; as in *Constantius de Imperio*, πηγὰς ἀφθὰν ἀναδιδέσθαι, “Springs yielding ‘*Aphtha*.’” This a learned Gentleman renders Springs which cause Ulcerations; whereas it means Springs running with liquid Bitumen, or *Naphtha*. So then *Aphtha* is put for *Naph-*

tha; and the *Arabians*, on the contrary, put *Naphtha* for *Aphtha*, which signifies the Vesicle, or Bladder of an Ulcer. Hence *Sal Naphthi*, ὁ ἐσχαραστικός, “escharotic,” which by its caustic Quality raises Ulcers and *Aphthæ* on the Skin; and induces Eschars. *Avicenna* observes nearly the same Order with *Dioscorides*, in assigning proper Qualities to the different Kinds of Salt: Δύναμιν δὲ ἔχουσιν οἱ ἀρρετηνόμενοι ἅλεις πολλὰ χρεῖσεν, συλλήνην τε καὶ σμυκτικὴν, καὶ ἀποκαθαριστικὴν, καὶ διαχυτικὴν ἐπὶ δὲ καλαστικὴν, καὶ ἰχθυώτικὴν, καὶ ἐσχαραστικὴν, τῷ μέλλον καὶ ἡπὶον διαφύεσθαι. “The fore-mentioned Salts have many useful Qualities, being indued with an astringent, absterfve, cathartic, “and discussive Virtue; together with a Power of repressing, “attenuating, and raising an Eschar, being more or less efficacious according to their different Kinds.” The escharotic Salt, then, of *Dioscorides*, is the *Naphthi* of *Avicenna*, render'd literally *Vesicatory*. Tho' the modern Physicians call those scorching Medicines *Vesicatories*, which they will have to be of a milder Kind than Escharotics and Caustics; yet the *Greeks* often confound them, and call those Topics, which raise Vesicles on the Skin, and induce a Crust over the scorched Part, by the general Name of Caustics and Escharotics. 'Tis certain that there is to be found a Salt indued with a Faculty of scorching the Skin, causing an Itching, and raising Pustules. *Strabo* calls such Salts κνησμώδεις ἅλεις, “Itching Salts,” some of which Kind, he says, are to be found in a certain Lake of *Atropatene*, a Province of *Media*, which burns the very Clothes that are washed in it: Λίμνην δὲ ἔχει τὴν Σπᾶντα, ἐν ᾗ ἅλεις ἐπανθενεῖς πηλοῦσιν· εἰσὶ δὲ κνησμώδεις καὶ ἐπαλγέες ἔλαιον δὲ τῆ πάθους ἁλός, ὅδωρ δὲ γλυκὺ τοῖς καλαστωμένοις ἰματίοις, εἰ τις κατ' ἀγροίαν βάλῃσιν εἰς αὐτὴν πλύσας χάρην. “It has a Lake called ‘*Spanta*, in which are Salt Springs, which concrete. These “Salts raise a troublesome Sort of Itching, which is cured by “Oil. The Water burns Clothes that are inadvertently “plunged in it, in order to be washed; in which Case they “have recourse to fresh Water.” *Strabo*, *Lib. II.* That Salt must needs be very scorching and escharotic, or, at least, as the Physicians speak, *vesicatory*. *Vesicatories* are properly such Topics as do not only raise a Redness, but Ulceration of the Skin; with Vesicles and Pustules, in *Arabic*, as I said, call'd *Naphthi*. The *Arabians* commonly insert an N in the Middle of Words; but to this Word, which is taken from the *Greek*, they have prefixed it, saying *Naphtha* for *Aphtha*. *Avicenna* says that *Sal Naphthi* is black, which is the Colour of Gunpowder, in a *Greek* Epigram called *Ethiopian Powder*, which is nearly the Name commonly given to *Naphthi* Salt. *Avicenna* informs us, that it is of that Colour on account of the *Naphthi*-city which is in it: He calls it, in *Arabic*, *Naphthia*, by which I understand a Faculty of burning, and raising a Blister: Thus, in the same Author, *Nitrofa* is Nitrosity; and there are other Words of a like Turn. He says, that it contracts this black Colour from its fiery and adust Nature; and that it loses this Quality when it is burnt; and returns to the Nature of *Sal Gem*. Indeed all Salts, when burnt, lose their Acrimony, and rather acquire a diaphoretic Quality; which is accounted a principal Property of *Sal Gem*: Οἱ δὲ κεκαυμένοι διαφορεῖται μέλλον “Salts, “when burnt, are the more diaphoretic.” *Paulus Aegineta*, *Avicenna*; in the same Place, adds, that the *Indian* Salt was black, not on account of its *Naphthi*-city, like the *Naphthi* Salt, but in its proper Substance. 'Tis doubtful what Sort he here calls the *Indian* Salt: The antient *Greeks* called their *Sugar Indian* Salt, because they found it in Canes, concreted after the manner of Salt. The same Author, *Lib. 4. Cap. Of the Roughness of the Tongue*, in *feverish Patients*, mentions a Salt which was brought from *India*; this appears to be the *Sugar* of the Antients; nor is it strange, that *Avicenna* should reckon this among the other Kinds of Salt, tho' it be of a very different Nature; for thus, under the Head *De Atramentis*, “Of Inks,” he speaks of the *Indian* Colours, because the *Greeks* called them μέλαν Ἰνδικόν, “*Indian Ink*.” Most of our later Writers seem to understand the Passage of *Avicenna*, where he treats of the Differences of Salt, and, among the rest, mentions *Indian* Salt, to be meant of this Salt. For *Brassavolus* writes; that the *Sugar* of the Antients, which themselves inform us was a kind of Salt found upon Canes, was not imported to us at this Time; but that the *Sugar* commonly called *Canduin*, “*Sugar-candy*,” supplied its Place; and that the *Druggists* commonly used, instead of it, I know not what Sort of Drug, which was black on the Outside; because, it seems, the *Indian* Salt of *Avicenna*, as he informs us, was black. But this very thing is the clearest Proof, that the *Indian* Salt, of which *Avicenna* treats in that Chapter, is different from that *Indian* Salt which he mentions in another Place, on the Authority of the Antients, and is no other than *Sugar*: For that *Indian* Salt has the Colour of common Salt, as *Avicenna* himself, in his Chapter *De Asperitate Linguae*, expressly says, And the *Greeks* also tell us, ἅλς ὁ Ἰνδικὸς χρεῖσται μὲν καὶ σφραδίζει ἡμῶν τῷ κοινῷ ἔλκι, γούσσει δὲ μέλιωδους. “The *Indian* Salt, for Colour and “Substance, is like the common Salt, but tastes like Honey.” But the common Salt is not black, but rather white. *Pliny* also tells us, that *Sugar* (which is the *Indian* Salt of the Antients)

rients) was white, and concreted after the manner of Gumis. Therefore *Avifena*, in his Chapter of the Kinds of Salt, must be understood to mean the true *Indian Salt*, not the Sugar of the Antients, which was, 'tis true, a kind of Salt; for Sugar is white, but this Salt of *Avifena* black. *Mesue* also mentions this Salt, and tells us, that the Naphthie and *Indian Salts* are to be preferred before all others. *Strabo*, Lib. 5. relates, from *Clitarchus*, that in *India* there are Quarries of native Salt, where the Salt grows again, like Stones, in many Places. Speaking of the remarkable Things of the Island of *Ilva*, *Τὸ δὲ παρὰ δόξαν ἢ νῆος ἔχει, καὶ τὰ δρυγμάλα ἀναπληρῶσαι πάλιν τῷ χεῖρῳ τὰ μελαλευθέντα, καθάπερ τὸς πλασμαμένους οἰασι τὸς ἐν Ῥόδῳ, καὶ τὴν ἐν Πάρῳ πέτραν τὴν μαρμαρεν, καὶ τὸς ἐν Ἰνδοῖς ἄλλας, ὡς οὐκ κλείεται*. "There is one Thing very remarkable in this Island, which is, that the Pits which are digged are fill'd up again in time; as they say the Canals are in *Rhodes*, and the Marble Quarries of *Paros*, or those of Salt in *India*, as *Clitarchus* relates." *Pliny* writes, that the same Sort of Salt is found in *Oromenus*, a Mountain of *India*, which he seems to take from *Clitarchus*: *Sunt & Montes nativi Salis, ut Indus Oromenus, in quo Lapidinarum modo ceditur renascens; majusque Regum Vestigal ex eo est quam ex Auro atque Margaritis*. "There are also Mountains of native Salt, like *Oromenus* in *India*, where they cut it like Stones out of Quarries, and it grows again; and it yields a greater Revenue to their Kings than Gold and Pearls." But, perhaps, the *Arabians* called this Salt *Indian*, not from the Country, but the Colour; as they say *Indian Myrobalans*, because that Sort is black; and *Indicum Colorem, τὸ μέλαν*, "Ink, *Indian Colour*." However, there are two homonymous Kinds of *Indian Salt* of a different Nature; namely, the Sugar of the Antients, which is the *Indian Salt* of the *Greeks*; and the *Indian Salt* of the *Arabians*.

To return to *Sal Ammoniac*; the *Barbarians* put *Armoniac* for it, as they do *Gum Armoniac* for *Ammoniac*. Hence *Pandectarius* calls this Salt *Armeniac*, as if it came from *Armenia*. I don't doubt that they dig Salt in *Armenia*, but then it is different from *Ammoniac*. At present we don't know what *Sal Ammoniac* is: Some conjecture that it is made of Camels Urine, concreted by Art. This seems probable to a very learned Man, because, as he says, it is imported at *Venice* from the *Eastern Countries*, where are innumerable Herds of Camels: This deserves to be laughed at; true *Ammoniac* comes rather from the *Western* than the *Eastern Parts* of the World; for they dig it in *Ammonia*, a Country of *Cyrenean Africa*. It is of the same Kind, indeed, as *Rock-salt*, and *Sal Gem*; but is supposed to have a peculiar Property from the Nature of the Place. *Sal Gem* is as white and transparent as *Sal Ammoniac*. *Herodotus* says, there are Mountains or Hills of Salt beyond the Country of *Ammonia*, whence they dig Salt, Lib. 4. *Μετά δὲ Ἀμμωνίας, διὰ τῆς ἐξέρους τῆς ἡάμεης δι' ἀλλήων δέκα ἡμερῶν ὁδῷ, κοινῶς τε ἀλλὰ ἐστὶν οὐκοῦν τὸ Ἀμμωνίον*. "Ten Days Journey beyond *Ammonia*, upon the Edge of the Sands, runs a Ridge of Hills of Salt, which is like the *Ammoniac*." Hence it appears, that *Sal Ammoniac* does not take its Name from the Sand, but from the Country *Ammonia*. *Serapion* tells us, that it is extracted from hard and clear Stones; which Expression has been criticized by a very learned Physician, though without Reason; when he informs us, in the same Place, that it is imported from the Country of *Corasan*; this must not be accounted the true *Sal Ammoniac*, which can only be brought from the Country of *Ammonia*, where it is produced, and whence it takes its Name. The *Corasan Salt* is of the same Kind, but not the same with *Ammoniac*. He tells us, in the same Place, that it is of several Colours, as black, white, and party-coloured; but the ancient *Greeks* describe an *Ammoniac* of but one Colour, which is white, and pellucid like Crystal; and in this they are followed by *Avifena*, who reckons but one kind of *Ammoniac*; of which Kind, and of this perhaps the blackest, is what the *Arabians* called *Milch hendi*, *Indian Salt*. *Salmasius de Homonym. Hyl. Iatr. Cap. III.*

Of GUM AMMONIAC (or HAMMONIACUM).

AMMONIACUM (*Gum Ammoniac*) is the Juice of a ferulaceous Plant, (*νάρθηξ*) which grows in that Part of *Libya* which lies about *Cyrene*. The whole Shrub and Root together are called *Agafyllis*.

Chuse what is of a good Colour, free from Chips and Gravel, in small Lumps like *Frankincense*, pure and dense, clean from Dross, smelling like *Castor*, and of a bitter Taste. This sort is called *Thrausma* (Lump or Fragment); but that which is mixed with Earth or Stones, *Phyrama* (*Miscellany*). It is generated in *Libya*, near the Temple of *Ammon*, being the Juice of a ferulaceous Tree.

It has a mollifying, drawing, heating Quality, discutitive of Hardnesses and Swellings. Being drank, it loosens the Belly, and brings away the Fœtus. A Dram of it, taken in Vinegar, wastes the Spleen, and helps the Gout and Sciatica. It gives Relief also in the Asthma, Straightness of Breath, (*ἁρμονιακοῖς*) Epilepsy, and Humidity of the Thorax, if made into an Ecleg-

ma with Honey, or taken in the Juice of *Puisan*. It expels bloody Urine, absterges white Specks in the Eyes, (*τὰ ἐν ὀφθαλμοῖς λευκώματα*) and takes off the Roughness of the Skin. Levigated in Vinegar, and applied, it mollifies the Hardness of the Liver and Spleen. Applied in a Cataplasm with Honey, or mixed with Pitch, it dissolves Tophi generated about the Joints. Mixed with Vinegar, Nitre, and *Cyprine Oil*, for an Acopon, and the affected Parts anointed therewith, it relieves those who labour under Lassitudes, or the Sciatica. *Dioscorides, Lib. 3. Cap. 98.*

Pliny gives much the same Account of it as *Dioscorides*.

In that Part of *Africa* which borders on *Ethiopia*, amongst the Sands, distils the Tear of *Hammoniac*, taking its Name from the Oracle of *Hammon*, near which grows the Tree call'd *Metopion*, whence it flows in manner of a Gum or Resin. There are two kinds of this *Hammoniac*, one called *Thrausma*, like *Male Frankincense*, which is most valued; the other is fat and resinous, and named *Phyrama*. It is adulterated with Sand, as if it were contracted in its Growth; for which reason, that which is in the smallest and purest Lumps bears the highest Price, which is forty Asses (about three Shillings) the Pound. *Pliny, Nat. Hist. Lib. 12. Cap. 23.*

Hammoniac mollifies, heats, discutifies, dissolves. Mixed in Collyriums it clears the Sight, and takes off the Itching, Specks, and Albugines of the Eyes, easeth the Tooth-ach, especially if burnt. Drank, it is good for the Asthma, Pleurisy, Infirmities of the Lungs, Bladder, bloody Urine, Spleen, and Sciatica; and, prepared with an equal Quantity of Pitch, or Wax, and Oil of *Roses*, is a proper Medicine for the Joints and the Gout. Applied with Honey, it ripens Pani, draws out Corns, and mollifies Hardnesses. Prepared with Vinegar and *Cyprian Wax*, or Oil of *Roses*, it is very successfully applied to the Spleen; and with Vinegar, Oil, and a little Nitre, is effectual in Lassitudes, the Parts being thoroughly anointed therewith. *Idem, Lib. 24. Cap. 6.*

Directions for the Management of Gum Ammoniac in Plaisters.

Ammoniac is put in when the Boiling is half over. If the Plaister is prepared for bleeding Wounds, the *Ammoniac* is to be macerated in Wine or Vinegar. If it be a soft Plaister, such as is prepared for the Anus, levigate the Gum in Water, and add it to the other Ingredients, after they are boiled. *Oribasius from Antyllus, Synop. Lib. 2. Cap. 61.*

Ammoniac is to be added in the midst of the Boiling, and if it can be pounded and sifted, put in the finest Powder; if not, let it be macerated in some Liquor, as Wine and Vinegar, if it be to make a Plaister for bleeding Wounds; if for Strumæ or Fistulas, with Vinegar only; if it be for a soft Plaister, such as is prepared for the Anus, let it be in Water, and poured to the rest when they are cooled, to prevent an Effervescence, and then boil them again together. *Aetius, Tetr. 4. Serm. 2. Cap. 25.*

Gum Ammoniac is thus distinguished amongst the Moderns: **AMMONIACUM**, Offic. C. B. Pin. 494. *Raii Hist. 2. 1844.* *Chomel. Plant. Usu. 182. Math. 2. 803.* *Ammoniacum*, Mill. Bot. Offic. 30. *Gummi Ammoniacum*, Schrod. 4. 184. *Gum Ammoniacum*, Park. Theat. 1544. *Ger. 898. Emac. 1056. Dale.*

AMMONIACUM is so called, because the Plant which produced it, was supposed to grow about the Temple of *Jupiter Ammon* in *Libya*. It is a Gum brought to us from *Turkey* and *India*, and is thought to be got from a Species of *Ferula*, there being often Seeds and Pieces of a ferulaceous Plant found amongst it. The best is that which is in little Lumps, yellowish on the Outside, and white within, apt to clog together, free from Dross, and easily dissoluble.

This Gum is opening, attenuating and cleansing, good to clear the Lungs of viscid Phlegm and Stuffings; and therefore of great Service in Asthmæ, and Shortness of Breath; as also in nervous, hysseric, and hypochondriac Disorders; outwardly applied, it is suppurating, ripening, and dissolving, and good for hard Swellings, and scrophulous Tumors. Official Preparations from it, are *Pilule de Ammoniaco magistrales*, and *Emplastrum ex Ammoniaco*. *Miller Bot. Off.*

This Gum contains Plenty of essential or volatile Oil, some Phlegm and Earth.

It resolves, digests, and is aperitive; proper for Hardness of the Spleen, Liver, and Mesentery; opens Obstructions, provokes the Menfes, and is used both internally and externally. *Lemery de Drogues.*

Geoffroy adds it as a good Emmenagogue, when given from a Scruple to half a Dram, and is very proper to be mixed with Preparations of Steel, and Flowers of *Sal Ammoniac*, in Pills or Boles. *Geoffroy.*

Preparations of Gum Ammoniac.

Pilule de Ammoniaco Magistrales: Magisterial Pills of *Ammoniacum*.

Take of *Gum Ammoniacum*, prepared with the Vinegar of Squills, two Ounces; of *Succotrine Aloes*, one Ounce and

an half; of Myrrh, Mastich, and Benjamin, each half an Ounce; of Saffron, and Salt of Wormwood, each two Drams; of Syrup of Wormwood, a sufficient Quantity to make them into a Mass for Pills.

These were not received into any of the Dispensatories of the College before, but seem to be taken from the *Augustane Dispensatory*, where they are ascrib'd to *Querietan* for their Author; the Variation here from that is very little. *Zwelfer* orders so much Vinegar to be used in the Dissolution of the Gums, as not to want any Syrup to bring it to a due Consistence. He also greatly blames the Lixivial Salt in this Composition, not only as foreign to the Intention of the Whole, but because it spoils its due Consistence for Pills, by taking away its Tenacity, and making it crumble, as all such Salts will do, to adhesive Substances. This Composition is given by *Scroder*, much in the same manner as it is continued here.

Emplastrum ex Ammoniaco. The Ammoniacum Plaster.

Take of the strained Gum Ammoniacum, six Ounces; of yellow Wax, and Resin, each five Ounces; of the simple Melilot Plaster, Ointment of Marshmallows, of the Oils of Bays and Orrice, and Venice Turpentine, each one Ounce and an half; of Goose-fat, one Ounce; of Sal Ammoniac, of Briony-root, and the Root of Orrice, each half an Ounce; of Galbanum, and Bdellium, each two Grains: Let them boil together, so as to make into a Plaster.

This hath passed through all the Editions of the *London Dispensatory*, without any great Alterations. It requires a good deal of Care and Skill to compound it well. All the things capable of melting should be so managed together and strained, and the other things sifted in, in fine Powder. But this is not much used, and but rarely made.

Lac Ammoniacum. Milk of Gum Ammoniac.

Take of the purest Gum Ammoniac, three Drams: Dissolve it in six Ounces of Hyssop-water cold, in a cold Mortar.

A Spoonful of this is to be taken frequently in Difficulties of Breathing. *Bates.*

Somewhat different from this is the *Lac Ammoniacum*, or *Emulsio Ammoniata*, Ammoniac Milk, or Emulsion of *Quincy*.

Take fine Gum Ammoniac, three Drams: Dissolve in distill'd Vinegar, half an Ounce; Rhenish Wine, two Ounces; and Hyssop-water, four Ounces: Strain it for Use.

The Dose of this is a Spoonful three or four times a Day, according to the Exigency of Symptoms. It not only expectorates and relieves the Breath that way, but is also good in the Asthma Siccum, or Spasmodic Asthma, where common Pectorals avail nothing, as it has peculiar Influences upon the Nerves themselves.

Of Sal Ammoniac, from the Memoires of the Academy of Sciences.

There is not a Drug more common than Sal Ammoniac; and it is pretty surprising, that we do not exactly know from what Parts it comes, nor after what Manner it is made. Formerly we had it by the Way of *Venice*, which made it believ'd, that it came from thence; but now we know the contrary. It comes from the *Levant*, and probably a great Part of it from *Egypt*; but we do not know from what Province of the *Levant*, nor from what Part of *Egypt*.

Every Chymist knows, that it is an urinous volatile Salt penetrated by an Acid, and he knows how to imitate it. For this there are different Processes, of which *M. Geoffroy* the younger has given a particular Account. 'Tis usual to put one Part of common Salt to five Parts of Urine; most add thereto half a Part of Soot. *Mr. Lemery*, and the late *Mr. Homberg*, put no Soot. This Mixture being put in a Vessel, there is sublimed a white, rarefy'd, farinaceous Substance, of a loose and brittle Contexture, which is the Sal Ammoniac. The Matter which rises by Sublimation under that Form, they call Flowers. But *M. Lemery* asserts, that this is not the Way of making Sal Ammoniac in the Places from whence it comes.

It is form'd into round flat Cakes larger than an ordinary Plate, and three or four Fingers thick, consisting of Crystals like Columns, which are dispos'd in the Direction of its Thickness. This Figure and Disposition are manifestly those of a saline Matter infus'd in Water, and after Evaporation crystallized, and remaining at the Bottom of the Vessel, where it assumes its Figure, which is directly contrary to Sublimation. Besides, the Sal Ammoniac which we make is not dispos'd to take the Figure of the Vessel into which it is elevated,

because it is in farinaceous Flowers, which have very little Cohesion; whereas the Cakes which are sent to us are very hard and compact. In short, if Sal Ammoniac were made in the *Levant* as it is made here in our Furnaces, a vast Quantity of Salt, of urinous Matters, of Wood, Coals, Utensils, and Workmen, would be necessary; and all this, added to the Charge of transporting it, would make this Commodity, which is dispersed over all *Europe*, very dear, whereas it is sold at a moderate Price. For this last Reason *M. Lemery* believes, that Sal Ammoniac is made in the *Levant* with as little Labour and Cost, as Salt in our Salt-marshes, which is as much as to say, that it is made by a simple Evaporation preceded by some Lotions, which serve to purify the Matter. It is possible, that there may be Mines of Sal Ammoniac, as well as Sal-Gem; and there is found some Sal Ammoniac form'd in Mount *Vesuvius*. If there are Earths naturally impregnated with common Salt; and at the same time well water'd with the Urine of Animals, and the Heat of the Sun be very great, it is easy to conceive, that the Fermentation caused by the fervent Heat will unite the Acid of the common Salt with the urinous Salt, and so produce Sal Ammoniac. That of the Antients was probably formed after this manner in *Libya* and *Arabia*. But these Places are not frequented enough at present; so that there is no Care taken to collect the Sal Ammoniac. It was always certain, that several Earths, and old Plaster, have afforded Signs of Sal Ammoniac; and so much the more as these Earths were more smoaky, and the Plaster the older. 'Tis true there is but little Salt to be got out of them, but there is a great Difference betwixt our Sun and that of *Egypt*. Perhaps too it is necessary, that the Earth, which yields plenty of Sal Ammoniac, should be barren, and incapable of producing any Plants which might attract that Salt for their Nourishment. This last Thought gave Occasion to a Notion of *M. Lemery* for making this Salt common in any Country; which is, that it may be extracted from Plants: Some Plants in these Parts are, without all Question, full of it; others are replete with Vitriol or Saltpetre, and, in a Word, with all the Kinds of concrete Salts.

Whatever Truth there may be in these different Conjectures, 'tis very certain, that in those Places whence we have the Sal Ammoniac, the Materials of which it is made must be very plentiful; and it is more than probable, that if it be made by Art, the Operation is very simple and easy. *Hist. de l'Acad. Roy. des Scienc. 1716.*

Of all known Substances there is not one, in my Opinion, that affords so much volatile Salt in a Body as Sal Ammoniac. They mix this Salt with Salt of Tartar, or with Lime, and distilling them with a moderate Fire, extract thence, as every one knows, the Spirit, and the volatile Salt; for the Lime, or the Salt of Tartar, detaining the acid Part of the Sal Ammoniac, give Room for the volatile Part to disengage itself, and to be sublimed. Fifteen Ounces of Sal Ammoniac, mixed with twenty Ounces of Salt of Tartar, afford ten Ounces of volatile Salt, which are two thirds of the Sal Ammoniac analysed; besides which, they extract three Ounces and an half of Spirit. The Caput Mortuum weighs twenty Ounces and an half; that is, half an Ounce more than the Salt of Tartar which was used. Hence it appears very probable, that the three Ounces and half of the Spirit of Sal Ammoniac proceed partly from the Phlegm in the Salt of Tartar, which Phlegm dissolves as much as possible the volatile Salt of the Sal Ammoniac united with a very penetrating Sulphur; for it is not probable, that fifteen Ounces of Sal Ammoniac analysed contain but half an Ounce of Acid. The Salt of Tartar always retains a great deal of Phlegm. How dry soever it appears, it grows very humid; and if it be placed over the Fire in an iron Kettle, in order to be dry'd anew, and used quite hot as it comes off the Fire, before the Air has penetrated it, the volatile Spirit of the Sal Ammoniac can scarcely be disengag'd. *M. Tournefort, Mem. de l'Acad. Roy. des Scienc. 1700.*

Spirit of Wine poured on Spirit of Sal Ammoniac, or Spirit of Silk, immediately produces a very considerable saline Concretion, which in the latter is manifestly separated into thick Concretions of Salt; but in the Spirit of Sal Ammoniac the volatile Salt is extremely divided, so that it is somewhat difficult, at first Sight, to know whether it be a saline or sulphurous Mass: This gave Occasion to name it *Offa Helmontii*; but 'tis soon prov'd to be all saline, for it entirely dissolves by an Affusion of Water: It seems manifestly to discover itself by the intolerable Smell. — *M. Tournefort, Memoires de l'Acad. Royal. des Sciences, 1700.*

Of all Salts Sal Ammoniac most intensely cools the Water in which it is dissolved, whose Coldness equals that of Water ready to freeze. And once indeed it happen'd, while I was dissolving a considerable Quantity of this Salt in Water, that some Drops fell out of the Matrass in which I made the Dissolution, and froze, so that the Straw on which the glass Vessel was placed, being wet, stuck to it for some time: This was in the Summer, when the Weather was pretty hot.

The great Coldness of the Solution of Sal Ammoniac does not proceed from the Difficulty of dissolving it, for it is dissolved with more Ease than other Salt; and Sea-salt, whose Solution is difficult, and very slow, least of all cools its Dissolvent. It seems, on the contrary, as if the Readiness of the Dissolution were the Cause of that exceeding Cold.

Sal Ammoniac is known to consist of a sea Salt, and an urinous Salt, one very easy, the other very difficult to be dissolved.

Among cold Solutions may be reckon'd the Experiment made by the late M. Homburg before the Company, which serves to prove, that the Coldness of Sal Ammoniac is perform'd as follows:

They take a Pound of corrosive Sublimate, and a Pound of Sal Ammoniac; they pulverize them apart, and then mix the two Powders very carefully; after this they put this Mixture in a Matrafs, and pour upon it three Pints of distilled Vinegar. After well stirring it, the Mixture becomes so exceeding cold, that you can hardly hold the Vessel in your Hands for any considerable time in Summer. When M. Homburg made a great Quantity of this Mixture, it was sometimes frozen.

We see in this Experiment a greater Cold produc'd than by a Distillation of Sal Ammoniac in common Water; this Excess of Cold is caused by the corrosive Sublimate, which by itself is not at all, or very little, dissoluble in distilled Vinegar. Hence it happens, that the fluid Parts of the distilled Vinegar having readily penetrated the Parts of the Sal Ammoniac, and having already lost much of their Motion, coming afterwards to engage in the Pores of a Body which they cannot dissolve for want of sufficient Action, soon lose that little Activity which they had left, and fix themselves, if not all, at least the greatest Part of them; and this Inaction of the Liquid excites excessive Coldness.

If on a Mixture of four Ounces of Oil of Vitriol, and one Ounce of Sal Ammoniac, you cast a Spoonful of common Water, at the time when the Fermentation is at its Height, and the Cold the greatest, and the Thermometer descends quickest, the Fermentation ceases, and the Cold very speedily changes to a very considerable Heat, which considerably raises the Liquid in the Thermometer. *M. Geoffroy, Mem. de l'Acad. Roy. des Sciences, 1700.*

M. Lemery had a Salt taken from Mount Vesuvius, which they call natural Sal Ammoniac. It was of a compact Substance, pretty ponderous, and very white, the Inside crystalline; it would not attract much Humidity from the Air, had no Smell, was of an acrid saline Taste, and very like that of Sal Ammoniac. He made several Experiments with it; among the rest, he mix'd it with three times as much Spirit of Nitre, and made an Aqua Regia of it, exactly like what is made of the common Sal Ammoniac. He found it to have several Effects of Sal Ammoniac, and also of Sea-salt. He supposes that his Salt of Vesuvius is no other than a fossile Salt, which is dissolv'd by the Sea, and sublimed to the Top of the Mountain by subterraneous Fires. *Hist. de l'Acad. Roy. des Scienc. 1705.*

A Memoire address'd to the Academy concerning Sal Ammoniac, and by M. Lemere, Consul at Grand Cairo, June 24. 1719.

Concerning Sal Ammoniac, I shall observe, 1. The Matter. 2. The Vessels that contain it. 3. The Disposition of the Furnaces. 4. The Manner of working. And, 5. the Quantity and Use of that Salt.

1. The Matter is pure Soot, and nothing else; but such a Soot as is swept from Chimnies where they burn Turfs of the Dung of Animals fed with Straw, which is the common Fuel in this Country, where they have no Wood. These Turfs, which are impregnated with alkaline and urinous Salts, communicate to the Soot certain Properties which it could not be expected to receive from the Smoke of Wood and Coal, and yet are absolutely necessary for the Production of Sal Ammoniac.

2. The Vessels which contain the Matter are exactly of the Figure of Bombs. They are great round glass Bottles, a Foot and half in Diameter, with a Neck two Fingers in Height. They case over these Bottles with a fat Earth, and fill them with Soot to four Fingers short of their Neck, which continues void and open. They contain each about forty Pounds of Soot, which at the End of the Operation yield six Pounds of Sal Ammoniac. Soot of an extraordinary Quality affords above six Pounds; what is worst, affords least.

3. The Furnaces are built like our common Ovens, except that their Vaults open with four Clefs in a Row lengthwise; upon each Cleft are four Bottles, which are placed in such a manner, that the Bottom of the Bottle being sunk in, and exposed to the Action of its Flame, only the Neck of the Bottle remains exposed to the Air; the rest of the Cleft is stopped up, and well cemented. Every Furnace then contains sixteen

Bottles; and every great Laboratory consists of eight Furnaces, disposed in two Rooms, so that it employs at once a hundred and twenty-eight Bottles.

4. In each Furnace, for three Days and Nights together, there is kept up a constant Fire made of the Dung of Animals mix'd with Straw. The first Day the gross Phlegm of the Soot exhales in a thick Fume by the open Neck of the Bottle. The second, the acid and alkaline Salts, being sublimed, associate towards the Top of the Bottle, where they touch the Neck, and, uniting, coagulate. The third Day the Coagulation continues, depurates, and is perfected. In the mean time the Master makes a little Hole in the Side of each Bottle, a little below the Neck, to see if the Matter be bak'd enough, and if there be nothing more to be sublimed. After he has made his Observations, he stops the Hole carefully with the fat Earth, and opens it from time to time. At last, when the Work is brought to the Point at which it ought to stand, he takes away the Fire, breaks the Bottles, shakes off the Ashes from the Bottom, and takes the round, white, and transparent Mass, of the Thickness of three or four Fingers, that adheres to the Neck, which is what they call Sal Ammoniac.

5. In two Towns of Delta, near one another, a League from the City of Mansouré, there are twenty-five great Laboratories, and some small ones, which make every Year fifteen hundred or two thousand Quintals [Hundreds] of Sal Ammoniac. In all Egypt besides there are but three Laboratories more, two of which are also in Delta; and one in Grand Cairo, which do not produce above twenty or thirty Quintals of this Salt.

Sal Ammoniac is principally used by Whiteners of copper Vessels, Goldsmiths, Casters of leaden Shot for Game, and is a noted Drug with the Chymists and Physicians. Father Sicarà, a Missionary, and an Eye-witness, says they add a little Sea-salt and Urine of Beasts. *Mem. de l'Acad. Roy. des Sci. 1720.*

The Plague at Marseilles having interrupted all Commerce to the Levant, obliged us to have the Drugs we wanted from Holland, among which was the Indian Sal Ammoniac, imported by the Dutch East-India Company. This Sort is made in the Figure of a Sugar-loaf, with the Top cut off; the largest of these Loaves are nine Inches in Diameter at the Base, and three Inches and a Quarter at the Top, and eleven Inches and an half in Height. They are not one solid Mass, but hollow on the Inside towards the Base, and this Cavity forms a Cone seven Inches and an half in Diameter, and about five Inches and an half in Height.

It appears by the Largeness of these Loaves, compared with those of Egypt, that they work up this Salt in much greater Masses in the Indies; for these last weigh fourteen or fifteen Pounds, whereas the others weigh but four or five.

Their Consistence is nearly the same, which shews, that they are produc'd by a Sublimation not much different; and indeed the Difference lies only in the Figure which they take from the subliming Vessel. The Indian Loaf is made in the Shape of a Cone, and it appears to be adapted to the Vessel which contains the Matter, both at Top and by the Sides. There is also Reason to believe, that this Salt is sublim'd after this Form, as the most commodious for so heavy a Mass. We find, in subliming Sal Ammoniac in our Retorts, that it rises in the same manner along the Neck, and there disposes itself in the Form of a Cone.

From the Manner in which I conceive these Vessels are adjusted, it is easy to imagine how it is possible to work a Quantity of Matter in them sufficient to afford fourteen or fifteen Pounds of sublimed Salt; for one might fill the Retort several times during the Sublimation, by an Aperture made on Purpose at the Top, as it is in our tubulated Retorts.

The Loaves of Sal Ammoniac made in Egypt owe their Smallness to their being sublim'd to the very Top of the Vessel that contains the Matter, which is of a Capacity too much limited. The same also gives them the Figure of a Cup turn'd upside-down, for that is the Shape of the Ball or Bomb in which they are sublim'd.

Another Advantage that arises from the Figure of the Indian Sal Ammoniac is, that its Superficies is cleaner, and freer from Impurities, because all the fuliginous Vapours, which rise during the Operation, have a freer Passage to the Top of the Cone, and are readily separated by cutting off that Top when the Loaves are formed.

Around the Circle which terminates the Loaves are the Marks of five or six Holes which were made during the Operation, by way of Precaution, to afford means for the Salt, in subliming, to arrive at the Top, and there solidly to condense, by letting out the rarefy'd Air and Fuliginosities, which might hinder the Sublimation.

The Vessels in which this Salt is sublim'd are of Glass; for I have found Bits of it sticking on the Surface of the Loaves, as I have observ'd them also on the common Sal Ammoniac.

The outer Surface of the Indian Sal Ammoniac consists of a solid Crust, five or six Lines thick in the strongest Part, and insensibly

insensibly diminishing to an Inch and an half from the Base, where it unites with that which immediately encompasses the Hollow of the Loaf. Both the internal and external Crusts are composed of Laminæ, which are transparent, horizontal, and lie very close one upon another. The interior is the most transparent, as being most exposed to the Action of the Fire, which confounds two or three Laminæ together; but in proportion as these Laminæ are distant from the Crust, they lose of their Transparency, and 'tis easy to observe the Number of Strata which constitute the Body of the Loaf.

One may readily know by the Gradation of these Strata after what manner they are formed, and united together by the Sublimation. The first which arise stick to the Sides of the Vessel, where they are harden'd by the Heat of the Reverberatory which covers the subliming Vessel; they afterwards close and thicken by the Accession and Union of saline Laminæ. After this manner is formed the crystalline Crust which covers the whole Loaf on the Outside.

The saline Mass, which is elevated in a great Quantity by the Violence of the Fire, disposes itself all around this Crust like Needles; these are much obstructed in their closing and condensing by the Thickness of the Mass; which being considerably augmented covers the intermediate Laminæ from the Action of the Fire. At last the Point of the Cone is clos'd by the Quantity of Matter which sublimes very briskly; so that the Fire then acts with Vigour on the last Strata that were elevated, and presses and hardens them extremely. And this is what forms the interior Crust, and the void Space about the Centre of the sublim'd Cone. This Space takes also the Figure of a Cone, because the Fire drives the Matter with its utmost Force upwards, and disperses it on all Parts towards the Sides of the Vessel. As it is thinner, and lies closer towards the Base, a Cavity is form'd, which lessens continually as it rises towards the Top, where it ends in a Point, because the Parts could be remov'd no farther.

If you cut a Loaf of Sal Ammoniac in Quarters; you may reckon between the interior and exterior Crusts no less than seven or eight Strata of different Degrees of Density.

As the greatest Thickness is towards the Top of the Loaf; there is Reason for making Holes, as I said, in order to clear that Part, which would otherwise be filled too soon.

To make a Comparison between the *Indian* and *Egyptian* Sal Ammoniac, it appears, that they are of the same Composition; and as to their Qualities, and the Uses to which they are apply'd, there can be no great Difference between them.

That of the *Indies* has the Advantage of being pretty clean from Impurities on the Surface, and having only its Top of worse Alloy than the rest; so that upon the whole Mass there must be less waste than in the *Egyptian* Loaves, which are charged with more Impurities in proportion to their Bigness.

Having been already particular on the Composition of this Salt, I shall now speak of its Decomposition, and first give my Observations on the manner of taking from it the volatile urinous Salt, so well known by the Name of *English Salt*.

'Tis the same Salt which is the Basis of the Sal Volatile Oleosum of *Silvius*, and therefore was always known to the Chymists. It was not call'd *English Salt* because the *English* were the Inventors of it, but only because they made the Use of it more frequent, and, as I may say, brought it into Fashion. Indeed its penetrating, tho' not disagreeable, Smell; besides, its being corrected by different Perfumes, extracted from odoriferous Plants, whence it took their Names, as tho' it really proceeded from them; its dry Form, which render'd it the fitter to be carry'd in the Pocket in little Bottles, with its Use in Vapours and Faintings, brought it in Vogue among the *French*, who are Lovers of Novelties, and especially of what comes from foreign Countries.

In 1700. M. *Tournefort* published in the Memoires of this Academy, that it was possible from fifteen Ounces of Sal Ammoniac to extract ten Ounces of volatile Salt, besides three Ounces of Spirits; but I have found by working on the same Salt, that it contains a much greater Quantity, which I have found means to disclose, and to sublime in the Form of a Salt, hard, thick, and transparent; in Fact, I extract from one Pound of Sal Ammoniac above thirteen Ounces of volatile Salt in a dry Form, that is, above Three-fourths; whereas M. *Tournefort* from fifteen Ounces did not extract above Two-thirds, which yet is more than any Chymist did before him.

It passes for certain Matter of Fact, that Salt of Tartar and Sal Ammoniac, mixed together, emit an urinous Smell; but if you take care first to dry them well, there will neither urinous nor volatile Vapour exhale from them. The Humidity of the Air is enough to moisten the Salt of Tartar, and make it fit to act upon the Sal Ammoniac, which it is then known to do by its Smell. If you take care then to secure this Mixture under Covert from the Moisture of the Air, you may keep it fifteen Days in a Vessel well stopped, and yet no urinous Spirit shall fly off from it; so that to extract the volatile Salt of

a good Dryness from Sal Ammoniac, you must avoid as much as possible too much Humidity.

M. *Lemery* was in the Right to say, that Spirit of Wine was so far from dissolving the volatile Salt, that it contributed much to its Preservation, whereas Water did nothing but resolve it into Spirit. I don't say, that in order to extract the volatile Salt dry as it ought to be, we must absolutely reject every Kind of Humidity; for then we should obtain nothing but simple Flowers, which can never make a solid Mass.

The Method in which I best succeeded was as follows: First, I took Sal Ammoniac the most purify'd, and pulverized very fine; then I took some alkaline Salt, as Salt of Tartar, Salt of Ashes of old Lees of Wine burnt, or some other like it, which have been purify'd by Calcination, Lixivation, and Evaporation; after this I calcined it again, in order to take away its Humidity as much as possible; then I pulverized it, and pass'd it hot through a Sieve. I took care likewise to dry the Sal Ammoniac very well, even till it smok'd. I then weighed Part of it, and three times as much of alkaline Salt, while it is yet hot: In this State the two Salts can perfectly mix without discovering any Volatility; they are put into the Retort, which is stopped very carefully, and there left twenty-four Hours, without any Emanation from them, like what usually proceeds from a Mixture of Sal Ammoniac with Salt of Tartar. I pour into the Retort, for every Pound of Sal Ammoniac, two Ounces and an half of Spirit of Wine, taking care immediately to stop up the Retort very closely, to retain the volatile Salts, which are sure to fly off, as soon as the Humidity, which the Spirit of Wine brings with it, diffuses itself among the Salts.

It is advisable to leave the Whole in a sort of Digestion, tho' in the Cold, and to stir the Salts in the Retort, in order to make way for the Spirit of Wine to diffuse itself, to penetrate, as much as possible, the saline Parts, and to excite a sort of Fermentation. After twelve Hours of Digestion, I unstop the Retort, and adapt to it two Receivers, the first of which has an Aperture at each End, in order to preserve a Communication between the Retort and the second Receiver: The Joints are well luted; and while the Lute dries there is an additional Time for Digestion. Then you put Fire by Degrees, in order to make a very gentle Sublimation by the Heat of the Reverberatory. At first there exhales a little of the Spirit in Vapours; which it almost immediately condenses against the Surface of the first Receiver; what passes into the second remains liquid; and at last all the first Receiver becomes furnished with volatile Salt, which sticks firmly to its Surface in Form of a Crust, and is more or less thick in proportion to the Quantity of Salt which is sublimed.

When no more comes off, the Vessels are unluted, and a Separation is made of the Liquor contained in the last Receiver, and that which may perhaps remain in the first. The Whole together gives back very nearly as much Spirit of Wine as was used. All the volatile Salt takes a dry Form, very solid; except a small Portion of it, which appears like Snow, because found in the Receiver mix'd with Spirit of Wine. There remains yet some volatile Salt in this Spirit; for after some Days it deposits the same in the Form of Needles, as it happens in Crystallizations of Salts under the common Operations. And if this Liquor be again emptied in another Bottle, it will in Length of Time deposit still more Salt like solid Crystals of different Figures; but the first are very fine.

This Salt, as well as other volatile Salts, is capable of Rectification. The most convenient Method for all Sorts of volatile Salts is to rectify them in the same sort of glass Vessel, set in Balneo Mariæ, where the Heat is very gentle and equal; and, on that account, preferable to a Sand-heat.

In making this Rectification, it will be proper to mix with this Salt those essential Oils, with which we would have it perfumed, because by this Method none are communicated but the most subtil and most fragrant Parts.

The Method I have described is also the most proper to determine, to the greatest Nearness, how much of the volatile is contained in Sal Ammoniac, and the Portion of acid Salt, by which this volatile is retained. This will now appear, by comparing the Matter which I used, with the Product of my Operation.

I took three Pounds of alkaline Salt, one Pound of Sal Ammoniac, and two Ounces and a half of Spirit of Wine; the Whole made together a Mass of four Pounds two Ounces and a half.

From this I extracted, in a dry Form, thirteen Ounces and three Drams of volatile Salt, and one Ounce five Drams and a half of Spirit, besides one Ounce and half a Dram imbib'd in the Papers, that I put about the Joints of the Vessel. This makes in all sixteen Ounces one Dram of volatile Salt, from which must be deducted two Ounces and a half of Spirit of Wine, which I used, and there will remain thirteen Ounces five Drams of volatile Matter, which one Pound of Sal Ammoniac yielded by my Operation.

The

The Caput Mortuum, which remained in the Retort, weighed three Pounds one Ounce, tho' I had used but three Pounds of alkaline Salt for a Medium; hence I had Reason to conclude, that this Ounce of Overplus was the Weight of acid Salt contained in a Pound of Sal Ammoniac, and which separated from it, in order to unite with a fixed alkaline Salt. Now the sixteen Ounces one Dram of volatile Substance, found in the Receivers, with the three Pounds one Ounce, that remained in the Retort, make but four Pounds one Ounce and one Dram; and all the Matter which I used, weighed four Pounds two Ounces and a half.

Here then I fall one Ounce three Drams short of my Weight. A Waste which must needs arise from the volatile Matter that evaporated; the Loss of which I could not prevent with all my Precautions.

Adding this one Ounce three Drams, to the thirteen Ounces five Drams of volatile Salt; found as well in a dry Form as otherwise, the Sum is fifteen Ounces of volatile Salt sublimed by my Operation. I may then conclude; that in one Pound of Sal Ammoniac there are fifteen Ounces of volatile Salt, united and incorporated by Sublimation, and only one Ounce of acid Sea-salt. This great Quantity of volatile Matter contained in Sal Ammoniac, will perhaps appear a Paradox in Chymistry.

M. Tournefort, who went farther than others, extracted, as I observed, from fifteen Ounces of Sal Ammoniac, but ten Ounces of Salt, and three Ounces of Spirit, which could scarce contain above six Drams of volatile Salt. But besides his not extracting as much volatile Salt as he might have done by his own Method, for want of using a sufficient Quantity of Medium, he took no Account of what volatile Matter might be lost in the Operation.

It might be objected, that this extraordinary Quantity of volatile Salt which I extract from Sal Ammoniac, was not absolutely contained in it, and that it might possibly proceed from the alkaline Salt, which served as a Medium, and was partly volatilized in the Operation.

But since it is impossible to extract the Ammoniac volatile Salt, without an alkaline Medium, must only what is extracted by other Methods, tho' in less Quantities, pass for the Sal volatile of Ammoniac?

Besides, by verifying my Weights, in which I used the utmost Exactness, I found in the Retort the Weight of the Alkali, which I used for a Medium, and one Ounce over and above for the acid Salt, which might be contained in the Ammoniac. There is no Appearance then, that the alkaline Medium was volatilized, because in that Case I should have found the Weight diminished in the Residuum. I cannot think then; that any one will say, that this Diminution was supply'd by the acid Salt of the Ammoniac, which ought to be supposed more than an Ounce to the Pound, since M. Tournefort, who in his Operation extracted much less volatile Matter, found the Weight of the acid Salt to be but half an Ounce, which certainly is not enough for fifteen Ounces of Sal Ammoniac, as he was well convinced; accordingly I obtained almost twice as much from the same Quantity. It is half a Dram of acid Salt for an Ounce, and by the Observations which I have made, it does not appear, that any more can be separated.

For Proof hereof, the Calcination of my Mixture of Salt of Tartar with Sal Ammoniac, afforded me precisely the very Proportion of the same acid Salt, as I had found after Sublimation, as you shall see by what follows:

That I might take all manner of Precautions, I chose two Crucibles exactly alike, in each of which I put three Drams of Salt of Tartar, with one Dram of Sal Ammoniac, such as I had used in my Sublimation, and a proportionable Quantity of Spirit of Wine. I urg'd them with an open Fire, in order to force from them their volatile Salt. Upon weighing the Residuum, I found it, both in this and the other Crucible, augmented exactly three Grains.

On the other hand, I had put in a third Crucible six Drams of the same Salt of Tartar by itself; and after giving them the same Calcination as I did to the others, for it was done at the same Time, and by the same Fire, I found the Residuum diminished just three Grains, that is, a Grain and half for three Drams.

But in the Calcination before-mentioned, of the Mixture of Salt of Tartar with Sal Ammoniac, instead of diminishing a Grain and a half, I found it augmented by three Grains; therefore the Residuum of this Calcination is, in reality, augmented in Weight four Grains and a half.

Now these four Grains and a half can be no other than the Weight of the acid Salt contained in the Body of the Sal Ammoniac, of which it made exactly the sixteenth Part. I can assure you, that Sal Ammoniac is a Compound of such a Nature, that of sixteen Parts there is but one detained in the Medium, and the other fifteen consist of Volatiles, as I had already proved by my Sublimation.

I took but a small Quantity of Matter for Calcination; that I might have the Weight more exact; and the Residuum of this Operation agrees, you see, to the utmost Nicety, with the Weight produced by the Residuum of the Sublimation of a considerable Mass.

This Augmentation of Weight in the Intermedium proceeds from a Portion of the Acid of the Sea-salt contained in the Sal Ammoniac, since from the Residuum of this Calcination, we extract by Lotion a crystallized Salt of a cubic Figure, which is a Shape peculiar to the Crystals of Sea-salt.

If any one now should object, that this Sea Acid, which was mixed with the Ammoniac, might itself, in part, be volatilized, I shall appeal to my Observations, which assure me, that in analysing Sal Ammoniac, every thing becomes volatile, except a sixteenth Part, which is retained by the Medium. M. Geoffroy, Cadet, Mem. de l'Acad. Roy. des Scienc. 1723.

These are the Accounts we have of the Origins of the different Species of Sal Ammoniac. But it is scarcely credible, that so prodigious a Quantity of Soot, as to make fifteen hundred or two thousand Quintals a Year, can be furnished by one Country, especially Egypt, which is a very warm Country, and where they only use Fires for culinary Uses, and at their Bagnios.

We must therefore surely conclude, that the Egyptians, who make Sal Ammoniac, have had the Address to keep their Method of doing it a Secret from the Europeans; and that they make use of some other Ingredients besides Soot.

Very good Sal Ammoniac is certainly to be made without any Soot at all. For I am well informed; that at the Sal Ammoniac Works, carried on some Years ago at Newcastle, the Rule for making it was thus:

Take of the Bittern, that is, the Liquor which drains from common Salt whilst making, one Gallon; and of Urine, three Gallons; let them stand together forty-eight Hours to ferment, and subside; then draw off the clear Liquor, and evaporate in leaden Vessels to Crystallization. Sublime these Crystals, when dry, in proper Vessels, and a very good Sal Ammoniac will be produced.

I am farther informed, that from one hundred Weight of Salt made from the Bittern, commonly sold under the Name of Epsum Salt, and three Hogheads of Urine, fifty-six Pounds of Sal Ammoniac may be procured.

From all these Accounts of Sal Ammoniac, it appears to be a neutral Salt, consisting of a volatile alkaline Salt, and an Acid. The Native seems to be thus generated: When Camels, or other Animals, deposit their Urine in the barren Sands of Africa, the Heat of the Sun, during the Day, makes all the Humidity evaporate; in the Night, the Acid of the Air is attracted by the alkaline urinous Salt, till it is perfectly neutraliz'd, and forms the antient Sal Ammoniac, or Sal Cyreniacus, which would be wasted in Vegetation, if the Soil was not utterly barren.

In Imitation of this, all the different Sorts of Sal Ammoniac are made, by uniting an urinous Salt with some sort of Acid.

But it must be remark'd, that Sal Ammoniac is a very different Substance from most of the Preparations made from it; for as alkaline Salts are mixed with the crude Sal Ammoniac, they absorb the Acid, which renders the Sal Ammoniac neutral; and then the volatile urinous Salts, set free from the Acid, rise in Distillation.

Boerhaave's Character of Sal Ammoniac is, that it preserves all animal Substances from Putrefaction, and its Brine penetrates into the most intimate Parts, and is the noblest Aperient, Attenuant, Resolvent, Stimulant, Errhine, Sternutatory, Diaphoretic, Sudorific, Antiseptic, and Diuretic.

Processes upon Sal Ammoniac from Boerhaave. Sal Ammoniac is neither Acid nor Alkaline.

Into a clean Glass put some very pure Sal Ammoniac, dissolved in three times its Weight of the purest Water, and filtered till it becomes a limpid Brine, and heat it to an hundred Degrees. Into different Portions of this, pour successively Vinegar, Spirit of Nitre, and Spirit of Sea-salt, and there will not appear the least Sign of Effervescence, nor does the Liquor grow turbid. In the Sal Ammoniac, therefore, there is no Alkali. Upon pouring in Oil of Vitriol indeed, there arises some Fume, and some degree of Motion; but this is owing to another Property of it, which will be more conveniently explain'd hereafter; for whilst the Oil of Vitriol lays hold of the latent Alkali of the Salt, it renders the acid Spirit of the Sea-salt volatile. Upon the same Brine, in another Vessel, pour a fix'd Alkali, and there no Effervescence will be excited; but there immediately arises from it a very penetrating, volatile, alkaline Smell. This Salt, therefore, is neither alkaline nor acid.

A M M

REMARK.

Sal Ammoniac agrees with the Salt of our Humours, because it causes no Effervescence, either with an Acid, or an Alkali, tho' upon the Effusion of a fixed Alkali, it presently gives out its volatile alkaline Part, with a very pungent Smell. Nor does this Salt act in the human Body, or any-where else, with an acid or alkaline Virtue, but with the more penetrating one of common Salt. That this is the Case, appears by all its Effects; but by this in particular, that if *Sal Ammoniac* is mixed either with Spirit of Nitre, or *Aqua fortis*, it will communicate to it a Power of dissolving Gold, or convert it into *Aqua Regia*, which nothing can effect but Fountain-salt, *Sal Gem*, and Sea-salt: In this respect, therefore, it is a semi-volatile Sea-salt.

Sal Ammoniac sublimed into Flowers.

Take some *Sal Ammoniac*, reduce it to Powder, dry it, and put a Pound of it into a Cucurbit made of *Hessian Earth*, and almost of a cylindrical Figure. Fix on a very large Head, and close the Joints with Clay and Sand work'd together in equal Quantities. Place them in a Sand Furnace in such a manner, that the Beak of the Alembic may decline a little downwards, that if any Water should come off first, it may run out of the Head into a Bottle applied to the Beak. Let the Cucurbit be covered with Sand, almost to the lowest Limb of the Neck of the Head, and let there be raised under it a Heat of a hundred and fifty Degrees, to be continued till all the Moisture is distilled into the Bottle. Then changing the Bottle, gradually increase the Fire till the Alembic begins to be clouded with a white snowy Substance, and keep it up in that Degree, without suffering it to diminish, for the Space of eight or ten Hours. Let all grow cold, remove the Sand, and take out the Cucurbit and Alembic very gently, lest the Salt in the Alembic should be shaken out. Lay the Cucurbit in an horizontal Position upon a Table; with a Knife take the Lute clean off; wipe off the Sand, Dust, and Lute from the Cucurbit and Alembic; and then whilst they continue in this Situation, very gently draw off the Alembic, and it will be full of a fine, light, sublimed, snowy Salt, of which too there will be a good deal upon the upper Rim of the Cucurbit. All this Salt being removed, and put into a very dry, clean, hot Glass, with a wide Mouth, you will find about the upper Part of the Cucurbit, a white, thick, dense, compact Crust, of the same Salt, but which did not ascend into the Cavity of the Head, but stopp'd and fix'd here. Take this off with the sharp Edge of a Knife, and put it into a Bottle as before. Then very gently turn the Cucurbit upside down over a clean Paper, and there will fall out a pretty deal of the first white Flowers, which dropped off in moving the Vessels, and which, if they are perfectly pure, may be added to the former. At the Bottom of the Cucurbit, there will then appear a few black, saline *Fæces*, which may be shook out, but are of no great Use, yielding only a bitter, black, feculent Matter. When the first Part is pure by itself, it is called the true Flowers of *Sal Ammoniac*, the *Aquila alba Philosophorum*; and the *Aquila Ganymedem in cælum Jovis rapiens in sublime*. The other Salt, which was at the upper Part of the Cucurbit, goes by the Name of *Sublim'd*, or *Rectified Sal Ammoniac*. If the Flowers, or sublim'd Salt, are dissolved in Water, they excite Cold, like the Salt itself. If you dissolve them, heat the Solution, and mix Acids with it, there is no Effervescence produced, except upon pouring in Oil of Vitriol. Nor does it cause any Effervescence with a fix'd Alkali, but immediately emits such a Vapour, as is described above. If you repeat this Sublimation of *Sal Ammoniac*, it gradually rises with more and more Difficulty, till at last it becomes almost fixed, tho' it still retains its former Qualities.

REMARK.

Here we have a Salt of the Nature of Sea-salt, but semi-volatile; for it is not so volatile as to rise with the Heat of boiling Water, nor yet so fixed as Sea-salt. When it is thus purified, it loses that Clearness which appeared, in some measure, in the common *Sal Ammoniac*. By Sublimation, it does not acquire an alkaline Quality, in which Particular, it differs from Salt of Urine; but it remains just as it was, only of a more beautiful Colour. It has this wonderful Property, that whilst it thus rises dry in a close Vessel, it carries up with it almost all fossile, vegetable, and animal Substances; and by this Sublimation, surprisingly attenuates them. Hence it is called the *Pistillum Chemicorum*, as the same Attenuation can scarcely be accomplished by any other means. And if these are sublimed with *Sal Ammoniac*, a considerable Number of times, they at last become fixed with it, and thus often give Rise to the

A M M

finest Medicines, as *Paracelsus* found in Colcothar, rendered very pure by Water, and then rubbed with Sulphur, and sublimed with this Salt.

Sal Ammoniac with Quick-lime, yields a fiery Spirit.

Take some very dry Flowers of *Sal Ammoniac*, put them into a clean hot glass Cucurbit, and pour upon them an equal Quantity of Lime reduced to Powder, as expeditiously as possible, in a dry, hot, iron Mortar, taking care that the Flowers are well covered with the Lime. At the same time have by you a clean dry Alembic, properly fitted for this Purpose, so that the fine exhaling Corpuscles may be immediately confined; for the very Moment, that these two Bodies come to touch one another, though they were at Rest, and inodorous before, there instantly arises a Vapour from them, than which perhaps there is not one more acrid, or violent in Nature. Fixing on the Alembic then, and luting it close, distil this Mixture, with a gentle Sand Heat, into a Bottle, applied to the Beak of the Alembic, and you will by this means have a very small Quantity of a Liquor the most volatile and acrid of any yet known, though not alkaline. If you then increase your Fire to a considerable Degree, the *Sal Ammoniac* will not be sublim'd; but by means of the Lime, the whole Mixture will become fixed; and if it should be afterwards put into a Crucible, and urg'd with the strongest Fire, it will not leave the Vessel, and become volatile: But when it comes to be cold, if it happens to be broken in the Dark, whilst it continues dry, it will emit a Light like Phosphorus.

Dissolve some pure powder'd *Sal Ammoniac* in triple its Weight of Water; then take Quick-lime, triple the Weight of the *Sal Ammoniac*; put it into a large glass Cucurbit a little heated, and pour upon it the Brine of the *Sal Ammoniac*, and clap on your Alembic, and lute it as expeditiously as possible with a thick Lute, made of Linseed-flower, and apply a very large Receiver to be luted with the same. There will suddenly be excited a Heat, Estivation, and most violent Ebullition, diffusing an incoercible Spirit, which would burst the Vessels, unless the Lute a little gave way; for the Impetus of it is so great, that it hisses and blows like a Wind through the Lute, dispersing a Smell all round; and at the same time a Liquor in great Plenty, and with surprising Speed, distils into the Receiver. When this spontaneous Heat of the Mixture is abated; let the Vessels be luted closer, raise a little Fire under them, and gradually distil to a Dryness. Let the Spirit thus produced be stopp'd up very close in a Bottle, and kept under its proper Title. In the Bottom there will remain a new and surprising kind of Body, which being dried with a strong Fire, appears almost of a glassy Nature, but gradually puffs up in the Air, tho' it does not dissolve like *Sal Ammoniac*, but is resolv'd into sandy Grains.

REMARK.

Here is another Instance of an Agreement betwixt the proper Salt of the human Body, and *Sal Ammoniac*; you see a Liquor produced from dry inodorous Bodies, that affects the Organs of Smelling, more than any thing else; you observe also the Generation of Spirits, which are vastly, and, as it were, spontaneously active, in the greatest Degree of Cold; and here you have a Spirit not alkaline, but extremely acrid, and next to Fire in Acrimony. It must be confess'd however, that if this Spirit, as it exhales through the Air, meets with a volatile Spirit of Nitre, they will in Conjunction produce white Fumes. This Process also furnishes us with a new Species of Phosphorus; and here you see a Fixation, in some measure, of *Sal Ammoniac*.

Sal Ammoniac, distill'd with a fix'd Alkali, yields alkaline Spirits, and a volatile alkaline Salt.

Take of the driest Flowers of *Sal Ammoniac*, ten Ounces; place them in a glass Retort, mix therewith of the purest dry Salt of Tartar, reduced to a fine Powder, three Ounces; and shake them well to mix them perfectly: Immediately there will arise a very acrid, alkaline Vapour, for which Reason you must immediately apply a large clean Receiver. Place the Retort in a Sand Furnace, and gradually raise the Fire to the greatest Degree. There will be sublimed a very pure, white, simple, volatile, alkaline Salt, which being impatient of Rest, will fly off as soon as exposed to the Air, and make its way out of Vessels, through almost every thing they are stopp'd with, except Glass. With all Acids, it causes a most violent Effervescence, and combines with them into a neutral Salt of a particular Kind, according to the Nature and Origin of the Acid. This Salt, on account of its prodigious fugacity,

A M M

city, can scarcely be manag'd or restrain'd; nor is it easy to take it out of the Receiver in a solid Form. At the Bottom of the Retort will remain a fix'd Salt, which cannot be sublim'd with the greatest Degree of Fire.

Or, To ten Ounces of the Flowers, add three Ounces of Salt of Tartar; pour thereon nine Ounces of Water, shake them, and distil them immediately through various Degrees of Heat, into a Receiver, accurately luted on to the Retort. Immediately a fine moist Vapour will ascend, which will be quickly congealed on the concave Surface of the Receiver, into a solid Salt, and will proceed in this manner every Moment. When the principal Part of the Salt is thus come over, it will begin to be dissolved by a Liquor less volatile, and more watery, than the former Salt. Then remove the Receiver, and applying another, urge the remaining Salt in the Bottom with a stronger Fire, till it becomes quite dry. This done, take the Liquor, and put it into the former Receiver, and shake it till the Salt is attenuated, and almost dissolved; then put them into a clean glass Vial, which stop very close with a glass Stopple. By this means you will have a Salt at the Bottom, and a Liquor at the Top, which is a true, moist saturated, volatile, alkaline Spirit: But if there remains no solid alkaline Salt at Bottom, it is a Sign that the Spirit is not very much saturated, but watery, and in a great many Experiments will not answer. At the Bottom of the Retort will be left a fixed Salt.

R E M A R K.

The *Sal Ammoniac*, as soon as it comes in Contact with the fixed Alkali in this Operation, is, from the Disposition of its own Nature, and the Assistance of the Fire, divided into two Parts, perfectly distinct, though both saline; one of which constitutes a very acrid, alkaline, igneous, volatile Salt, which is the purest that can be prepared by Art, and at the same time the most simple, and therefore reckoned the Standard of volatile Alkalis; under which the other Kinds may be reduced, and accordingly distinguished. The true volatile alkaline Spirit of *Sal Ammoniac*, therefore, is a Water containing in it as much of the purest alkaline Salt as it is capable of dissolving. To this too, as their Head, may be referr'd all other volatile alkaline Spirits. No other volatile alkaline Salts or Spirits are so pure and simple as these, being all tainted with an Oil, on which account they act in a very different manner. But, in this Property, *Sal Ammoniac* agrees with the Salt of Urine; for that Salt and Spirit cause a sudden and violent Effervescence with all Acids. If a Vessel, containing this Salt or Spirit, is left open, and another set by it, full of strong acid Spirit of Nitre, there is presently excited in the Air a pretty considerable Effervescence, arising from the Concurrence of the volatile Alkali, and Acid, exhaling from the Vessels. If this Salt is applied to the Skin, and so covered with a Pitch Plaister, that it cannot fly off, as soon as ever it comes to be heated, it causes an intolerable Pain, and produces the highest Inflammation, with a black Gangrene of the Part, so that no Poison acts with more Violence. Do those Physicians, therefore, act wisely in recommending this Salt or Spirit to be attracted, by full and free Smelling, to the olfactory Nerves, the *Membrana Pituitaria* of the Nose, and the extremely tender Vessels of the Lungs? A topical Inflammation and Corrosion seem, in such Cases, much to be feared. Both this Salt and Spirit become still more acrid and fiery, if they are sublimed again from a fresh, pure, dry Alkali. *Boerhaave's Chymistry*.

The dry Salt of this Process, is what we usually call

Sal Ammoniacum Volatile: Volatile Sal Ammoniac.

Some, instead of Salt of Tartar, put Lime; and others Chalk, or common Whiting. It is used for Pocket Smelling Bottles; but *Boerhaave*, as we see, with the greatest Appearance of Reason, condemns the Custom of smelling to these Salts, as highly pernicious. Some put Aromatics into the Retort, which gives it a more agreeable Smell. It is prescribed in malignant Fevers as a Sudorific, in the Form of a Bole, with other convenient Ingredients; for it is not fit for Powders, its Volatility soon wasting it: In Pills it will ferment, and it does so in Boles; but there it does not destroy the Form and Conveniency of taking. The Dose is from five Grains to ten.

Ten or twelve Grains of this Salt will saturate half an Ounce of distill'd Vinegar; which, with some simple and compound Water, and a little Syrup, make a Draught not disagreeable, and very useful in Fevers.

The first Process, directed by the College to be made with *Sal Ammoniac*, is the

Flores Salis Ammoniaci: Flowers of *Sal Ammoniac*.

Equal Quantities of *Sal Ammoniac*, and common Salt, are

A M M

decrepitated together, and then sublimed into Flowers, which are very volatile.

The Dose is from six to sixteen Grains.

The *Flores Salis Ammoniaci Martiales*, (chalybeated Flowers of *Sal Ammoniac*) are to be made thus:

Take of *Sal Ammoniac*, one Pound; of the Filings of Steel, ten Ounces: Let them be rubbed together, and distilled in a Retort with a large Neck, in a reverberatory Fire raised by degrees. When the Vessel is cold, sweep out the sublimed Flowers, and keep them in a Bottle for Use. The Dose is from six to sixteen Grains.

These, thrown into *French Brandy*, or common Proof Spirit, make the *Tinctura Martis Myrsiciti*, as now directed by the College; and the *Ens Veneris* is much the same thing, being usually Colcothar and *Sal Ammoniac*, sublimed together.

The *Spiritus Salis Ammoniaci*, "Spirit of *Sal Ammoniac*," is thus made:

Take of Salt of Tartar, and *Sal Ammoniac*, each three Pounds: Powder these separately, and when they are mixed, put them into a large Cucurbit, pouring upon them six or eight Pints of Water: Then distil in a Sand-heat, and the pure Spirit will come over, with a gentle Fire. If this Spirit be rectified in an higher Cucurbit, a most fine volatile Salt will sublime into the Receiver. The Dose is from ten to sixty Drops.

This is also directed various ways, but none easier and better than this: It is also made the Basis of many other medicated Spirits, described at large by some Writers, tho' none of them thought worth Insertion here, because quite out of Use.

Some, to add a greater Quickness of Scent, use Lime for Salt of Tartar, which in external Applications, particularly to the Nose in Swoonings, may be preferable to the other; but in internal Uses cannot be so good. The latter may be known from the former, by its leaving upon the Vessel, in which it is kept, a white Coat. Some (it is said) make it likewise, for Cheapness sake, with Brine, Urine, and Lime; and adding thereto a small Portion of a fetid Oil, which comes over in the making the *Spiritus Cornu Cervi per se*, they sell it for genuine Spirit of Hartshorn.

The Aqua Regia, with which so many Experiments are made, particularly in dissolving Gold, is from *Sal Ammoniac* and Nitre together; tho' it is most expeditiously made, by digesting, in a Sand-heat, *Sal Ammoniac* in Spirit of Nitre, or the double Aqua-fortis, till it be dissolved; but it hath so little Concern in Medicine, as not to require any farther Notice here.

But the most celebrated Medicine now in the Shops, from this Foundation, is the

Spiritus Salis Volatilis Oleosus: The oily Spirit of volatile Salt, generally called *Sal Volatile*:

Which is thus prepared:

Take of Cinnamon two Ounces; of Mace half an Ounce; of Cloves one Dram; of Citron-peel one Ounce and an half; of *Sal Ammoniac*, and Salt of Tartar, each four Ounces; of Spirit of Wine twelve Ounces: Mix and distil in a Sand-heat. The Dose is from ten to a hundred Drops, or more.

This is now become one of the most common Medicines of the Kind; its Invention is not older than *Sylvius de la Boc*, to whom it is ascribed. But though *Sal Ammoniac*, and a lixivial Salt, are the principal Ingredients, yet the Aromatics are so much varied at Pleasure, that very few make it alike: However, now a Standard is given by proper Authority, it ought to be kept to; that a Physician may know what to trust to, when he prescribes it.

But one great Rule, in a Composition of this Intention, seems not to be duly attended to; and that is, in Choice of Aromatics, which should be not only fragrant, but light and volatile in their natural Production; so that such things as the *Marum Syriacum*, Marjoram, Thyme, and the like, seem more suitable Ingredients than Cloves or Mace, whose Oils are too heavy, gross, and adhesive, to rise so conveniently with the *Sal Ammoniac*. The Goodness of this Medicine is judged by its Fragrancy and Quickness of Scent, and Softness to the Taste; for these Properties arise from the Goodness of the Aromatics, and the volatile Salts being covered with them; whereas when they are not good, or not in a sufficient Quantity, the Composition will be urinous, and very disagreeably pungent to the Taste. In making this Medicine with a slow and easy Heat, a great deal of Salt will harden to the Top of the Receiver, which may be scraped off, and preserved for Smelling-bottles, or any internal Uses, where Medicines of such Properties are required;

required; it is both much less caustic, and more cardiac, than the volatile Salt of Hartshorn, which is commonly directed.

The Spirit of Sal Ammoniac is now but little used internally, because the Gratefulness of the Sal Volatile Oleosum gains it the Preference; and this is commonly ordered with Spirit of Lavender, or of Castor, to be dosed out by Drops into ordinary Liquors: And when this is sent in Draughts or Juleps to a Patient, a very necessary Caution is to be observed, which is, not to order it in Company with any red Syrups or Tinctures; because it changes them into a very unsightly green Colour.

These Things are sometimes externally directed in Embrocations; they suit also well enough in unctuous Substances, provided too much Warmth is not given them before they are used, because that will exhale them; and this way they give a more penetrating Quality to Compositions, and agree well with warm Discutients, and such things as are commonly prescribed in Pleuritic and such-like Affections. *London Dispensatory. Quincey's Prelections.*

The *Spiritus Salis Ammoniaci succinatus*, "Spirit of Sal Ammoniac, with Amber," is made several Ways.

Either digest a Pound of Spirit of Sal Ammoniac with an Ounce of Amber; or,

Take Sal Ammoniac, and Amber, each five Ounces; Salt of Tartar, six Ounces; Spirit of Wine, and Spring-water, each eight Ounces.

This is reckoned to be cephalic, and exceedingly well suited to all nervous Indispositions; but it is something unpleasant. Its Dose is from ten Drops to forty.

AMMONIS CORNU, *Ammon's Horn*. A Fossile of an Ash-colour, found in the Shape of a Ram's Horn. *Rulandus* enumerates fifteen Sorts of it.

AMMONITRUM, *ἀμμόνιτρον*, from *ἀμμος*, Sand, and *νίτρον*, Nitre, that is, in *Pliny's* Sense, the lixivious Salt of a burnt Vegetable. *Pliny*.

This is a Mass compounded of Sand, and a fixed alkaline Salt, for making Glass. The Moderns call it *Frit*.

AMMONIUS, a Surgeon surnamed *Lithotomus*, from his inventing a way to cut the Stone, when it was too big to be extracted without Danger of a Rupture of the Neck of the Bladder. His Method was to grapple the Stone, with a Hook, so firmly as to hold it fast, that it might not roll back; then he took a Steel Instrument, of a moderate Thickness, slender, but blunt in its Fore-part; and bringing the Stone to bear in a right Posture, cleft it with a Stroke of his Instrument, being very cautious of wounding the Bladder, either by the Instrument or splintered Stone. *Celsus, Lib. 7. Cap. 26.*

AMMONII COLLYRIUM, otherwise called **COLLYRIUM HYGIDIUM**.

Take of Cadmia, washed, sixteen Drams; Cerufs, washed, a like Quantity; Castor, six Drams; *Indian Nard*, four Drams; Stibium, washed, forty Drams; burnt Copper, washed, fifteen Drams; Roses, twenty Drams; Squama *Aëris* burnt, five Drams; Aloes, six Drams; Cassia, four Drams; Myrrh, six Drams; *Indian Thorn*, three Drams; the Lapis Schistus, four Drams and a half; Saffron, six Drams; Lead, burnt and washed, eight Drams and a half; Opium, three Drams; Acacia, forty Drams; Gum Arabic, forty Drams. Make them up with Water: It is one of the most celebrated Remedies.

It is proper to be used in the Beginning of a Cataract, or Inflammation, and for all kinds of Exulcerations and Purulencies of the Eyes; for a *Conjunctio* and *Chemosis* (see the Words); for a Dislocation of the Bulb of the Eye; for an inveterate Myoeshalon, (a growing of the Tunica uvea over the Sight) and Staphyloma (see the Word); it deterges, incarnates, and heals an Unguis (a Collection of Pus in the Black of the Eye, in the Figure of a Man's Nail). It is an excellent Promoter of Sleep to such Persons as, through Pain of the Head or Eyes, or some other Cause, want that Benefit, supplying the Place of a Paregoric Medicine. It may be used with an Egg, or with Milk, or Water, and made thinner or thicker, as the Patient is more or less delicate of Sensation. *Aetius, Tetr. 2. Serm. 4. Cap. 113.*

AMNA ALCALIZATA, in the Phrase of *Paracelsus*, is Water which runs through Lime-stone, and is consequently impregnated with some of its Particles. *Paracelsus de Tartaro Tractatus C. 2.*

Rulandus calls it **AMNIS ALCALISATUS**.

AMNIOS. The internal Membrane which surrounds the Foetus. It will be impossible to form a competent Idea of the Amnios, without knowing at the same time the Nature of the other Membranes; and their contained Fluids: For, as *Needham* observes, these Subjects are so closely connected, that it would be difficult to treat of them separately: For who could give an Account of the Membranes, or discourse of their Uses, with any manner of Accuracy, if he were not to describe the

Humours contained in them? Or, what better Way can there be to discover the Nature of the Humours, than by a diligent Examination into the Figures, the Vessels, and Connexion of the Membranes?

The Membranes are very different in various Animals, in Number, Figure, and Situation. In some there are three, in others four, and in an Egg we can reckon six; for after we have opened the outer Membrane, which adheres to the Shell at the blunt End of the Egg, we find another of the same Colour and Consistence, which subtends the Cavity, and very freightly embraces the Egg: I doubted a long time whether this latter Membrane was a new one, or a Duplicature of the first; but, at last, I found it was a new one, and might be separated throughout the whole Compass of the Egg. This then being cautiously removed, there immediately appears the Membrane of the thinner Albumen, conspicuous for its Veins and Arteries, if inspected some Days after Incubation. This Liquor being let out, we meet with the Membrane of the Colliquamentum, or Amnios of the Chick, in which the Chick swims. After this come the thicker Albumen, and the Vitellus, invested with their peculiar Membranes; these are under the Chick, in the Bottom of the Egg.

In cotyledoniferous Animals, which may more properly be called glanduliferous, there are three Membranes; and so there are in Sows and Mares: The same Number are in placentiferous Females, and, among the rest, in Woman. All these have only two Humours, which gave Occasion to the great *Harvey* to mistake, in asserting, that the Allantois was nowhere to be found. For my own Part, after I have taken off the Chorion, which immediately contains no Humour, but serves for the Distribution of the Vessels, and for supporting and strengthening the other Membranes, I immediately find what may very truly be called an Allantois; and I have often taken it from the Foetus of Cows, Deer, Swine, and Sheep; and blowing it up like a Gut, have hung it up in my Chamber, to be seen and handled at Pleasure. It was therefore owing to the Imperfection of human Nature, that so great a Man should labour to banish out of all Belief, and the Nature of Things, a Membrane that was viewed, described, and delineated by so many Anatomists. As for *Everhard*, besides his being prejudiced by the Authority of *Harvey*, he had the Misfortune to be concerned with none but those little Animals called Conies; in which, tho' there are four Membranes, as will by-and-by appear, yet they do not readily offer themselves to Sight, except to those who, from beholding the like in larger Creatures, know where to look for them.

In Dogs, Cats, Conies, and perhaps other placentiferous Creatures, there are four Membranes, and three Humours; for I have always hitherto observed, that the Number of Membranes exceeds that of Humours.

In our Account of these Matters, we shall begin with Sheep and Oxen, and other glanduliferous Creatures, as well because the Art itself took its Origin from them, as appears by the Writings of the Antients; and thence the Names were transferred to other Animals, by too strained a Catachresis, as because they are most easily procured, and especially near Shambles, always ready for Inspection.

In these Animals then, we first meet with the Chorion, which, when you have separated the red fleshy Caruncles from the uterine Glandules, appears all over variegated with these Caruncles as with so many Roses. Besides, a great Part of the umbilical Vessels spread themselves over it, and are continued to the before-mentioned Caruncles. These Vessels also scatter Plenty of Capillaries throughout the Chorion, which probably imbibe the Humour, at least secondarily, and for the proper Use of the Chorion; that is, to maintain its Softness and Humidity, without which it would adhere to the Uterus. For tho' in Cows and Ewes, those little Placentas are copiously distributed all over the Membrane, yet, in Does, there are commonly but ten; that is, five in each Wing, which are situated in the lower and narrower Part of it; tho' there are considerable Branches of Veins and Arteries, which proceed as far as the opposite Region of Conception; where, by their Structure, Situation, and Magnitude, they seem to imbibe a Humour. And, in Sows, the Chorion does the Office of the Placentulae before-mentioned, during the whole time of Gestation; for there appears no other way of conveying nutritious Juice to the Foetus. In Mares also, during the first Month, this Membrane is single, and serves for the aforesaid Uses; but in Process of Time, it considerably thickens, and forms fleshy Caruncles of the Size of a small Pea; but these, at last, run together, and are conjoined in such a manner, that the whole Chorion seems to have degenerated into a very broad Placenta, interwoven with Millions of Vessels, which send forth innumerable Capillaries to the internal Membrane of the Uterus, which however remains single. In a Woman also this Membrane is, at first, without a Placenta, which yet soon grows, and connects the Conception to the Womb: When the Placenta is grown, the Chorion itself is best discovered by slightly wounding it with the Hand near the Placenta, and then pulling it off with

With the Fingers; it will appear thick, soft, and interspersed with small Veins; but all the larger Vessels end in the Placentas. The Case is the same in Conies; in Dogs and Cats the Foetus is divided in the Middle, as it were with a Girdle, in such a manner that we must look for the Chorion on both Sides of it, as tho' it were double.

The Use of the Chorion is easily understood, from what has been said: It sustains the umbilical Vessels, and the Caruncles aforesaid, in glanduliferous Animals; and both in these, as well as others who are without Glandules, imbibes a nutritious Juice, in these immediately, in the other secundarily. But in the placentiferous, almost all the greater Vessels direct their Course to the Placenta, and only some minute Vessels disperse themselves in this Membrane; so that the alimentary Liquor it may possibly receive, seems only sufficient for its own Moistening and Nourishment. However, the Chorion, both in these and other sorts of Animals, includes within its Compass all the other Membranes, as well as the Humours, and the Foetus itself, and defends them; but contains no Liquor of its own within its Cavity.

In stripping off this Membrane, you are to be very cautious, that you do not wound the subjacent Membranes. The safest way is to take hold of one of the Caruncles with your Hand, and, lifting it up, cut a small Hole in the adjacent Chorion, large enough to receive two Fingers; then, laying aside your Knife, tear it gently by degrees with your Fingers; carefully observing, all the while, whether any thing of a Duplicature, or a very fine whitish Membrane, offers itself, tho' in an obscure manner, to your Sight; for if there does, it is the Allantois, which it highly concerns you to preserve entire: But when you have proceeded a little farther, it will appear turgid with its own Humour, and render the Operation more easy; but if any Liquor should happen to run out, you may be sure, that there is a Rupture, either of this Membrane, or the Amnios. The Chorion being thus skillfully taken off, the Allantois is, at the same time, in a manner, separated from the Amnios, which may easily be perfected whenever you please, if you have divided them as far as the Cord; but there it is to be left alone with its Urine, till the Amnios and Foetus being opened, you may have Access to the Bladder.

The Amnios is interspersed with Vessels, almost in the same manner as the Chorion, and receives all the umbilical Branches, which do not pass into the Chorion. This being opened, shews you the Liquor in which the Foetus swims; which our famous *Harvey* proved to be absolutely nutritious, both from its Taste and Consistence, and from its being the same as is found in the Ventricle of an Embryo. This Membrane is often over-run with pinguious Concretions, which seem to be gathered from the Liquor within it; and, in a Cow, the Cord of the Embryo near its Root swells with a sort of glandulous Asperities. This is meant of Females with Cotyledons; as for the placentiferous, there is another Method of Dissection, of which by-and-by.

We are now come to the Foetus; and upon opening the Abdomen, we may take a View of the Umbilical Vessels. Here we shall only take Occasion to observe, that the Bladder, being wounded, discharges the same Liquor, in every respect, as is contained in the Allantois; and you may, at pleasure, force this Liquor, by Pressure, from the Allantois into the Bladder; or by fitting a Pipe to the Bladder, blow into the Allantois; nay, even before the Foetus is opened, if you raise the Membrane a little, and squeeze it in your Hand, it will emit the Humour through the Bladder and the Penis; which is enough to prove the Communication between them.

The Allantois deserves a particular Notice, as well because its Existence has been hitherto controverted, as for its remarkable Variety in different Animals. For in the glanduliferous Kinds, as Ewes, Cows, Does, it grows to the End of the Cord, and seems to be a sort of an Elongation and Dilatation of the Urachus, of the Figure of a Gut, and reaching, on both Sides, to the Extremities of the Uterus within the Chorion, and filling the Cornua. In Sows, which are multiparous, and have an Egg appointed for each Foetus, this Membrane reaches to the Extremities of that Egg, and, on both Sides, is shaped like a Gut; whence it took its Name *Allantois*, or *Allantoides*.

In Mares the Case is somewhat different; for this Membrane, in them, is every-where connected with the Chorion, and contains, within itself, the whole Foetus with the Amnios: It shews plain Marks of an Urachus, which seems rather to proceed from the Amnios, and to be a sort of Duplicature of it, folded outward, as far as the Bladder; to which it will easily transmit a Breath, or the Point of a Bodkin. You must look for its Perforation in the Cord, which twisting itself to a remarkable Degree, is, Part of it, dispersed over the Amnios; the rest, united, passes through this Cavity, and is, at last, inserted in the Chorion, and there divided into innumerable little Branches, by which the Chorion is so increased in Thickness, that it seems to deserve the Name of a Placenta. In this Animal also, as well as in glanduliferous Kinds, the frequent Concretions which swim in the Liquor of this Membrane, are worth Observation, which seem, at first Sight, to be Fat, or little Bits of Flesh;

but, pulled abroad with the Fingers, are dilated into a sort of membranaceous Substance, and seem to be Coagulations of a kind of soft and glutinous Urine.

We proceed now to placentiferous Animals, in whom the urinary Membrane is of quite another Figure. In these Kinds then, the urinary Membrane varies according to the Animal: In a Woman it furrounds the whole Foetus, almost after the same manner as in a Mare, growing every-where to the Chorion: In Dogs and Cats it is the same; but its Duplicature, near the Divarication of the Cord, constitutes a Cavity between it and the Girdle, which is designed for the fourth Membrane. Indeed, I judge a Mare to be a middle sort of Animal, between placentiferous and glanduliferous Animals; she agrees with the former, in that the Urine quite furrounds the Foetus, and tho' there be no Placenta in the Beginning, yet, in Process of Time, there grows one to such Dimensions as to embrace the whole Foetus: And, indeed, that thick Chorion almost deserves the Name of Placenta, barely on account of the Veins, which are dispersed over its Substance in as plentiful a manner as in the human Placenta. To this I add, that there is nothing which answers to it on the Part of the Dam, as is usual in the glanduliferous Kinds. However, this it has in common with those of ruminating Creatures, namely, to be connected to the Uterus by carneous Ligaments; and that this Thickness is not considerable before the sixth Month. But this, by this way. The Allantois in Conies is of another Figure, that is to say, pyramidal, and has a Placenta for a Base; whence it grows narrower by degrees, till it comes to the first Parting of the Umbilical Vessels, where it ends in the Urachus; for the larger Membrane, in which the Amnios swims, does not seem to be the urinary, as we shall see by-and-by.

It may be inquired, concerning this Membrane described in placentiferous Animals, whether it be really urinary, since the Perforation of the Urachus is less manifest in them, than in the glanduliferous Kinds. And as to the human Conception, I freely own, that I could never discover the least Sign of such a Canal in the Cord, by any transverse or oblique Section, or torturing it a thousand Ways. But the very same things happen in a Dog, where, tho' I could by no means find out the Duct, I was convinced, that there was a Passage, by frequently transmitting Wind through the same. I confess, that I could never obtain a human Foetus inclosed in the Uterus, tho' I have dissected the Secundines very frequently, and not a few Embryos, where I don't, in the least, doubt but blowing would have succeeded as well as in the others. For I look upon, as Demonstration, that Argument of *Spigelius*, which asserts, that Man must needs be furnished with an Urachus and Allantois, for this Reason, namely, that he is under an equal Necessity with other Animals, of having a Repository for his Urine; this cannot be otherwise than true, as to all Animals provided with a Bladder.

But *Courvoisier* has invented a pretty subtle Distinction, and imagines, that the Allantois belongs only to such Animals as have a large *Intestinum Cæcum*, because of the Compression of their Bladder, which he supposes insufficient to contain its Liquor, the Space being taken up by the Largeness of the *Cæcum Intestinum*; but in other Animals, where that Intestine is but small, there is no need of any such Membrane.

Now, I would advise *Courvoisier* to look upon the Allantois once more, and to measure the Quantity of Liquor contained in it, where he may see whether the *Intestinum Cæcum*, even in Subjects where it is largest, be of Capacity sufficient to contain such a Collection of Waters. 'Tis certain, that the Allantois of a Cow, at the End of Gestation, contains some Gallons of Urine. Let him view the Bladder, either the human or that of a Dog, and consider well with himself, whether it be more distended in these than in other Animals: His Eyes will convince him of the contrary. Therefore if there be any Collection of Urine during the Time of Gestation, it is necessary, that there should be another Reservoir for it; and yet, in a Bitch, not only the *Cæcum* is very small, but the Colon is wanting, that the Bladder may have still farther room to swell, and does not require an auxiliary Membrane to discharge Part of its Office: But since we meet with an urinary Membrane, not only in these, but in other Animals, which have a large *Cæcum*, and a Colon, we have no Reason to believe, that their Presence or Absence has any Influence towards causing any Alteration in the Structure, either of the Bladder or Allantois. Other Arguments may be drawn from the Liquor itself, which shall be reserved for another Place.

To conclude this Head, I shall add, that it is peculiar to this Membrane to have neither Vein nor Artery, that is visible, in its Substance: This I lay down as its Characteristic; for these Vessels disperse themselves either into the Amnios or the Chorion, having nothing to do with this Membrane, or at least are inserted into the Placenta, or Glandules: And in a Mare, tho' some Thousands of Vessels, both great and small, are seen creeping towards the Chorion, and imprint their Traces on it, not a single Branch can we discern to be directed to the Allantois, or there to end; but whatever it contains, is acquired from the Bladder. And tho' in the Foetus of a Cow, it is here and there interspersed

interspersed with a few Capillaries near the Urachus and the Cord, this does not always happen, nor do they ever proceed the Breadth of three Fingers, but vanish in a very short Space. The great *Harvey* writes, that this Liquor belongs to the Chorion, and is, at first, a hundred times the Quantity of the Liquor of the Amnios, but decreases by degrees. But I cannot forbear declaring, that I have observed the quite contrary, and know that this Liquor, which belongs to the Allantois, and not at all to the Chorion, increases every Day, and acquires a more and more urinous Colour, Smell, and Taste, to the very End of Gestation; at which time the Liquor of the Amnios, as he confesses, is almost consumed.

The Use of this Membrane is evident from the Premises, namely, that it is a Reservoir for the Urine; nor can it be of any other Service in an Embryo. But if any one be solicitous about the Nutriment of the Allantois, because I just now said, that it was destitute of Veins and Arteries, he must understand, that this is an Accident common to it, with many other Parts; for the same may be said of the outer Membrane of the Uterus, as well as of the like Membranes of the Intestines, the Stomach, and Œsophagus; as also of the Pleura, and the proper Integuments of the Muscles; which, tho' they have no conspicuous Veins, must be supposed to be furnished with Canals, reaching from the very Orifices of the Veins, since, when they are inflamed in Diseases, the Blood-vessels manifestly shew themselves; as, for Example, in a Pleurisy and Ophthalmy; and these Vessels furnish Nutriment enough for that peculiar Part, being not appointed for any public Office, distinct from the same.

Having finished the Description of the Allantois, it will be proper to take some Notice of another Membrane, which resembles it in Figure, but is appointed for a very different Use. You meet with it in Dogs and Cats, situated under the Girdle, near the Divarication of the Umbilical Cord, where the Vessels begin to separate, and to take their Course towards the Placenta: It stretches itself out in Length in a sort of Cavity, formed by other Membranes meeting there for that very Purpose, and is tied, or in a manner buttoned, to them at its Extremities, by a very white cartilaginous Ligament. As to its other Parts, it no-where closely adheres to the Sides of its Cavity, but hangs almost loose. In the Beginning of Gestation it is large, and full of Humour, containing more than all the rest of the Membranes taken together. It is very plentifully furnished with Veins and Arteries; but, in Process of Time, it decreases by degrees, till, being exhausted of all its Moisture, it becomes so exactly like the little Membrane in the Brain, called the Choroides, as to pass upon the Unwary for the same, when taken out. The Humour here reserved has nothing of Urine, but is something very noble, which is spent upon the Fœtus in the first Weeks, by means of peculiar Vessels: And this is observable of the Dog-kind, and many others, to whom Nature has added a Membrane for Services of the like Kind; tho' it be not always of the same Figure. For,

In a Coney this Membrane is large, and surrounds the whole Fœtus, almost in the same manner as the urinary Membrane in a Bitch; and, at last, forms a Cavity under the Placenta, which seems appointed for the Urine. 'Tis almost in the Form of a Half-moon, and, being inflated, resembles the human Kidney, both in Shape and Size: It is variegated with Vessels, which, if accurately traced, will be found not to meet in a Collection at the Placenta, but to descend to the Cord; and from thence, perforating the Abdomen, to proceed to the Mesentery.

But there is a Question, of no less Difficulty than the former, concerning the Ingress of the Humour into this Membrane, which coinciding with another like Difficulty, usually started about the Amnios, we shall treat of them both together.

Our Account of the Amnios has been almost anticipated in our Discourse on the Allantois, and needs no other Description than saying, that it belongs to all, as well oviparous as viviparous Animals, and is always supplied with Vessels from the Umbilicals; the Liquor it contains is nutritious, and sucked by the Embryo, as was said before. It remains only to inquire by what means it is convey'd thither, as into a Reservoir, in order to supply the future Necessities of the Fœtus; a Controversy sufficiently perplexed, and which *Harvey*, as *Courvaus* writes, quite neglected; either because he saw too much Difficulty in it, or none at all. *Courvaus* himself, and *Everhard*, account for it by a Filtration through the Pores of the Membranes, and tell us, there is a Transudation of the Humour, first into the Chorion, and from thence into the Amnios. But these learned Men should have considered, that there is not the least Humour to be found between the Chorion and Amnios; but whatever there is of liquid in these Parts, is all contained in the Allantois; and if there should be any Filtration from thence, through the Membrane of the Amnios, it is but reasonable, that there should be first a Collection of the same within the Chorion. This Argument is very well urged by *Wharton de Gland.* to which I will subjoin another, that shall amount to a plain Demonstration, as follows: In a Fœtus of the Horse-kind, the Urinary Membrane is every-where firmly connected to the Cho-

tion, and even contains in itself the whole Fœtus, with the Amnios, so that the Amnios swims in the Urine. I prove it to be Urine by the Smell, Colour, Taste, and its Communication with the Bladder by the Urachus. The Case is the same with respect to Dogs and Cats. Now I would ask of *Courvaus* and *Everhard*, whether the nutritious Liquor must pass through the Urine, and so be mixed with it. If they will not grant this, there is scarce any other way but by the Umbilical Cord; for in the Instance alledged, all other ways of Filtration are excluded.

But as to the Umbilical Cord, it is doubted, whether this Humour be convey'd through its Veins into the Blood of the Embryo, and afterwards deposited by the Arteries in the Amnios; or, whether it descends by the Jelly-like Substance of the Cord, and distils through the minute Papillæ, or Asperities, into the Amnios. *Wharton* is for the latter way, which, indeed, seems very probable to one who considers the Fœtuses of the Cow-kind, in which there is a copious and thick Jelly, and whose Cord is turgid, with a kind of glandulous Asperities, in that Part which swims in the Liquor of the Amnios; so that one might readily conjecture, that this Colliquamentum was squeezed from these Glands. But when I consult comparative Anatomy, and examine the Structure of this Cord in other Animals, I am persuaded the thing is quite otherwise. For in the placentiferous Kinds, there is no such Plenty of Jelly growing to the Cord, which, in Man, is thin, and runs out in Length; and must be judged very unfit for any such Use, by every one that sees it. In oviparous Kinds there is no Cord at all, but Vessels which spread over different Parts of the Fœtus, and enter it; some near the Anus, others near the Liver, and the usual Place of the Umbilicus: Nor do they ever gather into a Cord; but when the Time approaches for Exclusion of the Chick, the Left Artery, and Hepatic Vein, perishing, the rest of the Arteries, with the Mesenteric Vein, and the Intestinal Duct, are taken into the Abdomen, to supply the Vitellus: Now that the Colliquamentum of the Chick, with its Membrane, answers to the Amnios of viviparous Animals, is not at all doubted; so that we may reasonably conclude, that they have but one and the same way of receiving the Humour.

It will, therefore, be proper for us to inquire, in what manner the Liquor enters the Cicatrix in an Egg, and extends the fine little Membrane by degrees, till, at length, it becomes capable not only of a good large Fœtus, but also of a considerable Quantity of Liquor.

Whoever views this Cicatrix in the Egg, before Incubation, will perceive it very minute, and suspended in the Membrane of the Vitellus; yet this so small a Tenement entertains an Embryo, and becomes every Day more spacious, till an entire Animal arises thence, and shews itself. After two Days Incubation, as *Harvey* observed it, there will appear in it large conspicuous Circles, as big as the Nail of the fourth Finger: Within these Circles, as the same Author assures us, is contained a Liquor, extremely clear and refulgent, purer than any crystalline Humour, and appearing to be included within its own very fine Membrane, like a Part of the Albumen melted and clarified. He calls it, by a very significant Name, *Colliquamentum*. It increases continually; and on the fourth Day presents you with the Phenomenon of a purplish Border, with a small Line of a Blood-colour, which is continued to the *Punctum saliens*, situated in the Centre. The latter Augmentations are the most conspicuous; but the manner how it increases, is a profound Secret.

Whoever believes it done by Transudation, would do well to consider, besides the Arguments which are brought against this Opinion, from viviparous Animals, and which prove, that there is an Analogy between the Motions of their respective Liquors; I say, besides these Arguments, he would do well to consider, how carefully kind and indulgent Nature has provided for the Secretion of these Humours; and how circumspectly and warily she has, every-where, wrapt them up in fit and proper Coats: So that if, at any time, a Transudation was to happen, it must be made, not thro' a single Coat, but the Humour must break out from its Inclosures, and make its way into the Interstices of two Membranes; and then, at last, enter the Pores of another Covering. But who ever saw any Liquor between these Interstices? Or, to what Purpose did Nature use so much Care and Caution in separating these Humours? Would it not, at least, have been sufficient, that they should have been separated by single Coats, thro' which they might have easily afterwards pass'd? Besides, I would have the Abettors of this Opinion to consider, that when Nature allows an Ingress into a Membrane, thro' Pores of this Kind, she does not permit the Egress thro' the same Pores; so that the Humour which entered one way, must go out by another, and pass forward to another Membrane, which would render the thing void and ineffectual: The Ducts, all this while, which lead from Membrane to Membrane, are not as yet conspicuous; nor are there sufficient Reasons suggested for suspecting them; 'tis therefore incumbent upon us to cast about, and look out for some more rational and satisfactory Hypothesis.

What my own Sentiments are, I shall now inform the Reader: That minute Animalcule, which I imagine is generated in the first Conformation of the Egg, and lodged in the Cicatricula, contains a spirituous Liquor in its Vessels. This Liquor is precisely the same with that which *Glissoni* so often distinguishes by the Name of *Spiritus Vitalis*, or the vital Spirit. This Liquor, upon the Approach of Heat, takes up more Space than it did before, and so passes off through the Extremities of the Vessels; and whatever Part either of the White or the Yolk it falls upon, it colliquates and melts it. By this means the Part on which it falls, is render'd so fluid, that it is easily incorporated with the above-mentioned Spirit, and together with it received into the Mouths of the Veins, which are not as yet red, and so passes to the Fœtus in greater Abundance than is requisite, either to nourish its Body, or to saturate the Blood; by which I mean the fore-mentioned Liquor. The Blood being thus impregnated with this Spirit, deposits it in the Arteries, which are inserted into the Coat of the Colliquamentum, after the same manner as the Arteries are inserted into the *Amnios* of viviparous Animals; so that the Coat of the Colliquamentum is not only distended with this Juice, but deposits and lays up within itself the far greater Part of it as proper Store for the Fœtus. These things appear very plainly in an Egg, and unless there be some Foundation for a different Set of Occurrences in viviparous Animals, I see no Reason why they should not likewise happen in them. It is not at the same time to be deny'd, but this Hypothesis stands chargeable with many Difficulties, and lies open to some considerable Objections; two of the principal of which I shall only consider, since I imagine the rest so nearly link'd to them, that they must stand or fall according to their Fate.

The first concerns the Mixture of the nutritious Juice with the Blood, which yet must be separated from it, and afterwards received into the Stomach, in order to be reunited with the Blood.

The other Objection respects that *elective* Motion of the Liquor, which carries it to make its Ingress by the Vessels dispersed in the Albumen and Vitellus, but its Egress by those which are distributed over the Membrane of the Colliquamentum.

To the first it may be answer'd, That the very same Juice which serves for Nutriment in the Fœtus, was once intimately united with the Mother's Blood at least, after it had undergone the first Concoction in her Stomach; which granted, I don't see what Inconvenience will follow, if it should pass from the Mother's Blood into that of the Fœtus, and there leave whatever is fit to be immediately converted into Blood, without any farther Concoction or Fermentation. The rest may be repositied within the *Amnios*, as Matter for future Nutrition, to make its Passage through the Stomach, and there to be digested. This will appear the more probable, if we consider, that here is no Retrogradation of Nature, or Degeneration of Blood into a chylous Matter, but a Transfusion of alimentary Liquor for the Support of an Animal; which is no more than what happens in the Mother, both with respect to the Humours of the Uterus, and the Matter which forms the Milk.

To the second Objection I answer, That such elective Motions are found every-where in the animal Economy, with regard to the Distribution of Aliments as well as Excrements. So Milk always flows to the Breasts, the Humour we speak of, to the Uterus, Bile to the Liver, Serum to the Kidneys. The Reasons for this similar Attraction, I am incapable of giving, but believe they are to be reduced to Pulsion; but it is sufficient for our present Purpose, that such a Motion there certainly is, whatever be the Cause.

From what has been said, we may draw a Solution of another Question, which has been lately started, concerning the Use of the fourth Membrane belonging to the Dog-kind. The Answer is, That the Liquor there collected is deposited in that Place, as in a Reservoir for the Use of the Fœtus.

So much for the Membranes and Ducts. We shall add a few Words concerning the Humours.

All the Humours, let them be as many as they will, or in whatever Animal found, are nutritious, except only the Liquor of the Allantois. A great Part of viviparous Fishes emit an Egg of only one Colour, and including, as far as can be discern'd in so minute a Body, only one Humour. But the Method of Nature in their Generation, I confess, is unknown to me. But there are some Fishes which lay an Egg of two Colours, and consisting of a single Albumen and Vitellus; as the Ray. The Eggs of Birds, for the most part, include within their Shells three nutritious Substances, conspicuous to the Eye, for the Use of the Chick, that is to say, a Vitellus, and a double Albumen inclosed in Membranes. But after Incubation, we meet with a fourth, formed from a Colliquation of the others; and, by *Harvey*, very properly called *Colliquamentum*. I say nothing of the Chalaza, which is not properly a Humour: much less are the Seed of the Cock, or the Principle of the Chick, to be so accounted, but only Props to the Vitellus, which is suspended in the Centre of the Egg. But the Colliquamentum, though it appears to Sight as if it were

transferr'd thither from some other Place, most certainly owes its Original to the Liquor contained in the Cicatricula. I don't here inquire, whether this be the Liquor which forms the Chick, or rather the Blood of the Chick already formed; but we know, that from hence are extended Vessels, which being affixed to the other Parts, especially the Albumina, attract the attenuated Humour, and refund it into the common Receptacle, in the manner just now explained. So the tender Embryo goes on waisting his Provisions, till the Albumina being consumed, the Vitellus comes to be included in the Abdomen of the Chick, just before its Exclusion; and from thence by a peculiar Duct is carried into the Intestines, where it supplies the want of Breasts to those little Creatures, and affords them all their Nourishment till the twentieth Day.

In viviparous Animals there are sometimes two, sometimes three Humours. The first is immediately received from the Placenta into the Veins, and forthwith goes to the Use of the Fœtus. The others are also received into the Veins, but are afterwards distributed by the Arteries into the Cavities of peculiar Membranes. In glanduliferous Animals, as also in the Swine, and the human Species, there is but one Humour, which is lodged in the *Amnios*: That this Liquor is nutritious, has been proved from its being the same as is found in the Stomach. It is thin at first, but in Length of Time grows remarkably thick, especially in the larger Kinds. Besides, there is found in all of them an Urine in the Allantois, of which I have given an Account.

Besides these, there is in Dogs, Cats, and Conies, and perhaps in some other Kinds, a third nutritious Liquor. I have already described the Membranes in which it is included, and now come to speak of the Thing itself. Indeed the admirable Variety in which Nature sports, surpasses our Understanding, nor can I find out a probable Reason why a third nutritious Liquor should be more necessary for these Animals than for others. Rumination affords no Help in this Controversy, for a Horse is as much destitute of it as ruminating Creatures; nor is eating of Flesh to be regarded, for a Coney has it, while the Swine and the human Kind are without it, if Man is really to be accounted among carnivorous Animals, which is to be doubted; for tho' after the Deluge he obtained a Licence for eating of Flesh, he seems naturally constituted for living upon the Fruits of Vegetables, as appears from sacred History, and the Structure of the human Body. He has neither Teeth nor Nails like those of voracious Animals, nor any thing else in common with them. And as for the Swine, tho' he loves well enough to feed on Flesh, yet he is naturally more intent on turning up of Roots, and consuming of Fruits. But what shall we say of the Coney, a Creature that feeds on Grass and Herbs? I know not, for my part; and yet it might be suggested, that the Male Coney would almost constantly devour the young ones, if the Dam did not hide them; and, in reality, if the Coney be compared with the Rat or Mouse, both of them carnivorous, there will be found no great Dissimilitude as to their Membranes and Placentæ. But this is merely problematic, and too slight a Foundation for an Hypothesis. However it may be safely affirmed of these Animals, that they are next akin to oviparous ones, in which an Artery and Vein proceed from the Mesentery, and are appropriated to a particular Humour. But there is this Difference, namely, that the Vitellus, to which these Vessels belong, is consumed in the last Place, whereas, on the contrary, this Liquor in Dogs, &c. is the first that passes into Nutriment; and though it be copious in the Beginning of Gestation, yet before the Birth it is all gone, and not a Drop of it left in the Membrane. Hence, upon a right Computation, we shall find, that these Vessels answer to those of the Vitellus, and the Humour contained in them to the thinner Albumen; for the first Humour serves for Nutriment to the Embryo, and to increase and strengthen its tender Stamina, till it becomes more firm, and able to digest a thicker Juice.

However this be, we shall proceed in our Discourse on this and the other nutritious Liquor, and say somewhat also concerning the Urine. This last is known to be separated thro' the Kidneys and the Bladder. The others proceed also from the Blood, and very much resemble its Serum. And yet they are so far remote from the Nature of the sanguineous Serum, that being held over the Fire in a Spoon, they will not coagulate, as the other constant does. Nor will even the Colliquamentum of the Egg itself concreate by this means, though constituted of Juices evidently liable to Coagulation: So much do the Humours differ from themselves, when consider'd before and after Digestions, Percolations, and other Ways of Nature's Cooking. All these Liquors, in Distillation, afford a soft, smooth Water, very like distilled Milk; and this Property belongs to the Liquor of the Allantois as well as the rest; for as yet it remains in the mild State of the Serum of Blood, not having its Salts exasperated and exalted, nor betraying any Marks of a tartareous or saline Quality; even the very Nurfes observe, that the first Urine of Infants is not in the least salt. But in the larger Kinds of Animals, while I was passing this Juice through an Alembic, there seem'd to me to appear a small

small Quantity of volatile Salt in the Head. Coagulations attempted by Acids, succeed variously according to the Variety of the Humours. The Liquor of the Amnios of the Neat-kind, after a Decoction of Alum injected, exhibited but few Coagulations, and those very tender, but of a remarkable Whiteness. The Juice of the Allantois only became turbid like Urine; Spirit of Vitriol and Vinegar had less Effect on both of them, than Alum.

There are also spontaneous Concretions in the last Months, which are found in both the Humours, but larger and more frequent in the urinary Membrane; which was the very thing that formerly suggested to me an Occasion for reckoning this Juice among the nutritious ones, as tho' it did not pass from the Bladder to the Allantois, but from the Allantois to the Bladder, and from thence through the Penis into the Amnios. But after long and various Contemplations on its Colour, Consistence, Smell, and Taste, in different Animals, I am convinced, that it is nothing but Urine, in all of them. But it seems to be consequent from the Nature of Concretions, that the Urine of sound Persons brings off with it some of the nutritious Juice, which the famous Willis very ingeniously conjectures to be the Matter of the Hypostasis. This is done much more copiously in an Embryo, where the Blood is full of such Corpuscles, and consequently sends off more with the Urine, which, after long Maceration in the Urine, concrete, and represent such a sort of Substance.

This more frequently happens in the Urine than in the Liquor of the Amnios, because this latter undergoes continual Alterations, Part of it being still consumed by the Fœtus, and the rest mixed with new, so that the whole Juice is renewed in a short Space of Time; whence it appears, that it does not stay long enough to form Concretions.

But even here are also found adipous Coagulations, which, for the most part, adhere to the Membrane itself. Urine, on the contrary, tho' it has fewer Particles of this Kind, which are the Matter of the solid Parts; yet it preserves them from their first Entrance to the Birth, and by a continued Concoction at length condenses them.

Nor are these Membranes the Receptacles only of Liquors, but contain also a good Quantity of Air. This is abundantly evident to those who are accustomed to dissect these Parts, and frequently lift those soft Membranes with their Hand, whilst not at all distended, and find considerable Cavities between them and the Humours they contain, which must not be supposed to be a mere Vacuum. Besides, the Crying of the Child declares the Presence of the uterine Air, without which it seems impossible for a Sound to be excited. Indeed I could hardly be persuaded of the Truth of these Cryings, before I had the following Relation from a very noble Lady in *Cheshire*. This illustrious Person sitting with her Husband, the Chaplain, and other Company, in her Parlour, after Supper felt a strange Commotion in her Belly, which shook her Cloaths to such a Degree, that it was perceived by the Attendants. She was with Child, and in the eighth Month of her Term. On a sudden a Voice was heard; but whence it should proceed, having no Suspensions of the Unborn, they were at a Loss to conjecture. Soon after, the Lady was seized with a second Disorder, and a visible Concussion of her Belly and her Cloaths, and a Cry was heard as if it proceeded from thence. While the Company stood wondering, and talking to one another about this strange Event; the same was renew'd the third time with all its Circumstances, and the Crying heard so plain, that the People, who were now very attentive, could no longer doubt whence it should proceed. The young Lady, who was so audible in the Womb, is now living, and in a good State of Health. I could not but believe a matter of Fact so well attested, nor avoid publishing it, especially since it is of so great Moment in the present Controversy. Granting this to be true then, I know not how to account for it, without admitting Air to swim on the Liquors within the Membranes, when they were raised by the Head of the leaping Fœtus, and separated from the Superficies of the Humour.

But why should we account the Crying of the Child in the Uterus a Prodigy, when we so frequently hear the Chick peeping in the Egg, as well before the Shell is broken, as afterwards, the Membranes still remaining entire? *Needham de formato Fœtu.*

Monroe in the *Edinburgh Medical Essays*, has a long Dissertation of the Nutrition of the Fœtus, wherein he endeavours to prove, that none of the Liquor of the AMNIO enters the Stomach of the Fœtus for its Nutrition.

From the Memoirs and History of the Royal Academy of Sciences.

The Amnios is a very fine, transparent, and soft Membrane, of an uneven Surface on the Outside, but sleek and smooth on the Inside. It incloses the Infant, the Navelstring, and the Waters, is one of the Membranes that covers the Placenta, and ends at the Navelstring, near the Place where the Vessels separate. *Memoirs de l'Acad. Roy. des Scienc. 1714.*

With regard to the Waters inclosed in the Amnios, it is impossible for the Child to suck them in for want of Respiration; besides, they are too clear, and too like Urine, to serve for its Nourishment. They are of Use in preventing the Weight of the Child, and the Inequalities of its Body from bearing hard on the Neck of the Uterus, in its Situation in the Uterus. They defend the Child from receiving Hurt when it moves, and also prevent it from adhering to the Amnios. *Ibid.*

Some experienced Anatomists have taken great Pains, tho' to little Purpose, and stretched their Imaginations to discover by what ways the Liquor of the Amnios is conveyed over the urinary Membrane.

M. Tawry had recourse to a new Expedient. He supposes, that the Cavity of the Amnios was full at the very Beginning of the Formation, when as yet the Fœtus had no Urine to transmit to the urinary Membrane.

The Amnios being full, and the Fœtus grown stronger, the urinary Membrane begins to fill in its Turn; and the Amnios receives no fresh Supply, but keeps what it has in Reserve, dispensing by little and little what is necessary for the Nourishment of the Child till the Time of its Birth. An Observation which confirms this Conjecture, is, that the Amnios is less full, and the urinary Membrane fuller, in proportion to the Advancement of the Fœtus. If this be not a Contrivance of Nature, it is mysterious and fine enough to deserve it should be so. *Hist. de l'Acad. Roy. des Scienc. 1699.*

Over the middle Membrane comes the Amnios, which adheres to it in all its Extent, and in so close a manner, as to require some Pains to separate them. This makes me believe, that there is no such thing as Urine between the two Membranes, as some Authors have imagin'd; for if there were any Urine, which is dissipated at the Birth, there could be no such Adhesion between these two Membranes. The Cavity form'd by the Amnios contains a Liquor, in which is the Fœtus with its Cord; so that the Amnios does not immediately inclose the Child, as some have asserted. *M. Roubaux in Mem. de l'Acad. Roy. des Scienc. 1715.*

AMNIS. See AMNIA.

AMOIE, ἀμοιή. *Galen* explains this moderate. But *Hesychius* says, that ἀμοιή, amongst the *Sicilians*, signified bad.

AMOLYNTON, ἀμόλυντον, from α Negative, and μόλυνω, to pollute, or make dirty. *Cælius Aurelianus, Acut. Lib. 2. Cap. 27.* informs us; that this Name is given to a topical Application, which, if handled, will not defile the Fingers.

AMOMI. *Jamaica* Pepper is thus called by the *Dutch*.

AMOMIS, a Fruit somewhat like the AMOMUM. It is called also PSEUDAMOMUM. See AMOMUM.

AMOMUM. Tho' *Dioscorides* has been very particular in his Account of the Amomum, the Moderns have not only been much perplexed in determining what the true AMOMUM was, but are not certain, that any such thing as the Amomum of the Antients is now existing, or, at least, known to us.

The Account which *Dioscorides* gives of it, is thus:

Amomum is a small Shrub, that grows twisting its woody Stem into the Form of a Bunch of Grapes. It bears a small Flower; like that of the Leucoium, and Leaves like those of Bryony. The *Armenian* is esteem'd the best Sort, which is of a Colour inclining to Gold, of a yellowish Substance, and remarkably fragrant. The *Median* is weaker, as growing in flat and watry Places. This is a large Sort, of a greenish Colour, soft to the Touch; of a fibrous Substance, and smells like Origanum. What comes from *Pontus* is of a yellowish Colour, short, and not difficult to break, clustered like a Bunch of Grapes, full of Fruit, and very odoriferous.

Chuse what is new, and white or reddish, not the close and connected, but what is of a loose and diffused Substance, full of Seed, and like small Clusters of Grapes, ponderous, extremely fragrant, free from Worms or Mouldiness, acrid, and biting upon the Tongue, of one simple Colour, not parti-coloured.

It is of a heating, drying, astringent, hypnotic and anodyne Quality, if apply'd in manner of a Cataplasim to the Forehead. It ripens and dissolves Inflammations and Melicerides. Used in a Cataplasim with Ocimum, it helps those who are stung with Scorpions. It is good for gouty People, and helps and mitigates Inflammations in the Eyes, and also in the Bowels, if taken with dry'd Raisins. It is of Service in Womens Infirmities, used either as a Pessary, or by way of Inseffion. The Decoction of it is very proper to be drank by such as labour under Infirmities of the Liver, or Kidneys, or the Gout. It is also an Ingredient in Antidotes, and the most costly Ointments.

Some have got a way of adulterating Amomum with what they call *Amomis*, which is a Plant, that resembles Amomum, but has no Smell, and bears no Fruit. This grows in *Armenia*, and produces a Flower like Origanum.

In chusing such Kinds of Simples as this, be sure to avoid Pieces or Fragments, but take the whole Plants as they spring from one Root, entire with all their Branches. *Dioscorides, Lib. 1. Cap. 14.*

From

From *Pliny's* Account of the AMOMUM, we can only infer, that the Berry-bearing Ever-green, which commonly goes by the Name of *Amomum Plinii*, is neither the true Amomum, nor the Plant which *Pliny* alludes to; and that *Pliny* did not know himself, what the Amomum really was.

The Grape of Amomum, he says, is in Use, which grows on the Indian wild Vine, or, as others have imagined, on a Myrtle-like Shrub, an Hand's Breadth in Height. It is gathered with the Root, and packed up in small Parcels in a gentle manner, being extremely brittle. The most valuable is, what has Leaves nearest resembling those of the Pomegranate-tree, not wrinkled, and of a russet Colour. The next in Goodness is, the pale-coloured; the herbaceous is worse, and the white worst of all, which Colour it also takes with Age. It grows in that Part of *Armenia*, which is called *Otene*, and in *Media*, and in *Pontus*. They adulterate it with Pomegranate-leaves, and liquid Gum, to make it stick together, and roll itself up in the Form of a Cluster of Grapes.

There is also what is called *Amomis*, which is less veiny, but harder, and less fragrant; whence it appears to be another thing, or to be gathered before it is ripe. *Pliny*, *Lib. 12. Cap. 13.*

Amomum is endued with the same Virtues as the *Acorus*; only the *Acorus* is drier, and the Amomum the better Digestive. *Oribaf. Med. Coll. Lib. 15. Cap. 1.*

Salmasius has, with a great deal of Learning, endeavoured to shew the Difficulty of knowing what the true AMOMUM of the Antients was; and to prove, that none of the different Plants which have been taken for it, was the ancient AMOMUM.

Concerning Amomum, says he, there is much Dispute; for it is not only doubted what it is, but whether it be really existing; for the old Plant of that Name, which we are satisfy'd was formerly in Being, has been eagerly search'd after by our modern learned Botanists, but not found. In so doubtful a Case, it is however certain, that the true Amomum is not what is sold under that Name in the Shops. I should much wonder, that an Aromatic, so noted and celebrated in former Times, should be now out of Knowledge, did not I find, that several others of the spicy Kind, which were formerly of equal Use and Esteem with Amomum, lie conceal'd at present under the same Obscurity. It is much easier to tell what it is not, than what it is; for the latter is out of our Power, since nothing in our Times appears any-where which we can call Amomum, whatever may be pretended to the contrary. *Julius Scaliger*, in his Notes upon *Theophrastus*, confidently affirms it to be what they commonly call the *Rose of Jericho*, whose Want of Fragrance must be imputed to the Nature of the Place where it grows. Many, before and since his Time, who were of the same Opinion, have been exploded by others; for, besides other disagreeing Characters, this *Rose of Jericho* is tough and flexible; but the Amomum, as *Pliny* assures us, is extremely brittle. Hence there were two Sorts of it sold at the Spicery-shops; one whole, or in the Cluster, the other crumbled into small Bits and Dust. And they bore a different Price; for, as the same Author affirms, the Price of the former was sixty Denarii, of the other but forty-nine. *Andromachus* the elder, in the Composition of the *Theriaca*, calls it *βόλβον ἀμώμου*, "the clustered Amomum," in this Verse, which I read thus:

Καὶ σύεχα, μύουτ', ἰδὲ βόλβον ἀμώμου

"And of *Styrax*, and *Meum*, and Amomum in Clusters; and so *Damocrates*, in many Places of his Iambics, as he is quoted by *Galen*, has *βόλβον τ' ἀμώμου*, that is, *Uva Amomi*, "the Grape-like Cluster of Amomum." So in the Author of the Poem upon the Phoenix:

---- *Uvamque procul spirantis Amomi,*

"The Grape of the Amomum diffusing distant Odours."

The Words of *Pliny* are to be read, *Amomi Uva in Usu, ex Indica Vite labrusca; ut alii existimavere, Frutice botruso.*

"The Grape of the Amomum is in Use; it comes from the Indian wild Vine, or, as others imagine, from a Cluster-bearing Shrub." But none ever said, that Amomum was the Grape of the wild Vine, or was of the Kind of the Indian Vine. *Dioscorides* indeed says, that it had Leaves like Bryony, that is, the white Vine; but none ever heard or read, that it was the Grape of a Vine. What they call the Grape in Amomum, is nothing but the little Branches of the Shrub, twisted and interwoven in the Figure of a Cluster of Grapes, and, as *Dioscorides*, *βόλβος ἐκ ἑύλας ἀντεμπεπλεγμένης εὐαλῆς*, "a wooden Cluster, complicated and rolled up within itself." Such exactly is the Shrub of the *Rose of Jericho*, which is actually botryous, or shaped clusterwise, the slender Branches being twisted up in Folds one against another, in manner of a Bunch of Grapes. But, for all that, the *Rose of Jericho* is not Amomum; it should rather be *ἡ ἀμώμης*, "the Amomis," which was harder than Amomum, had no Smell, and, according to *Dioscorides*, was used in adulterating Amomum; to which *Pliny* adds, that it was not so full of Veins as Amomum,

but harder; and *Dioscorides* makes it have a Flower like *Origanum*. Nor indeed is the Flower of the *Jericho* Rose much unlike it in Figure; but then the Rose of *Jericho* has a Seed, whereas the Amomis, according to *Dioscorides*, has none. *Pliny* gives the Amomum the Leaf of the Pomegranate-tree: *Quam maxime laudatur Punici mali Foliis simile.* "They set the highest Value, says he, on what has Leaves like the Pomegranate-tree." Why does he reckon this among the good Properties of the best Amomum, if Nature gave it such a Leaf? All the Greeks tell us it had a Leaf like Bryony: *Isidore*, one of them, says, *Flore albo veluti Violæ, Foliis similibus Bryoniæ.* "It has a white Flower like the Violet, but Leaves like Bryony."

Pliny was deceiv'd by his own Ears; for when his Anagnostes [Reader] happen'd to be reading *καλλίστον ἐστὶν Ἀρμένιον χρυσεῖον τῇ χροῇ*, "the best is the Armenian, which is of a gold Colour," he wrongly fancy'd, that he heard *ἁμώιον* or *παράπλησον τῇ ῥοῇ*, "like, or much resembling the Pomegranate-tree." Hence he came to render it, *Laudatur quam maxime Punici mali Foliis simile.* "The most valued, &c." He says nothing of the golden Colour of the Leaf; which is at Argument, that the Words founded in his Ears like *ἰσάζον* or *ἰσίζον τῇ ῥοῇ*, [*isazon* or *isizon te roa*] "resembling the Pomegranate-tree," instead of *χρυσίζον τῇ χροῇ*, [*chryszon te chroa*] "of a Colour like Gold." Of this I don't in the least doubt.

It is a long time since the genuine Amomum began to be missed. The *Arabians* write nothing about it but what they transcribe Word for Word from the *Greeks*. They call it *Hamama*, a Word plainly deflected from *Ἀμώμου*, "Amomum." *Serapion*, in the Description of Amomum, quotes no *Arabian* Authors, but only *Dioscorides*, whose Words he transcribes; and *Avicenna* says no more of it than is in *Dioscorides*. But as to that Passage in *Dioscorides*, where he says, that Amomum has a small Flower *ὡς λευκοῖα*, "like the *Leucoium*;" the *Arabians* seem to have follow'd another Reading, or not to have understood what was the *λευκοῖον*, "*Leucoium*." The Translator of *Serapion* gives us a monstrous Version, without any Explication: *Habet. Florem parvum, similem Flori Plantæ dictæ Locadan.* It has a small Flower, like the Flower of the Plant called *Locadan*. *Cremonensis*, the Translator of *Avicenna*, seems to have follow'd another as bad a Copy, when he renders, *Et habet Florem similem Flori Indo.* *Bellunenſis* indeed made a Correction of it in the Margin, by *similem albæ Violæ*; but this he took rather from *Dioscorides*, than from any *Arabian* Author; for the *Arabic* Words of *Avicenna* sound nothing like it, but, according to the Edition at *Rome*, are to be render'd, *Et ei Folium magnum Hared*; "And it has the great Leaf of *Hared*," the *Arabic* Word signifying not a Flower, but a Leaf; and is soon after taken in that Sense, where the Leaf of Amomum is compar'd to those of the *Vitis Alba*. *Avicenna* says nothing of the Flower of Amomum in that Place, nor is *Hared* the Name of any Flower or Herb that I know of; but comes from a Verb that signifies to dilate and extend, whence *hared* is broad and extended. Wherefore I suppose, that *Avicenna* says, that the Leaf of Amomum is great and broad, and like the Leaves of the white Vine; for that is the plain Meaning of the Passage in the original *Arabic*, which ought to be thus render'd, Word for Word, *Et ei Folium magnum, latum, et in similitudinem Foliis Vitis albæ*, "And it has a Leaf, &c." There is no mention here of a Flower, for this was omitted by *Avicenna*. I wonder therefore whence the Translator could fish out his *Indian* Flower, to be compar'd with the Flower of Amomum. Besides, there is not the least Syllable said in the *Arabic* of the white Violet, which the *Arabians* call *Cheiri*. The Translator of *Serapion* also renders the Word *Hamama*, deriv'd from Amomum, by *Pes Columbinus*, "Doves Foot," which some were so fond of, that they did not scruple to affirm, that the Amomum of the Antients was the same with the Herb commonly called *Pes Columbinus*. This, among the rest, was the Opinion of *Garcias*, a Man very little skill'd in *Arabic*, tho' he conversed all his Life-time with *Arabians*. He tells us, that he was informed by a certain *Jew* Apothecary, that Amomum was called in the *Arabian* Tongue *Hamama*; but this Word signifies, when interpreted, no other than *Pes Columbinus*; nothing can be more wrong. A Dove, 'tis true, is called in *Arabic* *Hamam*, but Amomum has nothing to do with a Dove, or Dove's Foot. *Garcias* adds an Argument to confirm his Interpretation, which is, that he was presented with a Branch of Amomum by the *Persian* and *Turkish* Physicians, who officiated about the King *Nizamoxa*, which to the Life resembled the *Pes Columbinus*; and besides exactly agreed with the Description of Amomum, which is in *Dioscorides*. Mere Fables! and all that is said about the *Pes Columbinus* no more than Trifling, and nothing to the Purpose. I am at a Loss, I confess, to imagine how the vulgar Herbalists came to hammer out this Word. I have heard, indeed, that so they call a Species of the *Geranium*, which has the Leaf of the *Mallow*. But the Herb to which the *Arabians* give this Name is quite another thing; for they bestow it on the *περιερίον*, or *περιερίον* of the *Greeks*. This is called by them *rigel alhamam*,

mam, that is, the Foot of Doves, because of the Greek Name *Peristerion*, ἐκ τῆς τῆς περιστερᾶς πόδος ἐνδ' αἰσθῆναι ἐν αὐτῇ. "from the Doves delighting to be much about it." Hence it came to be call'd by the *Arabians* Doves Foot. *Apuleius Pseudonymus* also calls it *Columbina*, "Columbine," and says it is pleasant Food for Doves. Indeed an *Arabian* Botanist renders the τὸ περιστερίον, [*Peristerium*] in an old *Dioscorides*, by *rbai alhamam*, that is, the Food of Doves. There is mention made of this Herb in *Avicenna*, *Lib. 11.* which he imagines to be also called *rbai alabil*, that is, the Food of Camels. An old Interpreter renders it *Chaff*, for what Reason I know not. *Avicenna* himself, I am sure, says it is an Herb that has Seeds like Grains of Myrtle: He uses the *Arabian* Word *baxis*, which signifies *Chaff*, *Stubble*, or *Hay*. However this Herb is not absolutely to be called *Palea*, "Chaff;" for the Word in *Arabic* signifies any Herb. Whether it be the *Peristerium* of the *Greeks*, I know not. It has a Virtue of mitigating Ulcers that are subject to spread, if apply'd with Vinegar; but more properly it is not the same. There is another Herb, which, among the same *Arabians*, is called the *Pabulum Cameli*, or *Pastus Cameli*, "the Food of the Camel." *Garcias* writes, that the *Juncus Odoratus* is so called. *Scaliger* on that Passage observes, that it is named in *Arabic* *halaf algemali*; but I fancy he rather imagin'd that it was so from the Words of *Garcias*, than read the same in the Writings of the *Arabians*. The same *Garcias* informs us, that this *Juncus* was called by the same *Arabians* *Palea*, "Chaff," or simply the Herb, in *Arabic* *halaf*. As for the *Peristerium*, the *Arabian* Herbalist is in the wrong to make it the same with that Herb which *Avicenna* points out to be the Food of Doves, or of Camels; for this is the *Verbenaca*, "Vervain," of the *Latins*; and is called *Columbaria*, and also *Columbina*, "Dovefoot," by the *Latins* of later Ages. The *Arabians* also said *hamama*, and a very good *Græco-Arabic* Glossary has *χάμαμα, περιστερίον*, "Chamama, Peristerium." This Paragoric Form is to be found in many other Words; as *Curcum*, Saffron, *Curcuma*, Turmeric, a Saffron-colour'd Root; *Selach*, the Bark, *Selicha*, ἡ συγγυῖς κασία, "Cassia cover'd with the Bark." So *Hamama* is the Herb *Columbaria*, not a Dove, as is generally thought by the Learned. This Noun differs not in Pronunciation from *Hamama*, which signifies *Amomum*, but very much in the manner of Writing; for this latter is written with an *Elif* in the last Syllable, but the other with a *He* marked with two Points, which carries the Force of *Th*. Hence then proceeded the Mistake of those who by *Amomum* understood to be meant *Pes Columbinus*.

In the same *Græco-Arabic* Lexicon or Glossary, you may read various Expositions of *Amomum*, which are a full Confirmation of its being unknown even at that Time. "Ἀμώμων ἡρίζα τῆς πενταφύλλου." "Amomum is the Root of the Cinquefoil." Also "Ἀμώμων ἑτέρον Ἰνδίων, οἱ κλάδοι τῆς κιννάμωμου." "Another Kind of Amomum is the Indian, which is the Branches of the Cinamon-tree." This is an old Interpretation; for *Avienus Festus* understood τὸ κιννάμωμον, "Cinamon," in *Dionysius Periegetes*, to signify *Amomum*.

Alas amica Deo largum concessit Amomum.

"The Bird beloved by the God piled up a large Quantity of Amomum." The Greek Poet has it,

Ἦλθον φύλλα φέροντες ἀκηρασίαν κιννάμωμον.

"They came bringing Leaves of pure and unmixed Cinamon." *Hesychius*, in his Lexicon, observes, that *ἀμώμων*, "Amomum," signify'd also Frankincense. "Ἀμώμων ἐν ταῖς ὀνομασίαις ὁ λιβανός." "Amomum, in the Lexicons, is Frankincense." The same Author expounds κιννάμωμον, "Cinamon," by τὸν λιβανόν, τὸ λιβάνιον, two Words signifying Frankincense.

Some are of Opinion, that the *Amomum* of the Shops is the Seed of an Herb, which in the Editions of *Dioscorides* is called by Mistake *Σίσων*, [*Sison*] instead of *Σίνων*, which is the Word in all the antient Copies. *Σίνων* σημαίνει εἶναι ἐν Συρίᾳ, γινώμενον. "Sinon is a small Seed that grows in Syria." The Glossæ Iatricæ on this Passage say *Σίνων* εἶδος ἀρωματικόν, εἰκὸς ἀνίσω. "Sinon is a Species of Aromatic like Anise."

Lucan, *Lib. 10.* joins Cinamon with *Amomum*; and in so doing, confutes those who make *Amomum* to be the same with Cinamon.

*Cinnamon infundunt, quod nondum evanuit Aura,
Advectumque recens vicinæ Messis Amomum.*

"They infuse Cinamon unexhausted of its Odours, and Amomum fresh gather'd, and brought from the neighbouring Harvest." What, was it gather'd in such Plenty, as to deserve the Name of a Harvest? Or does he allude to the Etymology of *Amomum*, as tho' it took its Name ἀπὸ τῆς ἀμῆς, ἀ μετέδο, "from reaping?" Neither of these Conjectures, to me, seems probable: But it was usual with the Poets thus to speak when they talked of Spices, as *Quicquid metunt Arabes benevolentibus Arvis*. "All that the *Arabians* reap from their fragrant Fields." And in *Propertius*, *odorata Cultor Arabis Segetis*, "the *Arabian* Cultivator of the

"scented Crop." For they take their Spices to be their Harvest; whence *Pliny* says, that the *Arabian* Fruits consist of Spices, and even calls the gathering in of their Frankincense a Harvest, *Lib. 12. Cap. 14.* where speaking of Frankincense he says, *Meti semel Anno solebat minore Occasione vendendi*: "They used to reap it once a Year, when there was less Opportunity of selling it." And by-and-by he calls it *Vindemiam*, "a Vintage." The same Author says of Cardamom, *Metitur et eodem modo in Arabia*, "They reap it after the same manner in Arabia." *Meleager* of the *Juncus Odoratus*:

Ἐνδὴν σχοῖνον ἀμώμωνος.

"Having reap'd the fragrant Rush." But this is by-the-by. To return,

Virgil seems to have taken *Amomum* for a Grape, and the Fruit of the Vine, in this Verse:

---- ferat et Rubus asper Amomum.

"And let the prickly Bramble produce Amomum." The Bramble bears its Fruit in Clusters, and the Poet would have the Bramble for its Fruit produce Amomum. 'Tis plain, that he intended the Amomum should be taken for a real Grape and Fruit; but it is a Shrub, which, by the Implication and Convolution of its small Branches represents the Figure of a Cluster of Grapes, and is gather'd with its Root. In another Place he calls it *Affyrium Amomum*. *Servius* in one Place calls it a Flower, in another an Herb of a most pleasant Scent. By *Affyrian* the Poet means *Median*. *Pliny* says, that it grows in a Part of *Armenia* called *Otene*, and in *Media*, and in *Pontus*. Ὀτρη, "Otene," is that Part of *Armenia* which lies about the River *Cyrus*. What grew formerly in so many Places, is now no-where but in Name.

Theophrastus says, That *Amomum*, in the Opinion of some, was also brought out of *India*: Τὸ δὲ καρδάμωμον καὶ ἀμώμων οἱ μὲν ἐκ Μυθίας, οἱ δὲ ἐξ Ἰνδῶν καὶ ταῦτα καὶ τὴν νάρδα. "Cardamom and Amomum, some say, are brought out of Media; others affirm, that we have both these and Nard from the Indians." *Ovid*, like a Poet, says, that the Bird Phoenix lives on dry Amomum; therefore it must be a Native of *Arabia* or *India*. But *Dioscorides* makes no mention of the *Indian* Amomum, nor does any other of the Antients besides. *Dioscorides*, among other Characters by which the *Pontic* Amomum is distinguished from the rest, describes it as εὐσθραύστον, "not difficult to be broken." Therefore the other Sorts of Amomum are δύσθραυστα, "difficultly broken." This is directly contradictory to *Pliny*, who says, that it is *protinus fragile*, "very soon broken;" for which Reason it is gently and leisurely made up with the Hands, that it might not be broken; for the Passage must be read thus: *Carpiturque cum Radice, manu paulatim leviter componitur protinus fragile*. "It is gather'd with the Root, &c." Mention is also there made of the *friatum Amomum*, "the crumbled Amomum," which also was valuable. It was so brittle, it seems, as to be crumbled. But *Dioscorides* writes of the *Pontic* Amomum, Τὸ δὲ Πόντιον ὑπόκρητον, εὐμακρόν, εὐδὲ δύσθραυστον, βέλτερον δὲ, πλῆρες καρπῶ. "The *Pontic* is reddish, not long, brittle, cluster'd, full of Fruit." Wherefore the two former Sorts, the *Median* and *Armenian*, are δύσθραυστα, "not brittle." *Ovid* speaks of the Powder of Amomum,

---- et Amomi pulvere conde,

"and lay him in Powder of Amomum." But the Question is, whether this Powder was made of Amomum by pounding or crumbling. Cassia and Cinamon were also pulverized, but by means of pounding only, not by crumbling [*trita tantum, non friata*].

Amomum was sold by the Colour-sellers not only in the Grape, but, as it appears, also in Powder. And perhaps *Pliny* imagin'd, that this Powder was the Produce of the crumbling of Amomum, from whence he conjectur'd, that it was very brittle, or rather friable. *Dioscorides* does not say so much as this even of the *Pontic*: He says that it was not δύσθραυστον, "hard to break;" but it does not follow, that it was easily friable, because it was not difficult to be broken. Many things which are brittle, are not friable. The εὐσθραύστον, "easy to break," of the *Greeks* is different from their εὐθραύστον, "easy to crumble." I have no Faith in *Pliny*, being certain, from an infinite Number of Places besides, that he is not to be depended upon for one single Matter. From a preconceived false Opinion, that the Leaves of Amomum were like those of the Pomegranate-tree, he says, in the same Passage, that it was used to be adulterated with Pomegranate-leaves, and liquid Gum, that it might stick together, and roll itself up in the Form of a Bunch of Grapes. According to this Opinion, Amomum might be no more than a Parcel of Leaves conglobated and convolv'd, or rolled up. Yet *Dioscorides* has nothing about the Leaves, and 'twas the Shrub itself, not the Leaves, that composed the Cluster, βέτερος ἐκ ξύλων, "the Cluster consists of the woody Substance." And as *Avicenna* says, speaking of this same Amomum, *bunkud min chikeh*, "the

“the Cluster or Bunch is of Wood.” So that this Cluster consisted of the small ligneous Branches roll’d up within themselves.

On the same Authority depends the Assertion in the same Place, that the Cardamom was like the Amomum, both in the Name, and in the Shrub. He might as well have said, that the Cinamon too was like Amomum. For as to the Name, Cinamon [*Cinnamomum*] is as much like Amomum as is Cardamom, but neither is the Shrub of Cardamom at all like that of Amomum. Indeed if the Smell answer’d, and the Shape of the Leaves, there would be nothing wanting in the *Jerusalem Rose* to make it pass for the true Amomum. The Shrub is about a Hand’s Breadth in Length, shoots forth several Branches from its Root, which are reflected and conglobated in such a manner as to represent a Cluster, which incloses a Multitude of Seeds, as in a Spike, that stick to the small Branches or Sprays, like Grapes in a Cluster. *Isidore* says, *Amomum Frutex est in Syria et Armenia nascentis botrosus Semen reddens sibi connexum*. “Amomum is a Shrub that grows in Syria and Armenia, and bears a Seed connected in manner of a Cluster of Grapes.” I have two of these Roses now by me, which being compared with the Description of Amomum, seem, to me, to represent it in a lively manner. ’Tis certain, that of all the Things obtruded upon us for Amomum, there is nothing that agrees better with it. As to the Smell, it might be answer’d, that this is a Quality which depends on the native Soil: So the common Oenanthe, and the Attic itself, have no Smell; ’tis only the Cyprian Oenanthe, of which they make the Unguentum Oenanthium, that carries a Fragrancy. Yet the Country of Pontus, which is colder than Judaea, produces the most fragrant Amomum, *ἡ ἄριστη ἀνέστην*, “and that strikes the Sense of Smelling.” But this perhaps is not to be regarded; for the Median Amomum, tho’ the Country be hotter, yet; because it grows in Fields, and watery Places, is of less Virtue and Fragrancy, as *Dioscorides* informs us. As to the Leaf’s not answering the Description, the Fault perhaps might lie in the first Reporters. How many things do we find related in antient Authors, which are now discover’d to be false! For Instance, the Malabathrum, according to *Dioscorides*, is a Leaf that floats on Pools, and standing Water, like an aquatic Plant. We have observ’d more such Mistakes elsewhere.

It would be Folly to affirm the Rose of *Jericho* to be Amomum, especially since there are so many things that might induce us to believe the contrary. Those Antients would not have been at the Trouble to search in Armenia, Media, and Pontus, for a Plant which every modern Traveller brings home with him from Judaea. They would, at least, have inform’d us, that it grew also in Judaea, but without Smell. *Theophrastus* brings it from India. *Isidore* writes, that it is found in Syria; but none of the Antients agree with him. *Avicenna* has Egyptian instead of Pontic Amomum, by a Mistake of the Translator; for what he renders, *Est species Egyptiaca*, “And there is the Egyptian Species,” in the Arabic is no more than, *Est species alia est*, “and there is another Kind.” It is not improbable, that this Rose was seen by the Antients, and described for the Amomum. It would be Amomis; but that it has Seed, which Amomis wants, according to *Dioscorides*.

In so great a Variety of Opinions, one knows not how to determine, nor where to fix. *Pliny* tells us, that Amomum is extremely brittle and friable: *Dioscorides*, that it is soft to the Touch. The former gives it the Leaves of the Pomegranate-tree, the other those of Bryony. *Salmasius*, *De Homonym. Hyl. Iatr. Cap. 91*.

The most probable Account, however, of the true Amomum, is that given by *P. G. Camelli*, as follows, from the *Philosophical Transactions*.

After I had seen the cluster’d Bunch of Flowers of the *Tugus*, which some call *Birao*, others *Caropi*, and tasted the Kernels of the Grape, or the oblong Seed, and compar’d them with the Descriptions which the Botanists give us of Amomum, I became of Opinion, that the *Tugus* was the genuine Amomum of *Dioscorides*.

This *Tugus* is a Plant, sometimes above a Cubit high, with Leaves like the Plant *Tagbac*, or *Bagongbonque*, except that its under Part is cover’d with a delicate Down; and that it is more fibrous, longer, and fragrant. At the Root of the Plant, or Body of the Stalk, from the very Middle or Heart of a foliaceous Stem, sprouts forth a Parcel of floriferous and graniferous Leaves, an Hand’s Breadth and half in Length, in the Figure of a Cluster of Grapes, having some Resemblance to the Pistil or Bunch of Flowers of the *Amomum*, adorn’d with very red small Flowers, which are succeeded by Grapes, that run out in Length with a Neck, as tho’ they were the Reliques of the Tube of the Flower, and are inclosed in a thin sweet Rind, whence they are mostly, together with the Seed, or Kernels, devour’d by the Mice and the Birds, so as that it can be had only in very small Quantities. That it was not common in former Ages, nor grew in every Country, *Virgil* seems

to insinuate, by his promising, that *Affyrium vulgo nascitur Amomum*, “the Affyrian Amomum shall grow every-where.”

These Grapes commonly contain five or six reddish, oblong, unequal, aromatic, fragrant Kernels, or Stones, less acrid than *Amuyong*, or the *Cubebs* of the Shops. Some of the Indian young Women use to thread them, sometimes by themselves, and sometimes intermixed with Pearls and Coral, and so make them serve for *Caropi*; that is, Bracelets and Necklaces. Others make these Kinds of Ornament of these Kernels, and the Seeds of *Bolmusci*, by them called *Maricom*, or of the *Arundo Lithospermus*, which they call *Tigbi*, or of the *Canna Florida*, which is their *Ticaffias*, or of the *Pisum Coccineum*; by them called *Saga*; and also of the Seeds of *Amomum*, *Radiang*, and *Calanos*. But they wear the Kernels of the *Tugus* about their Neck on account of their Fragrancy; besides, they are found by Experience to preserve from Infection in corrupt Air, and to heal the Sting of the *Scolopendria*, [a venomous Insect] if chew’d and apply’d to the grieved Place. The Root is like the Root of *Tagbac*, or *Calamus odoratus*, being insipid, and white in the inner Substance, but wrapt up in cepaceous [Onion-like] Coats of a very red Colour, and endu’d with some Fragrancy. I had an Account, by a Letter from *Borongam*, that this Plant bore another Fruit on the Tops of the Stalks, which had no Smell; but this I never saw. The Indians of *Indostan* assured me of the same, but I fancy they mistook the *Tagbac* [Tagbac] for the *Tugus*.

It grows in *Borongam* and *Paranäs*, in *Samar* the chief of the other Islands, and in *Loyte*. And I don’t doubt but it may be also found in *Luxon*, especially at *Silanium*, in the deep Places worn by the Torrents.

N. B. The young and tender Buds of the Flowers of the *Tugus* have some Resemblance to the Pseudo-Amomum of *Garcias*, which expresses a Dove’s Foot. But that nothing may be wanting to clear up the Matter, I have sent with these Advices the Figure of the Plant. Some will object, I know, and say, that a Chestnut is better like an Egg, than the Leaves of the *Tugus* are like those of the Pomegranate-tree, which I freely allow. But all that *Dioscorides* and *Pliny* have related of the Amomum, I think, should be understood only of the floriferous Cluster of the *Tugus*, when turgid with Seed, because the entire Plant itself was unknown to them. For this *Thyrus* of the *Tugus* will be found to be the little Shrub [the *baupicus*, “Thamnisus,” of *Dioscorides*] about an Hand’s Breadth in Height; to consist of reddish-coloured Wood, or a ligneous Sort of Substance; that its Leaves and Flowers are like those of the Pomegranate; that it rolls itself up in the Form of a Cluster of Grapes, or, as *Barth. Merula* translates the Expression of *Dioscorides*, has a Fruit like *Botruon*; is full of Seed like small Grapes, contained under a carnosous Tegument; is very fragrant, of an acrid Taste, and of an astringent, heating, and drying Quality; with other Characters of the true Amomum, besides the Resemblance of the *Pes Columbinus*. It grows in *Turcomania*, a Province of *Armenia*, as *Joh. Botero Benes* writes. *Philos. Transact.*

There are three different Plants to which the Moderns have affix’d the Name of AMOMUM. The first is the *Amomum*, Offic. *Sison*, Mor. Umb. 14. *Sison* *Dioscoridis*, Hist. Oxon. 3. 283. *Sison vulgare* sive *Amomum Germanicum*, Park. Theat. 914. *Sison sive officinarum Amomum*, J. B. 3. 197. Mer. Pin. 113. Bot. Monsp. 242. Raii Hist. 1. 443. *Sison Cordi*, Merc. Bot. 69. Phyt. Brit. 114. *Sison*, *Quind*, *Simson*, sive *officinarum Amomum*, Chab. 308. *Sison quind Amomum officinis nostris*, C. B. Pin. 154. *Stium aromaticum*, *Sison officinarum*, Tourn. Inst. 308. Boerh. Ind. A. 57. Raii Synop. 3. 211. Dill. Cat. Giff. 139. *Petroselinum Macedonicum Fuchsi*, Ger. 864. Emac. 1016. BASTARD STONE-PARSLEY. Dale.

The lower Leaves of this *Amomum* are long and pinnated, or having small Leaves growing opposite to one another on a common long Stalk, being about an Inch long, and not above half the Breadth, broader at the Base, and ending sharper-pointed, cut in on the Edges, having a single Leaf at the End of the Foot-stalk. They are of a bright-green Colour. The Stalk arises to the Height of two or three Feet, finely chanell’d, and divided into several Branches, on which grow the like Leaves, but much less and finer; on the Tops grow small Umbels of white five-leav’d Flowers, producing little striated Seed, about the Bigness of Parsley-feed, of a pleasant, hot, spicy Smell and Taste, something like a Nutmeg. It grows in Ditches and Banks, and moist Places, flowering in Summer; its Seed, which is the only Part used, being ripe in August.

The Seed is hot and dry, attenuating, and good to open Obstructions, to cleanse the Reins of Gravel; it is diuretic, and promotes the *Menstrua*, and is esteemed to be *Alexipharmic*, and as such is put into *Theriaca Andromachi* for a *Succedaneum* to the true *Amomum*. *Miller, Bot. Off.*

The second is the *AMOMUM*, Offic. Comm. Flor. Mal. 14. Plant. Ufu. 88. Barr. Icon. 571. Obs. 1393. 27. *Amomum verum*, Ger. Emac.

Emac. 1548. Raii Hist. 2. 1697. *Anomum genuinum*, Park. Theat. 1567. *Anomum racemosum*, C. B. Pin. 413. Jons. D. *Anomum novum Cardamomi vulgaris facie, sive Indicus racemus*, J. B. 2. 195. Chab. 127. *Eleitari*, 1. Hort. Mal. 11. 9. Tab. 5. TRUE AMOMUM. Dale.

This Fruit is an Ingredient in the *Theriaca*, and is sometimes mixed with strong Purgatives, to qualify them a little. Each Fruit is divided into three Cells, and is of a very pungent Taste: It is brought from the *Philippine Islands*, and is reckon'd carminative, alexipharmic, stomachic, &c. *Geoffroy*.

It is incisive, and digesting; it resists Poison; it disperses Wind; it strengthens the Stomach; it creates Appetite and Strength; and it provokes the Menstrues. *Lemery de Drogues*.

The Amomum which is reckoned amongst medicinal Drugs, and which is a principal Ingredient in the *Venice Treacle*, grows on a Tree which bears the same Name with itself, the Leaves of which are long, strait, and of a pale-green Colour; and its Flowers resemble those of the white Stock-gilly-flower: Its Fruit is pretty like the *Muscadine Grape* in Colour, Bulk, and Shape; but it is not quite so full of Grains, and is less juicy. Its Pods, which have no Pedicels, are crowded together, and glued, as it were, on a long Nerve, which they surround to the very Top; and which serves as a Support to them: In the inner Side of these Pods are found purple-coloured Grains, of an almost square Figure, distinct, and covered with slender white Membranes. The Taste of these Grains is sharp and acrid, and their Smell extremely piercing and aromatic.

The newest Amomum is always the best; it ought to have its Pods round, of a whitish flaxen Colour, weighty, and well-filled: That, on the other hand, the Pods of which are black and shrivelled, are very little, or not at all, esteemed.

A great many People confound the Amomum with the greater Cardamoms, tho' they do not resemble each other in one single Circumstance. *Savary Dictionnaire de Commerce*.

The third is called,

AMOMUM PLINII, Offic. Ger. 289. Emac. 361. *Solanum fruticosum bacciferum*, C. B. Pin. 166. Raii Hist. 1. 673. Tourn. Inst. 149. Elem. Bot. 124. Boerh. Ind. A. 2. 67. Rupp. Flor. Jen. 37. *Fruticosum Americanum, dictum Amomum Plinii*, Park. Theat. 352. *Anomum Plinii, seu Pseudocapsicum*, ejusd. Parad. 431. *Strychnodendros*, J. B. 3. 614. *Apollinaris Solani species ex Apennino*; *Strychnodendros, Solanum arborecens*, Chab. 523. TREE NIGHT-SHADE. Dale.

Its medicinal Virtues are esteemed to be much the same as the common SOLANUM, Night-shade, which see.

AMONGABRIEL, according to *Rulandus*, AMOGABRIEL according to *Johnson*, is *Cinnabar*.

AMONGEABA. This is the Name by which *Piso* calls a kind of Grass which grows three, four, or five Foot high, from Roots consisting of small Filaments, much after the manner of a Reed. The Leaves are about a Foot long, beautifully twisted, green, almost of the Figure of the Leaves of the larger Nut-bearing Palm, and a considerable Number of them on one Stalk. The Stalk at the Top bears an Ear a Foot and an half long, like in Bulk and Shape, to the Ear of the *Milium*, or *Wild Panicle*.

It is of an emollient Nature, either internally or externally applied: It supplies the Place of Mallows, and is beneficial in a TENESMUS, used by way of Fomentation.

AMOR, Love. It is no Wonder that Love has been esteemed a Distemper, as it is productive of many Disorders, especially Madness, as *Caelius Aurelianus* observes very judiciously; for as Madness is generally caused by thinking too much of one thing, nothing is more likely than Love to fix the Attention upon one Object.

Besides Madness, Love may, and certainly does, produce every Distemper which arises from a too great Laxity or Stricture of the Animal Fibres: For Anger, Envy, and Jealousy, the usual Attendants on Love, brace up the Fibres, and render them too tense and rigid. Again, Joy, Complacency, Fear, and Grief, relax the same Fibres, enervate the Solids, and impair the Actions, whether Animal, Vital, or Rational.

The Seeds of Love are, no doubt, planted in the Constitution of every Man; and of every Woman; for Purposes conducive to the Designs of the Creator, and extremely beneficial to the Creature. For, besides the great End of supplying the World with People, Love incites Mankind to Action; and perhaps the little Difficulties with which it is attended, stimulate the Mind, and, in Consequence thereof, the Body: Inasmuch, that if the Desire, implanted in each Sex, of being agreeable to the other, was removed, perhaps no other great Incitement to Action would remain, except Hunger: So that what *Virgil* says of Agriculture, is applicable to Love:

Pater ipse colendi

*Haud facilem esse Viam voluit, primusque per Artem
Movit agros, Curis acuens Mortalia Corda;
Nec torpere gravi passus sua Regna Venerio.*

Upon the Whole, if it was not for Love, Mankind would soon degenerate into Brutality; and it only becomes criminal

or pernicious, when so excessive as not to be guided and directed to a proper Object, and with Moderation, by Reason.

It is no absurd thing to reckon Love among the Affections of the Brain, since it is a kind of Solicitude; and Solicitude is an Affection of the Mind, when Reason is employed in a tiresome Motion or Pursuit.

Love is attended with the following Symptoms: The Eyes are hollow, and weep not, but appear as if they were replete with Pleasure. The Eyelids often twinkle; and tho' the other Parts of the Body maintain their Plumpness, the Eyes of Persons in Love are contracted and sunk. There is no Pulse peculiar to Lovers, as some have thought, but it is like that of the Careful and Solicitous. When the Remembrance of the beloved Object is excited, either by the Hearing or Sight, and especially if it be sudden, the Spirits are all in Confusion, and the Pulse changes, and neither beats equal Time, nor with equal Force. Some are sad and wakeful; others, who are not conscious of their Affection, pine away in Sloth and Slovenliness, and a low Diet. But the wiser Sort, when they find themselves in Love, divert their Thoughts, and relieve themselves by going to the Baths, drinking of Wine, Gestation, entertaining Sights, and pleasant Conversation. Some Lovers ought to be terrified; for they who are always at Leisure to indulge their amorous Thoughts, will hardly get rid of that troublesome Passion. It would also be very proper to enter into a Controversy, or commence a Suit against such a Person in Love, which may affect that State of Life, or Way of Business which he has chosen; for all Means must be tried to divert his Cares and Pursuits into another Channel. *Eginet. Lib. 3. Cap. 17. Oribas. Synop. Lib. 8. Cap. 9.*

This Method of curing a Person in Love, by stirring up a Law-suit against him, is likely enough to have its Effects; but I should doubt whether a Cure of this Sort would be consistent with the old Maxim, which requires it to be performed *tuto, cito, & jucunde*.

Dr. James Ferrard published a Treatise of Love, as a Distemper, which was printed at Oxford, 1640.

AMORIS POMA, Offic. Ger. 275. Emac. 346. *Poma majora amoris, fructu rubro*, Park. Parad. 379. *Solanum pomiferum, fructu rotundo striato molli*, C. B. Pin. 167. Raii Hist. 1. 675. Hist. Oxon. 3. 520. *Mala aurea, odore satido, quibusdam Lycopersicon*, J. B. 3. 620. *Mala aurea*, Chab. 525. *Lycopersicon Galeni*, Tourn. Inst. 150. Elem. Bot. 125. Boerh. Ind. A. 2. 69. Rupp. Flor. Jen. 37. LOVE APPLES. Dale.

AMORIS POMUM. This is a Species of *Solanum*, bearing many large winged Leaves, divided into several Segments, of a yellowish-green Colour; the Stalk is branched into many Divisions, on which, at the setting on of the Leaves, grow the Flowers, several together, each consisting of a single Flower, divided into five Parts like a Star, of a yellow Colour, with a deeper Umbo in the Middle. Each Flower is follow'd by a round Fruit as big again as a Cherry, green at first, and of a yellow Red when full ripe; in which are contained a great many flat whitish Seeds, in a juicy Pulp. It is sown in Gardens, and flowers in July; the Fruit is ripe in September, and perishes with the first Frosts.

In Italy they eat these Love-apples with Oil and Vinegar, as Cucumbers are eaten here; but they are seldom eaten with us, being of the Nature of the other *Solanums*; and therefore only used outwardly, in cooling and moistening Applications, in Inflammations, and Erysipelas; and its Juice especially is commended in hot Defluxions of Rheum upon the Eyes. It is but seldom used. *Miller Bot. Off.*

AMORGE, ἀμόργη, the Fæces or Recrement of Oil. See AMURCA.

AMPANA. This is the Name in the *Hortus Malabaricus* for the *Palma Coccifera, Folio flabelliformi*, Mas. The Portuguese call it *Palmeiro Bravo Macho*.

AMPAR, Amber is sometimes thus called.

AMPELION, ἀμπέλιον, Vines Leaves, or Tendrils. *Hippocrates* recommends these bruised, and mixed with Honey, and made up, with Wool, into the Form of a Pessary, in order to promote the Menstrual Discharges, or the Lochia. *De Natura Muliebri*, and *de Morbis Mulierum*, L. 1.

AMPELIS, a Bird described by *Aldrovandus*, and said to be delicate Food. I take it to be the *Beccafico*.

AMPELITES TERRA, a Sort of black Earth, thus distinguished.

TERRA AMPELITES, Offic. Worm. *Ampelitis terra sive Pharmacitis*, Ind. Med. 8. 31. Agric. 595. *Aldrov. Mus. Metal.* 260. *Terra Ampelites sive Pharmacitis, qua Medici utuntur*, Kentm. 3. *Lapis Ampelitis Galeni*, Charit. Foss. 14. *Lapis obsidianus*, Mer. Pin. 217. *Carbos Theoph. Succinum nigrum*, Swenckfeld Cat. Foss. 394. *Terra Ampelitis*, Calc. Mus. 128. Gæbal. 28. CANNAL COAL. Dale.

I believe Cannal Coal will not dissolve when Oil is poured upon it, which is one of the Characteristics that *Dioscorides* gives to the TERRA AMPELITIS: This, therefore, seems different from what we usually call CANNAL COAL.

The Terra Ampelitis, by some called Pharmacitis, is found in *Seleucia*, a City of *Syria*. Chuse what is black, resembling small (*Oribasius* reads *μαρσις*, long) Pitch-tree Coals, that will cleave, in some measure, into thin Bits, and shines alike in every Part; that, moreover, being levigated, will readily dissolve upon the Affusion of a little Oil. The white, cineritious, and what can't be liquefied, is to be rejected.

It has a discussive and refrigerating Virtue; is an Ingredient in Cosmetics for the Eyelids, (*καλλυβλάφας*) and to colour the Hair. It is also used to anoint the Vines, at the time of their Budding, in order to kill the Worms which breed in them. *Dioscorides*, Lib. 5. Cap. 181.

The Terra Ampelitis is more medicinal, drying, and digestive, has more of a biting, and less of a mitigating Quality, than the Terra Chia, Samia, or Selinusia. *Oribasius*, *Med. Coll.* Lib. 15. Cap. 1.

The Ampelitis Terra is also called Pharmacitis, because it is more medicinal than the other Earths; and because the Country Farmers, when the Spring comes, dilute it with Water, and so rub it about the Roots of those Vines which have sent forth Buds, that no noxious little Animals might approach to touch them. It sufficiently shews its medicinal Virtue in killing the Cnipes (Worms) which infest the Vines. No mitigating or lenitive, but a drying Quality belongs to it; for which Reason it is an usual Ingredient in drying and discussive Compositions. *Actius*, *Tetr.* 1. *Serm.* 2. *Cap.* 9.

To supply the Want of Terra Ampelitis, you are directed to take a little more than half the Quantity of *Brutian Pitch*, by *Marcellus Empiricus*, *Cap.* 7.

AMPELITIS *sive* Pharmacitis, is a very bituminous Earth, as black as Jet; it is divided into Scales, and is easily reduced into Powder; it is taken from a Quarry near *Alenon*; there are two Sorts of it, one of them tender, the other hard; when growing old, it pulverizes of itself, and they get from it some Saltpetre.

It is proper to kill Worms, being applied to the Belly; it dyes the Hair black.

Some call it Earth of Vine, because, being in the Vineyards, it kills the Worms which creep up the Vines. *Lemery de Drogues*.

AMPELOPRASON. See ALLIUM.

AMPELOS, ἀμπελος, is Bryony, according to *Oribasius*, *Med. Collect.* L. 13.

AMPHARISTĒROS, ἀμφαριστερός. It signifies the Reverse to AMBIDEXTER, that is, having two Left Hands; which means being clumsy, or having a perfect Use of neither. Figuratively, it imports *unlucky*, *unfortunate*.

AMPEMERINOS, ἀμπεμερινός πυρετός, a Quotidian Fever; that is, a Fever which brings on a Paroxysm, or Fit, every Day. It is derived from ἀμπερ, a Greek Preposition, which imports a kind of Revolution, and ἡμέρα, a Day.

AMPHIBLESTROIDES, from ἀμφιβλεστρον, a Net. The same as RETIFORMIS, which see.

AMPHIBRANCHIA, ἀμφιβράγχια, from ἀμφι, about, and βράγχια, properly the Gills of Fishes; but sometimes taken for the Fauces. The Parts about the Tonils.

AMPHICAUSTIS, ἀμφικαυσίς. This imports a Sort of wild or mountain Barley; and, in some Writers, it signifies the PUDENDUM MULIEBRE; but I don't know that it is used in this Sense by any medicinal Author.

AMPHIDEON, ἀμφιδέων, the Orifice of the Uterus, call'd the Os Tincæ.

AMPHIDEXIOS, ἀμφιδέξις, the same as AMBIDEXTER.

AMPHIMETRION, ἀμφιμέτρειον σημεῖον. *Galen* in his Exegeſis, says *Hippocrates*, in his second Book of Epidemics, means by this a Sign which manifests the Condition of the Uterus. But the Word is neither to be found there, nor in any other Part of *Hippocrates*. *Foſſius* thinks that the Word ἀμφιδύμιον, in the sixth Book of Epidemics, *Seſt.* 8. *Aph.* 38. should be ἀμφιμέτρειον, and that *Galen* alludes to this Passage.

AMPHIPLEX, ἀμφιπλήξ, according to *Ruffus Ephesus*, is the Part situated betwixt the Scrotum, Anus, and internal Part of the Thighs.

AMPHIPNEUMA, ἀμφιπνεύμα, from ἀμφι, about, or around, and πνεύμα, Breath. It signifies an extreme Difficulty of breathing, in *Hippocrates*, *Epidem.* L. 4.

AMPHIPOLOS, ἀμφίπολος, a Maid-servant. This Word has no other Right to a Place in a Medicinal Dictionary, but that it is used by *Hippocrates* *Epidem.* Lib. 5. But the Case he relates in this Place is very remarkable. The Servant of *Dyseris* in *Larissa*, whilst young, felt extreme Pain in Coition, but at other times was very easy. She was never with Child. When she was about sixty, she used to be seized with excessive Pains, like those of Labour, after Noon. One Day, having eaten in the Morning a large Quantity of Leeks,

she was seized with more severe Pains than usual; and upon Examination, she felt something rough at the Orifice of the Womb; soon after this she fainted, and, during her Fit, another Woman took from her a rough Stone, as large as the Spondyle of a Distaff. After this she was well, and continued so ever after.

AMPHISBÆNA, a venomous Serpent. The Amphisbæna and Scytala resemble one another; for they are not shaped with a thick Body, tapering into a slender Tail, but are of equal Thickness throughout their whole Length; so that a Spectator is puzzled to find at what End the Head or Tail are situated. The Amphisbæna differs from the Scytala, in that it moves with either End forward, whence it takes its Name [ἀμφι either way, and βαίνα to go]. *Galen* says, the Amphisbæna is an Animal with two Heads. They say, if a big-belly'd Woman steps across this Serpent, she falls in Labour and miscarries.

The Bites of these Creatures are hardly perceptible, and much like the Punctures of Flies; wherefore they are not mortal, but cause an Inflammation like what arises from the Sting of a Bee or Wasp, tho' in a more intense Degree; so that what is good for the Stings of these Insects, will be of Service here. *Actius*, *Tetr.* 4. *Serm.* 1. *Cap.* 30.

The Colour of the Amphisbæna is a shining White, distinguish'd with reddish Spots; its Cheeks are so large, that they conceal his Eyes; and this Circumstance hath made it said, that it is blind.

It is found in the Isle of *Lemnos*; its Bite is dangerous, and requires the same Remedies as that of the Viper. It contains a great deal of volatile Salt and Oil. Its Flesh, Liver, and Heart, are proper to excite Sweat, to take away bad Humours by Transpiration, and are a good Antidote against Poison. *Lemery des Drogues*.

AMPHISMILA, ἀμφισμίλα, from ἀμφι, on each Side, and σμίλα, an Incision Knife. A dissecting Knife, with an Edge on each Side. *Castellus* from *Galen*.

AMPHISPHALSIS, ἀμφισφαλισίς, from ἀμφι, and σφάλω, to wander. *Foſſius* translates this by the Words, *Oberratio*, *Circumductio*, *Circumactio*, *Circumagatio*. This Word, I believe is peculiar to *Hippocrates*. He uses it in his Book of *Articulis*, to express a Circumaction, or turning of the Leg, in order to replace the Head of the Femur, when slipp'd out of the *Acetabulum*.

AMPHITANE, the same as CHRYSOCOLLA, which see. *Castellus* from *Fallopius*.

AMPHODONTA, ἀμφόδοντα, from ἀμφι, on both Sides, and ὀδών, a Tooth. This Word is used by *Hippocrates* in his *Treatise de Arte*, as an Epithet of Animals, to express their having a Row of Teeth in both Jaws.

AMPHORA, is a Roman Measure for Liquids. It is originally a Greek Word ἀμφορεύς, *Iliad.* 23. *Odyss.* 9. by a Syncope, ἀμφορεύς; it is so called from the two Ansæ or Handles for Carriage. It is the twentieth Part of the Culeus. It contained seven Gallons one Pint English Measure. *Arbuthnot of Antient Measures*.

AMPLEXATIO, or *Basiatio*. The Alchymists call thus a kind of Union betwixt their Philosophical Mercury, which they call the *White Female*, and by which they mean *Regulus* of Antimony, and the *Red Husband*, by which they mean Gold. This Embracing some of them express in Terms, not very decent.

AMPOTIS, ἀμποίς. It signifies properly the Recess or Ebb of the Tide. But *Hippocrates*, who was of *Cos*, one of the Grecian Islands, and must have had many Opportunities of observing the Tides, very elegantly applies this Word to the Recess of Humours, from the Circumference of the Body, to the internal Parts.

AMPULLA, a Vessel of an indeterminate Capacity, and a particular Form; for it must have a Belly like a Bottle, Jug, or Crewet, in order to be an Ampulla.

In Chymistry, any Vessels are called *Ampullæ*, which have large Bellies, as Cucurbits, Boilheads, and Receivers.

Hildanus calls the first Appearances of the Heart, Liver, and Brain, in a Fœtus after Conception, *Ampullæ* from their Shape.

AMPULLASCENS. The Alveus Ampullascens is the most tumid Part of *Pecquet's* Ducts, which convey the Chyle from its Receptacle, to the Subclavian Vein.

AMPUTATIO, Amputation.

Celsus, who lived more than an Age before *Galen*, is the first Author who gives us a Description of Amputation; and tho' his Surgery be, as is said, taken from *Hippocrates* and *Asclepiades*, he quotes neither of them with respect to that Operation.

Hippocrates treats of a Gangrene and a Sphacelus; what is putrefy'd, he says *, must be cut off, but he does not describe the Amputation of a Member. *Asclepiades* lived an Age before Christ †; we have nothing of him concerning this Affair, and do not know whether he ever performed the Operation. As

* De Articul. 4. Observ. 17. de Morb. Vulg. Lib. 2. Sect. 7. *Epidem.* Lib. 7.

† Daniel Le Clerc, in his History of Physic, Edit. 1723. p. 392. says, that this Physician was in great Reputation at Rome, during the Life of *Mitridates*, that is to say, about the Middle of the thirty-ninth Century.

much might be said of *Herophilus* and *Erasistratus*, who acted as Surgeons †. We find then no Description of this Operation before *Celsus*; however, we cannot doubt, but it was performed before his Time, and that, even the Manner of it was described in some Authors, whose Works are lost. In all Probability, the Operation was never performed in those Times; nor ever since, till the fifteenth Century, but on occasion of an Arm or a Leg affected by a Sphacelus. It seems to have been done but very seldom; because the Patients were always in imminent Danger of their Lives, or, according to *Celsus* ‡, died; for the most part, of an Hemorrhage, under the Operation.

We are not to wonder at this; for *Celsus* made no Ligature above the Place of Amputation, to compress the Vessels, and prevent an Hemorrhage; at least, he does not mention it in the Description of his Operation, which is as follows, *Lib. 7. Cap. 23.* "An Incision is to be made with the Knife in the Flesh, between the sound and the corrupt Part, as far as the Bone, in such a manner as not to do it against a Joint, and rather to cut off a sound Part than leave any thing unsound. When you come to the Bone, the sound Flesh is to be drawn back; and the Bone is to be cut upon quite round it, that it may be perfectly bare (of the Periosteum). This done, the Bone itself is to be amputated with the Saw, as near as is possible to the sound Flesh; then the Face of the Bone, which was exasperated by the Saw, is to be smoothed, and the Skin is to be brought over it; in order to which, and that it may the better cover it on every Side, it ought to be lax. Where the Skin cannot reach, the Place must be covered with Lint, and a Sponge dipt in Vinegar must be bound upon it. The Cure must afterwards be managed as a Wound in which a large Suppuration is to be prevented."

In this Description we see no Means to prevent an Hemorrhage; and this is the very Reason why the Patients often dy'd by the Loss of Blood under the Operation. But, what is surprising, we find no Method for that Purpose, in any Author who has described that Operation, till the sixteenth Century. *Paulus Aegineta*, *Avicenna*, *Guido de Cauliaco*, say not a Word of it. This last, who lived about the Middle of the fourteenth Century, made two Ligatures, one above, and the other below the Place of Amputation; but he does not say, that he made them to prevent an Hemorrhage, or so much as to take away the Sense of Feeling from the Part. We may well imagine, that he did it only to keep down the Flesh tight and firm; that the Incision with the Knife might be made with the greater Ease and Smoothness. We know not whether *Vesalius* used a Ligature to stop an Hemorrhage or not; because we do not well comprehend his Description.

Bartholomæus Maggius, who wrote about the Middle of the sixteenth Century, and whose Works are collected by *Gesner*, made a Ligature upon the sound Part, above the corrupted. They drew this Ligature very tight, to deprive the Part, in some measure, of Feeling; but there is not a Word said throughout the Whole, concerning Means to prevent an Hemorrhage during the Operation. He says, that *Celsus* made a Ligature above the corrupted Part; but *Celsus* has not describ'd his Operation in the same manner that *Maggius* reports it; and you see, by the Quotation above, that he says nothing of that Ligature. *Botallus*, Physician to *Charles IX.* says, that in his Time they made three Ligatures; one, doubtless, to take away the Feeling, tho' he does not expressly say so, and the two others above and below the Place of Amputation; but not a Word is said of the Means to prevent an Hemorrhage.

Paré, Surgeon to *Charles IX.* tells us, that when we are determined to make an Amputation, we must draw the Skin and Muscles towards the sound Part, and make a Ligature just above the Place that is to be cut, with a strong and thin Fillet, which, he says, serves, first, with the Help of the Assistants, to keep up the Skin and Muscles in a raised Posture; secondly, it prevents an Hemorrhage; thirdly, it takes away the Sense of Feeling from the Part. This is the first Author, that I find, who talks clearly of the Manner of preventing an Hemorrhage during the Operation.

Pigra, *Fabricius ab Aquapendente*, *Hildanus*, and all the Surgeons who came after him, put his Method in Practice. 'Tis true, this Ligature did not constantly and totally suppress an Hemorrhage; for the Vessels bled more or less in Spite thereof, which was an Inconvenience, that sometimes endangered the Life of the Patient.

The *Sieur Morel*, a Native of *Franche Comté*, who was a Surgeon in the Army, and a very ingenious Person, discovered a surer Method of stopping the Blood. In 1674. he invented the Tourniquet, as it is now used, by means whereof, the Operator has it in his Power, either wholly to stop the Blood, or let

it run more or less, as he thinks fit to compress the Part. It takes away the Sense of Feeling, so that the Patients feel none of those acute Pains when the Flesh is cut, and the Ligature of the Vessels is perform'd, which makes them support that cruel Operation with the more Patience; an Advantage to be reap'd but in an imperfect manner from the Method of *Paré*.

One Defect of the Tourniquet, 'tis said, is, that it pinches the Skin, and causes very acute Pains. This is true, when the Surgeon has not the Address to accommodate it in a right manner; but with a little Care and Attention, and placing a Piece of Paste-board at the Side of the Stick, that Accident is avoided.

Another Defect imputed to the Tourniquet is, that, tho' it prevents an Hemorrhage after the Operation, we dare not leave it on the Part, because it entirely suppresses the Circulation of the Blood below the Place where it is apply'd, by which means that Part is in Danger of a Mortification. *Monsieur Morel* did not pretend to make any other Use of his Tourniquet, than as a sure means for preventing an Hemorrhage during the Operation, and till he had secured the Patient from such an Accident by the Ligature of the Vessels, which none had ever been able to do before. Besides, it is very rare to see an Hemorrhage break out afresh, when the Ligature is made according to the manner, of which we shall speak in the Course of this Memoir; after we have taken a View of the Methods formerly used in cutting the Flesh.

Neither *Hippocrates* nor *Galen*, as I said, have given us any Description of Amputation; it would be in vain then to search in these Authors for the Manner in which they cut the Flesh, or how they stopp'd the Blood in the Vessels. They have only left us, in general, their Method of stopping Hemorrhages; but have not told us a Word, in particular, of the Means of stopping the Blood in an Amputation.

I have been surpris'd not to find the Operation of Amputation in *Galen*, who describes the Operations of Surgery in so clear a manner. He wrote of a Gangrene and Sphacelus*; he says, after *Hippocrates*, that the corrupt and putrid Flesh must be cut away; but says no more of it. It appears however, that this Operation was practis'd at *Rome* in his Time; for *Celsus*, who was a *Roman*, and lived about a hundred Years before *Galen*, has described it, and practis'd it himself, or saw it done by others. *Galen* cites neither Physician nor Surgeon who performed that Operation: He ought, at least, to have cited *Celsus*, who must have been in great Reputation for Surgery; but I do not so much as find the Name of *Celsus* in any Place of *Galen's* Works.

We have inserted, in the Beginning of this Discourse, the Description which *Celsus* has given of the Operation. We have seen, that he cuts the Flesh to the very Bone, and does it in the quick; rather than in the mortified Part. He saws off the Bone, and brings the Skin over the Stump, and no doubt over the Mouths of the Vessels, tho' he does not say so. But how can that Skin be brought to cover the Bone and the Vessels? We don't find, that he takes the Precaution to draw up the Skin and the Flesh above the Part, unless we are willing to suppose; that he would be so understood. Besides, it does not appear, that he form'd a Label of Skin, as some Surgeons did at the End of the last Century; the thing is so remarkable, he would not have fail'd to speak of it. He cut very near the mortify'd Flesh, *inter sanam vitiatamque Partem*, which was not the way to facilitate his leaving a Label of Skin. He did not pass a Thread across the Flesh; and into the Skin, as it has been the Practice since his Time, in order to keep down the Skin tight upon the amputated Part. And yet it is plain by the Description, that he intended the Skin should cover the Bone, and reunite with that and the Flesh; and in order that this might be done with the greater Facility, he left the Skin to hang loose; but this could not be effected without drawing up and raising that Skin above the Amputation. But he does not say so much; his Words are only these; *Supraque inducenda Cutis, quæ sub ejusmodi curatione laxa esse debet*. He took care to clear the Face of the Bone from those Asperities which the Teeth of the Saw might have produced on it, and which require Exfoliation; and, in the last place, he applies an Astringent to the Vessels, but mentions nothing of a Cautey, or Ligature of the Vessels. Such a Proceeding would be contrary to his Design, which, in all Probability, was to close up the Orifices of the Vessels, with the Skin and the Flesh brought down along with it; and by that means to prevent an Hemorrhage, and unite them all together. He thought it sufficient to put some Tow or Lint to the Part where the Skin could not reach, and over all to apply a Sponge dipt in Vinegar. By this Method he avoided a Suppuration, and healed up the Wound with great Expedition. This is exactly the Method

† Mem. Acad. An. 1725. p. 11.

‡ Lib. 7. cap. 33. *Sed id quoque cum summo Periculo fit; nam sæpe in ipso Opere, vel Profusione Sanguinis, vel Animæ Defectione moriuntur.*

"But this too is not performed but with the utmost Danger; for the Patients often die under the Operation, either of an Hemorrhage, or fainting."

* Lib. 2. ad Glauco. cap. 9. In Lib. Hippocr. de Fruct. Comment. 11. De Meth. Med. lib. 2. cap. 9.

of Verduin and Sabourin, one a Dutchman, and the other of Geneva, who, towards the End of the last Century, did both at one time set up the Practice of this Operation, with leaving a Part of the Skin and Flesh in Form of a Label, for the more easy covering of the Bone and the Mouths of the Vessels, which they call'd the Operation of Amputation with a Label [*Operation de l'Amputation à Lambeau*]. By this way they avoided a Suppuration, and also shortened the Cure of the Wound:

It were to be wish'd, that *Celsus* had explain'd himself more clearly on the Means he us'd to keep the Skin loose. We find in our Times, that whatever Endeavours are us'd to draw back the Skin and Flesh before they are cut, we are not able to bring back the Skin over the Bone after the Amputation, at least, not to keep it there with any manner of Facility; which obliged several celebrated Surgeons to retain the Skin and Flesh upon the Wound, by means of a Thread pass'd across them. We shall take Notice of this, when we come to speak of those Surgeons, who have described this Operation at the End of the sixteenth and in the seventeenth Centuries.

It appears, from all that I have just now said, that there are abundance of Obscurities in the Description of *Celsus's* Operation.

Paulus Aegineta, who, according to Dr. *Freind*, lived in the seventh Century, is the first, that I can find, who, since *Celsus*, has described this Operation, *Lib. 6. Cap. 84*. He does not want Obscurity any more than *Celsus*, and 'tis not easy to discover whether he cuts in the sound or sphacelated Part. He relates the Manner in which *Leonidas* perform'd that Operation, and says, that before sawing the Bone, it was necessary to put a Linen Cloth, or broad Fillet upon the Part that was cut, to hinder the Saw from touching it, and so putting the Patient to Pain; which shews, in some manner, that he cut in the quick Part; and to stop the Hemorrhage, he seared the Orifices of the Vessels, with an actual Cautery.

Avicenna, who lived in the twelfth Century, advises cutting in the Sphacelus, to avoid an Hemorrhage, and to apply heated Irons to the mortify'd Part, that is left under the sound.

Guido de Cauliaco cut the Flesh between two Ligatures, and, after the Example of *Paulus*, apply'd a Linen, or broad Fillet upon the cut Part, to defend it from the Saw: He then saw'd off the Bone, and cauterized the Flesh with hot Irons, or boiling Oil.

Vesalius, who wrote in the sixteenth Century, has given a Description of this Operation, in a manner which is a little confused. He speaks of a Ligature, but 'tis impossible to discover how or for what Purposes he us'd it. It appears, that he cut the Flesh with a hot Knife; but we can only guess whether it were in the quick or in the dead Part. At last he applies hot Irons to the large Vessels, and to the Flesh, which he cauterizes till the Patient feels the Pain. This makes it conjectured, that he cut in the mortify'd Part, and that the Vessels did not bleed afterwards; then he cauterized the Fore-part of the Bone, to make it exfoliate the more readily.

Bartholomæus Maggius, Cotemporary with *Vesalius*, cut the corrupted Part, and separated it from the sound; and after he had saw'd off the Bone, applied hot Irons to the Vessels, and the Flesh that was half corrupted, or dipp'd the Member in boiling Oil, alone, or mix'd with Sulphur, till it penetrated to the quick; and this was very near the Method of *Guido de Cauliaco*.

Botallus relates the Operation in the same Manner as *Maggius*, only makes no mention of the boiling Oil. But this Gentleman found it took up too much Time to perform the Operation this way; and besides, in his Opinion, it put the Patient to too much Pain in sawing of the Bone, from which it was impossible to take off all the Flesh that stuck to it, but that some would be mangled with the Saw, especially when there were two Bones to be saw'd. He contriv'd therefore a Method to cut off a Limb with one Stroke; a Method, he says, the surest, easiest, and quickest, that can be imagin'd. For this Purpose he made use of two large Knives, like Butchers Cleavers, one of which was fastened in a Block of Wood, and placed between two wooden Posts; the other was fixed in a Piece of Wood, that slid up and down between the Posts by means of Grooves, after the manner of the Machine us'd for drawing Piles. The Member was placed between the Posts upon the under Cleaver, and the Piece of Wood, which was rais'd aloft, and charged with Lead to make it the more ponderous, being let fall, the Limb was cut off in an Instant, by the Meeting of the two Knives, with very slight Pain to the Patient. A Cautery was immediately applied to the Vessels, and the Hemorrhage was very inconsiderable.

This Method has been censured on account of the Contusion which the Flesh suffer'd; but principally for fracturing the Bones, which broke into several Splinters, and rendered the Cure difficult. It was for this last Reason, I suppose, chiefly,

that this Practice was not at all followed. *Botallus* cites one Mr. *Jaques*, surnamed *Regius*, a Surgeon, who practis'd this Operation with Success. *Hildanus* strongly oppos'd this Method.

Paré, Cotemporary with *Botallus*, cut the Flesh in the quick with a crooked Knife, and made use of 2 broad Fillet, cut in two, like *P. Aegineta* and *Guido de Cauliaco*, to raise and cover the Flesh, and defend it from the Saw. He then cut with an Incision-knife, a little crooked, the Flesh between the two Bones, when an Amputation was to be made of the Leg. After this he saw'd off the Bones, and then took hold of the Vessels with the Forceps, called the *Crow's-bill*, stretch'd them out, and ty'd them up with a double Thread together with the Flesh, if any happen'd to be in the way. He then took off the Fillet, that bound the Limb above the Amputation, and, passing a Needle and Thread through the Lips of the Wound, making four Holes crosswise, he drew over the Bones the Skin and Muscles that were cut, tho' only so far as till they were extended to the same Length as before the Amputation, not drawing the Threads too close. If the Ligature of any Vessel unloos'd, *Paré* did not trouble himself to search for it with the *Crow's-bill*, for so he would never have found it; but, without tying up the Member with a new Ligature, ordered it to be grasp'd by a strong Man, who press'd hard on the Part where the Course of the Vessels lay; then he took a square Needle well edg'd, four Inches long, and threaded with a good Thread three or four times doubled, and pass'd it into the Flesh at half a Finger's Breadth from the Orifice of the Vessel, and above it; then, carrying it round the Vessel, he repass'd it below the same, and drew it out an Inch from where it enter'd. Between the two Ends of the Thread, he placed a small Bolster, and upon this he made a Ligature. After this, he apply'd Astringents to the Wound, and dress'd it on the fourth Day.

Paré makes us observe, that in an Amputation of the Leg, he causes the Member to be held bended, because after the Section of the Bone, it must be extended, that the Vessels, which are to be ty'd, may the better appear. He says, he is the first who found out this Expedient. I could never conceive how it should produce the Effect which he ascribes to it: For as the Vessels are united with the Flesh which surrounds them, they stretch or contract together with it by the same Springs. *Paré*, however, made Discoveries of greater Importance; for he was the first who practis'd Ligatures of the Vessels in Amputation; and notwithstanding the Fury of *Gourmelen* against them, this Method has been found very serviceable, and has been followed.

I find yet more new Inventions of *Paré*; he does not indeed claim them for his own; but I have met with them nowhere else. One is, that he is the first who introduced the Use of the crooked Knife for cutting the Flesh. It does not appear, that *Maggius*, who wrote but a little time before *Paré*, us'd it; he says nothing of it in his Description. I would not however pretend to be sure, that it was never made use of before *Paré*; there is a Place in *Botallus* which may make us suspect the contrary. In the Description he gives of the Manner of operating in his Time, he uses only the Word *Culiro* * in the Ablative Case, without saying whether the Knife was crooked or not; but his Commentator *Van Horne* says, *Cultrum intelligit instar corniculatæ Lunæ falcatam*, "He means such a Knife as is falcated like the horned Moon." *Botallus* makes use of the Term *Novacula*; but *Hildanus*, who us'd a crooked Knife, calls it also *Novacula*.

The other new Invention, or Improvement, which I have observed in *Paré's* Description, is, that he cuts the Flesh between the two Bones of the Leg; for this Purpose he made use of an Incision-knife a little crooked. It is not certain, that *Paré* was the Author of these two last Inventions; he would not have fail'd, it is probable, to have valued himself on their account, as well as the preceding, since they were of great Service, and have been constantly us'd since that Time.

There is still another thing, which I don't find in any before him, and which he does not ascribe to himself any more than the two last; it is this: After he had ty'd the Vessels, he brought the Skin and Flesh over the Bone, and held them there, by running two Threads crossing one another over the Lips of the Wound. This Expedient was doubtless practis'd in his Time, but it was of no Use, and even impracticable on some Occasions. It was of no Service, first, when the Flesh was cut in the mortify'd Part, because the putrid Skin and Flesh would not bear Perforations of the Needle, but must easily break away. Secondly, they who cut in the quick, and applied hot Irons over all the Surface of the Amputation, could make no use of it, because of the Crust form'd there, and because the half-roasted Flesh would easily break out: And even they who made no use of Fire at all, found themselves oblig'd to disuse it, because, when the Threads were drawn tight, it caus'd much Pain, and excited an Inflammation in the Part,

* De Vuln. Sclop. cap. 22. *Duplici modo Chirurgica Ars, dum fas est, amputare solet, nempe Serra & Culiro*. "The Surgeon's Art is exercised in Amputation, when the Case requires it, two ways, that is, with a Saw or a Knife."

which obliged them to cut the Threads sooner than they intended. It could do no Service, if the Threads were not drawn somewhat close; and Bandage alone was sufficient to answer the Intention proposed by this Method.

Daniel Sennertus has described Amputation after the same Manner as *Paré*.

Pigray differs not from *Paré*, but in that he says; when he could not easily take hold of the Vessels with the Crow's-bill, his Manner was to cauterize them with an actual Cautery.

Guillemeau is of the same Opinion; but besides, he makes a Ligature of the Vessels after a particular Manner: He pierces the Skin above the Amputation with a good Needle and Thread, which he carries above and beyond the Vessel, and brings it out under the Skin a Finger's Breadth from where it entered, and by this means takes in the Vessel and the Flesh, which he binds tight by tying the two Ends of the Thread upon a small Bolster, put there to hinder the Thread from cutting the Skin. This Method does not appear to have been followed by any but *Dionis*, who too has made some Alteration in it.

Fabricius ab Aquapendente, who wrote in the Beginning of the seventeenth Century, cut the Flesh an Inch within the Sphacelus, after the Manner of *Avisenna* and *Vesalius*. By this Method, he said, he avoided the Hemorrhage and the Pain. Afterwards he apply'd Fire to the Place till the Patient felt the Heat, and a Crust was formed upon the Mouths of the Vessels.

The Practice of this Method has at last been quite abandon'd, because it is subject to several Inconveniencies. The first is, that whatever Precautions you take to burn away all the mortify'd Part which is left under the quick, 'tis to be feared there will remain enough to produce a Corruption in the sound Part. A second Inconvenience is, that the sphacelated and cauterized Part being separated from the quick by Suppuration, there remains a long Stump of a Bone, that sticks out, and very much retards the Cure of the Wound, which is not easily consolidated.

Marcus Aurelius Severinus gives the same Description of the Operation as *Paré*, but differs from him, in that he makes no Ligature of the Vessels, but only brings the Skin over the Wound. He covers the Vessels, and retains the Skin over them, by passing the threaded Needles across. The Inconveniencies of this Method have been made to appear.

Gulielmus Fabricius Hildanus, after tying the Limb very tight, to suspend the Circulation of the Blood, binds it down to a Bench with a Fillet, and draws over it a sort of a leather Sleeve, which may be closed at the End like a Purse. He then cuts the Flesh in the quick home to the Bone, either with a Razor, or a crooked two-edged Knife; he lays the Bone bare of the Periosteum, and when there are two Bones, he cuts the Flesh between them with an Incision-knife bent a little crooked; after which, he envelopes the cut Flesh by drawing the Strings of the Sleeve, and by that means pulls it back, and raises it; he lays the Bone bare, and prevents the Blood that comes out of the Vessels from covering the Place where he is to apply the Saw. Then he saws off the Bone, and, taking off the Sleeve and Fillets, applies an actual Cautery to the Vessels, till there is a Crust form'd for stopping of the Blood.

What is peculiar in *Hildanus* is, first, the making use of a Bench, to which he binds the Member that is to be amputated. But this appear'd to be very useless, and might, possibly, be troublesome; which was the Reason, that he was not follow'd in this Particular. In the second place, he uses a sort of Sleeve of Leather, which is also more troublesome than useful, since a wide Linen Fillet, cut in two at one End, would with greater Ease and Readiness answer the Purpose. *Hildanus* also sometimes made use of a red-hot Knife to cut the Flesh, and of an actual Cautery for stopping the Hemorrhage from the Vessels, especially when the Member was sphacelated. But, according to him, a Ligature would be sufficient, if the Patient were young, robust, and plethoric, in which Case he makes his Ligature like *Paré*. He is wrong in quoting *Celsus*, *Galen*, and *Avisenna*, for the Ligature of Vessels in Amputation; for they never used any but for Vessels that were opened by Wounds, as I observed before.

Hildanus brings the Skin and the Flesh, as far as possible, over the Bone, without keeping them there by a Thread passed through the Skin and Flesh crosswise, which he disapproves for the Reasons above-mentioned.

Vigier, who published his chirurgical Works about the Middle of the Century, made an Amputation, after the same Manner, and with the same Precautions, as *Pigray*. *Barbette* did the same; he wrote a little later than *Vigier*.

Nuck closely followed their Steps: He is the first who speaks of the Tourniquet, which Mr. *Morel* invented for preventing the Hemorrhage; but he found the Ligature so painful, that he chose rather to make use of an actual Cautery. In this Point he is mistaken; for a Ligature of the Vessels well made is less painful, and surer, than an actual Cautery. *Nuck* advises us to use a sort of Mush-room, which he calls *Bovist*, and we *Puff-balls*, which is commonly used in *Germany* and *Holland* for stopping of Hemorrhages.

Charrierre, *John-Baptist Verduc*, and *Dionis*, have done nothing but copy preceding Authors in their Descriptions of Amputation. But *Dionis* gives us two new ways of stopping the Blood by a Ligature of the Vessels. In the first, he ties up the Vessels with a Needle and waxed Thread, and makes use of a *Valet à Patin*, [Nippers with a Ring] with which he takes hold of the Vessel, and pulls it out from the Flesh; he winds the Thread about the Vessel, and after passing the Needle through the Extremity of the Vessel, ties the Thread, and fastens it in such a manner as not to be thrown off by the Pulsation of the Artery. In the second Method, he takes two Needles threaded in like manner with waxed Thread; with one of them he pierces the Flesh above the Vessel, and having passed it through the Flesh and Skin, he draws it out two Fingers Breadth above the Amputation. With the other Needle he enters the Flesh and Skin below the Vessel, and pulls it out half a Finger's Breadth from where the other Needle came forth; he then lays between them a little Bolster, on which he ties the two Threads with a Knot, and so closes the Vessel. This second way differs not from what *Guillemeau* speaks of, except in that the latter uses but one Needle.

The *Valet à Patin* is a sort of Nippers, invented about the Middle of the last Century, and not much used at present. *M. Garangeot*, Master Surgeon at *Paris*, gives a Description of it with a Figure. When that Instrument began to be used, there went over it a Thread with a sliding Knot. They drew out the Artery with the *Valet à Patin*, and ty'd it with the Thread in a Knot, that could not slide. This Invention was subject to two Inconveniencies: First, If the Thread was drawn a little too tight, to prevent its slipping, it would cut by degrees the Artery, which being ty'd at its Extremity, would separate too soon, and be followed by a new Hemorrhage, more dangerous than the former. Secondly, If the Ligature was made a little too loose, the continual Pulsation of the Blood would by degrees push the Thread to the Extremity of the Vessel, where it would slip off. *Dionis* was willing to remedy this Defect by passing a Thread through the Vessel, in the way that he first proposed; but this was too troublesome a Method to be followed, and his second was more so, and besides put the Patient to greater Pain. At present, they tie the Arteries after the Manner of *Paré*, which is the most simple Method, and followed by all good Artists. They pass the Needle, as I said before, through the Flesh which surrounds the Artery, and fasten the two Ends of the Thread with a Knot upon a small Linen Bolster. *Dionis* tells us also, that he could stop the Blood with a Button of Vitriol, which was practised and recommended by several Surgeons of the last Century.

Cyprus Vitriol, which is what is used to cauterize the Orifices of the opened Arteries, and raises a good Eschar on the Place, does not so readily stop the Blood as an actual Cautery and Ligature. It must liquefy, in order to insinuate into the Pores of the Flesh; so that this Remedy works but slowly. The Blood would soon break through the Barrier opposed to it, if we did not take great Precaution. They who used this Method, laid graduated Compresses on the Button of Vitriol, and other long Compresses on the Course of the Vessels, in such a manner, that by the Help of a pretty tight Bandage, the Flesh might be compress'd upon the Vessels.

A Servant must be sure to attend, in order to keep his Hand continually upon the Stump. We ought indeed to take the same Precautions in all other Methods of Amputation; but this, in particular, requires the most careful Attention.

As to the rest, we must avoid making use of strong Suppuratives, for fear of making the Eschar separate too soon, and fall off before the Mouths of the Vessels are entirely closed, and quite stopp'd up.

Here it will not be foreign to my Purpose, to explain the Action of Escharotics. I shall give you my Conjectures about the Matter, which is full of Difficulties, as well as many others. I am always for running this Hazard of exposing my Sentiments, because it will doubtless engage some able Naturalists to examine them with Attention, and perhaps propose such as are more probable, which will be received with Pleasure.

We make use of two sort of Cauteries or Cauterics in general, which are, the actual and the potential Cautery. The actual Cautery is Fire, and all burning Bodies, as heated Iron, very hot Water and Oils, &c. When these are apply'd to any Part, their Heat penetrates the Flesh, where the Air is included in the circulating Liquids. This Air is rarefy'd and expanded to an extraordinary Degree by the great Heat. This violent Expansion separates and disunites all the Parts in which the Air is contained, and so destroys their Structure. The expanded Air easily escapes through the Pores and Interstices of the Flesh, whose Contexture it has thus destroy'd; and carries with it, at the same time, all the aqueous Particles contained therein; which is the Cause of the drying up of the cauterized Part, and the forming of a Crust upon it.

Melted Lead, melted Sulphur, and very hot Oils, which some make use of, act after the same Manner.

I make three Sorts of *potential* Cauteries, according to the Parts on which they act. The first act only on the Flesh uncovered of its Skin, the second on the Skin and the Flesh, and the third only on the Skin.

The Cauteries of the first Sort are *Cyprus Vitriol*, *Arsenic*, the *Sublimate Corrosive*, &c. These make no Eschar but in the Flesh, and make none at all when apply'd upon the Skin. *Cyprus Vitriol* is what is commonly used to cauterize the Vessels, because *Arsenic*, and the *Sublimate Corrosive*, act too slowly, tho' otherwise they make a good Eschar. These Salts absorb the Humidity which dissolves them, by means of which they are introduced into the integral and extremely sensible Parts of which the Flesh is composed. The Blood, which circulates in those Parts, continually supplies them with new Humidity, which probably unites with the saline Particles in proportion as they arrive, which occasions these Particles to penetrate more and more into the Flesh, where they still find new Humidity, which gathers about them; hence the Pores, which contain them, must be considerably enlarged, and the solid Particles, which compose the Partitions between them, are obliged to give way, and separate; by which means the Texture of the Fibres, which compose the Vessels and the Flesh, is quite subverted, and forms a Substance which is no longer Flesh, nor capable of receiving Nourishment.

The potential Cauteries of the second Sort are of several Kinds; some of them are liquid, others solid. The liquid cauterize the Skin and the Flesh, at the Instant they are apply'd; such are Oil of Vitriol, Spirit of Nitre, Aqua Regia; their Action is very quick. Spirit of Salt, and Spirit of Vitriol, cauterize but slowly, and are seldom used alone, but in Conjunction with some metallic or saline Particles. Butter of Antimony, Butter of Arsenic, the Oil or Liquor of Mercury, which proceeds from the Washings of Turbith Mineral, are more frequently used.

Solid Caustics are either metallic or saline. The metallic are *Lapis infernalis*, made with Silver or Copper, dissolved in Spirit of Nitre, or Aqua-fortis.

Saline Caustics are in common Use, and properly called *Cauteries*. They are made of Lime and Ashes of Tartar, &c. They prepare them also from the Lye of the Soap-houses, which is composed of Kali, Quick-lime, and Copperas, &c. But these are not so good Cauteries as the preceding.

These Caustics burn and cauterize the Skin and Flesh, and produce an Eschar, without causing any great Pain.

In order to explain the Action of these Caustics, you must observe, that generally, all Bodies which have endur'd a strong Fire, are Caustics. Some of these lose that Causticity in cooling; such are all actual Cauteries. Others preserve their Causticity in cooling, which is the Case of potential Cauteries.

Caustics of the third Sort act upon the Skin. These are improperly called *Escharotics*, for they make no Eschar; it does not so much as appear, that they act upon the Epidermis, which remains whole and entire. I would not place them in this Rank, did they not work very nearly the same Effects as are produced by very hot Bodies, which remain but a very short time on any Part. They produce nothing but Vesicles on the Skin, and for that Reason have the Name of *Vesicatories*.

In the Number of Vesicatories are rank'd,

Cantharides, which are of most frequent Use.

The *Ranunculus Tuberosus major*, *J. B.*

The *Flammula Ranunculus*, *Dod.*

The *Flammula*, *Dod. pempt.*

The *Flammula altera*, *Dod.*

The *Flammula Jovis Surrecta*, of *Ger.*

Fabricius ab Aquapendente chose rather to make use of this Herb than Cantharides, because it occasions no Disorder in the Bladder, as Cantharides sometimes do, in his Opinion. For my part, I never knew any ill Accident happen from the Use of them, tho' I have ordered their Application a vast Number of times.

They also use very often the Root of *Thymelæa* [Flax-spurge]. *Petit* in the *Memoirs of the Royal Academy of Sciences* 1732.

Having given the History of Amputation, I shall proceed to specify the Operations requir'd for the Amputation of particular Parts, as now practis'd, from *Heister*.

Amputation of supernumerary Fingers.

Children are sometimes born with supernumerary Fingers, which are generally mis-shapen, and inconveniently placed. These Fingers are not all of the same Nature. Some have Bones and Nails; others want them, and appear to be nothing but carnosus Excrescences. If any of these are troublesome, or deform the Hand, they ought to be cut off. If there are no Bones in them, the Knife is most convenient; but if there are Bones, a strong Pair of Sheers will better do the Business, by taking off all together. Sometimes more than one of these Fingers are found upon the Hands of Infants, who are too infirm and tender to bear immediately the Repetition of such an

Operation, and the Pain attending it. In this Case it is safest, after the Excision of one Finger, to allow so long an Interval, that the Wound shall be entirely heal'd before you proceed to amputate the other. The Flux of Blood is easily stopp'd with Lint and Compresses, either dry; or wet with Spirits of Wine, and the Wound is readily healed with a Vulnerary Balsam, as other Wounds. It will not be foreign to the Purpose to mention here, in few Words, a Case of this Kind, which I myself was concerned in. An Infant about three Months old had a very long preternatural Finger growing to the Thumb, (See *Tab. 33. Fig. 15.*) and had a strong Bone in it; but instead of a Nail at the End, a Substance like a Cock's Spur protruded: I made an Incision quite round the Integuments, and then with a Pair of Sheers took off the Bone; this done, I stopp'd the Bleeding with Lint, and Compresses wetted with Spirits of Wine, and dress'd the Wound with a Vulnerary Balsam, which soon heal'd it. I could here produce many Instances of Cures of this Kind, which I have performed both in the Hands and Feet; but one Case is sufficient, as the others are much of the same Kind, and the same Method of Cure was observed in all.

Amputation of the Fingers.

The Fingers require Amputation, when they are so lacerated or bruised by Bullets, or other hard Bodies, that they cannot be restored to their former State; or are totally mortified; or being indurated, or affected with a Caries, or Cancer, cannot be cur'd by other Treatment.

But Surgeons should be very careful not to cut off any bruised or fractur'd Fingers, whilst there remain any Hopes of saving them: Therefore if the Fingers are only moderately broken, or gangren'd, let some spirituous and resolving Fomentation be judiciously apply'd, in order to prevent their farther Corruption; and let the Fragments of the Bones be carefully replac'd, and treated in the manner directed for Fractures.

If any Parts of the Fingers are so much fractur'd as to be almost entirely divided from the rest of the Hand, in this Case they may immediately be separated from it with the Knife or Sheers. The same Rule is to be observ'd when a Finger is totally mortified; for a Delay, at such a Juncture, would be attended with great Danger.

But if a Finger should be cut, by a sharp Instrument, almost off, if the Wound is fresh, however bad, it will be then better to replace it in its former Situation, than wholly to divide it; and even if the Part is quite divided from the Hand, provided the Wound is oblique, it will be prudent to fix it in its proper Situation, and to try by Degrees to unite it: For it is better to attempt a Union of the Parts this way, tho' your Labour may sometimes be in vain, than rashly to destroy all Hopes, by cutting off the Finger, which perhaps might have been sav'd.

Heister gives an Instance of a Butcher's Wife, who entirely cut off a Finger, by an oblique Wound, with a Cleaver; she immediately replac'd it, and secur'd it with Bandage, and it united without farther Applications.

Amputation of the Fingers is perform'd three ways: First, With the sharp Forceps, or, which is preferable, especially in Children, with a strong Pair of Sheers.

Or, secondly, with the Chisel and Mallet, by which the Part is very readily cut off at one Blow (See *Tab. 33. Fig. 17.*): This Operation I have performed several times in cancerated and cariated Fingers; and also when the Bone has been corrupted. *Roosbuisen*, in a Spina Ventosa, also has done the same upon a scirrhus great Toe with Success, whatever some People may think to the contrary.

Or, thirdly, a mortified Finger is to be taken off with a Knife at the Joint, leaving Skin enough to cover the End of the Bone. This Method of Amputating is preferable to both the other, as the Work is done without any Danger of splintering the Bones, and thereby causing another Caries. By this Method I have frequently cut off the Fingers, Thumbs, and Toes, even of old and decrepit People, where the Bones have been wholly carious, at their Articulations with the metacarpal or metatarsal Bones, and have made a perfect Cure. However inconvenient this way of Amputating may seem to some, who imagine the Skin will not grow over the Cartilage without a great deal of Difficulty, if at all, yet I have never found it so. But this Inconvenience may be avoided, by not only drawing back strongly the Skin before you make the Incision, but by taking off with a Knife the Cartilage at the End of the metacarpal or metatarsal Bones; for by so doing, they will more easily unite and grow together. The Finger being cut off, the Wound must be dress'd with Lint, and bound up with Compress and Roller. If the Patient is full of Blood, let a few Ounces run from the Wound before you bind it up; for after this there will be little Danger of a fresh Hemorrhage, and indeed I never remember one to have happen'd after it. If two Joints of the same Finger are mortified with Part of the third, it will then be better to cut away with a Chisel the corrupted Part only, than by a more painful Incision to divide the

Whole

Whole with a Knife from the metacarpal Bone. But if a Mortification has seiz'd the whole Finger, or Toe, it must be amputated in the Joint, leaving a sufficient Portion of the Skin:

Of the Amputation of the Hands, Arms, and Humerus.

Amongst chyrurgical Operations the Amputation of the Arms and Feet appears the most cruel and terrible, and this not without Reason; notwithstanding, in some Cases, it is found necessary for the Preservation of the Patient's Life. For when a Mortification has seiz'd upon the whole Member, and destroys even the Muscles; or when both Bones and Muscles are corrupted; after a Fracture; or when an incurable Caries, or Spina Ventosa, affects the Member; or when the Brachial, or especially the large Crural Artery, is so much wounded, that the Blood cannot be stopp'd: In these Cases you will scarcely be able to save the Patient's Life without taking off the Limb; nor will that always do it. Lastly, it must be perform'd in Limbs, especially the Hands, when render'd monstrous, by a Spina Ventosa, or any other Cause, especially if they are very painful. *Marcus Aurelius Severinus*, in his *Treatise de Abscessibus*, *Bidloo*, in his *Exercitationes*, and *Ruyfch*, give some Cases of this Kind. In the mean time let me seriously admonish the Surgeons, never to undertake an Amputation of this Kind rashly, and without the Counsel and Assistance of other prudent Physicians and Surgeons, lest perhaps they should afterwards be accus'd of Cruelty, Rashness, or Imprudence.

But that it may appear more plain how Operations of this Sort must be perform'd, it will not be amiss to treat them in a regular Order. I will therefore begin with the Hand.

The Hand may be amputated at one Blow, as was formerly practis'd, by placing a strong and sharp Chisel near the Wrist, and with a heavy Mallet driving it through. But this way of Amputating is not only very hazardous, but also very pernicious. For there is always Danger, lest the Bones of the Wrist or Cubit, by the Violence of the Blow, should be shivered or broken, and the Patient thereby expos'd to very great Inconveniences.

Fabricius Hildanus is of the same Opinion, and says farther, it is an Operation too violent and cruel, and consequently unbecoming a rational Surgeon.

The modern Surgeons therefore act very reasonably in substituting the Knife and Saw in the Place of the Mallet and Chisel. But here great Care must be taken, that the Saw be not apply'd to the Carpus or Metacarpus; for should the Ligaments, and those little Bones, be lacerated and divided with the Saw, a great deal of Pain and Danger would arise. It is better therefore, according to the present Method, that the Hand be amputated with the Knife and Saw, apply'd to the Bones of the Cubit, in the manner I shall describe; and at the same time it will appear how we are to proceed in amputating the Arm, or Cubit, and the Humerus. *Heister*, however, thinks, that the Hand may be amputated at the Articulation with the Cubit, with the Knife only, tho' he has never made the Experiment.

In cutting off the Hand, or Arm, whether on account of a Mortification, incurable Caries, or any other Cause, two things seem principally necessary to be regarded. The first is the Place where the Operation must be performed, which is at least a Finger's Breadth, or two, above the dead or corrupted Part, but never upon the sphacelated or corrupted Part. Moreover an Amputation of a large Limb must not be performed in the Joint, on account of the extreme Thinness of the Flesh in those Parts, which cannot, in the Opinion of Surgeons, cover the Bones, and heal over them; from whence a Caries may arise, with many other Inconveniences.

Notwithstanding, if a sufficient Portion of Skin on both Sides be saved, I imagine the Wound may be heal'd in the same manner as it is in a Finger cut off at the Joint.

The Place for Amputation being determin'd, that the Operation may succeed the better, it is necessary, in the next Place, that the Instruments and Apparatus, both for the Amputation, and Dressing afterwards, should be ready beforehand, and placed regularly in two Dishes, or on two proper Tables, but not in the Patient's Sight, lest he should be terrified by seeing them.

But lest any one should be unacquainted with the Instruments and Apparatus necessary in this Operation, it will be worth while to enumerate them all in this Place. We will begin with the Torcular or Ligature, with the Turn-stick, call'd by the French Tourniquet. There are various ways of making it, but this is the readiest.

Take a Fillet, about an Inch broad, and a Yard and a Quarter long; then provide a cylindrical Piece of Wood, or Stick, of about a Finger's Length; and then a Fillet roll'd up two Fingers thick, and four long; longer Cloths or Compresses must also be provided to encompass the Limb, which must be three or four Fingers broad, over which the Fillet is to be apply'd; and lastly, a Piece of Pastboard, or thick Leather, about four Fingers square.

The Method of using the Torcular or Tourniquet is thus: Let the Fillet roll'd up be plac'd lengthways upon the large Artery of the Limb, the Situation of which is known from the Anatomy of the Part, and upon this let Compresses be plac'd transversely, so as to encompass the Limb like a Ring; then wind the long Fillet twice round these, but loosely, so that the Hand may easily pass betwixt it and the Limb, and then fasten it with a Knot; then upon the Side of the Limb, opposite to the roll'd Fillet, place the Pastboard or Leather under the long Fillet, upon which let the Fillet be twisted with the Stick, till the Circulation is wholly stopp'd; the Stick must be held fast, lest it should give way before the Limb is amputated, and the Profusion of Blood stopp'd, either by astringent Medicines, by Ligature, the actual Cautery, or by any other Art whatever; which being performed, the Torcular may be loos'd, and entirely remov'd. See the long Fillet, with the cylindrical Stick, *Tab. 24. Fig. 2.* and the Manner of placing it, *Tab. 24. Fig. 1. K L N.*

Mr. Petit, a celebrated Surgeon at *Paris*, has invented another Sort of Torcular, which is called by his Name, and is preferable to the other, as its Pressure continues without any Assistance; whereas, when the common Torcular is us'd, an Assistant is oblig'd to hold and manage it: And again, because if Necessity requires, it may remain upon the Limb, as long as may be judg'd proper, without Impediment to the Circulation of the Blood in the affected Part; whereas by the common Torcular the Blood is wholly intercepted, insomuch that in a little time it must be taken off again. These are Advantages in Hæmorrhages from Wounds, or otherwise, where the Torcular is sometimes us'd; but Disadvantages in Amputations, where the Circulation ought to be stopp'd in the whole Limb for some time.

I have endeavour'd to alter and improve *Petit's* Torcular. See *Tab. 26. Fig. 6.* where A A denote the superior Part, B B the inferior, and C the Screw, all represented in their proper Size, and made of some strong and durable Wood. Towards the Extremity at D are inserted two lesser Screws, made of Iron, to which a strong filken Fillet is to be fix'd, which must be as wide as the Torcular, and twenty Inches long, that it may the better reach round the larger Members; the other End is to be fix'd to the small Hooks represented at E; in the Extremities F F, F F, both Parts, both above and below, are a little excavated, that the Fillets may rest the firmer in them, and may not be so easily mov'd, or slip quite out. At the Letter G is an iron Plate, to render the Machine stronger, lest it should give way to the Force apply'd to it. Thus when an Artery is to be compress'd, either on account of an Hæmorrhage from a Wound, or to prevent one during Amputation, the inferior Part of the Torcular B B, cover'd with a good many Folds of Cloth, is laid on that Side of the Member which is opposite to the Artery; the Fillet is lightly wrapt about the Member, and the Ends of it are fixed to the Hooks E; then by means of the Screw C, the Cords are drawn to such a Degree of Tension, as is necessary for stopping the Blood, and are allowed to remain in that Degree of Tension upon the Part as long as the Surgeon shall think proper.

Garengot describ'd and delineated another Torcular of the same Nature, invented by that celebrated Surgeon *Morand*, which indeed agrees with the former in many Particulars, but differs from them principally in this, that instead of a simple Screw, *Morand*, for the sake of a quicker Action, made his with a compound one, and had it made of Iron; so that in his, one Turning of the Screw wound up the Cords more, and compress'd the Artery better, than two or more Turnings of the Screw in other Torculars. But *Garengot* makes some Objections against this Machine, and prefers that of *Petit* to it.

Some Years ago, when I was call'd to *Berlin*, to attend a certain General Officer of the *Prussian Army*, I there saw a Species of the same Torcular, made of Iron, very heavy, and much resembling that of *Morand*, but alter'd in some Particulars, by whose Directions I know not. As I have not as yet seen it delineated, I have given a Representation of it in *Plate 26. Fig. 7.* A is the inferior Plate, with many little Holes towards its Circumference, that so a small Cushion, or Foldings of Cloth, may be more conveniently be put under it, and sew'd to it. B is an excavated or hollow'd-End, for receiving the Screw. C is the upper Plate. D the Hollow in the upper Plate for receiving the Screw. E E the Extremities of the upper Plate, one of which is furnish'd with Hooks, the other with Hooks, and a sort of Bow, so that the Fillet design'd for embracing the Member may not slip. F is a Sort of Ring incircling the Cavity of the Screw in the upper Plate. G is a square or cubic Part, hollow'd in Form of a Screw, fitted for the Reception of the small Screw H, and contrived in such a manner, that the large Screw I K, which would otherwise easily yield and slip out, may be the more conveniently fixed and retained in the Cavity D. L is an iron Cylinder, firmly fixed in the inferior Plate, but free in the upper, that so the upper Plate may be made to approach the under at Pleasure, again

again recede from it at Discretion, for stretching the Fillet, and compressing the Artery, and keep the upper Plate in the same Posture with the under, that so it may not be distorted or driven awry, and the Action of the Machine by that means prevented.

For preventing this Inconvenience, I took care to have a Torcular made of Copper in another manner, a Representation of which may be seen in *Plate 27. Fig. 1.* where the superior Lamina is much shorter than the inferior, and has a Fillet fix'd at one of its Extremities, which, being wrapt about the Member, is to be fasten'd to the Hooks in the other Extremity; and the Fillet passes thro' the Holes of the inferior Lamina, and by that means keeps them in a perpendicular Situation, and prevents moving any way when the Screw is turn'd. A Surgeon may make Choice of any one of these he pleases; they all answer the End, only some do the Business much sooner than others; but in this Case, the Surgeon may proceed upon that common and well-known Maxim, *Sat cito, si sat bene*; the Operation is soon enough, if it is well enough perform'd.

The first Part then of the Apparatus for Amputation, is the Tourniquet.

The second is a smooth Fillet of Linen, near an Inch in Breadth, and about half an Ell long.

The third is a small Knife for dividing the Skin, of which see a Figure, *Tab. 34. Fig. 1.*

The fourth is a great crooked Knife for dividing the Flesh. See *Tab. 34. Fig. 2.*

The fifth is a small double-edg'd Knife, for the separating the Flesh between the Radius and Ulna, *Tab. 34. Fig. 3.*

The sixth, a linen Cloth, about three Spans long, and six Fingers broad, slit lengthways half thro'. See *Tab. 23. Fig. 17.*

The seventh, a good Saw for dividing the Bones. See *Tab. 34. Fig. 4.*

The eighth, a Pair of Forceps to lay hold of the Arteries. See *Tab. 34. Fig. 5. and 6.*

The ninth, a crooked Needle, with a strong Thread.

The tenth, vitriol Buttons, wrapt up in Lint or Cotton.

The eleventh, little four-square Compresses. *Plate 23. Fig. 21.*

The twelfth, great Plenty of Lint.

The thirteenth, a Powder for stopping the Blood; but as it often causes Inflammations, and prevents Suppuration, Spirits of Wine, or Oil of Turpentine, is better. However, we easily do without any Astringents at all.

The fourteenth, a large and round Compress of Tow, or a great Piece of the *Crepitus Lupi*, or Puff Ball, for covering the rest of the Cloths and Compresses.

The fifteenth, a Calf's or Hog's Bladder, or instead of it, either a large sticking Plaster, in the Shape of the *Maltese Cross*, (see *Tab. 23. Fig. 15.*) for covering the Trunk with the preceding Apparatus; or three Plaisters about two Spans long, and three Fingers broad.

The sixteenth, a Cloth in the Shape of a *Maltese Cross*, but larger than the Plaster.

The seventeenth, a thick four-square Cloth for covering the End of the Stump.

The eighteenth, three Compresses two Spans long, and two Inches wide.

The nineteenth, a Roller five Ells long, and three Fingers broad, for binding up the Limb.

Lastly, Wine, and other internal Medicines, as well as external, for raising the Spirits of the Sick, when inclin'd to faint.

It remains next, to shew the proper Situation of the Patient, the Surgeon, and his Assistants, when the Operation is to be perform'd. The Patient then must be plac'd in a low Chair, and set almost in the Middle of the Room, that free Access may be had to him all round, and that the Assistants may be plac'd more commodiously about him.

The Surgeon himself must stand in the Middle, between the Patient's Feet; but the Assistants, six of which at least ought to be present, must help the Surgeon in this Manner: One of them should stand behind the Patient, and hold his Body; another, standing at the Patient's Side, should clasp the upper Part of the Arm which is to be amputated, near the Elbow; a third should hold the Hand; a fourth should assist at the Side with the Instruments, so that when they are wanted by the Surgeon, they may be given commodiously; the fifth must deliver the Dressings in regular Order; and the sixth must be ready to give the Patient a Cordial, and to do such other things as the Surgeon may perhaps direct.

After that, the Surgeon, who ought to have a Towel before him, in order to wipe his Hands, if it should be necessary, must moderately twist the Torcular about the Arm to be amputated, in the manner, and at the Place represented, *Tab. 24. Fig. 1. K.* For by so doing, not only a too great Flux of Blood from the great Artery of the Arm is prevented, but the Nerves also being moderately compress'd, the Patient feels the

less Pain from the Operation. But lest the Torcular should give way, the Stick ought to be held carefully by the Assistant who stands behind the Patient's Back; but if the other Torculars are us'd, they stand of themselves, without any Assistance. Then the Servant, who holds the upper Part of the Arm, must draw the Skin back as much as possible, whilst the Surgeon himself binds the Fillet; about half an Ell long, and an Inch broad, several times about the Part where the Operation is to be performed, the End of which is to be sew'd fast; this is to serve him, not only as a Guide for the more regular Division of the Flesh with the Knife, but to keep the Flesh so firm, that it might not give way to the Knife. Some do the same with a leathern Thong and Buckle. But before we proceed any farther, the Patient ought to be comforted, not only with Words, but with Wine, or some other spirituous Liquor, lest he should sink under the Operation.

These things being done, the Operation must be hasten'd; in which the Surgeon's first Business is, to place the Arm in a strait Line, which being held by two Assistants, he is then to make an Incision with the lesser Knife through the Skin all round; which being perform'd, the Assistant who holds the upper Part of the Arm, must draw the divided Skin back as much as he can; then near the Edges of it, either with the same Knife, which here will do very well, or with the large crooked Knife, the whole Flesh must be divided all round the Bones. By this Method of Amputating, the Bones are much sooner and easier cover'd, and the Healing of the Wound much forwarded. This being perform'd, the Flesh between the *Ulna* and *Radius* must be divided with a small two-edg'd sharp Knife, and the *Periosteum* from the Bones must be scrap'd off, where the Saw is to be apply'd, lest being tore by the Teeth, violent Pains and Inflammation should be excited; then the Assistants holding the Arm, should strongly draw back the divided Flesh, that the Bones may appear the more fairly in View, in order to be saw'd off. And that the Flesh may the better be drawn back in the upper Part of the Wound, and the Bones cut off very high, it is convenient to apply a Cloth slit in the Middle, in such manner, that the Bones only should come through; and that the whole Parts of the Cloth resting upon the Flesh, may, by being drawn back by the Assistant who holds the upper Part of the Arm, draw back the Flesh also along with it: For in Cases of this Kind, the Bone must always be cut off as near as possible to the Flesh which is drawn back, that, as we said before, the Bones may be sooner cover'd, and the Wound much sooner heal'd. But the Surgeon ought so to apply the Saw, that both the Bones may drop together. For the Danger is, that if they should not be cut equally alike, either one or the other on which the Saw presses alone, not being strong enough, would be split, and thereby the Patient would be expos'd to many Inconveniencies in the Cure. In the Beginning, the Saw ought to be moved lightly; afterwards, when it is well fix'd in the Bones, it must be moved a little faster, but carefully. And lest it should by any Chance be stop'd in its Motion, or squeez'd between the Bones, the Assistant holding the upper Part of the Arm should raise it a little, whilst he who holds the lower Part depresses it, so as to make way for the Saw, for about a Minute or two; in which time the Hand, and part of the Arm, will be entirely taken off.

The Hand and Arm being now amputated, the Surgeon's immediate Care must be to suppress the Hemorrhage from the divided Arteries; and after that to dress, and bind up, the remaining Stump: That the Mouths, therefore, of the Arteries may the more easily be found, let the Assistant, who holds the Torcular, loosen it gently, by untwisting the Stick a little; or if the Torcular is of the other Kind, the same is done by turning back the Screw; for the Blood bursting out, as from a Siphon, will directly shew the Mouths of the Arteries. If the Patient is full of Blood, it will be much the best to keep the Torcular loose a little, and let the Blood run gently into the Vessel underneath; but if he is very weak, and has but little Blood, the Torcular ought then to be twisted again immediately, as soon as the Orifices of the Arteries are discovered. And if the lower Arm is cut off near the Hand, it will not be very necessary to tie the Arteries there; for as the Arteries in these Parts are small, the Blood is easily stopp'd, by applying to the Apertures of the larger Bits of Vitriol, with a great deal of loose Lint, or square Compresses. Chabert is of Opinion, that Vitriol is unnecessary; because Lint, with Compresses, and proper Bandage, will be sufficient to stop the Hemorrhage. And this, says Heister, I have found true, especially where the Patient has not been over-robust, and full of Blood. Others esteem acrid and caustic Applications very pernicious, or, at least, uncertain Remedies; because, when the Eschar made by them drops off, there is great Danger of the Hemorrhage being renew'd. But to the Bones and Flesh, Dressings made of loose dry Lint, or Rags, are to be applied, and laid on thick: Upon the Dressings a large Piece of the *Crepitus Lupi* must be laid, either with or without a large Bolster of Tow; and the Whole must be firmly secured, either by a wet Bladder, or large Plaster, in the Form of the *Maltese Cross*, brought over the Stump. Instead of this large Plaster, two small

small ones in the Form of a Cross, or three in the Form of a Star, may be applied with better Effect; with which the Skin may be drawn down, that the Wound may be the sooner cover'd by it, and healed: Upon the Plaisters a large Compress, in the Form of the *Maltese Cross*, is to be placed, in such a manner, that its extreme Parts may be held, and turned round the Arm, by an Assistant: Then a thick four-square Compress, and over it three long thin Compresses, are to be applied, in the Form of a Star, in such manner, that their extreme Parts should be brought up the Arm, and fixed there: Lastly, the Whole is to be secured by proper Bandage: See *FASCIA*.

It was customary amongst a great many of the antient, as well as modern Surgeons, to stop the Flux of Blood from amputated Members, by burning the Arteries with a Cautery, or hot Irons; but this Practice the Surgeons of our Age forbid; as being not only uneasy and terrible to the Patients, but at the best dubious, and often dangerous, especially in an Amputation of the Thigh or Arm. For, almost always, after the third Day, the Crust made with the hot Irons loosens, and causes a fresh Hæmorrhage: But if any one has an Inclination to use them, they may be applied in the lower Arm, or Leg; not altogether without Advantage; but it is better to follow the Method described before, and not to burn, unless in case of Necessity. But if, as modern Surgeons advise, you should be willing to tie the wounded Arteries, either in the Arm or Leg, which, nevertheless, is scarcely necessary in the lower Arm, they must be laid hold of, and held with the Crow's-bill, Forceps, (see *Tab. 24. Fig. 4. and Tab. 34. Fig. 5. and 6.*) or any other convenient Instrument, and tied by means of a crooked Needle, and strong waxed Thread, past round them.

When the Humerus requires to be amputated, the Operation is almost the same as in the Arm, except that the Brachial Arteries, of which there is sometimes only one, sometimes two, and sometimes three, are always to be held with a convenient Forceps, and tied, by means of a crooked Needle and strong Thread. Cauteries and Astringents are here of no Service: The extreme Parts of the great Arteries being tied, the Torcular must be loosened a little; and if any small Arteries bleed, they may be secured in the same manner. There are some Surgeons who, with a somewhat less Needle, pass the Thread through the End of the Artery itself, whilst held by the Forceps, before they tie the Knot; for by doing so, they imagine the Ligature to be the stronger, and that it will not easily give way. Others, instead of the Forceps, use a very crooked Needle, threaded with a strong waxed Thread; this they pass twice thro' the Flesh, almost round the Orifices of the Arteries, and then tying the Thread, they inclose the Arteries, together with a Portion of the Flesh, in order to secure the Stitch from breaking out. But nevertheless, if I am not deceived, it is better that the Arteries should be held by the Forceps, and afterwards tied, as is said above: For otherwise there would be some Danger, lest either the Thread should miss the Branch of the Artery, or the Artery slip from under it again.

Our Surgeons differ in their Opinions from Heister, in this respect.

The Dressing of the Stump being finished, it remains, that a little Wine, or some cordial Potion, is to be given to the Patient; who must then be laid upon the Bed, and the Stump of the amputated Arm must be placed in the Hand of an Assistant, and held some Hours. For, by this means, the Dressings and Bandage adhere more firmly, and the Hæmorrhage ceases sooner, and with more Certainty. Then the Torcular may be loosen'd by degrees, as much as may be thought necessary for carrying on the Circulation in the Part: And upon this, if no more Blood bursts out, it is then a Sign the Operation is well performed. The Patient therefore must be enjoined to rest, and, instead of Potions, should take sometimes a strengthening and anodyne Emulsion; by which Sleep being procured, the Pains may vanish by degrees, and his lost Strength be restored. The next Day the Torcular may be either a little more loosened, or even wholly taken away; and the strictest Regimen must be directed. And if Powders, and small temperating Potions, be ordered, and, if the Patient be very hot, he loses some Blood, these will contribute to prevent Accidents; but where there is no Heat, nor Fulness of Blood, it is unnecessary to bleed, as it weakens the Sick, who is already much reduced. But if a fresh Flux of Blood should happen, which cannot be stopp'd, either by the Application of the Hand to the Stump, or by binding a thick Cloth upon it, somewhat tighter, with a fresh Roller, which is generally sufficient, the Method is to apply the Torcular again, and having loos'd the Bandage, let the Arteries be tied afresh; or, if they cannot be laid hold of, the actual Cautery must be used; or it may be stopp'd with a large Quantity of loose Lint, the Wound being again accurately bound up, and the Stump gently compressed, till the Bleeding ceases.

But the first Bandage ought never to be taken off before the third or fourth Day, unless great Pain, Inflammation, Loss of Blood, or some such Accident, should happen, that the Orifices of the divided Arteries may be the more firmly and surely closed. Neither will it be amiss for a Servant to attend by the Patient's

Bed for eight Days; who should be very watchful, that he may apply the Torcular immediately, if the Blood should chance to burst out again; and, in the mean time, he should take care to send for the Surgeon to make a fresh Bandage. If all things proceed successfully, as often as the Wound is dress'd, every thing should be taken off separately and gently; but what is next to the Wound must not be touched, much less violently pull'd off, lest a fresh Hæmorrhage should ensue: For it is better to leave them for some time upon the Wound, and at every Dressing to soften them with warm Wine, or Spirits of Wine, till a Suppuration being made, they loosen or fall off of their own Accord; after which, it will be sufficient to dress but every other Day, or once a Day, unless the Suppuration be very great, especially in Summer-time, and then it may require twice.

At every Dressing one Caution is carefully to be observed, which is, that the Wound is, first of all, to be gently cleansed with Lint, and fresh Pledgets of Lint must then be applied, the undermost of which, or that which is next to the Wound, must have some digestive Ointment spread upon it; but 'tis proper to apply all the rest dry: Over the Dressings of Lint, three, four, or six Pieces of Plaster, about a Foot long, and an Inch broad, spread with Diapalma Plaster, that of *Andreas a Cruce*, or some other of a glutinous Consistence, are to be applied in the Form of a Star: Last of all, a thick square Compress of Linen, and three long narrow ones disposed over it, in the Form of a Star, are applied over the Plaisters. The Application of Bandage being continued in this manner for about fifteen Days, so great a Quantity of Lint, or so many Compresses, are no longer requisite, since the Danger of an Hæmorrhage is then over. The Surgeon, in the mean time, must proceed in the Cure of the Wound by a digestive Ointment, or Vulnerary Balsam, laying upon it only a small Quantity of Lint, and Plaisters, with some Compresses over all; and, last of all, dry Lint is used with a Plaster upon it; and the Wound itself is, by this means, dried and agglutinated, in the same manner as other Wounds: But this Agglutination almost always requires two Months before it is perfected. 'Tis here necessary to give Surgeons a short, but necessary Caution, which is, that they never apply the first Bandages, especially in case of an amputated Humerus or Thigh, till the Torcular is applied, in order to check the Motion of the Blood; and prevent an Hæmorrhage; or at least when the Operation is performed in the Arm, till the Artery is strongly compress'd by the Thumb of an Assistant.

When, after the Amputation, a pretty violent Motion, or Fervour of the Blood ensues, which is generally the Case with sound robust Bodies, and such as abound in Juices, 'tis necessary to let Blood very plentifully, and prescribe temperating and refrigerating Medicines; together with a very strict and exact Regimen. If this should be neglected, 'tis to be dreaded, lest a very terrible Fever, commonly called the Vulnerary Fever, or a Sphacelus, or some other Disorder of that Nature, should destroy the Patient.

AMPUTATION of the FEET and LEGS.

When the antient Surgeons intended to amputate a Foot that was corrupted in the Tarsus, or Metatarsus, that is to say, in any Part that lay below the Tibia, they used a Chisel of a large Size, and a Mallet made for the Purpose: They sometimes also made use of a Pair of very large, strong, and sharp Sheers, with which they cut off the corrupted Part; and then applying proper Bandage to the Wound, healed it with balsamic Medicines. This Operation is fully described by *Scultetus*, who had often seen it performed: But as this Method of going to work was very painful in itself, and likely to lay a Foundation for future Danger, by the Collision of the Bones, and the Laceration of the Nerves and Tendons, the more modern Surgeons, for very good Reasons, chose with a Knife to divide the Bones of the Toes from those of the Metatarsus; and, in like manner, those of the Metatarsus from those of the Tarsus; and when the Corruption happens to reach a little higher, they even venture to divide the first Bones of the Tarsus from the remaining and posterior Bones, where they are joined to each other; after which they proceed, as the Antients did, to agglutinate the Wound; for, by this means, the Patient is able to walk better upon the remaining Part of his Foot, than on a Wooden Leg or Foot. But because many have, in this Case, dreaded the Difficulty of Agglutination, or the Impossibility of again covering these Bones; or because they have, perhaps, known this Operation to be very troublesome in itself, they have therefore rather chose to cut thro' the Tibia itself, and that not towards its lower Extremity, but in its upper Part, about four Inches below the *Patella*; for tho' by this means a sound as well as a large Portion of the *Patella* is cut off, yet, by following this Method, the Deformity of the Foot, and the Difficulty of walking, are more effectually prevented; for since no one can either stand or walk well upon a long Stump, and since an artificial Foot, or other Support, cannot be commodiously fixed to it, it is much more convenient to cut the Tibia in its upper Part, and that four Inches below the *Rotula*; since if the Incision was made

made higher, its Flexor Muscles might be hurt by that means; and by this Method the Deformity of the Part is concealed, and a way paved for adapting and accommodating to the Knees artificial Legs, either of Wood or Silver. I am not ignorant, that there are, even in our own Days, some Surgeons who think with *Solingen*, *Verduin*, and *Dionis*, that the corrupted Part is only to be taken off; but I see no Reason why, in this Case, we should pay any Veneration to their Authority, or be sway'd by their Judgment; for besides that in the inferior Part of the Tibia, that is, under the Calf of the Leg, it is very difficult to fix any artificial Foot or Support; if an artificial Leg is fastened to the Knee, and the remaining Stump is bent backwards, it causes not only a great Deformity, but a considerable Inconvenience in Walking.

With respect to the Apparatus, Manner of Operation, and Bandage, nearly the same Rules must be observed, as in Amputations of the Arm. There are, however, some Cautions necessary to be regarded, which relate particularly to Amputations of the Leg. As first, the Patient may either sit in a Chair, or lie upon a Bed, or on a Table, so that the Feet may be stretched out. Secondly, the Hairs about the Part, which is to be amputated, must be shaved off, lest the Plaisters afterwards should stick to them, and cause great Pain when taken off. Thirdly, after Amputation the Arteries in the Legs are very difficultly closed, without the actual Cautey, or tying their Orifices by means of a crooked Needle and Thread; for altho' they appear not very large, yet, without these Assurances, they almost always, after dressing up, bleed for some time, especially if the Crural Artery is not, at the same time, well compress'd with narrow Compresses, and the Fillet. Fourthly, before the Operation, it is necessary, that either the common Torcular with a Stick, or the new one with a Screw, should be fixed above the Knee, so that the Fillet, roll'd up in the Form of a Cylinder, may lie under the Ham, and compress the Artery there descending, as is express'd *Tab. 35. Fig. 4. D.* Tho', to me, it seems much better that the Artery should be compressed by a Torcular, placed at the upper Part of the Thigh, especially if the Leg is to be cut off near the Knee; for so the Bandage, after Amputation, may be made more commodiously than when the Torcular is applied so near the Knee. See *Table 24. Fig. 1. L. M.*

Petr. Adrian Verduin, a celebrated Surgeon, formerly at *Amsterdam*, and my Friend when living, acquaints the World with a new Method of amputating the Legs, different from the other, in a particular Treatise wrote in *Dutch, German, French, and Latin*, tho' he was not the Inventor of it. There are many who ascribe the Glory of the Invention of this Operation to *Sabourin*, a *Geneva* Surgeon, as the History of the Royal Academy of Sciences, *Garengot*, and others. This Man is said to have performed it at *Geneva*, and after at *Paris* also, at the same time *Verduin* did it at *Amsterdam*. However, long before this time, I find this Operation was known, performed, and described by some *English* Surgeons, *Lowdham* and *Young*, as may be seen in a little Book intituled, *The triumphant Chariot of Turpentine; or, An Account of the many admirable Virtues of Oleum Terebinthinae, particularly in Wounds and Hemorrhages, a new Way of Amputation, and speedier curing Stumps*, London, 1679. *Koenerding*, Surgeon to the great Hospital at *Amsterdam*, and my Friend also, mentions it in a Book wrote in *Low Dutch*, intituled, *A Treatise of the Gangrene and Sphacelus, and of the old and new Method of amputating the Legs*, Amsterdam, 1698. who also performed this new Operation twice, in the same Year that *Verduin* did it. The Whole of this new Method amounts to this: That the Calf of the Leg is to be divided with the Knife, represented *Tab. 34. Fig. 3.* at the Tendo Achillis, and then cut upwards again, according to the Length of it, and separated from the Bones to the Place where they are to be taken off with the Saw (see *Tab. 35. Fig. 5. 6. 7.*). Then the Flesh of the Calf hanging down, must, by an Assistant, be drawn upwards with a Cloth to the Ham, *Fig. 6. A.* Afterwards the Skin on the fore Part of the Leg, and the Flesh between the Bones, must be divided, as in the common way, with a proper Knife, as those represented *Tab. 34. Fig. 1. and 3.* and the Limb must be taken off with the Saw, as is said above. The Calf, first clean'd with a Sponge moistened with Spirits of Wine, must be brought down to the Stump, and spread over it like a Pledget; and if there should be too much, or it should be unequal, it must be cut off, and the Remainder must be secured by adhesive Plaisters, or even with a Stitch or two. Lastly, Compresses, with the wet Bladder and Bandage, must be made use of, as is before directed in general Amputations; or the Dressings may be secured by a particular Machine of Leather, described by *Verduin* and *Garengot*, with Buckles and Straps, which are to be fixed upon the Stump of the Leg; mean time, the Trunk of the Leg must be compress'd by the Hand of an Assistant some Hours, till the Danger of an Hemorrhage is over; and, at the same time, the Torcular with a Screw, represented *Tab. 26. Fig. 6.* or that delineated *Tab. 27. Fig. 1.* is to be applied for the same Purpose. From this Method the before-mentioned Authors ima-

gine many Advantages accrue to the Patient. For, first, the Flesh, by compressing the Arteries, stops the Hemorrhage without astringent Applications, the actual Cautey, or tying up the Arteries: Secondly, a Caries cannot easily happen, the Bones being immediately covered again with the Flesh, but which often is the Consequence of the other Methods, and exceedingly protracts the Cure. Thirdly, by the Use of Vulnerary Balsams, in the succeeding Dressings, the Flesh and Stump will unite together, and the Cure will thereby be much accelerated. And, fourthly, the Flesh lying upon the divided Bones, like a Pillow, will be extremely commodious to the Patients in Walking, especially as there is no Necessity to bend the remaining Stump backwards, as is generally done in the common Methods: But a hollow Machine may be made of a light Wood, so that the Patient may walk, in some degree, as with a natural Leg. This Flesh, every time the Bandages are loosed, must be held and press'd close, by an Assistant, to the Bones, lest it should fall from them, and retard their Union. *Verduin* has explained all these things more fully in his Treatise above-mentioned, and has represented them in a great Number of Copper-plates.

But tho' not only *Verduin*, but other Surgeons also, have successfully performed this Operation many times, yet there are very few who approve of it, or who have endeavoured to introduce it into Practice instead of the other Methods. For, besides that neither the *English*, *Verduin*, nor *Koenerding*, ever used it afterwards, and *Sabourin's* Patient at *Paris* died, Instances are not wanting at *Amsterdam*, where, during the Cure, and even after the Part has been quite healed, some sharp Fragments of the Bones protuberated, and, by pricking the tender Parts, have caused intolerable Pain, and many other Disorders; not to mention, that *Sabourin's* Patient lost more Blood than is usual in the other way of Amputating, and other Inconveniencies which often succeed this Operation; and on which Account *Koenerding* prefer'd the old Method before it, as he declares freely in his Book. But, however this may be, 'tis certain *Garengot*, a modern *French* Surgeon, to whom the Writings of *Young* and *Koenerding* seem to be unknown, praises this Operation, and makes no Question but to bring it into Practice again. For there have been Men in *France*, as he reports, who have been so well cured by this Method, as not only to walk commodiously, but also to dance very readily; but if we would hope for such good Success, the Patient must be healthy, and the Causes, which require the Amputation, external.

Lastly, it is to be remarked, that this Operation is not confined wholly to the Leg, as many imagine, but it also may be performed in the Arm, by leaving Part of the Flesh and Skin for covering the Bones after the Limb is taken off, and which may be done with Success; as may be seen not only in *Young's* and *Koenerding's* Treatises, but also in *Ruyssch's Epist. Problem. 14. de nova Artuum decurtandorum Methodo*; where he accurately describes an Operation of this Sort, performed by *Verduin* and *Bortell*, the Son-in-law of *Verduin*, himself and others being present.

AMPUTATION of the FEMUR.

Whenever the Leg is corrupted as far as the Knee, or Thigh, or the inferior Part of the Thigh itself is affected with a Caries, Sphacelus, or incurable Fracture, or the Crural Artery is much injured, the Thigh itself must generally be amputated. The Danger and Hazard attending this Operation can scarcely be express'd, especially when it is performed in the superior Part of the Femur: For, besides that a violent Hemorrhage is sometimes caused by a Division of the great Arteries, the Strength of the Patient is so perpetually wasted by the constant Discharge of too great a Quantity of Matter, from so large a Wound, that the Patient frequently sinks under the Cure. Therefore, whenever the Thigh is to be cut off, the Surgeons ought, by all means, to take care, that it is done, if possible, in the smallest Part, about three Fingers Breadth from the Knee, and that as much of the Flesh and Skin is saved as possible; for by so doing, this violent Operation will be supported the better, and the Cure will be completed with more Ease and Safety.

The Fillet roll'd up in Form of a Cylinder must, by means either of the common Torcular, or one of those with a Screw, compress the Crural Artery, by being placed upon the highest and inward Part of the Thigh, that is, where the Head of the Vastus Internus Muscle, and the Triceps, meet; see *Tab. 24. Fig. 1. L. M.* for there is the greatest Danger otherwise, lest, as it often happened before the Torcular was invented, a very large Hemorrhage, from that great Artery, should suddenly destroy the Patient, even during the Operation.

With respect to the Amputation of the Thigh, very little is to be said here, the same Method being to be observed as in cutting off the Arms or Legs. But this, however, must be particularly taken Notice of, that, in the first Place, the Hairs are to be shaved off the Part; secondly, that as soon as the Skin, with the Fat, is divided all round with the lesser Knife, *Tab. 34. Fig. 1.* they are to be drawn upwards as much as is possible, before the Muscles, or Flesh, are divided. Afterwards these Muscles,

Muscles, near the upper Edges of the divided Skin, a little higher than the first Incision, must be cut through all round to the Bone, either with the same smaller Knife, or that represented *Tab. 43. Fig. 7.* or with the large crooked Knife, *Tab. 34. Fig. 2.* By this means, as was before observed, after the Bone is saw'd off, the Trunk of the Bone will be the sooner covered with the Flesh, and Integuments that are left; a Caries will be prevented, and the Cure of the Wound much accelerated. But if this Method is not carefully observed, but the Muscles are divided, together with the Skin at the same time, as is sometimes done, these strong Muscles, being cut through, contract so much upwards, as I have often seen, that the Thigh Bone, after the second or third Dressing, has stood out beyond the Flesh two or three Fingers Breadth, like a Stick: In which Case a long time is required for the Flesh to grow, and extend itself, so as to cover the Stump, which alone is sufficient to debilitate the Patient, and give him much Uneasiness. Add to this, that the Wound cannot be expected to heal before the Trunk of the Bone is covered.

Then, as to an Hemorrhage, because of the remarkable Largeness of the Artery, it can scarcely be stopp'd otherwise than by Ligature, which is therefore ordered here to be done with the greatest Care, the Artery being first taken hold of by the Forceps, or Tenacula, *Tab. 34. Fig. 5.* or 6. and tied well with a strong Thread pass'd round it. If more Arteries bleed, if they are large, they must be tied, but if small, there is no Occasion, as Dossils of Lint, or a Bit of Vitriol, very often do the Business. The Bandage is the same as we mentioned above in an Amputation of the Arm; only there should be greater Plenty of Lint and Puff-ball, a larger Bladder, and also larger Compresses and Plaisters; and lastly, longer and broader Rollers are here necessary, and the Crural Artery must be compress'd the whole Length of the Thigh, with a narrow and thick Bolster, and a particular Roller, or the Torcular itself, *Tab. 26. Fig. 6.* or *Tab. 27. Fig. 1.* is to be kept on for some time. Then, the Patient being put to Bed, it is proper to place a Pillow under the Thigh, by which it may be well elevated, that the Force of the Blood, against the Mouths of the Arteries, in the elevated Limb, may be more gentle; for this contributes much to the preventing an Hemorrhage. Then the Stump must be compress'd for a considerable time, with the Hand of an Assistant, and every thing else must be done as is directed in the Cure of an amputated Humerus.

But if any Part of the Foot, or Arm, should be taken off by a Bullet, or Cannon Ball, or should be torn off, or broke to-pieces by a Wheel, or any such Machine, the Surgeon must consider, that the first thing to be done is to apply the Torcular immediately, to check the Hemorrhage. Secondly, that the Parts of the Bones standing out of the Flesh, if there are any, be taken off, either with a sharp Pair of Pincers, or a Saw, so that the End of the Bone may be rendered even and smooth, and that no pointed Fragments may appear above the Flesh; but if the Bones do not protuberate, then nothing is to be taken away. And, thirdly, that the wounded Arteries be either compress'd with thick Dossils of Lint, or small Compresses, or be tied up; or even, in Cases of Exigency, as the Nature and Situation of the Wound, or other Circumstances, seem to require, with the actual Cautery, and afterwards carefully bound up. And, as to the rest, he must proceed in the Manner laid down before in other Amputations of the Limbs.

But tho' *Botallus*, a celebrated French Physician, formerly invented a new, and, in Appearance, wonderful and expeditious Method of amputating the Limbs, by a Machine, furnished with a very large and sharp Iron Instrument, which being very heavy, and falling suddenly from a considerable Height upon the Place where the Limb was to be amputated, cut it off without either Knives or Saw, most expeditiously, and at one Stroke; and tho' *Hildanus* has also imitated this Method of Amputating, nevertheless the more prudent Surgeons, and that not without Reason, have abandoned this Contrivance; for it is greatly to be feared, that, left from the excessive Violence of the Blow, the Bones themselves should be splintered, and very much shattered. See above.

After the Stump is perfectly healed, it may not be amiss to make an artificial Leg, either of Silver for Gentlemen; or, for the poorer Sort, of Wood; which, being properly fitted to the Part, either with Buckles and Straps, or even by Springs, the Deformity may be concealed, and the natural Use of the Limb, in some measure, restored. Not only *Paré*, *Hildanus*, and *Solingen*, but some modern Mechanics, have curiously shewn, in what manner it should be made; but if Circumstances are very narrow, then only the common wooden Leg, hollowed in its upper Part, so as to fit the Knee, may be bound on, so that the Patient may walk with it tolerably well.

Lastly, if the Ends of the Bones should prove carious, as is very often the Case, whatever Care the Surgeon may take to prevent it, it is certainly necessary (altho' many Surgeons are silent upon this Subject, because it impedes the Cure) to dress the Caries with Powder of Euphorbium, or to touch them with the actual Cautery; or, which appears to me better, the rotten

Part may be scraped off with the Rugine; for, by so doing, in a little time the Flesh will unite with the scraped Bone, and the Wound will be healed, which could not be done whilst the Caries continued.

AMPUTATION of the whole ARM, at the Joint of the HUMERUS.

I myself have never performed an Amputation in the Joint of the Humerus, nor have read of its being done by any other Surgeons, except *Le Dran*, and *Garengot*, after his Example, tho' he does not name him; nevertheless, it will not be improper to shew briefly here, what they have specified concerning it.

There are two Cases, in which they tell us this painful Operation ought to be performed. The first is, if the upper Part of the Arm is broke to-pieces by a Bomb-shell, Hand-granado, or by any other Violence is excessively bruised and shattered. The other Case is, if the Head of the Humerus, by any internal Disorder, suppose either by a Tumour, a Spina Ventosa, a Caries, or even an Abscess, is found to be rotten; to which perhaps may be added, a Sphacelus of the Arm, which extends itself to the Joint.

But before so dangerous and difficult an Operation is attempted, the several things are to be provided, which may seem necessary to the Accomplishment of it. First, the Patient is to be placed in a convenient Chair, with his Face covered: But in this Operation the Torcular must not be applied, as in other Amputations, because it cannot be well fixed; but the Brachial Artery must be tied, as soon as the Flesh is divided, which, they inform us, is to be done in the following manner:

As soon as the Patient is properly seated, the affected Arm must be extended, and held strongly by an Assistant, and the true Situation of the Brachial Artery must be traced from the Axilla; in doing which, Anatomy will greatly assist the Surgeon: But if, from the Largeness of the Tumour, it cannot be found, it is necessary to make an Incision through the Flesh, on both Sides of the Arm, lengthways, so that the Bone may be touch'd by the Surgeon's Fingers, that from hence he may judge of the Situation of the Artery. The Brachial Artery being thus found out, a Needle, threaded with strong Thread, six or eight times doubled, and waxed, must be pass'd through the Flesh, about two Fingers below the Armpit, near the Os Humeri, between the Bone and the Artery, taking care the Artery is not wounded by the Needle in its Passage, holding down the Arm, that the Skin may be the more lax; the Thread then, being brought round, must be secured by a firm Knot. This being done, it is to be considered, whether the Pulse of the Artery, in the neighbouring Part of the Arm, is ceased or not: For if it is not perceived, it is a Sign the Artery is sufficiently compress'd by the Ligature; but if any Pulsation of the Blood remains, the Thread must be drawn tighter, till the Pulsation entirely ceases: And then a second or third Knot, with Bows, must be made, lest the Ligature should be too easily relaxed. For this Purpose, *Le Dran* proposes a strait Needle; but *Garengot* recommends one that is crooked, such as is represented *Tab. 35. Fig. 10.*

With respect to this Operation, three Cautions are principally necessary. For, after the Artery is tied in the manner before-mentioned, and secured from an Hemorrhage, great Care must be taken, first, that sufficient Skin and Flesh is left at the Shoulder; secondly, that the Flesh is properly cut thro'; and lastly, that the Ligament itself, in the Joint of the corrupted Bone, is divided; then let the Bone be loosed from the Sinus of the Scapula, and at last entirely removed. But that these things may be happily accomplished, it ought to be the Surgeon's Care to find out, carefully, the true Situation of the Acromion; then that the Skin should be drawn back sufficiently; and lastly, that the Knife, for dividing the Flesh, be introduced two or three Fingers Breadth under the Acromion; for by so doing, a great Part of the Deltoid Muscle is saved, by the Assistance of which, not only the hollow Sinus of the Humerus may be filled up, but the healing of the Wound may be surprisingly hastened.

These things being well considered, the Skin, with the Fat and Deltoid Muscle, must, in the Place specified above, be cut through with a sharp Knife, such as that represented *Tab. 34. Fig. 1.* or *Tab. 33. Fig. 14.* Afterwards the Arm must be gently raised, that the Heads of the Biceps Muscle may be the more easily found and divided. If, by Accident, a Flux of Blood from the lesser Arteries and Veins should perplex the Operation, an Assistant must apply either his bare Finger, or Dossils of Lint, or hard and small Compresses, to the Mouths of the bleeding Vessels; but if the Flux be from a large Artery, it must be tied by means of a small Needle and Thread: Then the Ligament, first in the superior Part of the Joint, and afterwards on both Sides, must carefully be divided, and the Head of the Bone of the Arm must be taken away, with the Left Hand; then all the other Parts which surround the Head of the Arm on every Side, must be loosened and divided; but with the greatest Caution, lest the Brachial Artery itself should

be cut. In this way of Operating, it may be readily perceived, whether the Arteries are exactly enough secured. We must also take great Care afterwards, that the Skin and Muscles which are tied together with the Artery, are not rashly divided: Therefore the Skin must be so divided from the Bone, that an almost triangular Piece may remain near the Armpit, the broadest Part of it next the Armpit, the lower or outward Part somewhat narrower, and accommodated to the Shape of the Deltoid Muscle; and thus the whole Limb is, at last, entirely taken off.

The Arm being amputated, as above-mentioned, it remains, that the Artery tied with the Flesh should be found, and another Ligature made above the former, by passing a Thread, by the Help of a smaller Needle, *Tab. 27. Fig. 5.* betwixt the Skin and the Artery, which must be tied very securely: Then the other Ligature, which bound the Skin also, must be cut, lest a painful and dangerous Inflammation should be excited.

The Manner of binding up the Wound, after the Operation, is thus directed: Immediately a Pledget of Lint must be applied to the Trunk, and a small Compress upon the Arteries, to secure the Ligature. *It is, however, Heister's Opinion, that it would be a better way to apply the Flesh immediately to the Sinus of the Scapula, and upon that the Pledgets and Compresses; for he thinks, by this means, the Flesh would sooner unite with the Bone, than if they were at first separated by the Interposition of the Lint and Pledgets.* Then the lower Part of the Skin must be drawn upwards, and the upper Part, together with the Deltoid Muscle, drawn downwards; and a great Quantity of dry Lint must be laid upon them, which must be secured upon the Parts by a Plaister, in the Shape of the *Maltese Cross*. Over the Plaister a thick and large four-square Compress must be applied, and a round Bolster to the Armpit, by which the Pulsation of the Arteries will be the better secured from breaking the Ligature. All these must be covered with a double Compress in the Shape of the *Maltese Cross*, and in such a manner, that two or three more Compresses, of about two Thirds of an Ell long, and four Fingers broad, may be laid upon it. These two Compresses are to be placed thus: The first must be applied obliquely upon the Trunk, so that the anterior Part of it may rest upon the sound Shoulder, and the posterior Part about five Fingers below the sound Armpit: The second should be placed upon the Trunk, cross-ways, over the first; and the third, broader than the other, must be applied over them both, so as to cover them, and be pass'd cross-ways upon the sound Shoulder; then with the Bandage, which the Surgeons call *Spica descendens*, (see *FASCIA*) the Whole must be firmly secured, placing first a thick Compress or Bolster under the sound Armpit, lest the Veins there should be too much press'd, and that the Roller may the more conveniently be pass'd round.

This Operation *Le Dran* the younger, and *Garengot*, report was performed with good Success upon a French Nobleman, in the Presence of, and with the Consent of *Mareschall, Arnold, Lapeyron, Petit, Merry*, and other noted Surgeons at *Paris*, on account of a Caries, or rather a Spina Ventosa, in the upper Part of the Arm. But *Garengot*, in his second Edition of *Chirurgical Operations*, adds, that the same Nobleman died of a Plethora, six Months after the Cure was completed. He also orders this Operation to be performed, in an Abscess, near the Joint of the upper Arm; but whether a simple Abscess can call for so dangerous and difficult an Operation, I leave to the Judgment of more prudent Surgeons.

The Opinion of our own Surgeons, relative to Amputations, is much to be regarded; and this we may learn from the Practice of the Hospitals, which (according to Mr. *Sharp*) is as follows:

A spreading Mortification has been always looked upon as so principal a Cause for Amputation, that it is a Fashion with all Writers to treat of a Gangrene, previous to the Description of this Operation; and, I think, they have all agreed, that whatever the Species of it be, if the Remedies they prescribe do not prevent its Progress, the Limb must be amputated: However, this Operation is spoken of as frequently unsuccessful; and, in Length of Time, its want of Success has been so unquestionably confirmed, by repeated Experiments, that some of the most eminent Practitioners here in *England*, make that very Distemper an Exception to the Operation, which so few Years since was the great Inducement; and the Maxim now is, never to extirpate till the Mortification is absolutely stopp'd, and even advanced in its Separation.

Gangrenes may be produced two Ways, either by Indisposition of Body, or by Accident in a healthful State; for, as the Life of a Part depends upon the Circulation of its Fluids, whatever shall make the Circulation cease, will inevitably occasion a Gangrene: Thus a mere Compress, preventing the Course of the Blood, as effectually causes a Mortification, as any Indisposition in the Fluids or Vessels.

It frequently happens in old Age, that the Arteries of the lower Extremities ossify, which destroying their Elasticity, must, in Consequence, produce a Gangrene in the Toes first, and afterwards in the Limb, nearly as high as where the Ossifi-

cation terminates; so that, in Mortifications arising from this Cause, we at once see why Amputation, during their Increase, is of so little Service, unless performed above the Ossification; but we have no way to judge where the Ossification ends, but by the Inference we make from the Gangrene's stopping: Hence we may learn the Propriety of our modern Practice in this Case.

If, by any Accident, the Limb has been injured to that violent Degree as to begin a Mortification, it will be no more fit to operate here, till it stops, than in the other Instance; because all Parts that are mortified, have had the Disposition to become so, before the Effect is produced; and cutting off a Limb half an Inch above the absolute dead Skin, is generally leaving a Part behind, with the Seeds of a Mortification in it; so, unless we can be sure the Vessels are not affected in the Place of Amputation, which will be hard to know but from the Consequence, the Operation will be useless.

Sometimes the Fluids of the Body are so vitiated, as to lose their proper nutritious Qualities, and the Limb becomes gangrened, not from any Alteration in its Vessels, but chiefly from its Situation; which being at a great Distance from the Heart, will be more subject to feel the ill Effects of a bad Blood, than any other Part, as the Circulation is more languid in the Extremities. When therefore a Gangrene, arising from this Cause, is running on, Amputation above it will, for the most part, be useless; since it is only removing one of the Effects of the bad Juices, and leaving them in the same State, to produce the like Mischief in other Parts: Thus we see, after Amputations on this Account, the Gangrene sometimes falls on the Bowels, or the other Extremities; from which Observation, I think, we may conclude it not safe to amputate, till the Fluids are altered, and this Alteration will presently discover itself by the stopping of the Mortification.

I have laid it down as a Rule, that the Mortification should not only be stopp'd, but advanced in its Separation; the Reason of which is, that tho' the Blood is so much altered for the better, as to occasion a Stoppage of the Gangrene, yet at this Point of Alteration 'tis still in a bad State, and should be left to mend, with the utmost Tranquillity of Body, and Assistance of cordial Medicines, till such time as Granulations of Flesh, upon the living Part of the Extremity, shew the balsamic Disposition of the Blood: In the mean while, to take off the Stench of the Gangrene, it may be wrapt up in spirituous or odoriferous Applications. I have seen some Limbs taken off immediately upon the Mortification's ceasing, when afterwards the Patients have sunk, from frequent Effusions of Blood, not discharged by the great Vessels, but the whole Stump. These Hemorrhages, I conceive, were owing to the Thinness of the Blood, which hardly gave a reddish Tincture to the Cloaths and Bandages; on the other hand, upon waiting a considerable time after the ceasing of the Mortification, I have taken off some myself with as good Success as for any other Disorder.

Gun-shot Wounds, compound Fractures, and all sudden Accidents requiring Amputation, are attended with the best Success, if immediately performed. Disorders of the Joints, Ulcers of long standing, and all scrophulous Tumours, do sometimes return on other Parts, after the Operation. When a Leg is to be amputated, the Manner of doing it is this:

Lay your Patient on a Table, three Foot four Inches high, which is much better than a low Seat, both for securing him steady, and giving yourself the Advantage of operating without stopping, which is not only painful, but inconvenient, in the other Situation. While one of the Assistants holds the Leg, you must roll a Slip of fine Rag, half an Inch broad, three or four times round it, about four or five Inches below the inferior Extremity of the Patella: This being pinn'd on, is to serve as a Guide for the Knife, which without it, perhaps, would not be directed so dexterously: The Manner of rolling has always been perpendicular to the Length of the Leg; but having observed, that tho' the Amputation at first be even, yet afterwards the Gastrocnemius Muscle, contracting, draws back the inferior Part of the Stump more strongly than the other Muscles can do the rest of it; I have lately, in order to preserve the Regularity of the Cicatrix, allowed for this Excess of Contraction, and made the circular Incision in such a manner, that the Part of the Wound which is on the Calf of the Leg, is farther from the Ham, than that on the Shin is from the middle of the Patella.

In the mean time, one of your Assistants must carry a strong Ligature round the Thigh about three or four Inches above the Patella, which passing through a couple of Slits in a square Piece of Leather, he must twist with a Tourniquet till the Artery is sufficiently compress'd, to prevent any great Effusion of Blood; and to do it more effectually, he may lay a Bolster of Tow or Linen under the Ligature, upon that Part where the Artery creeps.

The Course of the Blood being stopp'd, you must begin your Incision just below the Linen Roller, on the under Part of the Limb, bringing your Knife towards you, which at one Sweep may cut more than the Semi-circle; then beginning your second Wound

Wound on the upper Part, it must be continued from the one Extremity to the other of the first Wound, making them but one Line. The Incisions must be made quite through the Membrana Adiposa, as far as the Muscles; then taking off the Linen Roller, and an Assistant drawing back the Skin as far as it will go, you make your Wound from the Edges of it when drawn back, through the Flesh to the Bone, in the same manner as you did through the Skin. Before you saw the Bones, you must cut the Ligament between them with the Point of your Knife; and the Assistant, who holds the Leg while it is sawing, must observe not to lift it upwards, which would clog the Instrument.

In amputating below the Knee, it is of Advantage to stand on the Inside of the Leg, because the Tibia and Fibula lie in a Position to be saw'd at the same time, if the Instrument be apply'd externally: Whereas, if we lay it on the Inside of the Leg, the Tibia will be divided first, and the Fibula afterwards; which not only lengthens the Operation, but is also apt to splinter the Fibula, when it is almost saw'd through, unless the Assistant be very careful in supporting it.

When the Leg is taken off, the next regard is to be had to the stopping the blood, which must be effectually done before the Patient is put to Bed, or there will be great Danger of Bleeding again, when the Fever is excited, and the Vessels of the Stump dilated, both which happen a very little while after the Operation. There is no Method for this Purpose so secure, as tying the Extremities of the Vessels with a Ligature, which with a crooked Needle pass'd twice through the Flesh, almost round them, will, when the Knot is made, necessarily inclose them in the Stricture; and to discover the Orifice of a Vessel, your Assistant must every time loosen the Tourniquet: This is a much better way than using the Artery Forceps, where the Vessels are apt to slip away out of the Ligature; and as to Astringent Applications, their want of Safety is so well known now, that the Use of them in Hemorrhages from large Vessels, is almost universally rejected.

It sometimes happens in a large Stump, that ten or more Vessels require tying; which done, you must apply loose dry Lint to the Wound, or in case the small Vessels bleed plentifully, you may throw a Handful of Flower amongst the Lint, which will contribute to the more effectual stopping up their Orifices. Before you lay on the Pledget, you must bind the Stump, and begin to roll from the lower Part of the Thigh down to the Extremity of the Stump. The Use of this Roller is to keep the Skin forwards, which, notwithstanding the Steps already taken, to prevent its falling back, would in some measure do so, unless sustained in this manner. The Dressings may be secured by the cross Cloth, and gentle Bandage; and the Method of treating the Wound may be learn'd from what has been said, with respect to recent incised Wounds.

Before the Invention of making the double Incision I have just now described, the Cure of a Stump was always a Work of Length of Time; for by cutting down to the Bone at once, and sawing it directly, the Consequence was, that the Skin and Flesh withdrew themselves, and left it protruding out of the Wound two or three Inches in some Cases; so that it rarely happened, that an Exfoliation did not follow; which, besides being tedious, also frequently reduced the Wound to an habitual Ulcer, and at best left a pointed Stump, with a Cicatrix ready to fly open upon the least Accident; all which Inconveniences are avoided by this new Method, and I know not of any Objection to it, unless that the Pain of making the Wound is supposed to be twice as much as in the other, because of the double Incision; but when we consider, that we only cut the Skin once, and the Flesh once, tho' not in the same Moment, I fancy, upon Reflection, the Difference of Pain will be thought inconsiderable.

In amputating the Thigh, the first Incision is to be made a little more than two Inches above the Middle of the Patella; after the Operation, a Roller should be carried round the Body, and down the Thigh, to support the Skin and Flesh. This is also the most proper Bandage, as Abscesses will sometimes form in the upper Part of the Thigh, which cannot discharge themselves so conveniently with any other, it being almost impracticable to roll about the Abscess, unless we begin from the Body.

The Amputation of the Arm and Cubit differs so little from the foregoing Operations, that it will be but a Repetition to describe it. However, it must be laid down as a Rule, to preserve as much of the Limb as possible, and in all Amputations of the upper Limbs, to place your Patient in a Chair.

There are, in Armies, a great many Instances of Gun-shot Wounds of the Arm, near the Scapula, which require Amputation at the Shoulder; but the Apprehension of losing their Patients on the Spot by the Hemorrhage, has deterred Surgeons from undertaking it. I have heard of its having been done once, but though it had never been perform'd, we might learn it is practicable from the Case of a poor Miller, whose Arm and Scapula were both torn from his Arm by a Rope which was accidentally twisted round his Wrist, and suddenly drawn up by the Mill. Almost every one in London knows the Story, and

that he recovered in a few Weeks: It is very remarkable in this Accident, that after fainting, the Hemorrhage stopp'd of itself, and never bled afresh, tho' nothing but Lint and Turpentine were laid on the great Vessels. In case therefore of a Wound or Fracture near the Joint, or incurable Fistulas in the Joint, not attended with much Caries, I think the Operation may be perform'd safely in this manner:

The Patient's Arm being held horizontal, make an Incision through the Membrana Adiposa, from the upper Part of the Shoulder, across the Pectoral Muscle, down to the Armpit, then turning the Knife with its Edge upwards, divide that Muscle, and Part of the Deltoid; all which may be done without Danger of wounding the great Vessels, which will become exposed by these Openings; if they be not, cut still more of the Deltoid Muscle, and carry the Arm backward; then with a strong Ligature, having tied the Artery and Vein, pursue the circular Incision through the Joint, and carefully divide the Vessels at a considerable Distance below the Ligature; the other small Vessels are to be stopp'd as in other Cases.

In doing this Operation, regard should be had to the saving as much Skin as possible, and to the Situation of the Processus Acromion, which projecting considerably beyond the Joint, an unwary Operator would be apt to cut upon.

The Amputation of the Fingers and Toes is better performed in their Articulation, than by any of the other Methods: For this Purpose, a straight Knife must be used, and the Incision of the Skin be made not exactly upon the Joint, but a little towards the Extremity of the Fingers, that more of it may be preserv'd for the easier healing afterwards: It will also facilitate the Separation in the Joint, when you cut the Finger from the Metacarpal Bone, to make two small longitudinal Incisions on each Side of it first. In these Amputations, there is generally a Vessel or two that require tying, and which often prove troublesome when the Ligature is omitted.

It may happen, that the Bones of the Toes, and Part only of the Metatarsal Bones, are carious, in which Case the Leg need not be cut off, but only so much of the Feet as is disordered; a small Spring-saw is better to divide with here than a large one. When this Operation is performed, the Heel and Remainder of the Foot will be of great Service, and the Wound heal up safely, as I have once found by Experience, Sharp.

AMPUTATION of the BREAST.

The Extirpation of a Cancer is an Operation of such Importance, that it cannot be performed with too much Caution: Before 'tis therefore attempted, the Surgeon ought carefully to examine, whether the neighbouring Glands under the Armpit, are already indurated; and whether the Cancer is entirely adherent to these indurated Glands. If it is, the Cure, for the most part, does not succeed so happily as could be wish'd, because the cancerous Disposition, or the Poison of the Disease, seems now to be lodged in other Parts, besides the Breast; and for this Reason, when the Breast is taken off, the Disorder uses in a little time to shew itself afresh. There are, in the mean time, some few Instances, where the Patients have been recovered by extirpating the Cancer, together with the indurated Glands under the Armpit; but when the Surgeon inclines to undertake the Extirpation of this Sort of Cancer, the Patient must be duly and skilfully prepared for the Operation by proper Management, and a due Regimen. After this Course of Preparation is at an End, if the Cancer is as yet moveable, and not immoderately large, but only possessing a Part of the Breast, [vid. Tab. 43. Fig. 1. A. B.] the Patient must be placed upon a pretty high Chair adapted to that Purpose, and the Arm next to the affected Breast, must be either well extended, or even held backwards and downwards, or tied in a proper manner to the Chair; for by these means the Pectoral Muscle is strongly expanded, and the corrupted Part of the Breast may, by means of that very Expansion, be more easily and more thoroughly loosened from it. Then 'tis customary with many, in the very Middle of the Tumour, to make pretty long crucial Incisions into the Skin and Fat, which cover the Cancer; which having done, they with an Incision-knife separate the Lips of the Incisions, and so proceed to the Separation and Extirpation of the Cancer itself. To do which with the greater Accuracy and Dexterity, some use to raise and free the corrupted Part with a flaxen Chord pass'd thro' it, by means of the large Needle delineated in Tab. 27. Fig. 5 or 6. or with such a Hook as may be seen in Tab. 29. Fig. 2 or 3. But I have several times happily cur'd Cancers of this Kind, which were larger than the Fist, and reached from the very Nipple to the Humerus, as may be seen in Tab. 43. Fig. 3. A. B. and yet made only one Incision, and with the Help of no other Instrument than an Incision-knife, delineated in Tab. 33. Fig. 14. separated it entirely from the sound Parts, and agglutinated the Wound, of which there is a Representation in Tab. 43. Fig. 2. But where the Skin itself is corrupted, or closely adherent to the Cancer, a Cure can scarce be expected in any other way, than by cutting out the Cancer, and

and together with it the Skin, which, for the most part, may be very soon done by a skilful Surgeon; and I myself have performed Cures of this Kind, without leaving any considerable Cicatrix.

After the Extirpation, unless the Patient is already too much weakened, it is very proper to take as much Blood from her, as her Strength and Condition will allow; for by this means an Inflammation, a Fever, and a fresh Effusion of Blood, may most probably be prevented. Nor indeed is there in this Case any great Necessity for a hot Iren to stop the Hemorrhage, as the Antients imagined; for proper Bandage will sufficiently answer the Intention, by the Application of a good deal of fine Lint, some Folds of thick Linen Cloth considerably broader above it, and a Roller of a sufficient Length above all. And indeed *Bidloo*, once my Master, and a Man very much conversant in Operations of this Kind, affirms, that the Blood, in Cases of this Nature, may most advantageously be stopp'd, by a Mixture of Plaister of *Paris* (Gypsum) with the Lint [*Exercit. Anat. Chirurg. p. 157.*]. Some again apply various Styptic Powders, and others tie up the larger Arteries. But *Garengot*, agreeably to that Method of Cure proposed by Mr. *Petijt*, a famous Surgeon in *Paris*, maintains not only that the Blood will soon stop, but that the Incision will soon heal, and the Cancer return no more, if without the Use of any Lint and Styptic Medicines, the Lips of the Wound be carefully and speedily brought into Contact by means of Suture. I myself made a Trial of this Kind of Cure; but tho', upon cutting out the Cancer, there was a very small Effusion of Blood, and the Patient was soon recovered; yet her Disorder soon return'd, and she herself at last died of a Cancer, formed a second time after the Extirpation of the first, even though the Wound was perfectly agglutinated: I therefore think it incumbent on me, in Wounds of this Kind, where a vehement Effusion of Blood happens by the Extirpation of a Cancer of the Breast, and where it is to be fear'd, that it cannot be stopp'd by Lint alone; I say, in this Case, I think it incumbent on me to use either the best rectify'd Spirit of Wine, or some Powder fit for stopping Hemorrhages, made of Bole, Dragonsblood, Colophony, and Mastich, together with Lint, and the Crepus Lupi. When the Patient is weak, but little or no Blood should be designedly allow'd to flow from the Wound; but we ought, immediately after the Extirpation, to proceed to Bandage. But in changing or renewing our Bandages, we are to proceed according to the general Rules for dressing Wounds. See VULNUS.

I have learn'd from Experience, that it was no bad Method proposed by *Helvetius* [*Traité des Pertes de Sang*] to lay some broad thick Compresses of Linen Cloath, well soaked in warm Ale and Butter, over the first Dressings, in order to prevent Inflammation; but yet Matters proceeded well enough, when I apply'd all my Compresses dry.

But if a Cancer or Scirrhus possesses the whole Breast, in this Case, whether the Cancer should happen to be broke, or as yet remains covered, the whole Breast is to be cut off. Of this Kind was that large Cancer, which in the Year 1720. I myself very successfully extirpated, and described in a Treatise by itself; nor had it, as appears from *Tab. 43. Fig. 3. A. B.* only possessed the Whole of the Breast, but it was at the same time so large, that it weigh'd above twelve Pounds. In this Case likewise, we are carefully to examine, as I before cautioned, whether the Cancer is adherent to the Glands below the Armpit, or the Pectoral Muscle, because in both these Cases, most Authors maintain, that the Operation is performed to no manner of Purpose. But, not to repeat what I have already said of these Glands, *Bidloo*, as he himself affirms, [*Exercit. Anat. Chirurg. p. 168.*] more than once, successfully treated Cancers of this Kind, where, at the same time, a corrupted Part of the Pectoral Muscle was to be cut off. The same Author also affirms, that the Case is not always desperate, even when a certain Degree of Caries has seiz'd the Ribs; and, that he himself has sometimes known such a Caries carried off by scraping, or even by the yellow Ointment of *Wurtzius*. But when the Cancer neither adheres to the Glands nor Muscles, the Hopes of a happy Cure are far better founded.

Having thus shewn in what particular Cases the whole Breast, in which a Cancer is lodged, is to be cut off, it now remains, that we point out the proper Method in which this Operation is to be performed. But since different Surgeons have gone to work in different Manners, it will not be amiss here to enumerate some of the principal Methods: First then, let the Patient be placed on a Chair, in the manner described above; then, according to the Directions of *Scultetus*, a large Needle, represented in *Tab. 39. Fig. 12.* with a large Thread or Chord in its Eye, is to be pass'd thro' the lower Part of the Breast. Then the Extremities of this Thread or Chord are to be brought together in such a manner, as to be a kind of Handle for raising the corrupted Breast. Sometimes, when one of these Threads or Chords does not seem sufficient for the Purpose, two of them are pass'd through the Breast in a crucial

Direction, as may be seen in *Tab. 43. Fig. 4* and *5.* After this, the whole corrupted Part is to be carefully cut out, not by passing the Knife downwards, as *Scultetus* in his thirty-sixth Plate directs, but upwards, as is represented in *Tab. 43. Fig. 5.* lest perhaps an Effusion of Blood should either put an entire Stop to the Surgeon's Proceeding, or at least prevent his performing the Operation with that Accuracy he could wish. If the Breast is large, a proportionably large Incision-knife is to be used, that so the Operation may be the sooner performed. In a small Breast, on the other hand, a small Knife is sufficient. Another Method of performing this Operation was principally used by *Solingen* and *Bidloo*, and it only differs from the former in this; that instead of Threads or Chords, a kind of Fork, delineated *Tab. 43. Fig. 6.* is used. This Fork is pass'd in such a manner through the corrupted Breast, beginning at its lower Parts, as that the Knife, represented *Plate 43. Fig. 7.* may be strongly pass'd under it. If the Cancer should only possess a small Space, *Bidloo* did not in that Case use the Fork for supporting the Breast, but an Instrument, not unlike a small Sword, which you may see represented *Plate 43. Fig. 8.* All these Instruments must have proper Handles. But because, in our Days, these two Methods of performing the Operation, seem'd too barbarous and cruel, and could not be accomplished without the most exquisite Pain and Horror of the Patient, *Helvetius* made an Attempt not at all inconsistent with the salutary Art of Surgery, when for this Purpose he invented a kind of Forceps; one of which, represented *Plate 44. Fig. 1.* embraces, as it were, in its Arches, the upper Parts of the affected Breast; and the other, represented *Plate 44. Fig. 2.* lays hold of its superior and inferior Parts; so that betwixt them both, they embrace the Whole of the Breast, to the end that it may be the more easily rais'd, and thoroughly extirpated with the Assistance of a large Knife. But the fourth, and, in my Opinion, the best Method of performing this Operation is; when the Surgeon, without any other Instrument than a large Knife, lays hold of the Breast with one Hand, and elevates it, and with the other cuts out the Parts, over which the Corruption has spread itself. When the corrupted Breast is so large, as that the Surgeon cannot elevate it with one Hand, an Assistant is to do this Office with both his Hands, and the Surgeon is to separate it thoroughly, but at the same time cautiously, from the sound and subjacent Parts. And in this manner, without any other Steel Instrument than a Knife, did I cut off that great Breast weighing twelve Pounds, represented in *Plate 43. Fig. 3.* and that too very expeditiously and successfully. Examples of Cancers cur'd by this Method of Operation may be seen in the forty-fourth Observation of *Scultetus*.

The last Method of performing this Operation is that used a few Years ago by a Dutch Surgeon, and illustrated in a Dissertation wrote by my Townsman Doctor *Tabor*, who also describes an Instrument fitted and adapted to that end; a Representation of which may be seen *Plate 44. Fig. 3.* The corrupted Breast is embraced by the Arches A A, B B, of this Instrument *Plate 44. Fig. 3.* as may be seen in *Fig. 4.* of the same Plate. The Extremities of these Arches C C, *Fig. 3.* are shut with the Left Hand, that so the Root or Basis of the corrupted Breast may be pretty strongly compressed. Then by a sharp crooked Instrument represented by E F, and which should pass through the Cleft of the other Arch D D, the Breast is very diligently to be cut off. But however curious this Method of Operation may seem, or however specious and ingenious, that the plain and simple Method, directed above, is preferable to it; but as it is a late Invention, I chose to pass it over in Silence. A fuller Explication of the Figure will be given in the Description of the Figures of *Plate 44.*

When the Breast is cut off, in whatever Method it has been done, it is proper, if the Patient's Strength will admit of it, to take away some Ounces of Blood even before the Application of the Bandage, for preventing, as we already hinted, Inflammation and an Hemorrhage. The Opinion of some Surgeons, who imagine, that by this means the vitiated or cancerous Blood is quite drawn away, seems to be a Matter of no Consequence. But when the Patient is weak, it is more adviseable, immediately after the Operation, to apply a proper Bandage, than by an unseasonable and ill-tim'd Bleeding, to render her more and more weak. I am not indeed ignorant, that *Bidloo* and *Garengot* imagine, that in this Case there is no Danger of an Effusion of Blood, but that it is easily stopp'd and repress'd; but Experience has taught me the contrary; for I have often observed large Quantities of Blood break through thick Dressings and Bandage, by which means the Patients were considerably reduced. 'Tis therefore absolutely necessary in this Case, carefully and cautiously to apply Bandage.

In what manner Bandages may be most advantageously apply'd, we have already directed. I must only here give a Caution not to remove them before the third Day, and even then they are not to be violently torn away, but allow'd to fall off of their own accord. Besides, the less frequently, and the more circumspectly, the Dressings are renewed, the Agglutination suc-

succeeds proportionably the better. But if, in the Course of the Cure, too great a Quantity of purulent Matter should happen to flow from the Wound, in that Case the Dressings are to be frequently renew'd; and lest the Patient should be too much reduc'd, or even quite destroy'd, by a copious Discharge of the purulent Matter, the digestive Ointment will be more properly omitted, and Lint either dry, or slightly soak'd in Essence of Myrrh, and Amber, substituted in its Place. A certain Surgeon told me, that in Cases of this Nature, he us'd with Success burnt Alum, with the Addition of a small Quantity of red precipitate Mercury; and that by this very Means, a firm Cicatrix was very soon brought over the Parts.

That the Patient's lost Strength may be gradually restor'd, she must be careful to use not only Foods that are of good Nourishment, and easy Digestion, such as Broths, Jellies, soft Eggs, and other Aliments of a like Nature, but also cordial Medicines, and especially grateful and palatable Emulsions. Great Care on the other hand is to be taken, lest the Wound agglutinate too soon; for in this Case, as some Authors have observed, the Malady gathers fresh Strength, and returns with greater Violence. For which Reason, if there is any apparent Danger of this Misfortune, Honey of Roses is now-and-then to be used in the Dressings, that so a due Suppuration may be kept up for a sufficient time; but when the Cancer is once cured, the Patient must take great Care always to observe a strict and proper Regimen, and to shun the Exorbitancies of the tumultuous and ungovern'd Passions. She is likewise at stated Seasons of the Year, especially in the Spring and Autumn, to use purgative Medicines, and to have as much Blood taken from her, as her State shall require.

When in the Course of the Cure, a vehement Fever, accompany'd with violent Pains about the *Præcordia*, and a Difficulty of Breathing seize the Patient, certain and unavoidable Death is generally the Consequence. That this may not therefore prove the Patient's Fate, Blood is to be taken from her in time, and Medicines preventive of these Disorders prescrib'd. There are indeed some Women, who bear this Operation with uncommon Fortitude, and more than heroic Bravery of Mind; whereas others of their Sex, lose their Courage so far, as to shriek and cry in a manner so terrible, as is sufficient to shock and confuse the most intrepid Surgeon, and disconcert him in his Operation. 'Tis therefore absolutely necessary in this Case, that the Surgeon, as *Celsus* directs, be intrepid, and acquit himself in all the Steps of his Operation, in such a manner, as if he was deaf to the moving Groans, and piercing Shrieks, of the tortur'd Patient.

Mr. Sharp's Observations on this Subject must not be omitted, as they acquaint us with several Particulars of Importance.

The Success of this Operation is exceedingly precarious, from the great Disposition there is in the Constitution, after an Amputation, to form a new Cancer in the Wound, or some other Part of the Body. When a Scirrhus has admitted of a long Delay before the Operation, the Patient seems to have a better Prospect of Cure, without Danger of a Relapse, than when it has increased very fast, and with acute Pain. I cannot, however, be quite positive in this Judgment; but upon looking round amongst those I know, who have recovered, find the Observation so far well grounded. There are some Surgeons so disheartened by the ill Success of this Operation, that they decry it in every Case, and even recommend certain Death to their Patients, rather than a Trial, upon the Supposition it never relieves; but the Instances where Life and Health have been preserved by it, are sufficiently numerous to warrant the Recommendation of it.

The Scirrhus may be distinguished by its want of Inflammation in the Skin, its Smoothness and Slipperiness deep in the Breast; and generally by its pricking Pain, which, as it is more or less, increases the Danger accordingly, though there are some few with little or none in the Beginning. As the Tumour degenerates into a Cancer, which is the worst Degree of Scirrhus, it becomes unequal and livid; and the Vessels growing varicose, at last ulcerates.

In extirpating the Scirrhus, if it be small, a longitudinal Incision will dilate sufficiently for the Operation; but if too large to be dissected out in that manner, an oval Piece of Skin must be cut through first, the Size of which is to be proportioned to that of the Tumour: For Example; if the Swelling is five Inches long, and three broad, the oval Piece of Skin cut away must be nearly of the same Length, and about an Inch and an half in Breadth. In taking off the whole Breast, the Skin may be very much preserved, by making the Wound a great deal less than the Basis of the Breast, which must be carefully clear'd away from the Pectoral Muscle. This is not difficult to do, because all these Scirrhi, being enlarged Glands, are encompassed with their proper Membranes, which make them quite distinct from the neighbouring Parts, and easily separable; at least this is the Case when the Tumour is move-

able; for sometimes it adheres to the subjacent Muscle, and that Muscle to the Ribs; in which Circumstance the Operation is impracticable. When it is attended with Knots in the Armpit, no Service can be done by Amputation, unless the Knots be taken away; for there is no sort of Dependence to be laid on their subsiding by the Discharge of the Wound of the Breast. The Possibility of extirpating these Knots, without wounding the great Vessels, is very much question'd by Surgeons; but I have done it when they have not lain backwards and deep.

The Bleeding of the large Arteries is to be stopp'd by passing the Needle twice through the Flesh, almost round every Vessel, and tying upon it, which will necessarily include it in the Ligature. In order to discover the Orifices of the Vessels, the Wound must be clean'd with a Sponge wrung out of warm Water.

The scirrhus Tumours that appear about the lower Jaw, are, generally speaking, scrophulous Disorders, that distinguish themselves almost by the Circumstance of fixing on the Salivary Glands. These are very stubborn of Cure, but not so bad as the Scirrhus, since they frequently suppurate, and heal afterwards. If they imposthume again after healing, 'tis for want of a good Bottom, which may sometimes be procur'd by destroying their bad Surface with a Caustic, and is a Method I have often practis'd with extraordinary Success. Besides these, there is another Species of Scirrhus in the Neck, that succeeds better after Extirpation than either of the former Kinds; this is an Enlargement of the Lymphatic Glands, that run close up by the Jugular Vein; and is distinguishable from Cancers of this Part, by its Moveableness, want of Pain, the Laxness of the Skin covering it, the small Degree of Pressure it makes on the Oesophagus and Trachea; and lastly, the good Habit of Body, as it seldom affects the Constitution, which Cancers here do very early after their first Appearance. This Tumour, from its Situation, requires great Exactness in the cutting off. The last I took away of this Kind, I separated from the Jugular Vein near the Length of an Inch and an half; they sometimes extend up the Chin towards the Mouth, and occasion a Division of the Salivary Duct in operating, which proves very troublesome to heal; but when all other Methods have fail'd, may be cur'd by a Perforation into the Mouth, through that Part of the Cheek where it is wounded, which by a Tent, or small Seton, may be made fistulous; then by dressing upon the Outside, the ouzing of the Saliva that way will be prevented, and the external Orifice healed without Difficulty.

The Treatment of all these Wounds may be with dry Lint first; and afterwards, as in the common incised Wounds. *Sharp's Surgery.*

As Accident sometimes, but more frequently Lewdness and Debauchery, lay People under a Necessity of having the Whole, or a Part of their Penis amputated, I must not omit the Method of performing the Operation.

Amputation of the Penis.

If at any time a Gangrene should happen in the Penis, in Consequence of an Inflammation, a Phimosis, or Paraphimosis, then the same Method of Cure is to be pursu'd, which is laid down under the Article PHIMOSIS.

But if a Sphacelus, or a Cancer in Consequence of a scirrhus Gland should appear in the Penis, then every Part, to which the Contagion has reach'd, is with all Expedition to be extirpated, lest the Taint diffuse itself farther, and the Patient's Misery be produced by the Surgeon's Negligence. The most convenient and proper manner of performing the Operation is this: A small Tube of Silver or Lead, a little longer than the Part affected, is inserted into the Urethra, and pass'd a little farther than the Extremity of the corrupted Part. Then the sound Part of the Penis, which next adjoins to the corrupted Part, is to be tied with a strong linen or ilken Ligature, in the same manner as when Tubercles or Excrescences of Flesh are to be taken off by Bandage. Then the Tube inserted into the Urethra is carefully fix'd, that it may not slip out, but afford an easy and open Passage for the Urine. The Ligature is left upon the Penis; and if Necessity require it, may be made tighter next Day, by applying another above it; and by this means, after some Days, the corrupted Part falls off where the Ligature was made. I am not ignorant, that some Surgeons forthwith cut off the corrupted Part, and that the Blood is sometimes stopp'd, and the Wound happily and thoroughly agglutinated by actual Caustery, or styptic Medicines: An Instance of which may be seen in the fifty-sixth Observation of *Scultetus*. But as this Method of Cure seldom succeeds well, and for the most Part draws a Train of dismal Consequences after it, I cannot help preferring the way by Ligature to it. Besides, when there is only a part of the Penis taken off, there remains, after the Cure, a certain Power of Procreation, which bears a Proportion to the Size of the remaining Part.

Whoever is desirous of seeing Cases of this Nature, let him consult, besides *Scultetus*, *Hildanus*, *Observat.* 60. and 65. *Ruyfchius*.

Ruyfchius, Cont. 3. Observat. 88. and Doebelius, Observat. 30. for he has written a Treatise upon this very Subject. Heister, Tom. 2.

C A S E S.

One *Peter Perrod*, a Blacksmith, in a small Village near *Lausanne*, of forty Years of Age, of a melancholic Constitution, and who led a Country Life, had from his Infancy been troubled with a Wart on the Top of the Glans Penis, not exceeding the Size of a Lentil. Before Marriage he felt no Pain from it, unless upon some accidental Collision; but when he chang'd his Condition of Life, and enter'd into the Marriage State, by the Attrition of the Parts, during his Embraces, he began to feel a Pain so intense and uninterrupted, that he was forc'd for thirteen Years to part Beds with his Wife. But in Process of Time, the Pain increas'd, and the Wart degenerated into a monstrous Cancer, as large as a new-born Child's Head. His Penis was in a manner transform'd into a Mass of Flesh of a livid Colour, and uneven on its Surface. The Smell it exhald was so rank and disagreeable, that his Friends and Acquaintance could no longer endure to be in the Place where he was. A great many Ulcers, thro' some of which his Urine came, surrounded this cancerous Fungus. The Disease growing daily worse and worse, Physicians of all Characters were consulted, but all in vain. When the Patient's Case was by them all pronounc'd desperate and incurable, when his Life was in imminent Danger, and the Excess of his Misery mov'd the Compassion of all about him, he implor'd my Assistance; and that worthy old Clergyman *Parus Pagesius*, who was at once a venerable Model of Piety and Erudition, prevail'd upon me to undertake the Cure, which I did, after I had declar'd my Sentiments to his Friends, and the rest of the Company present. When I had diligently examined his Case, I found it to be very terrible; for the Cancer had by this time thrust its Roots as far as the Abdominal Vessels, and fix'd them there: For this Reason I judg'd it more adviseable to try the last Remedy, or in other Words, to cut off the Member, than to leave a Man, who had already suffer'd so much, in such Excess of Agony and Pain.

As for the Cure itself, I proceeded in it after this Manner:

After prescribing the Regimen I thought most proper, I purg'd him with this Potion:

Take of the Herbs Fumitory, Scabious, Dodder, and Spleenwort, each half an Handful; of Anise-seeds, half an Ounce; of Sena-leaves, three Drams: Boil all together in such a manner, that the Liquor to be strained off amount to no more than three Ounces, in which dissolve three Drams of the Confection of Hamech, a sufficient Quantity of the solutive Syrup of Roses, made with Rhubarb, Agaric, and Sena; to which add one Ounce of Cinamon-water distill'd without Wine: Mix all up together into a Potion, to be given pretty early in the Morning.

Next Day I open'd a Vein in his Left Arm, and took six Ounces of Blood from him. Then, for the better Preparation and Evacuation of the Humours, I prescribed the following Apozem:

Take of the Roots of Succory, with the whole Herb, the Roots of sharp-pointed Dock, Purslain, Polypody, the greater Figwort, Tamarisk Bark, and the inner Roots of black Alder, each one Ounce; of the Herbs Agrimony, Speedwell, Scabious, Dodder, Spleenwort, golden Maiden-hair, Crane's Bill, of each a Handful; of the three cordial Flowers, Broom, and Elder-flowers, of each one Pugal; of Liqueice, and ston'd Rafins, each an Ounce: Boil in a sufficient Quantity of Water to a Consumption of a third Part. In a Pint and an half of the strain'd Liquor infuse and macerate according to Art, two Ounces of pick'd Sena-leaves; of the Roots of Bastard Hellebore, that is, the Root of the Female Sanicle of Fuchsius, and of Polypody, each one Ounce; of Agaric newly reduced into Troches, three Drams; of the best Rhubarb, three Drams: Make a Potion, according to Art, for four Mornings.

Having with the above Medicines purg'd his Body, and ordering him to discharge the Contents of his Bladder, upon the tenth of July 1601. I plac'd him in a Seat, and in the Presence of that renown'd and learned Gentleman *Johannes Rhetorius*, Professor of Hebrew in the School of *Lausanne*, *Claudius Mariones*, a most knowing Apothecary, *David Clerk*, and some others who are still alive, I extirpated his Penis in the very Abdomen itself; then I apply'd my styptic Powder upon Stupes dipt in Whites of Eggs; and with Cloaths folded, and dipt in Oxycrate, I wrapt up his Scrotum and Groins, and apply'd proper Bandage; which being done, I appointed Servants, who, in their Turn, should, with their Hand wet in

Oxycrate, press gently upon the Stupes, lest an Hæmorrhage should happen; for in this Case the actual Cautery is highly dangerous, both because it may obstruct the urinary Passage, and bring on an Inflammation of the Bladder, and adjacent Parts. The Wound being dress'd in this manner, I allow'd it to remain untouch'd till next Day. Then by the Use of Digestives for some Days after, anointing his Belly, and the Parts adjacent to the Wound, with Oil of Roses, and Myrtles, and by applying a defensive Plaster to the lower Part of his Belly, I cur'd the Wound in my ordinary manner. By the Use of these Means, accompany'd with the Blessing of God, he recover'd his Health perfectly.

For a Conveyance to his Urine I order'd him a very simple Instrument, not unlike a human Penis, which he us'd immediately after the Cure, with little or no Degree either of Difficulty or Pain. Besides, he enjoy'd such a good State of Health, and perform'd the several Branches of his Profession, with such Ease and Freedom, that all who had an Opportunity of knowing his deplorable State, were struck with Surprize at so complete and so unexpected a Cure.

Besides, since some imagine, that a Cancer extirpated in one Part never fails to appear in another, 'tis worth while to observe, that this Man liv'd for many Years without the least Symptom of that Kind; enjoy'd so good a State of Health, that he followed his own Trade, and other Parts of Country Labour, without the least Impediment, and even without the Instrument he us'd at the Beginning, discharg'd his Urine as freely, as if he had an entire and sound Penis, since he was able to throw it out a considerable way; and which is still more surprizing, he several times told me, that he was very often tantalized with a Stimulus to Venery. At last, however, he died, about the End of the Year 1611. when I was in the *Netherlands*; but what the Disorder which prov'd fatal to him might have been, I cannot tell.

During the War between the Duke of *Savoy*, and the Inhabitants of *Geneva*, a Soldier happen'd in a Skirmish to have his Penis struck off by the Shot of a Musket. Being brought to *Geneva*, he was happily cur'd by that skilful Surgeon Mr. *John Griston*; but in this Patient the Hæmorrhage was not great, otherwise the Cure had been difficult and dangerous, as might be confirm'd from many Instances.

In the last Observation but one, I gave an Instance of a Penis cut off, and cur'd with Success. I shall now shew, from two Instances, that Operations of this Kind are highly dangerous, unless when perform'd with Skill, Dexterity and Caution.

In the Year 1581. a poor Countryman went out a begging; and having a pretty weighty Bag hung about his Neck, he had the Misfortune to attract the Eyes of a Cut-purse, who, while he was deliberating about the most proper Expedient for getting it into his Possession, observed, that when the poor Man bend'd his Body forwards, the Bag hung down between his Thighs; and that when he recovered his Body from that Posture, the Bag was again rais'd to his umbilical Region. When he had thus taken his Observations as accurately as he could, and saw the poor Man standing before a Shop, and gazing on the Commodities, he secretly came behind him, and seizing at once his Penis and the Neck of the Bag, he cut both off at one and the same time. But the miserable Countryman, falling upon the Ground, expired upon the Spot.

In the Year 1582. a Man of about forty Years of Age, labouring under a malignant Ulcer in the Glans of his Penis, had the Misfortune to fall into the Hands of a Surgeon who was none of the most skilful: He having cut off the Glans, and not being furnish'd with styptic Powders strong enough for stopping the Blood, set about heating the first Piece of Iron that presented itself to him in the Kitchen, during which time, so terrible an Hæmorrhage happened, that the Patient died a few Days after; for so great an Hæmorrhage had impaired his Strength so entirely, that it was impossible to restore it. Hence young Surgeons ought to learn, that the greatest Skill, Diligence, and Caution, are necessary for cutting off a Penis in a proper manner. *Hildanus, Cent. 3. Observ. 88, 89.*

The human Penis may be successfully enough extirpated, provided the several Steps necessary be carefully and faithfully taken.

A Countryman had for two Years been troubled with a scirrhous Swelling on the Glans of his Penis, which at last degenerated into an exulcerated Cancer, and became as big as a Person's Fist. *Joachim Schrader*, a skilful Surgeon, who had the Cure entrusted to his Care, call'd that experienced Physician Dr. *Hiddingh*, myself, and *Andrew Boekelman*, together with his Son *Cornelius*, to a Consultation. We unanimously approved of Extirpation, which was accordingly set about next Day, and that, Thanks be to Heaven, with such Success, that tho' he lost his Penis, he returned home with his Health, which he still continues to enjoy. The Operation was performed in this manner: Having pass'd a Catheter up his *Urethra*, into the Cavity of his Bladder, we made a strong Ligature

Ligature upon his Penis, just behind the affected Part, with a Cord, which was indeed small, but capable of making a very great Compression. The Patient bore the Agonies of the Operation with such a manly Courage, as surpris'd all the Spectators; for he was only heard to utter a few Complaints. After we had apply'd this Ligature, we so fixed the Catheter with Thread, that it could not slip out of the Urethra. Next Day we apply'd a fresh Ligature, that the Part affected might mortify the sooner. In the mean time we wrapt up the Whole of his Penis in a wet Bladder, for the Reception of his Urine, and preventing a bad Smell. Upon the fifth Day, if I rightly remember, the mortified Part was cut off with a Knife, without any Hemorrhage ensuing, because it was totally mortified. We still left the Catheter in his Urethra for a Day or two, till the Ligature should come off of its own Accord, and the Patient stand no longer in Need of it. Being now recovered, he discharged his Urine thro' an ivory Instrument; for that Part of his Penis which was left, had wholly shrunk back into his Abdomen, so that he was oblig'd to use this Instrument to prevent his Cloaths being made wet. *Ruyssch, Vol. 1. Obser. 30.*

AMPUTATIO is used by *Caelius Aurelianus* in a Sense different from that already explain'd. Thus *Acut. L. 2. C. 6.* and *10.* VOCIS AMPUTATIO imports a Deprivation of Speech, or Inability to speak. And the same Words are also used by this Author, *Chronic. L. 4. Cap. 7.* in exactly the same Sense.

In this Author also *amputare Vires* signifies to render weak, or take away Strength.

Nervus amputare also in this Author signifies to take away the Strength.

AMUETICA, *ἀμυντικά*, from *ἀμύνω*, to vellicate. *Caelius Aurelianus, Chron. L. 2. Cap. 6.* uses this to express Remedies, which by vellicating and stimulating the Bronchia, raise a Cough, and by that means contribute to the Discharge of whatever is offensive to the Lungs. These Medicines are the same as those call'd ARTERIACA.

AMVETTI, or Vetti-Tali, otherwise distinguished by the Name of *Arbor Indica, Floribus spicatis, Seminibus parvis in Vascularibus siccis*.

It is the Name of an Indian Tree; but I don't find any medicinal Virtues attributed to it.

AMULETA, Amulets. As these and Charms are nearly ally'd together, I shall treat of them under the same Article.

As we learn from sacred History, that Idolatry had diffus'd its baleful Influences over the Minds of Men long before the Days of *Moses*, 'tis probable, that Magic, and the ridiculous Attempts to prevent Diseases, and restore Health, by the Use of Charms and Amulets, are as old, since they seem to be closely connected, and nearly ally'd to each other. As this is the Case, it must be as difficult to trace the Origin of Magic and Amulets, as of Idolatry itself: But as Disquisitions of this Nature are foreign to our present Purpose, we refer the Curious to those Authors who have wrote expressly upon that Subject.

That we may deviate from our Subject as little as is possible, it is sufficient for us to know, that these illicit Methods of procuring Health, which were founded on a false Religion, and supported by the Credulity of a giddy and unthinking Multitude, were not only practis'd, but in a manner incorporated with Physic, long before the *Greek Æsculapius*, who in all Probability practis'd them himself.

As to the Manner in which this Abuse crept into Physic, and the Motives that have induc'd Mankind to prostitute their Understandings, and affront their Reasons, so far as to countenance it, 'tis probable, that Men seeing the natural Means of preserving Health, and preventing Death, frequently unsuccessful, grasp'd at every thing that first presented itself, and believ'd the first Impostor, who had Confidence and Wickedness enough to impose upon them. They allow'd themselves to be so much the more easily decoy'd in this Particular, because they imagin'd, that tho' these superstitious Practices should happen to do no Good, yet at least they could not possibly do any Harm; and though they were of themselves without Virtue, and without Efficacy, yet to authorize and establish their Use, it was sufficient, that some Persons believed, that they reap'd Advantage, and received Ease, from them. It is even possible, that the Relief afforded by these Charms might have been real, since the Force of Imagination in the Patient might have supply'd the Defect of medicinal Virtue in the Amulet; and the Impression made upon the Mind by it, might have communicated itself to the Body, and chang'd the State and Condition of its Parts. If to what has been said we join these two Considerations; that these Amulets were not, like other Remedies, ungrateful and painful; and that Religion, or rather Superstition, which has too great an Influence over all Mankind, join'd her sacred Sanction, and pronounc'd them lawful. I say, if we reflect upon these things, we shall not be surpris'd, that Men fell into the Mistake, embraced the agreeable delusive Error, and justified their Prostitution of Sense and Reason, by an Allegation of imaginary good Effects produced by them.

Whether besides the Craft and Artifice of Men, there was any thing more in the Matter, is a Point, the Decision of which I leave to Divines. But whatever the Case be, certain it is, that Charms and Incantations have been so effectually introduced into Physic, that all the Nations of the World have used them Time out of Mind. The *Pagans* are not the only People who have fallen into this Folly. Those who have been honour'd with the Knowledge of God, have allow'd themselves to be corrupted and carried off by the bad Example of their idolatrous Neighbours; and some even of those who have been accounted the wisest of Men, whatever the Religion they profess'd was, have been so weak and superstitious as to split upon this Rock, as well as the Vulgar; tho' there have been in all Ages, even among the *Pagans*, some free unfetter'd Souls, who nobly dar'd to think for themselves; who look'd thro' the Mask, and sneer'd at the wild Delusion.

Sometimes People charm'd by single Words, or by certain Sentences, whispered in the Patient's Ear, or even pronounced at a Distance from him, with an Intention to cure him; and this Form was always accompany'd with various other Ceremonies. These Words or Sentences were called by the *Greeks* *ἐναιδαι*, by the *Latins* *Incantamenta*, or *Carmina*, which Words correspond precisely to our English Words *Incantments* and *Charms*, as being a sort of Song pronounced over any one; for the Words were generally in Verse, or at least pronounced with the Air and Spirit of a Song; not but that they also made use of Prose for this Purpose, and even employed barbarous and insignificant Words, which neither he that performed the Ceremony, nor he for whose sake it was performed, understood.

At other times they wrote these Words or Sentences on certain Substances, which they tied to some Part of the Patient's Body, or made him carry about him. These are what the *Latins* call *Amuleta*, probably from the Verb *amovere*, to remove or take away; they call them also *Proëbia* or *Proebra*, from *prohibere*, to guard or defend. The *Greeks* have with a like Propriety and Significancy call'd them *Apotropæa*, *Phylacteria*, *Amynteria*, *Alexiteria*, and *Alexipharmaca*, because they imagin'd, that these Remedies could defend them, not only against such Diseases as proceed from natural Causes, but also against the Charms or Incantations which might have been used by others, with a View to hurt or destroy them.

These Amulets were made of Stone, Metal, Simples, Animals, and in a Word, of every thing their Fancy suggest'd, or their Caprice directed them to. Upon Stone, Metal, and Wood, they engraved Characters, Figures, or Words, which were to be disposed and ranged in a particular Order, as well as those delineated on Paper. Such is that prescribed by *Serenus Samonicus*, for the Cure of a certain Species of Fever, call'd by Physicians *Hemitritæa*. The Cure consists in writing the Word *Abraquadabra* in a certain manner upon Paper. See *ABRACADABRA*.

The *Jews* have attributed the same Virtue to the Word *Abracalan*, pronounced in the same manner. See *ABRACALAN*.

We find in *Marcellus Empericus*, in *Trallian*, and other Authors, several Examples of Amulets made by Characters, rang'd in a certain Order, and engraved upon Metal, Wood, or Stone.

Sometimes they neither wrote nor engrav'd any thing upon the Substances intended for the Amulets, but used a great many superstitious Ceremonies in preparing and applying them. Not to mention the Pains they were at in observing, whether the Stars were favourably dispos'd, or not. The *Arabians* have given this last Species of Amulet, the Virtue of which depends principally upon the Influence of the Stars, the Name of *Talisman*, which in their Language signifies an Image.

Amulets were made of all Forms, and tied to all Parts of the Body; for which Reason they were also call'd *Periaptæ*, and *Periammata*, from a *Greek* Word which signifies to tie about any thing. Some of these resembled a Piece of Money, thro' which they bor'd a Hole, and with a Piece of Thread hung it about the Patient's Neck. Others of them were in the Form of Rings, which were put upon the Fingers, or other Parts of the Body. Others of them were contriv'd in the Form of Bracelets, or Necklaces, which were wore upon the Arms, and about the Neck; and some of them resembled Crowns, with which the Patient's Head was incircled.

We may join in the same Class with Amulets and Charms, all the other superstitious Remedies, in which the Antients reposed so much Confidence, and of which they used to great a Number. There were, for Instance, certain Simples, which they could neither gather, prepare, nor apply, without at the same Time performing some Ceremonies, which, consider'd in themselves, could neither facilitate the Operation of the Medicine, nor augment its Virtue, and seem'd altogether of an indifferent Nature, but without which it was pretended that the Remedy was useless. The Writings of the ancient Physicians abound with Descriptions of Remedies of this Nature, which are still used by Quacks, old Women, and others.

others who have the Misfortune to be under the Influences of Credulity and Superstition. See BARA.

There are also a kind of Amulets, in which neither Charms nor Superstition had any Share, tho' no Person could account for the Effects attributed to them, nor comprehend the Manner in which they acted. These are, at this very Day, approv'd of by some Physicians, and as industriously ridiculed and despised by others. *Le Clerc. Hist. de la Medicine.*

Amongst Amulets and Incantations, none seems to have gain'd so great a Reputation as the Royal Touch for the King's Evil, which has the Appearance of being a Mixture of both. There is scarcely a Royal Family in Europe, which does not pretend to inherit from some of their pious Ancestors, the Power derived from Heaven, of charming this Distemper. This Claim would be more justifiable, if most of their Thrones had not originally been gain'd by Rapine and Violence, and supported by an almost continual Series of Oppression and Injustice, which are not likely to draw down from Heaven any extraordinary Benediction. If, however, we look upon this sort of Incantation as a Piece of political Craft, we shall have Reason to believe it has its Origin more in Villainy than Folly: For Miracles are very proper to extort a Veneration from the Vulgar, and impose upon Minds furnish'd with little Sense, and much Credulity. I am sensible, that many grave Authors have treated this miraculous Method of Cure as a Reality, and that there are not wanting Persons, who at this Day, pretend to produce Instances of People who have been healed by the Royal Touch. But, at the same time, I can produce as good Evidence of Tricks play'd by Witches, Spirits, and Fairies, which however I cannot implicitly believe. I should therefore think it more probable, that those who relate and assert Stories either of Witches, or Cures by the Royal Touch, have suffered themselves to be imposed upon through a little Enthusiasm, and a Fondness for the Marvellous, or intend to impose upon others, than that such Relations should be true. I will not deny, that the Solemnity of the Ceremony, and the Presence of a crown'd Head, may possibly strike the Person touched with an Awe and Surprise, which may induce some Alteration in the Circulation of the Blood, and consequently upon the Solids and Fluids of the Body; but this Cause does not appear adequate to the Effects attributed to it. It is possible also, that the Gold worn about the Neck may have some salutary Influence, if it can attract to itself, and draw out of the Body the Matter, which is the immediate Cause of the King's Evil, as it does Mercury, which however is not so certain as to be depended upon.

AMURCA is the Fæces which subsides to the Bottom of the Vessel, where the Oil of Olives newly express'd is put.

It is emollient, lenitive, and resolute, and proper to ease Pains in the Head, being applied to the Forehead, and to stop Fluxions. *Lemery de Drogues.*

The medicinal Virtues of Amurca, as related by some of the Antients, are somewhat different from those mentioned by *Lemery.*

AMURCA, ἀμύρκα, is the Lees or Sediment of the pressed Olive.

Boiled in a copper Vessel to the Consistence of Honey, it becomes an Astringent, and is serviceable in the Tooth-ach, and for Wounds, being mixed with Vinegar, Wine, or Wine and Honey, [ἀνόμελιν] and the Parts anointed therewith. It is also an Ingredient in Collyria and Plaisters. The older it is, the better. Administered in a Clyster, it is good for Exulcerations of the Anus, Pudenda, and Uterus. Boiled with Omphacium to the Consistence of Honey, it draws out rotten Teeth, that are anointed with it. A Decoction of it with Lupines and the Chamæleon, cures the Scab in Cattle, being rubbed over with it. Crude and new, it makes a good Fomentation for those who are afflicted with the Gout in their Feet or Joints.

Being spread upon a Sheep-skin with the Wool, and apply'd to hydropical Persons, it represses the Swelling. *Dioscorides, Lib. 1. Cap. 138.*

Amurca is of an earthy Substance, hot, but not sensibly acrid. When boiled, it becomes of grosser Parts, and more dry. *Orib. Med. Coll. Lib. 14. Cap. 1.*

By reason of its heating and intensely drying Qualities, it cures Ulcers in Bodies that are of a dry Temperment; but in all others increases and exasperates them. *Actius Tetr. 1. Serm. 1. Eginet. Lib. 7. Cap. 3.*

AMYCHE, ἀμύχην, a superficial Exulceration, Laceration, or Scarification of the Skin.

It is derived from ἀμύω, to scratch, and is sometimes used by *Hippocrates.* Hence AMYCTICA, Stimulating, Vellicating, used by *Cælius Aurelianus, Lib. 2. Cap. 6.*

AMYDROS, ἀμυδρὸς, somewhat obscure, scarcely to be seen. It is used by *Hippocrates* in his Treatise de Insomniis.

AMYGDALÆ, Almonds, the Fruit of the AMYGDALUS, which see. It also sometimes signifies the TONSILLÆ, which see.

AMYGDALIA; ἀμυγδαλία, Almonds. *Hippocrates de Morbis, Lib. 2.*

AMYGDALATUM, an artificial Milk made of Almonds, usually called an Emulsion.

AMYGDALOIDES, a Name by which *Oribasius* calls the Tithymalus, which, he says, goes also by the Names of *Tithymalus Mas, Characias, Cometes, and Gobius.* See TITHYMALUS.

AMYGDALOPERSICUM, the Almond Peach. It is also called *Persea Amygdaloides.*

AMYGDALUS *amara, & dulcis, Offic. J. B. 1. 174. Mont. 36. Jonf. Dendr. 122. Amygdalus sativa, C. B. Pin. 441. Raii Histor. 2. 1519: El. Bot. 497. Amygdalus sativa, fructu majore, T. Inf. 627. Boerh. Ind. A. 2. 245. Amygdalus, Chab. 12. Ger. 1256. Emac. 1445. Parkinf. Theat. 1515. The ALMOND-TREE. Dale.*

The Decoction of the Roots of the bitter Almond-tree, bruised, clears the Face of Freckles; and a Cataplasim of the Almonds has the same Effect. Apply'd by way of Pessary, they provoke the Menfes; and made into a Cataplasim with Vinegar and Oil of Roses; and apply'd to the Forehead or Temples; they ease Pains of the Head; with Wine they cure the Epinyctides [Pustules arising in the Night]; and with Honey are properly apply'd to putrid and spreading Ulcers, [σπινθηρὰς καὶ ἐσπινθας] and the Bites of Dogs. Being eaten, they ease Pain, loosen the Belly, incline to Sleep, and provoke Urine. Taken with Amylum, they help such as vomit Blood; drank in Water, or made into an Eclegma with Refin of Turpentine, they relieve those who are afflicted with Diseases of the Kidneys, or labour under a Peripneumony. Taken in Raisin-wine, [γλυκὴν] they relieve such as are troubled with a Difficulty of Urine, or the Gravel. Made into an Eclegma with Honey and Milk, and taken to the Quantity of a Hassle-nut, they cure Diseases of the Liver, Coughs, and Inflations of the Colon; eaten before drinking, to the Number of five or six, they prevent Drunkenness. They kill Foxes, being mixed with their Food. The Gum of the Tree is astringent and heating; and, drank, relieves those who bring up Blood. Mixed with Vinegar, and the Parts anointed therewith, it takes off Tetters that affect only the Superficies of the Skin. Drank in Wine and Water, it cures an inveterate Cough; and drank in Raisin-wine, it relieves those who are afflicted with the Gravel.

The sweet and esculent Almond is much inferior in Virtue to the bitter one, though it attenuates, and provokes Urine. Green Almonds, eaten with their Shells, amend the preternatural Humidity of the Stomach. *Dioscorides, Lib. 1. Cap. 176.*

Oil of bitter Almonds, which some call *Metopium*, is thus prepared:

Take of bitter Almonds, clean'd and dry'd, six Pints; bruise them gently in a Mortar with a wooden Pestle, till they come to a Paste, and thereto pour two half Pints of boiling Water. Let it alone for half an Hour to imbibe the Moisture, after which beat it again more strongly, and pressing it, put what sticks to the Fingers into a Muscle-shell. This done, pour again half a Pint of Water to the Mass, and suffering it to imbibe the same, do as before. Every six Pints of Water will produce half a Pint of Oil.

It is effectual against Pains and Strangulations of the Uterus, and against Contortions and Inflammations of the same Parts; also for Pains of the Head, and Pain and Noise, or Ringing in the Ears. It helps those who are afflicted with Diseases of the Kidneys, a Difficulty of Urine, the Stone, the Asthma, or Disorders of the Spleen. Mixed with Honey, Root of Lilly, and *Cyprian* Cerate, or Cerate of Roses, it clears the Face of Spots and Freckles, from Sun-burning, and smooths it from Wrinkles; it also rectifies a Dimness of Sight, and deterges Achors, and Scald Heads. *Dioscorides, Lib. 1. Cap. 39.*

Troches of bitter Almonds are thus prepared:

Take of Anise, the Seed of Smallage, Asarabacca, bitter Almonds, the Tops of Wormwood, of each an equal Quantity, and make them up with Water into Troches of the Weight of a Dram. To a Patient in a Fever give them in Hydromel; to one without a Fever give them in Wine and Water [ἀνόμελιν]. *P. Egineta, Lib. 7. Cap. 12.*

Oil of Almonds is prepared after the following manner:

Take clean bitter Almonds, and pound them, instilling now-and-then a little Water; this done, to the Quantity of four Ounces put a Pint of sweet Oil; let it stand forty Days in the Sun, or let it boil three Hours in a double Vessel, and then strain it for Use. Some put two Ounces of bruised Almonds to an Italic Pint of Oil, and boil it in a double Vessel.

An Oil of Almonds, called also *Metopium*, prepared differently from that described by *Dioscorides*:

Take of Oleum Omphacinum, [Oil expressed from unripe Olives] twenty Pints; of bitter Almonds, two Pounds; of

of Cardamoms, one Pound; of the Flowers of Juncus Odoratus, Calamus Aromaticus, Carpobalsamum, each one Pound; of Myrrh, Galbanum, each half a Pound; of Turpentine, two Pounds; of sweet-scented Wine, to macerate the dry Ingredients in, four Pints; of Attic Honey, three Pounds. Bruise and dissolve the Galbanum and Turpentine in Part of the Oil, and mix them with the rest of the Ingredients after they are boiled, and then add the Honey. When all is thoroughly mixed, take it off the Fire whilst it is in a gentle Warmth, and strain it; for when cold, it is thick.

The Egyptians, who invented this Oil, called it *Metopium*, because it had Galbanum for an Ingredient, which was the Produce of a Plant called *Metopium*. *P. Aeginet. Lib. 7. Cap. 20.*

AMYGDALIS AMARA ET DULCIS. This Tree is so much like the Peach, both in Leaves and Blossoms, that it is hard to know them asunder, but by their Fruit, which is less in this, containing little or no pulpy Flesh, but a tough cottony Skin, under which is the Stone, which is smoother and more pointed at one End, but full of little Hollownesses. The Kernel of this is the Almond, not distinguishable whether bitter or sweet, but by the Taste.

The Almond-tree grows only spontaneously in the warmer Countries, as Spain, and particularly Barbary: It flowers early in the Spring, and the Fruit is ripe in August.

Sweet Almonds are accounted nourishing, but if eaten too much, are hard of Digestion, and very stuffing; of these, with Sugar, are made several Sweet-meats, as *March Panes*, and *Maccaroons*. But it is the Oil drawn from the sweet Almonds that is most in Use, and is an useful and excellent Medicine. It is of great Service in Affections of the Lungs, as Coughs, Shortness of Breath, in Soreness of the Stomach, pleuritic Pains. In the Stone, Gravel, and all Diseases of the Kidneys and Bladder, it is of singular Use, by its softening and lubricating Quality. It very much corrects the bilious Salts in the Stomach and Bowels, and is of great Advantage in the Colic, and helps a costive Habit of Body. It is commended to be given to Women with Child, to take freely of it for some time before they expect their Delivery. It is very useful for Childrens Gripes, and to purge them gently, mix'd with any opening Syrup.

The bitter Almonds are more used outwardly as a *Cosmetic*, being cleansing and beautifying. The Oil dropp'd into the Ears, is good for Deafness; and is frequently put among *Anodyne* Liniments.

The only officinal Preparation is, the expressed Oil of bitter and sweet Almonds. *Miller Bot. Off.*

Sweet Almonds contain a great deal of Oil, and a little Salt and Phlegm.

The bitter Almonds contain a great deal of Oil, more Salt than the sweet Almonds, and but little Phlegm; it is for that Reason, that the Oil of the bitter Almond will keep a longer time without growing musty, than the Oil of sweet Almonds. *Lemery de Drogues.*

Pomet adds, that the Oil of bitter Almonds, outwardly apply'd, softens hard Nerves, takes away Spots in the Skin, and brings down the great Bellies of Children. Some say, that the Oil of sweet and bitter Almonds both may be preserved from growing rancid, by the Help of Spirit of Wine tartarized.

Sweet Almonds cause Sleep, and increase the feminal Powers.

Both the one and the other agree at all times to every Age, and all Sorts of Constitutions, provided they be moderately used.

After your sweet Almonds are bruised and steeped in Water, they squeeze a milky Juice out of them, which is given to lean, consumptive and pleuritic People, and does them a great deal of good; the Reason of which is, because the Milk contains a great many oily, balsamic, and embarrassing Parts, fit for nourishing and restoring the solid Parts, moderating the violent Motion of the Humours, and allaying their Sharpness.

The Difference of Taste between the sweet and bitter Almonds proceeds in this, that there is less Salt in the sweet ones, and that this Salt is perfectly confined and cooped up by the rosy Parts, insomuch that it can make but a very slight Impression upon the Tongue.

The bitter ones, on the contrary, contain much sharp Salt, which being but half embarrassed with the oily Parts, cause a stronger, but a more disagreeable Sensation.

Plutarch tells a Story of a certain Physician, who lived with *Drusus*, the Son of *Tiberius*, and who by the Use of bitter Almonds became so great a Drinker, that he was never made drunk, and out-did all that lived in his Time that way. *Lemery on Foods.*

Some Years ago there happened a remarkable Case in this Part of the World. Ten young Gentlemen, descended of illustrious Families, used some Water-gruel, in which more than two Ounces of Arsenic, mixed with an equal Quantity of Sugar, had been put. Soon after, they were racked with great

Disquietudes, and Gripes in their Bellies; but, by the Blessing of God, I removed all their Symptoms, and put them out of Danger, by Oil of sweet Almonds and Milk. *Hoffman.*

Oil of sweet Almonds well prepared, and taken to the Quantity of some Spoonfuls, in a little Broth, is a most effectual Medicine in all Pains and Spasms; even in such Spasms as shake the most remote Parts of the Body: For this Reason, it is very properly prescribed in convulsive Coughs, spasmodic Asthmas, Fits of the Stone, Stranguries, and Colics. *Hoffman de Consensu Partium Nervosarum.*

There are certain Poisons which prove noxious to particular Animals, and yet produce no poisonous Effects upon Men: Thus, for Instance, bitter Almonds are pernicious to Fowls, and excite Convulsions in the Stork and Dove particularly. The same Almonds, as well as the Nux Vomica, when given to Cats and Dogs, throw them into such violent Convulsions, as put an End to their Lives. *Hoffman Medicin. Rational. Systemat. Vol. 1.*

AMYLEON, or AMYLION, ἀμύλεον, or ἀμύλιον, from a Negative, and μύλη, a Mill, because made of Corn without grinding. Starch. See AMYLUM.

Hippocrates in his Treatise of the Diseases of Women, L. 2. recommends this, roll'd up in Wool, as a Pessary, good against a Discharge of Water from the Uterus.

AMYLUM, Starch.

AMYLUM is so called, because it is prepared without the Help of a Mill (from a Neg. and μύλη, or μύλιον, a Mill). The best is what is made of Sitanious Wheat, (such as is sown and reaped in three Months) in Crete or Egypt. It is prepared of this Kind of Wheat, cleansed, in the following manner: They water it five times in the Day, and, if it may be done, in the Night also; as soon as it is soften'd, they gently let the Water run off, without stirring it, for fear the best Part of the Grain should flow off with it: When it appears to be thoroughly soft, they pour off the Water, and tread it with their Feet; then pouring on it fresh Water, tread it again. After this, they take off the husky and branny Parts, that swim on the Top, with a Skimmer, and pass the rest through a Strainer; and as soon as this is done, they lay it upon new Tiles to be dried and condensed in the burning Sun; for if it should, in the least, continue moist, it would contract a Sourness.

It is good for Rheums in the Eyes, hollow Ulcers, and Pustules. Drank, it stops vomiting of Blood, and mollifies the Parts about the Aspera Arteria; it is usually mixed with Milk, and other Food.

Amylum is also prepared of Zea, (Spelt) macerated a Day or two in Water, then kneaded with the Hands into a Mass like Dough, and afterwards dried in the fervent Sun as before. But this Sort of Amylum, tho' very good in other respects, is unfit for medicinal Use. *Dioscorides, Lib. 2. Cap. 123.*

Amylum is made of all Kinds of Wheat, but best of the common Sitanious. It was invented in the Island of *Chios*, and the finest still comes from thence: The Name was given it on account of its being prepared without a Mill. The next in Goodness is made of a sort of very light Sitanious Wheat: It undergoes a Maceration in fresh Water in wooden Vessels, so as to be covered with the Water, which is changed five times in the Day; and it would be better, if the same were done in the Night, that it might be thoroughly mixed and softened alike, before it grows four. When it is dried enough in Bags and Baskets, they shoot it out upon a Tile smeared with Leaven, and let it condense in the Sun. Next to the *Chian* Amylum, for Goodness, is the *Cretan*; and after these the *Egyptian*. It is valued by its Lightness, Smoothness, and Newness. *Pliny, Lib. 18. Cap. 7.*

The forbile Liquor of Amylum is proper in Fevers attended with a Diarrhoea; and, upon account of the Belly, Lentils may be mixed with it. The same may also be used in Milk, or mixed with Water, or be used alone; in which Circumstance it is fittest in Dysenteries, and Fluxes excited by coughing. In boiling put ten Drams of Amylum to four half Pints of Water. *Oribas. Med. Col. Lib. 5. Cap. 7.*

Starch is esteemed drying and astringent.

Starch, boiled with Milk, is a famous Empirical Remedy for a Diarrhoea, which happens in a Fever, or in Child-bed, and is not a bad one. Mr. *Clutton*, in a Treatise he published some time ago, lays great Stress upon a Solution of Starch, given by way of Clyster, in a Diarrhoea, either accompanied with a Diarrhoea or not; and, if the Stools are bloody, and the Intestines very much relaxed, he advises to make the Confection of Starch, as he calls it, very thick, and to add, to four Ounces of this, an Ounce of French Brandy.

Modern Method of making STARCH of Wheat.

The Grain, being well cleaned, is put to ferment in Vessels full of Water, which they expose to the Sun, when in its greatest Heat; changing the Water twice a Day, for the Space of eight or twelve Days, according to the Season. When the Grain bursts easily under the Finger, they judge it sufficiently fermented.

fermented. The Fermentation perfected, and the Grain thus softened, it is put, Handful by Handful, in a Canvas Bag, to separate the Flour from the Husks; which is done by rubbing and beating it on a Plank, laid across the Mouth of the empty Vessel that is to receive the Flour.

As the Vessels are filled with this liquid Flour, there is seen swimming at the Top a reddish Water, which is to be carefully scum'd off, from time to time, and clean Water put in its Place; which, after stirring the Whole together, is all to be strained through a Cloth or Sieve; and what is left behind, put into the Vessel with new Water, and exposed to the Sun for some time; and as the Sediment thickens at the Bottom, they drain off the Water four or five times, by inclining the Vessel, but without passing it through the Sieve. What remains at Bottom is the Starch, which they cut in Pieces to get out, and leave it to dry in the Sun: When dry, it is laid up for Use.

Castellus, from Libanius, informs us, that AMYIA, in a general Sense, is used to express any Sort of Chymical Fæcula.

AMYOS, ἀμῶς, from α Negative, and μῦς, a Muscle. Hippocrates, in his Treatise de Arte, applies ἀμῶς to the Leg, to express its being so emaciated, as to appear as if it had no Muscles.

AMYTHAONIS EMPLASTRUM, Amythaon's Plaster for Convulsions and Distortions of the Joints; it is also a Drawer.

Take of Gum Ammoniac, Wax, Bdellium, each eight Drams; of Turpentine, Illyrian Orris, Galbanum, each twenty Drams. P. Æginet. Lib. 7. Cap. 17.

AN-PATER, Sulphur. Rulandus.

AN-FIR, Filius, Mercury. Rulandus.

AN-FIRARTO, Spiritus, Salt. Rulandus.

ANA, ἀνά, a Greek Proposition much used in Prescriptions. It is explained under the Article A. which see. Ana is also used by some enthusiastic Writers to signify the Mind; and Castellus tells us it is the Name of a certain Idol.

ANABASIS, ἀνάβασις, from ἀναβαίνειν, to ascend, signifies the Augmentation or Increase of a Fever in general, or of a particular Paroxysm. Hence ANABATICA is synonymous to EPACMASTICA, both being Epithets of Fevers, which, in their Progress, continually increase or grow more violent.

ANABOLE, ἀνάβολη, from ἀναβάλλω, to cast up. The discharging any thing upwards, as by Vomit.

ANABROCHISMOS, or ANABRONCHISMUS, ἀναβροχισμός, or ἀναβροχισμός, from βροχέω, a Noose. An Operation performed upon the Hair of the Eyelids, when they are offensive to the Eye. It consists in engaging the offending Hairs in a sort of Noose, by means of a Needle, threaded with a fine Thread doubled, or a Woman's Hair, after passing the Needle thro' the external Part of the Eyelid, near the Hair. Celsus takes Notice of this Operation, Lib. 7. Cap. 7. in these Words:

Quidam aiunt, acu transsui juxta pilos exteriorem partem palpebræ oportere, eamque transmissi duplicem capillum muliebrem ducentem; atque ubi acus transiit, in ipsius capilli sinum, qua duplicatur, pilum esse injiciendum, & per eum in superiorem palpebræ partem attrahendum, ibique corpori adglutinandum, & imponendum medicamentum, quo foramen glutinetur: sic enim fore, ut si pilus in exteriorem partem postea spectet.

Paulus Ægineta confines the Operation to Cases where only one or two, or at most three, Hairs irritate the Eye. He describes the Operation, Lib. 6. Cap. 13. but somewhat obscurely.

ANABROSIS, ἀνάβρωσις, from ἀναβρόσκειν, to devour. A Corrosion or Exesion of the solid Parts by acrid Humours. It means the same as DIABROSIS.

ANACAMPSEROS, Anacampseros vulgo Faba crassa, J. B. Pit. Tournes. Telephium vulgare, C. B. Telephium alterum sive Crassula, Dod. Cotyledum alterum, Dioscor. Col. Scrofularia media vel tertia, Brunf. Fabaria, Matth. Acetabulum alterum, Cord. in Diosc. Faba inversa, Ad. Lob. Crassula sive Faba inversa, Ger. ORPINE, or LIVE-LONG.

It is a Plant which grows to the Height of one Foot, or more; its Stalks are strait and round, clothed with thick Leaves, and full of Juice like that of Purslane, but longer, of a pale-green Colour, often intermixed with a little Red; some are notch'd at their Edges, others entire; of an insipid viscous Taste. The Flowers grow on the Tops of the Stalks in large Bunches, and almost like an Umbrella, of a white or purplish Colour; every Flower is composed of five Leaves, disposed like a Rose, which, falling, are succeeded by a Fruit composed of many Husks, which forms a sort of Head full of small Seeds. The Root is glandulous, and formed of many white Bulbs like Turneps, of an insipid Taste. This Plant grows in uncultivated, stony, and shady Places. It contains a great deal of Phlegm and Oil, and but little Salt.

It is drying, cooling, resolute, deterfive, vulnerary, and consolidating, proper for Ruptures, and to take out Spots in the Skin. Lemery de Drogues.

Columna has confounded his *Rapuntium umbellatum*, with the *Telephium floribus purpureis*, Lob. C. Baubine is guilty of the same Fault; but it is easy to see, by Columna's Description, and by his Figure of the Flowers, that he has given a good Design of the *Trachelium azureum umbellatum* Pona. Bald. Ital. 44.

The Leaves of the Orpine have a glutinous Acidity, and give a strong red Tincture to the blue Paper. This Plant, being analysed, yields a good deal of Acid; a moderate Proportion of Earth and Oil, and a pretty deal of volatile concrete Salt. Thus there is room to believe, that it contains an aluminous Salt, mixed with Sal Ammoniac, and wrapt up in a little Sulphur. It is deterfive, astringent, and vulnerary: Being applied externally, it hastens the Suppuration of Tumours. Martyn's Tournefort.

ANACAR, ἀνάκαρ, a Greek Adverb, sometimes used by the Greek Medicinal Writers, to express upwards, or towards the superior Part.

ANACARDIOS ANTIDOTOS THEODORETUS, the Antidote of Anacardium, a divine Gift.

Take of Spikenard, Malabathrum, Cloves, Saffron, Cassia, Epithymum, Flowers of Schœnanth; Myrobalans, each three Drams; of yellow Aloes, twelve Drams; of Chestnut, Ginger, Mastic, each one Dram; of Illyrian Orris, six Drams; of Anacardium, Agaric, each one Dram; of Asarabacca, six Drams; of Seed of Smalage, one Dram; of Costus, one Dram and a half; of Pepper, three Drams; of Fennel, and its Juice, of each eight Drams: Beat the Fennel in a Mortar, and macerate it in Vinegar three Days; then boil it well, and carefully strain it. Add of a sufficient Quantity, Attic Honey, or Sugar, and boil it again to the Thickness of Honey. Let the several Ingredients be pounded together, and well levigated: If there be Plenty of Fennel, press out the Juice, and the Antidote will be the better.

It is good in all obstinate and dangerous Diseases, for epileptical Persons, and Demoniacs; for Pains in the Head, Disorders of the Thorax, Pleurifies, Asthmas, Peripneumonies, and such Stomachs, as turn the Food sour; and for any malignant Distemper of the Belly or Stomach. It wonderfully revives and restores those who are just got over a tedious Distemper, and have not yet recovered their Colour. It helps the Yellow Jaundice, Anasarca, Consumption, Distempers of the Kidneys; and does Service to those who are continually subject to Colic Pains: It corroborates those who have a Sense of Weight all over their Bodies: It is beneficial in inveterate Distempers, and intermittent Fevers, given in the Intervals; and helps the Gout, if given before the Fit. It is excellent in Womens Distempers, and in particular the Strangury, Difficulties in Menstruation, and Suffocation of the Uterus. It helps those who, by their Habit of Body, are subject to miscarriage, and gently loosens the Belly: It cures Inflammations of the Womb, and the Furor Uterinus. To say all in a Word, it is a divine Gift; and whoever uses it once or twice in the Spring and Autumn, and is not very faulty in his Diet, shall live free from Diseases. It is to be taken to the Quantity of a Hazle-nut, in the Morning. Myrepsus, Sect. 1. Cap. 218. Actii Tetrabib. 4. Serm. 1. Cap. 122.

Another Preparation:

Take of yellow Aloes, an Ounce and a half; of Orris, Cassia Lignea, each seven Drams; of Ginger, Anacardium, Carpobassum, each four Drams and a half; of Malabathrum, Spikenard, Myrobalans, Spignel, Epithymum, each three Drams one Scruple; Cloves, Flowers of Schœnanth, Pontic Rhubarb, Mastic, each one Dram three Grains; the Bark of the Root of Fennel, washed, one Pound: Macerate them in two Pints of good Vinegar for seven Days; then boil them and strain them, and add two Pounds of pure Attic Honey, or a sufficient Quantity of Sugar, and boil it to the Consistence of Honey. In this put the Ingredients well beaten, and, after well working them together, set them aside, in a proper Vessel, for Use.

It is good against Epilepsies, Apoplexies, and Paraplexies, that owe their Rise to Phlegm and Melancholy; and is excellent in Female Disorders. Myrepsus, Cap. 219.

ANACARDIUM, a sort of Fruit, of which there are two Sorts, the Oriental and Occidental. The Oriental is thus distinguished:

ANACARDIUM, Offic. Ger. 1360. Emac. 1544. Mont. Exot. 15. Commel. Flor. Mal. 15. Park. Theat. 1563. C. B. Pin. 511. J. B. 1. 334. Anacardium vel Anacardus, Chab. 24. Anacardium Orientale, Jomf. Dendr. 156. Pluk. Almag. 28. Oepata, Hort. Mal. 4. 95. Tab. 45. Arbor Indica, fructu conoide, cortice pulvinato nucleum unicum, nullo officulo tectum, claudente, Raii Hist. 2. 1566. THE ANACARDIUM, or MALACCA-BEAN-TREE.

The Oriental Anacardium is a Seed growing at the Top of a conical Fruit in the *East-Indies*. It is, in Shape and Colour, like a Bird's Heart; covered with a tough Skin, including a spongy Substance, full of an hot caustic Oil underneath; in which, inclosed in another Skin, lies the Kernel, in Taste like an Almond. It is said to be hot and dry, to comfort the Heart and Vitals, and to excite Venery: It is rarely to be met with, and now never prescribed, the *Mel Anacardium* being left out in the three last Editions of the *Dispensatory*. They say that the *Indians* use the caustic Oil of this Fruit, in staining their Chints and fine Callicoes, which sets the Colours so in, that they are not to be washed out. *Miller Bot. Off.*

They contain a great deal of Oil and Salt.

They rarely and purge the pituitous Humours, are resolving, refresh the Brain, and strengthen the Memory, being taken in Decoction. *Lemery de Drogues.*

In some old Dispensatories we find a Composition named *Confectio Anacardina*, which is not now in Use. *Hoffman*, in his Treatise of *Officinal Medicines*, tells a very surprising Story concerning this Confection; which is, that by the Use thereof a young Man, who was before so dull and stupid, as not to be capable of learning any thing, became in a short time a very great Genius, and comprehended every thing that was taught with Ease. It was thought very proper to quicken the Motion of the Blood; and, on some Occasions, is said to cause a Fever; which shews that the whole Nut, not the Kernel only, was an Ingredient in this Confection. *Geoffroy.*

I find the ANACARDIUM recommended by *Schroder*, and most other Writers on the *Materia Medica*, for quickening the Senses, and strengthening the Memory. As very few Drugs have such useful Virtues attributed to them, I shall give the Preparations of Anacardium, as delivered by *Arnaldus de Villa Nova* and *Zwelfer*, in the *Pharmacopœia Augustana*.

Take of Anacardium, bruised, three Drams and an half; or Honey of Anacardium, two Drams; these Remedies are endued with a natural Property of restoring a lost Memory.

Confectio Anacardina, a Confection of Anacardiums, which helps the Memory, restores lost Reason, removes a Lethargy, and cures the Gout, Hemorrhoids, and those who are oppressed with Melancholy or Phlegm.

Take of Emblic, and Belleric Myrobalans, long Pepper, and white Pepper, each twelve Drams; Ginger, Honey of Anacardium, each eight Drams; Castor, Storax, Cloves, each five Drams; Camomile Flowers, Bay-berries, Cypereus, each three Drams; Sugar, twenty Drams; Honey, a sufficient Quantity. The Dose is the Quantity of a small Nut in Whey, warm Wine, or a Decoction of the Seeds of Anise and Fennel; and the Patient is to avoid the Cold, and to abstain from phlegmatic Meats, as well as from Anger, Venery, and Drunkenness.

This Remedy quickens the Wit and Senses, brightens the Understanding, and is a proper Confection for wife Persons, and such as desire to be so.

The Anacardiums, before they are fit to be used in Medicine, are to be thus prepared:

Bruise them very well in a Mortar, and then put them in the strongest Vinegar, where let them macerate for seven Days. After this, boil them over a gentle Fire to a Consumption of two Thirds of the Vinegar; then strain off the rest from the Dregs; and keep it for Use.

To make Honey of Anacardiums.

Mix, with the Vinegar aforesaid, an equal Quantity of clarified Honey, and boil them together to a proper Consistence. *Arnaldus de Villa Nova, Lib. 1. Cap. 28.*

MESUE'S CONFECTION of ANACARDIUMS.

Take of Chebul, Emblic, Belleric, and Indian Myrobalans; of black Pepper, of long Pepper, and of Castor, each two Drams; of Costus; of prepared Anacardiums, of white Sugar, of the Seeds of Rocket or Fennel, of Bay-berries, each six Drams; and of Cypereus four Drams.

Let the Anacardiums be pounded by themselves; and when the other Ingredients are pounded, mix all together, and beat up into an Electuary, with new unsalted Butter, and pure Honey, each five Ounces and an half.

This Medicine is good against all cold Disorders of the Brain; and lower Belly; purifies the Blood, and rendering the Animal Spirits pure and fine; thereby invigorates all the Senses, the Apprehension, the Intellect, and the Memory; for which Reason *Mesue* dignified it with the specious Title of the *Confection*

of the *Wife*, and, by its means, confidently promised Assistance to those who were desirous of acquiring Knowledge. It also warms the whole Vascular System, and imparts a lively Heat to all the Body. But this Medicine is to be used cautiously, and not till a Fortnight after the Fermentation is over. After taking it, the Patient is to beware of Labour, Anger, Venery, and Drunkenness. *Pharmacop. August.*

CEPHALIC CONFECTION of ANACARDIUMS.

Take of the Waters of Marjoram, Orange-flowers, and Clove Gilly-flowers, each six Ounces: These being pour'd into a glass Cucurbit, immerse in the Liquor three Ounces of prepared Anacardiums: Let them macerate for twenty-four Hours, the Vessel being closed all the while; then strain off, and in the strained Liquor dissolve two Pounds of the best Sugar; by the sole Dissolution of which, reduce it to the Consistence of a Syrup; to which add, while it is still warm, that so they may, as it were, dissolve in it, one Dram of Ambergrise, one Dram of Lemon-seeds, with their Husks taken off, two Drams of the Resin of Storax, well pounded, and one Dram of Gum Labdanum: To all these, when dissolved, add the following Ingredients; one Ounce of the Powder of prepared Anacardiums, an Ounce and an half of the true Leopard's-bane Root, an Ounce of the Powder of Aloes Wood, full of its Gum; of the lesser Cardamoms, of Cubebs, and Coriander-seeds, each two Drams; of Nutmeg, half an Ounce; of Mace, three Drams; of Cloves, two Drams; of Indian Nutmeg, preserved and beat to a Pulp, three Ounces; of distilled Oil of Cinnamon, one Scruple, mixed with half an Ounce of Sugar of Roses.

Mix all up into an Electuary, which is a precious and excellent Medicine for a cold and weak State of the Brain, and Animal Faculty; for strengthening the Stomach, preventing Apoplexies and Epilepsies, recruiting old Age, strengthening the Memory; and, lastly, excellent for all such Disorders of the Brain and Stomach as proceed from Cold. Its Dose is from two Drams to half an Ounce. *Pharmac. August.*

The Occidental Anacardium is thus distinguished:

ANACARDIUM OCCIDENTALE, *Jonst. Dendr. 156. Anacardium Occidentale, Cajou, Mont. Exot. 9. Anacardium Occidentale Cajou dictum, officulo reni leporis figura, Herm. Cat. Hort. Lugd. Bat. 36. Comm. Flor. Mal. 15. Anacardii alii species, C. B. Pin. 512, Herm. Mus. Zeyl. 37. Anacardus Zeylanica, folio nucis Juglandis Cajou, Kagbu, Ejusd. 55. Cajou, Ger. 1360. Emac. 1544. Park. Theat. 1658. J. B. r. 336. Chab. 24. Laet. 606. Acajou, Tourn. Inst. 658. Boerh. Ind. A. 2. 262. Arbor Acajou, vulgo Cajou, Pif. Mant. Arom. 193. Acajaiba, Pif. (Ed. 1658) 1120. Acajaiba, & Acajaiba Brasiliensis, Marceg. 94. Kapamara, Hort. Mal. 3. 65. Tab. 54. Pomifera seu potius Prunifera Indica; nucis reniformi summo pomo innascente, Cajou dicta, Raii Hist. 2. 1694. Cat. Jani. 187. Sloan. Hist. 2. 136: THE CAJOU; or CASSU-TREE. Dale.*

This grows at the End of a Fruit, in Shape and Colour like a small ripe Apple; in Form and Bigness it resembles a Hare's Kidney; only the End next the Fruit is bigger than the other. The Outside is covered with a tough, ash-coloured Bark, under which is a spongy Substance like the former; it contains a larger Quantity of caustic burning Oil; and under that, in a soft Shell, a white pleasant Kernel. It grows both in the *East* and *West Indies*, on a large Tree; having pretty big, stiff, oval Leaves, with several hard Veins, running almost directly across from the middle Rib. It bears Tufts of five-leaved white Flowers. In *Jamaica* they eat the Kernel of this Fruit, after it has been roasted in the Embers till all the caustic Oil is consumed. They bring them to Table as a Desert: They are much of the Nature of the *Eastern Anacardia*. The caustic Oil is very good for Corns and Warts. *Millar Bot. Off.*

Geoffroy adds, that the Fruit of the Tree is called, in *Brasil*, *Acajaiba*. It is proper to take Freckles or Sun-burn from the Face; but Women ought never to use it in the time of their Menses; because, in that Case, it often causes an Erysipelas; though even that may be cured by a Wash made of Brandy and Water. *Geoffroy. See ACJAIBA.*

ANACATHARSIS, *ἀνακαθάρσις*, from *ἀνακαθαίρειν*; to purge upwards. A Purgation of the Lungs by Expectoration. I don't know that it is used by Authors in any other Sense; tho' *Blancard* says it includes Vomits, Sternutatories, Errhines, Masticatories, and Medicines that promote the Discharge of Saliva. Hence

ANACATHARTICA, Medicines which promote Expectoration:

ANACESTOS, *ἀνάστος*, incurable, from a Negative, and *ἄστος*, a Remedy. It is sometimes wrote *ἀνάστος*.

ANACHMUS, an incorporeal Spirit: *Dornerus* from *Paracelsus*.

ANACHREMPISIS,

ANACHREMPIS, ἀνάχρεμις, from ἀνά, for ἀνω, which imports upwards, and χρέπτομαι, to hawk. The bringing up from the Lungs, by hawking, any viscid and tough Matter, which adheres to the Inside of the Bronchia.

ANACINEMATA, ἀνακινήματα, from ἀνακινέω, to agitate, or toss, literally to move upwards. This is a Species of Exercise taken Notice of by Hippocrates, in his second Book, περὶ διαίτης; but he does not explain what it consists in. Gorræus takes no Notice of it; Boesius only says, ἀνακινήματα are Com-motions of the Body, which are reckoned amongst Exercises.

Dacier however, from a parallel Passage in Plato, concludes these Exercises to be those Gesticulations and Motions, which the Combatants used before they entered the Lists. By the Derivation however, ἀνακινήματα, Anacinemata, should signify Leaps.

ANACLASIS, ἀνάκλασις, from ἀνακλάω, to bend upwards, or elevate. It is used by Hippocrates, περὶ ἀγμάτων, Sect. 3. to express the Elevation of the Left Arm altogether, whilst the Joint at the Elbow is not at all bent; but the Humerus, together with the Arm, appear as one strait Bone. This Situation the Left Arm is in, when it supports and elevates a Bow, in order to resist the Right Hand, which draws the String. I know this is not the common Explication of the Word, but it seems to be the Meaning of Hippocrates.

ANACLINTERIUM, ἀνακλιντήριον, from ἀνακλίνω, to recline. A sort of Chair, made in such a manner, that a Person may recline or lie upon it; a Couch or Settee.

ANACLISIS, ἀνάκλισις, from ἀνακλίνω, to recline. Hippocrates, in his Treatise περὶ εὐχρησίου, uses this Word to express the Decubiture of the Sick, which, he says, is to be regarded, both on account of the Season of the Year, and because it makes some Difference, with respect to the Cure, whether the Patient lies upon an elevated Place, (βέβητος) as a Bed or Couch; or upon the Ground, and in a dark Place.

ANACLISMOS, ἀνακλισμός, that Part of a Chair on which the Back of the Person, who sits in it, leans. Hippocrates περὶ ἀφθέρων.

ANACOCK, the Name of an American Species of Phaseolus, in the Opinion of Ray. It is called by J. Bauhine, *Pisum Americanum aliud, magnum, bicolor, coccineum et nigrum simul; sive Phaseolus bicolor Anacock dictus*. By C. Bauhine, *Phaseolus peregrinus ex rubro et nigro distinctus*. By Gerard, and Parkinson, *Phaseolus Ægyptius*. Raii Hist. Plant.

I don't find any medicinal Virtues particularly attributed to it.

ANACŒLIASMUS, a sort of Remedy used by Diocles, according to the Report of Cœlius Aurelianus, Chron. Lib. 2. Cap. 14. for the Cure of a Phthisis. His Words are, *Utitur etiam anacœliasmis, quorum qualitates non memoravit, adjiciens verrendum sive deducendum a Pulmonibus Humorem, quando fuerat mitigandum potius Ulcus quam repurgandum*.

It does not appear, by this, that the Author knew himself what Diocles meant by Anacœliasmus. If, however, we consider the Derivation, which must be from κοιλία, Abous, the Belly; and reflect upon the Effects which the Anacœliasmis are expected to produce, *deducendum a Pulmonibus Humorem*, we may perhaps find Reason to believe, that Anacœliasmis were frequently repeated gentle Purges, or Medicines which kept the Patient perpetually laxative, especially as these are found of the utmost Importance in the Cure of a Phthisis, or pulmonary Consumption.

ANACOLLEMA, ἀνακόλλημα, from ἀνακόλλω, to agglutinate. A Name for certain Topics apply'd to the Forehead to prevent Defluxions of Humours upon the Eyes. Galen de Comp. Medic. S. Gen. Lib. 6. Cap. 8.

It is much the same as FRONTALE; (which see) except, that an ANACOLLEMA was usually made of astringent Powders, as Bole, or Dragon's-blood, or Acacia, made up with Vinegar, or the White of an Egg, whereas FRONTALE signifies any sort of Application to the Forehead.

ANA-COLUPPA, the Name of a Plant mentioned in the Hortus Malabaricus, called also *Ranunculi Facie INDICA spicata, Corymbiferis affinis, Flosculis tetrapetalis*.

The Juice of this Plant, with a little Pepper bruised in it, is recommended as a sovereign Remedy in an Epilepsy; and is said to be the only Preservative against the Effect of the Bite of the Cobra-Capella. Raii Hist. Plant.

ANACOMIDE, ἀνακομιδή, from ἀνακομιζω, to repair or recover the Strength of a Person after Sickness. This is a Word which frequently occurs in Hippocrates. It imports the Restoration of Strength to a Patient after an Illness, or the Recovering of Health.

ANACONCHYLISMOS, ἀνακογχυλισμός, or ἀνακογχυλισμός, a Gargle, from ἀνακογχύλλω, to gargle. Both these are much used by Galen, and the later Greek Writers; but I don't remember to have met with it in Hippocrates.

ANACOS, ἀνακός, an Adverb used by Hippocrates. It imports carefully, prudently; with Circumspection.

ANACOUPHISMATA, ἀνακουφίσματα, from ἀνακουφίζω, to lift up, or elevate. This, in Hippocrates, (περὶ διαίτης, L. 2.) joins with ANACINEMATA (which see). Dacier translates and explains it by Sauts, Leaps. But some others have thought, that all those Exercises which the Antients called Gestations, are included in ANACOUPHISMATA.

ANACTESIS, ἀνάκλισις, from ἀνακλίνω, to recover Health. The Restoration of Strength to a Person recovering of a Distemper, which has render'd him weak.

ANACTORION, according to Blancard, a Name of the Gladiolus, Corn-flag.

ANACYCLEON, ἀνακυκλῶν, from κυκλῶ, to wander about. It answers to the Word Circulator, Mountebank. Castellus.

ANACYRISIS, ἀνακυρσις, from κύβηξ, Authority. Hippocrates, in his Treatise of Decency, giving Advice to Physicians as to their Conduct towards the Sick, advises them, amongst other things, to remember to support their Authority, and the Dignity of their Profession, which he expresses by this Word.

ANADENDROMALACHE, ἀναδενδρομαλάχη, a Name for the ALTHÆA. Galen says it is the vulgar Name for the ALTHÆA, Marsh-mallows.

Blancard says ANADENDRON signifies the same.

ANADIPLOSIS, ἀναδίπλωσις, from διπλῶ, to redouble. It is the same as EPANADIPLOSIS, which is the Reduplication of the Paroxysm or Fit, in a semi-tertian Fever; that is, a Renewal of the cold Fit, before the preceding Fit is entirely ended. Galen de Typis, Cap. 4.

ANADOSIS, ἀνάδοσις, from ἀναδίδωμι, to distribute. The Distribution of the Aliment over all the Body.

ANADROME, ἀναδρόμη, from δρέμω, an old Greek Verb, which signifies, to run. It imports a Recess, or a Removal of Pains from the inferior to the superior Parts of the Body, in the Sense of Hippocrates. This is always esteem'd an unfavourable Circumstance, and of bad Prefage, because acrid Humours, or whatever causes Pain, cannot do so much Hurt in the Extremities, as in the vital and more noble Parts.

Hippocrates in his first Book of Predictions informs us, that a Distortion of the Eye, consequent upon a Recess of Pain from the Loins or Hip, is bad. And in the Coacæ Prænotiones, he says, that a Recess of Pain from the Hips or Loins to the Head, whilst the Hands are affected with a Torpor, and the Patient feels a Cardialgia, (Heart-burn) is a Sign of a copious Hæmorrhage from the Nose, and Plenty of Stools; mean time People thus affected, are generally delirious.

ANÆDES, ἀναδῆς, an Adverb used by Hippocrates, in a Sense somewhat different from the common Significations; for in this Author it imports continually, perpetually, whereas the natural Meaning is, impudently.

ANÆDROMOS, ἀναδρόμος, of the same Derivation as the former. It is used as an Epithet for those Fish, which at certain Seasons ascend from the Sea into Rivers.

ANÆSTHESIA, ἀναίσθησία, Insensibility. A kind of Resolution of the Nerves, accompany'd with an Abolition of the Sense of Feeling. Aretæus περὶ συμ. κ' ἀσθ. νεφρ. νῆς. L. 1. C. 7.

ANAGALLIS, the Name of a Plant.

There are two Kinds of Anagallis, which differ in Flower. That with the blue Flower is called the Female, the other with the scarlet Flower the Male Anagallis. They are small Plants, that spread themselves on the Ground, with small, roundish Leaves, like those of Pellitory on the Wall, set on little square Stalks; the Fruit is round.

Both Kinds are lenitive, cure Inflammations, extract sharp-pointed things, which have pierced the Body, and restrain phagedenic Ulcers. The Juice of them, gargarized, purges the Head of Phlegm, and, instilled into the Nostrils, easeth the Tooth-ach, provided it be into the Nostrils opposite to the aking Tooth. Mixed with Attic Honey, it deters an Albugo, and helps Dimness of Sight. Drank in Wine, it relieves those who are bitten with a Viper, or are diseased in the Kidneys or Liver. Some say, that the Anagallis with the blue Flower, apply'd in a Cataplasm, restrains the falling down of the Fundament; but that with the red Flower, thus apply'd, on the contrary, provokes the Disease. Dioscorides, Lib. 2. Cap. 209.

Some call the Anagallis *Corchoron*; it is of two Kinds, which grow no higher than a Hand's Breath; they flourish in Gardens and watry Places. What is strange, Cattle avoid the Female Kind; but if, being deceived by the Likeness, for they differ only in Flower, they happen to taste it, they presently seek out an Herb called *Asyla*, as a Remedy, the same which we call *Ferus Oculus*. Some advise those who have a mind to dig it up, to salute it thrice in the Morning, before they have spoken a Word, and then to take it up, and press it; for so it will have the more Virtue. Pliny, Lib. 25. Cap. 13.

Both Kinds of Anagallis are very deterfive, and have somewhat of a heating and drawing Quality, whence they extract Splinters out of the Flesh, and upon the Whole have the Virtue of Drying without Mordacity; for which Reason they conglutinate Wounds, and help putrid Ulcers. Oribas. de Virtut. Simpli. Lib. 2. Cap. 1.

The *Anagallis* of the Greeks is the *Macia* of the Latins; the Juice of it is recommended to be poured on the Head. *Marcellus Empiric. Cap. 1.*

There are three Sorts of *Anagallis* commonly used in Medicine, the *Mas*, *Fœmina*, and *Aquatica*. The first is the

ANAGALLIS TERRESTRIS MAS, Offic. *Anagallis Mas*, Ger. 494. Emac. 617. Raii Hist. 2. 1023. Mer. Pin. 7. *Anagallis flore Phœniceo*, C. B. Pin. 252. Tourn. Inst. 142. Elem. Bot. 119. Boerh. Ind. A. 204. Hist. Oxon. 2. 568. Raii Synop. 3. 282. Dill. Cat. Giff. 126. Rupp. Flor. Jen. 14. Park. Theat. 558. *Anagallis Mas, flore Phœniceo*, Merc. Bot. 1. 19. Phyt. Brit. 7. *Anagallis Phœnicea Mas*, J. B. 3. 369. *Anagallis Phœnicea*, Buxb. 19. *Anagallis*, Chab. 452. **MALE PIMPERNEL**. Dale.

This is a small low Plant, not above a Span high, having a great many square smooth Stalks, with small Chick-weed-like Leaves, set one opposite to another, without Foot-stalks, full of small, round, blackish, red Spots underneath: The Flowers spring from the setting on of the Leaves, and grow singly on long Foot-stalks, being a Flower of one Leaf, divided into five Partitions, of a beautiful scarlet Colour. The Seed-vessel is round, opening horizontally in the Middle when the Seed is ripe, which is small and round, of a dark-brown Colour. The Root is small and thready, perishing every Year. It flowers in May and June, and grows in Corn Fields. *Miller Bot. Off.*

The second is the

ANAGALLIS TERRESTRIS FŒMINA, Offic. *Anagallis Fœmina*, Raii Synop. 3. 282. Ger. 494. Emac. 617. Raii Hist. 2. 1024. Mer. Pin. 7. *Anagallis Fœmina, flore cœruleo*, Merc. Bot. 1. 19. Phyt. Brit. 7. *Anagallis cœrulea*, Buxb. 19. *Anagallis cœruleo flore*, C. B. Pin. 252. Rupp. Flor. Jen. 15. Dill. Cat. Giff. 132. Hist. Oxon. 2. 569. Boerh. Ind. A. 204. Tourn. Inst. 142. Elem. Bot. 119. Park. Theat. 558. *Anagallis cœrulea fœmina*, J. B. 3. 369. Chab. 452. **FEMALE PIMPERNEL**. Dale.

This differs in nothing from the former, but in the Colour of its Flowers, which in this are blue; and it is more rarely to be met with.

The Virtues of both *Pimpernels* are much the same: It is a Plant moderately warm and dry, with a little Stypticity, and is therefore accounted by some a good Vulnerary. The Juice, being given inwardly by itself, or mixed with Cow's Milk, is useful in Consumptions, and Distempers of the Lungs; it is often put in cordial Waters, as an Alexipharmic; and is good against malignant Distempers: It has been commended by some Writers of Note, as of singular Advantage in maniacal Cases, and in delirious Fevers. The whole Plant is used: *Miller Bot. Off.*

Both these contain a great deal of Salt, and a moderate Quantity of Oil and Phlegm.

They are deterfive, vulnerary, and good against the Bite of a mad Dog, internally and externally applied. *Lemery de Drogues.*

This, however common in foreign Countries, is very rare in England. Dr. Fysher has found it near Peckham.

John Baubine took the Flower of this Plant to be pentapetalous, and its Fruit to be like that of the Chick-weed: But *Cæsalpinus* knew the Structure of its Parts better, for he affirms (not without Reason) that the Flower of the Pimpernel is only divided into five Segments; and that its spherical Fruit loses half its Shell when the Seed is ripe.

The Pimpernel has an herby, styptic, saltish Taste, and gives a deep Tincture of Red to the blue Paper: The Fruit gives it a deeper; so that it is probable, that its Salt may very much resemble the *Terra foliata Tartari Mulleri*. *Tragus* says, a Glass of the Decoction of Pimpernel in Wine, is a potent Sudorific, if the Patient lie still in Bed, so as not to interrupt the Sweat. In pestilential Cases he also advises to wash the Wound with it, upon the being bitten by a Viper or mad Dog, drinking a Glass of it at the same time: Instead of the Decoction of Pimpernel, the Juice may be used, which he commends for the Dropsy, and for Obstructions of the Liver and Kidneys, out of which it expels the Stone, without any ill Consequence. *Hartman, Mynsicht, Rolfincius, Michael, Willis*, and several others, very much commend the Decoction of this Plant, or its Tincture, in Spirit of Wine, for Madness, or the Delirium that attends continued Fevers: The Extract has the same Virtues; it may be mixed with that of St. John's-wort for the Epilepsy. *Simon Paulli* mentions a Cataplasm of Pimpernel, boiled in Urine, and applied to the Feet of those who have the Gout, as a Remedy very much used in his Country. *Martyn's Tournefort*.

The third is the

ANAGALLIS AQUATICA, BECABUNGA, Offic. *Anagallis Aquatica vulgaris, sive Becabunga Officinarum*, Merc. Bot. 1. 19. Phyt. Brit. 7. *Anagallis sive Becabunga*, Mer. Pin. 6. Ger. 496. Emac. 620. *Anagallis Aquatica minor, folio subrotundo*, C. B. Pin. 252. *Anagallis Aquatica, flore cœruleo, folio rotundiore, minor*, J. B. 3. 790. *Anagallis Aquatica*, Chab. 568. *Anagallis Aquatica vulgaris sive Becabunga*, Park. Theat. 1236. *Becabunga major & minor Officinarum*, Chomel. 537. *Beccabunga*, Rivin. Irr. M. 100. *Beccabunga Officinarum*, Rupp. Flor. Jen. Vol. I.

199. Buxb. 332. *Veronica Aquatica rotundifolia Becabunga dista, minor*, Raii Synop. 3. 280. *Veronica Aquatica major, folio subrotundo*, Hist. Oxon. 2. 323. Boerh. Ind. A. 225. Tourn. Inst. 145. Elem. Bot. 122. Raii Hist. 1. 852. *Becabunga major Officinarum*, Volck. 58. **BROOK-LIME**. Dale.

The Stalks of Brook-lime are thick, round, and smooth, shooting out fibrous Roots at the lower Joints, by which it easily propagates itself; the Leaves come forth at the Joints, on very short Foot-stalks, one opposite to another, fat, succulent; and round, little or nothing serrated about the Edges, somewhat more than half an Inch broad; the Flowers come forth at the Joints, growing in long Spikes, each Flower being made of a single Leaf, divided into four roundish Segments, and standing on a short Foot-stalk, of a fine blue Colour, and is succeeded by a flattish Seed-vessel, in Shape like a Heart, full of very small Seed. It flowers in June, holding the Leaves all Winter. It grows in Rills and running Ditches. The whole Herb is used.

Brook-lime is a good Deobstruent and Antiscorbutic, abounding with volatile Parts, very good for the Scurvy, being an Ingredient in the antiscorbutic Juices, and Diet-drinks, for that Distemper. It is also deterfive and cleansing, and useful in Obstructions of the Kidneys, by Gravel or slimy Humours; as also for the Stone and Dropsy. *Miller Bot. Off.*

Besides these, Ray mentions the following:

Anagallis omnium minima, Moris. Prælod.

Anagallis lutea, Ger. *Flore luteo*, Park. *Lutea nemorum*, C. B. *Lutea*, *Nummularia similis*, J. B. **YELLOW PIMPERNEL**.

Anagallis cœrulea, foliis binis ternisque ex adverso nascentibus, C. B. *Tenuifolia*, Ger. Emac. *Tenuifolia flore cœruleo*, Park. *Tenuifolia Monelli*, Clus.

ANAGARGALICTA, ἀναγάρλικτη, Gargarisms. Medicines with which the Fauces are washed; from γαργαρεύω, the Throat. *Hippocrates de Affectionibus*.

ANAGARGARISTON, ἀναγάργειον, of the same Derivation as the preceding: A Gargarism to wash the Fauces with, in a Quinsey. *Hippocrates de Morbis, Lib. 2.*

ANAGLYPHE, ἀναγλυφή, from ἀναγλύω, to engrave. A Name given by *Herophilus* to a Part of the fourth Ventricle of the Brain. It is called by Anatomists at this time **CALAMUS SCRIPTORIUS**, from the Resemblance it bears to a Pen, preserving the Analogy of the Greek. *Galen. de Anatom. Administ. Lib. 9. Cap. 5.*

ANAGNOSIS, ἀνάγνωσις, from ἀναγνώσκω, to read or persuade. It signifies, strictly, Reading; or Persuasion, or Conviction. But *Foësius* thinks, that in the Treatise of *Hippocrates*, intituled *παραγγέλαι*, it imports frequent visiting a Patient, and examining the Case.

ANAGRAPHÉ, ἀναγραφή, from ἀναγράφω, to prescribe.

Hippocrates, in his Treatise of *Dæmony*, advises Physicians to have, in Readiness, Portions capable of inciding, prepared ἐξ ἀναγραφῆς, according to stated Prescriptions. In this Sense all the Official Medicines may be said to be made ἐξ ἀναγραφῆς.

ANAGYRIS, the Name of a Plant.

Anagryis, which some call *Anagyros*, others *Atopos*, is a Shrub, in Leaves and Branches like the *Vitex*, of a very strong Smell, bears a Flower like that of Cabbage; and produces a parti-coloured solid Seed, in the Shape of a Kidney, and contained in long Pods; this Seed hardens about the Time that Grapes ripen.

The young and tender Leaves, bruised, and applied as a Cataplasm, repress œdematous Tumours: Taken, to the Quantity of a Dram, in Raisin Wine, it helps the Asthma, promotes the Expulsion of the After-birth, the Menses, and the Embryo. For the Head-ach it is taken in Wine. It serves for an Amulet for Women who are subject to hard Labour; but it must be taken off, and thrown away immediately after Delivery. The Juice of the Root is diaphoretic and digestive. The Seed, eaten, is a powerful Emetic. *Dioscorides, Lib. 3. Cap. 167.*

The Anagryis is thus distinguished by modern Botanists:

ANAGYRIS, Offic. Chab. 78. Mont. Ind. 36. *Anagryis fastida*, C. B. Pin. 391. Ger. 1239. Emac. 1427. Park. Theat. 245. Jonsb. Dendr. 364. Raii Hist. 2. 1722. Tourn. Inst. 647. Elem. Bot. 507. Boerh. Ind. A. 2. 27. *Anagryis vera fastida*, J. B. 1. 364. **STINKING BEAN TREFOIL**. Dale.

It is a Shrub, very branchy; the Bark is of a greenish Brown, the Wood yellowish or pale; the Leaves are set in Order, three by three, oblong, pointed, green above, whitish underneath; of so strong and stinking a Smell, especially when they are broken, that they give the Head-ach. The Flowers are yellow, and resemble those of Broom; they are succeeded by Pods as long as one's Finger, like those of Kidney-beans, and cartilaginous; every one of them contains three or four large Seeds, like the Kidney-beans; white at first, afterwards purplish, and at last when perfectly ripe, blue and blackish. This Shrub grows in warm Countries. The Leaves are resolute, and the Seed emetic. *Lemery de Drogues.*

ANAIDES. See **ANÆDES**.

ANAISTHESIA. See ANÆSTHESIA.

ANALCES, ἀναλκεις, from α Negative, and ἀλκῆ, Strength, weak, effeminate. Hippocrates uses this as an Epithet for the Asiatic Nations.

ANALDES, ἀναλδεις, from α Negative, and ἀλδῆ, to increase. It imports Not receiving Nourishment, or Augmentation. It is apply'd by Hippocrates to the Fruits which grow about the River Phasis, de Aere, Locis, Aquis.

ANALENTIA, a Species of Epilepsy mention'd by Paracelsus.

ANALEPSIA. Johannes Anglicus calls by this Name, that Species of Epilepsy which proceeds from Affections of the Stomach.

ANALEPSIS, ἀνάληψις, from ἀναλαμβάνω, to recover, or regain Strength and Vigour, after Sicknefs. It signifies a Renutrition, or regaining Strength, after having been render'd weak by a Distemper. Hence

ANALEPTICA, Analeptics, Medicines destin'd to promote this Renovation of Strength, Restoratives.

Among all the several Classes of corroborative Medicines, those call'd *Analeptics* justly claim the first and highest Rank. Under this Denomination are included all such Remedies as restore impair'd Strength, raise depress'd Spirits, and possess what we commonly call a comforting Quality. Such Medicines are likewise known by the Names of *Cordials* and *Cardiacs*. The Parts of the vegetable Kingdom, which best answer this Intention, are the Flowers of Roses, of the Lemon-tree, of the Orange-tree, of Jessamine, and of Lillies of the Valley; the Herbs Baum, Origanum, Marum, Lemons, China Oranges; and of Spices, Cinamon; of resinous Substances, Amber; of Animals, Musk: And also the Preparations of all these, the Oil of Cedar, of Turkish Baum, the true Oil of Roses, the OLEUM CANANGE, Oil of Bergamotte, Essence of Ambergris rightly prepar'd, Oil of Cinamon made into an *Elæosaccharum*, Baum-water prepar'd with Lemons, Water of Lillies of the Valley, of Cinamon prepar'd with Quinces. Under this Class may likewise be reckon'd Strawberries, Currans, Raspberries, Cherries, and their Stones, Waters prepar'd of fresh Cherries, Lemon-juice, and Syrup of Lemons.

These Cordials act by their fragrant, sweet, subtile, and oily Principle, and very soon enter the Nerves, and communicate a mild and gentle Motion to the Fluid they contain; for such is the Nature of all sulphureous, subtile, and strong-scented Medicines, that they soon pervade the inmost Recesses of the nervous Parts, and quickly produce their Effects, which is evident from fetid Medicines; and even such as are of an agreeable Smell, especially in Constitutions, that thro' an Idiosyncrasy cannot bear them. Hence by their Smell alone, as in Faintings and Swoonings, they speedily exert their corroborative Virtues, and raise the drooping, languid Spirits of the Patient; and this because the Extremities of the Nerves, and small Blood-vessels, are in no Part of the Body less cover'd, or more immediately expos'd and naked, than in those large and capacious Ducts which we call the Nostrils, to which when fragrant Medicines are apply'd, they very quickly affect the Nerves and Spirits.

I.

Though we are not to deny the above-mentioned Analeptics their proper Share of Efficacy in cherishing Nature, and recruiting impair'd Vigour, yet it must be confess'd their Power that way is pretty much limited and restrain'd. It were indeed to be wish'd, that there were in Nature Medicines of this Kind, of a certain and infallible Virtue, which the Vulgar foolishly enough imagine, and as foolishly require at the Hands of the Physician, such as could effectually exert their restorative Powers, and recruit languishing Vigour in all Distempers, but especially those of the acute and malignant Kind. But as in all Diseases there is not a more rational, or a more certain way of restoring Strength, than by carrying off the morbid Causes, and banishing the noxious Principles of the Disorder from the Body; so unless the Physician effect this, the Use of ANALEPTICS is to no manner of Purpose.

II.

Nor is it to be thought, that a genuine, lasting, and uniform Restoration of Strength is to be procur'd only by Medicines which excite a Motion in the Spirits and solid Parts; for in many Diseases, especially in Fevers and Convulsions, there is a great moving Force and Power in the Heart, the Arteries, and nervous Membranes, and yet the natural Strength is weak and languid; so that a true and genuine Restoration of the natural Strength principally depends upon proper Aliments, both of the eatable and drinkable Kind, being converted into good Blood, and laudable Juices, which afterwards generate that subtile Fluid which is secreted in the Brain; and being carried thro' the Nerves to the Muscles, and muscular Coats, principally supplies the Body, and its several Parts, with Strength and Vigour.

III.

Those Nutritives therefore which afford a Matter most proper for this Purpose, are the best Analeptics, of which Kind are

gelatinous Broths of Fleish, Capons, and Bones with their Marrow, boiled in a close Vessel with Water, a little Wine, some Slices of Lemon, a little Salt, Powder of Mace, and Cloves. Broths also made of coarse Westphalian Bread, Water, Wine, and Eggs.

Chocolate, with or without Milk, Ass's Milk, Water distill'd from coarse Bread, and Lemon-peel, and Wine, especially rich old Rhenish Wine, and unadulterated Hungarian Wine; but these nutritive and strengthening Aliments are not to be used in the very Time of the Disease, nor when the whole Mass of Blood and Humours is very impure; but when the Distemper is over, and where, by a preceding Disease, or by Excess of Passion, long Watching, Fatigue and Labour of Body or Mind, or large Hæmorrhages, the Strength is wasted and impair'd, in these Cases such Medicines are very proper; but even then Caution is to be used, and a proper Moderation to be observ'd, and kept up to, because they pass very speedily into the Blood, and augment its Quantity. Hoffman, *Medicina Rational. Systemat.*

ANALGESIA, ἀναλγεία, from α Negative, and ἄλγος, Pain, or Grief. It signifies a State of Ease, without Pain, whether in a natural State of Health, or from some morbid Affection depriving any Part of Sensation.

ANALLIS, ἀναλλις. Erotian says this is the Name of a Plant; but neither he, nor any other Author I have met with, say what Plant it is.

ANALMYROS, ἀνάλμυρος, from α Negative, and ἄλμυρος, Salt, unfalted.

ANALOGISMOS, ἀναλογισμός, from ἀναλογία, Analogy. It signifies Ratiocination, or the Investigation of things not evident from the Analogy they bear, or are supposed to bear, to things well known.

ANALOSIS, ἀνάλωσις, from ἀναλίσσω, to consume, a consuming, or wasting.

ANALTHES, ἀναλθης, from α Negative, and ἄλθω, to cure. Incurable.

ANALTOS, ἀναλτος, from α Negative, and ἄλς, Salt, unfalted, insipid, not salt to the Taste.

ANALYSIS, ἀνάλυσις, from ἀναλύω, to resolve. The Resolution of any Substance into its first Principles, with a View of discovering its component Parts.

The Method of analysing mineral Waters has been delivered under the Article ACIDULÆ, which I would advise the Reader to peruse, because I have there specify'd the Nature of many Substances, some or more of which are found to exist in most compound Bodies; and in the same Place I have specify'd the general Methods of discovering them.

There is something very trifling in the common Analysis of Plants and Animals; the way is to distil them in proper Vessels, and examine what rises into the Receiver, and the Caput Mortuum, or what remains in the Vessel, and is too heavy to be rais'd by the Fire. But by this Method very little or nothing can be discovered, inasmuch that it is not possible from the common Analysis to discover even what the analys'd Plant or Animal was.

In the Analysis of Plants a large Quantity of Phlegm generally comes over first, then an acid Spirit; an alkaline or urinous Salt; and lastly, a black fetid Oil. From the Ashes of what remains, is obtain'd a lixivial Salt, such as Salt of Tartar, which runs *per deliquium* in the open moist Air; or a Kind of *Sal Salsus*, such as that of the common Wall-flower. Besides these Substances, which are got by Distillation from almost all Plants, there are others obtainable only from some of them. Thus from aromatic Plants, such as Lavender, Thyme, Sage, &c. a subtile, fragrant, essential Oil, generally rises first. From a few Plants, such as Hellebore, Helleborastrum, Speedwell, Cresses, and others, a very sharp, penetrating Spirit or Oil comes over with the first Degree of Fire, which is likewise obtain'd after the Plants have been fermented, but in a different Order. Sometimes the first Degree of Fire brings over an acid or urinous Spirit, sometimes an inflammable and very volatile Spirit.

These are the few Elements, or Principles, obtainable from Plants. We are not, however, to imagine, that those which go by the same Name are exactly alike in all Plants. The fix'd Salts, for Instance, got from their Ashes, being originally derived from some Acid, must differ from one another in various Plants, as much as Acids themselves do. For the same Reason the acid Spirits, volatile urinous Salts, and even essential Oil, must be different; and accordingly we observe, that the essential Oil of Thyme, digested with Spirit of Sal Ammoniac, gives a violet or purple Tincture, which many other essential Oils will not do. Wherein all these Differences precisely consist, has not hitherto been sufficiently clear'd up.

From animal Substances we obtain a large Quantity of volatile urinous Salt, a thick Oil, very little fix'd Salt, and still less acid Salt. The same Substances, being boiled in Water, yield a Mucilage, or Jelly, from which, by Distillation, the Principles already mentioned may easily be got. But as most animal Substances yield these in much the same manner, and as they appear very little, if at all different, in different Animals, nothing

nothing can be determined *a priori* concerning the medicinal Virtues of particular Animals from their Analysis.

The following Observation of *Homberg*, and *Lemery*, deserve Notice, as there is something extremely curious in them upon this Subject.

Observation on the ANALYSIS of Vegetables, by M. Homberg.

All the Chymical Analyses of Plants which have hitherto been made with a View to discover their Natures more perfectly, have been conducted and managed almost in the same manner; that is, by separating, by means of Fire, their constituent and component Parts. The principal Difference which has been observ'd in Separations of this Nature, is, that some have fermented the mix'd Body, before it is subjected to the Powers of the Fire; whereas others have began the Analysis without any previous Fermentation. The Principles produced or furnished by both these Manners of Separation, universally consist of certain Quantities of *Salts, Oils, Water, and Earth.*

It has, for very good Reasons, been doubted, whether what we here call *Principles*, are the true and real *Principles*, which constitute and make up the mixt Body, before it was subjected to the Analysis; or, in other Words, it has been doubted, whether these four Substances, into which the compound Body is resolv'd by the Force of Fire, were really to be found in that Body, when it was in its natural State.

The first Reason for our doubting of this, is, that two Plants perfectly differing in Taste, in Smell, in Figure, and in Virtues, *Cabbage*, for Instance, and *deadly Night-shade*, are, when subjected to an Analysis, reduced into Principles so similar, both with respect to Number and Quality, that a Person would take them for one and the same Plant analysed at different times; and nothing is more certain, than that the one is a Pot-herb, and the other a Poison.

The second Reason for our doubting of this, is, that one cannot make up the same compound Substance, by rejoining the Principles into which it has been resolv'd by the Analysis, whatever Fermentation they should undergo, or whatever Degrees of Fire should be employed for that Purpose.

I pass over other Difficulties, since they seem to be of less Consequence; but these I have now mentioned, certainly challenge some Attention. As for what regards the first Reason of Doubt, I shall only say, that we cannot absolutely deny, that these four Substances, Salt, Water, Oil, and Earth, enter the Composition of all Vegetables, since they are universally found in them; after whatever manner the Analysis is conducted or carried on; but the Difficulty only is, to know whether they exist after the same manner in the Plants, as they do when we have procured their Separation by Analysis; or whether the Powers of the Fire have not alter'd these Principles, and given them a quite different Appearance, from what they had in the compound Body.

I have made several Experiments, in order to satisfy myself with regard to this Point; but I shall only here give an Account of the Manner in which I performed one of them, since I intend to draw some Consequences from it.

The Juice of ripe Grapes, newly express'd, put into a Vessel, and distill'd, will first yield a large Quantity of an aqueous Liquor, of which, the Part that first comes over, is tasteless and insipid; and that which come last, acid, with some Marks of a volatile urinous Salt; then by augmenting the Fire, it will yield a small Quantity of a very foetid Oil; and that which remains in the Vessel, being incinerated and lixiviated, yields a lixivial Salt, and leaves a small Quantity of insipid Earth.

This same newly express'd Juice of Grapes being evaporated to about a third on a very slow Fire, and put into a cool Place, an essential Salt, somewhat acid, crystallized itself in it; and an oily Substance, very sweet and agreeable to the Taste, floated on its Surface; and the Liquor that remained was a little tartish, on account of some essential Salt, which still remained in it.

This same Juice of Grapes, having fermented, and become Wine, yielded in Distillation a pretty large Quantity of inflammable Spirit, afterwards a great deal of a purely aqueous Liquor; then the Matter, which remained in the Alembic, being evaporated to the Consistence of thick Honey, I took it off the Fire, and poured upon it the strongest Spirit of Wine well dephlegmated, which became charged with a reddish Oil, of an aromatic Smell; a little earthy Matter was precipitated, and an acid Salt, resembling Tartar, crystallized at the Bottom.

These three different Analyses, of one and the same mixt Body, yield us the same Principles, but very much alter'd by the great Fire in the first, and by the Fermentation in the third Analysis; so that the Principles yielded by the second Analysis, having neither suffered the Torture of a strong Fire, nor undergone a Fermentation, must least of all recede from the natural State which they retained in the Plant. We find the Sweetness of the Grape in the oily Matter which floats above the Crystallization, its poignant Taste in the tartish Salt which was crystallized, and its Fluidity in the aqueous Phlegm which was evaporated from it. The earthy Matter remain'd mixt with the Oil and Salt, and could not be separated but by a great Fire,

as happened in the first Analysis, in which we observe the same things with regard to the Salt of this Plant, as in strong Distillations we observe of fossile Salts, such as Saltpetre, and Vitriol, which we very well know to be acid volatile Salts, mixed with a proportionable Quantity of fixed Salt, and insipid Earth, which serve as a Kind of Matrix to them. But as the Salts of Plants are more compounded than fossile Salts, we accordingly find the Salt of our Plant divided into three different Parts; the first is that acid Salt which pass'd thro' the Neck of the Retort along with the last Parts of the Phlegm; the second is that volatile urinous Salt which passed partly with the last Drops of the Acid, partly alone, and partly with the foetid Oils; the third is the fixed Salt, which is separated from the earthy Parts by Lixivation; and these three Salts being naturally joined together in the Plant, compose its essential Salt, which, as we have seen, crystallized in the second and third Analyses.

The Oil of this Fruit, which in the second and third Analyses is sweet, and of an aromatic Smell, is in the first Analysis considerably changed into a very acrid and stinking Oil, probably on account of a Quantity of urinous and acid Salts contained in the Plant, which the Violence of the Fire has carried off at the same time, and mixed with the said Oil, which Salts, after passing thro' the Neck of the Retort, became volatile, whereas the Salts yielded by the other two Analyses were not so; and as Fermentation naturally disengages volatile from fixed Substances, we find in the third Analysis a great deal of a burning Spirit, which is the most volatile Part of the Oil of our Fruit, and which was separated from it by the least Heat.

We see by the Comparison we have made of the Principles yielded by one and the same mixt Body, in three different Analyses, that these Principles are always found in the same Number, but different only in Degrees of Volatility and Fixation, according to the Fermentation and Degrees of Fire these compound Bodies have undergone, during their respective Analyses. Besides, if to this we add the infinite Combinations of *more or less* of these Principles, the Differences of which may be imperceptible by us in the Analysis, we shall not be surpris'd to find two Plants so different in Taste, in Smell, and in Virtues, as the *Cabbage* and *deadly Night-shade* are, so much alike and similar in their Principles.

For these very Reasons we may likewise easily comprehend, why one cannot, if I may use the Word, *recompose* a mixt or compound Body, by rejoining the Principles into which it has been resolv'd by Analysis; because the Fire having changed their natural Arrangement, and respective Degrees of Volatility and Fixation, and having, even unavoidably, dissipated some Part of them, these Principles, being again join'd together, are neither found in the same Quantity, possessed of the same Quality, nor arrang'd in the same manner they were in the compound Body before it was subjected to the Analysis.

To convince myself still further of this Truth, I have mixt very simple Principles, in order to compose certain Bodies, which I afterwards subjected to Analysis, and which yielded the several Principles quite chang'd from what they were; for Instance, the fixed lixivial Salt, and the express'd Oil of Plants, mixed together on a Fire, compose a Soap, which, among other Principles, yields in its Analysis, an acid Liquor, an insipid Earth, and an urinous Salt, which do not at all appear in the Ingredients of which it is composed.

The Mixture of an acid Mineral, with the essential Oil of any aromatic Plant, composes a Resin perfectly resembling that which flows from certain Trees. This Composition is only made up of two very volatile Ingredients; and yet, upon an Analysis, it yields all the four Principles. It must indeed be own'd, that upon the Mixture of these two Substances, so sudden and violent a Fermentation arises, that a Flame is often thence produced; and as we know, that in all Fermentations a Separation is naturally made of the volatile from the fix'd Parts, there was no great Difficulty in separating the one from the other in the Analysis, tho' they did not appear such before the Fermentation.

All these Considerations and Remarks shew us, that those Analyses in which only a great Fire is employ'd, are not so proper to discover the Principles and Virtues of Plants, as when by a moderate Heat, and Fermentation, we promote the Separation of their component Principles. *Homberg, Mem. de l'Acad. Roy. A. 1701.*

Remarks upon the Usefulness and Deficiencies of the common Methods of analysing Vegetable and Animal Substances; by Mr. Lemery.

That I may throw a greater Light around what I intend to say upon this Subject, I shall make use of a Comparison, which, to me, seems very well calculated for the Illustration of the Subject.

Suppose then two Edifices, almost of the same external Form, but built of Materials different in themselves, and differently arranged and disposed with regard to each other. If, in order to discover this Difference of Materials, and their different Arrangements in each Edifice, one should destroy both, and make,

make, if I may be allow'd the Expression, a sort of Decomposition or Analysis, by means of an active and violent Agent, which, instead of sparing the Materials on which it was to act, and only separating them from one another, and leaving them entire after their Separation, should by the natural Force and Quickness of its Motion, in a short time, reduce them to a Dust; in such a Chaos, where every thing would not only be confounded, but even considerably altered and changed, would it be possible to know and distinguish the Difference of the several Materials, which had enter'd the Composition of each Edifice? Or might it not possibly happen, that the Dust, produced by the Demolition of the one, might resemble that afforded by the other? If this should happen to be the Case, People would not fail to conclude, that both Edifices were built of the same Materials, tho' in Reality it was otherwise.

This is a full Image and Representation of what happens in the ordinary Analysis of Plants and Animals: The Fire employ'd in Operations of this Nature is the quick and active Agent above-mention'd; for it spares none of the Substances submitted to its Action; it soon confounds and attenuates them; and, if I may so speak, reduces them to a kind of Dust. But, whether by the Confusion and Derangement of the Parts, or by the foreign and adventitious Parts conveyed to the different Substances of the compound Body, it lays a Foundation for the Production of new Compositions, which are often widely different from those which were naturally inherent in the Body itself. 'Tis probably for these Reasons, and on account of a certain Change induced by the Fire on the different Parts of Plants and Animals, that it often happens, that two Plants, one of which has very salutary, and the other poisonous Qualities, and whose natural Composition must be consequently very different, resemble each other so much both in the Substances they yield, and the Quantities of these Substances, that if their Qualities were not known before, we should be induced, in Consequence of the Analysis, to believe them one and the same Plant.

When I say, that the Fire produces such a remarkable Change and Alteration upon the Substances yielded by compound Bodies, I do not intend to represent these Substances as real Principles, nor to insinuate, that the Principles of compound Bodies are alterable by the Action of the Fire. What has laid a Foundation for this Opinion is, that some Substances, which commonly, but unjustly, receive the Name of Principles, actually undergo such a Change by the Fire; but I shall afterwards prove, when I come to examine what Bodies, in a truly Chymical Sense, deserve the Name of Principles, that we have all the Reason in the world to be assured, that these Bodies do not change their Forms by the Action of the Fire, or rather, that if they are susceptible of any Change by means of that Agent, the Alteration does not fall upon any of the Principles in particular, but only upon their Union, or the Manner in which they are united with one another; so that the Fire may well change the Form of the compound Body, by disuniting its Parts, and arranging them in a different Manner from what they were, but can produce no Change with regard to the Principle, the Solidity of which renders its Parts inseparable, and consequently its Form unalterable.

It may perhaps be said, that if People would make a just Estimate of the Advantages arising from Chymical Analysis, in acquiring the Knowledge of compound Bodies, before they engaged in them, the Fruitlessness of the Labour would make them drop the Project; by which means they should save a great deal of Labour, Expences, and Time, which might be more advantageously employ'd.

I answer, that we are not able to form a just Judgment of Chymical Analyses, till such time as they are made, and we ourselves put into a Condition of examining all their Circumstances carefully, and comparing them with one another. Since then a Knowledge of the small Advantage that attends them, must be the Result of a Trial made; it is requisite for Conviction in this Point, and to put us in a Condition to discover wherein their Defect lies, that such Trials and Experiments be first made; and even tho' one should foresee before the Experiment, all that is observed to happen after it is made, yet the Reasons alledged against the Attempt, amount only, at best, to bare Conjectures, incapable of procuring Assent, and unworthy to be laid in the Balance against the Advantages, which, 'tis pretended, the Public receives from Labours of that Nature. Besides, as these Conjectures could not have been confirmed, but by going thro' the Analyses themselves, there would have still been a Necessity for making them, but with this Difference, that in the one Case, the Analyses should have succeeded the Conjectures, and been a kind of Confirmation of them, whereas in the present Case, the Analyses are first made, and lay a Foundation for our future Reflections.

Besides, tho' all the Analyses which should have been made, should answer no other End, but to undeceive us with regard to themselves, and point out what we ought to think of them, this would still be an Advantage sufficient to balance the Time and Pains we have laid out in that way: But what still more

contributes to justify Labours of this Kind is, that in examining a long Train of Accidents that happen in analysing a great Number of compound Bodies, one discovers a great many curious Facts, which without Trial and Experiment had never been known, and which may, perhaps, prove of singular Use to Mankind.

The Execution of the Project having then sufficiently shewn the little Advantage to be reap'd from ordinary Analyses, that Point, as it is now no longer controverted, is not what I here propose to discuss and prove. I take the Fact for granted, and look upon it as certain and incontestable; but I search for the Reason or physical Cause of it, in the ordinary manner of carrying on Analyses, that is, in the Violence and Activity of the Fire, which is the Agent employ'd, and in the Disorder, Derangement, and Confusion, which it brings to all the Parts of the compound Body.

I have already given an Idea of this Disorder and Derangement, in the Beginning of this Memoir; but as this Idea is too general, and requires to be proved and illustrated by a more minute Examination of the particular Change which each Substance in the compound Body undergoes, I shall set about it so much the more willingly, since by narrowly considering wherein the Defect of the ordinary Analysis consists, we shall acquire more correct Ideas of the Matter, and, perhaps, be enabled by that means to contrive and carry on other Kinds of Analyses, longer indeed than these, but at the same time more exact, exempt from their Inconveniencies, and much better calculated for discovering the Principles of compound Bodies. In order to form a sound Judgment of the Change produced by the Fire, on the different Parts of a compound Body, analysed in the ordinary manner, we have only to consider each of its Parts in their natural State, and compare this State with that which succeeds it, after they have undergone the Action of the Fire: Two Kinds of Substances, in Plants and Animals, deserve our particular Attention; one is their saline, and the other their pinguious Parts.

I have already said, that I did not pretend to represent these Substances as Principles; and indeed to declare my real Sentiments with regard to Chymical Principles, I shall shew, that each of these Substances is capable of being resolved into different Parts, none of which are themselves Principles; but, compound as they are, 'tis of Importance for the Knowledge of the Nature of compound Bodies, to extract them, and to know them to be such as they are in these compound Bodies, that is, when they are entire, and no ways disfigured or changed; for it is in this Shape, that they act immediately upon our Fluids; and this Action does not depend upon any particular Part of which they are composed, but upon the general Union of all these Parts, whence certain Masses are produced, the Effects of which are often very different from those of each of the Parts, whether considered separately, and acting in this manner, or supposed simply mixed and blended, but not closely and intimately united, as they are in the compound Body. It is then plain, that one cannot be at too much Pains to know these Masses in their natural State, and to extract them as entire as the Nature of the thing will admit of: And if we incline afterwards to discover more perfectly the hidden Contents of these Masses, 'tis only then we can analyse them with Advantage, as I shall clearly prove, when I come to treat of Analyses of that Nature.

I compare these Masses to the very Materials of the two Edifices I have already proposed as an Example; for in order to know the interior Composition of these Edifices, 'tis not enough to destroy them by breaking the Union of their Materials; but these Materials must be separated in their entire State, at least they must not be unlike that which they were in the Edifice itself, or before the building of the Edifice; otherwise they will give us but a faint and obscure Idea of the interior Composition of the Building. This is what also happens in the different Substances extracted from Plants and Animals, in the ordinary Method of carrying on Analyses; for I shall shew by an Examination of each of these Substances, that after the Analysis, and their Separation from the compound Body, they are so far from resembling the exterior Form which they bore in it, that they become often so different from what they were, and acquire Virtues so opposite to those they had, that we should scarcely believe the Difference, if Experience did not in a manner force us to it.

The saline Parts of Plants and Animals are commonly lodged in them under the Form of a concrete Salt, of which they contain several Kinds.

I have observed, in examining a great Number of Animal Substances, on account of my Disquisitions into the Nature of Saltpetre, that these Substances contained a great Quantity of Sal Ammoniac, that is to say, a Salt of the same Nature with that which may be made by the Conjunction of an acid and a volatile Salt; Spirit of Salt for Instance, and volatile Salt of Hartshorn, or of Vipers. Besides, I have observ'd, that the Acid of the natural Sal Ammoniac, contained in these animal Substances, was nitrous, or like to that which is yielded by

by Saltpetre; so that one might, by a Train of Operations, so well purge this Acid of the pinguous Substances, which are naturally complicated with it in the Animal; that it should become a Spirit of Nitre, differing in nothing from the common Spirit of Nitre. Besides, the animal Substances, on which I made my Observations, left me no Reason to doubt of their containing a small Quantity of true Saltpetre, that is, of a Salt like to that which is produced by an Union of the Acid of Spirit of Nitre, and a fixed alkaline Salt. In a word, in these Substances, where the nitrous Acid is found in a large Quantity, tho' so much envelop'd, that one cannot discover it without a great deal of Pains and Industry, the greatest Part of this Acid is join'd with a volatile Matter, and forms a Sal Ammoniac; and a small Portion of this Acid is stopp'd by a fix'd Matter, and forms Saltpetre.

Besides the nitrous Sal Ammoniac, and the Saltpetre contain'd in all the animal Substances I have examin'd, I have also extracted from some of them, and that with a great deal of Ease, a considerable Quantity of true common Salt, entirely like the ordinary Sort; but I could never observe, that any of these Substances contained a Sal Ammoniac, produced by the Acid of that Salt. I do not, however, deny the Fact. I only think I have a Right, in Consequence of the many Experiments I have made upon animal Substances, to advance, that the greatest Part of the Sal Ammoniac contained in them, is nitrous; and that if any Part of it is produced by another Acid, that Acid is to be found in a much smaller Quantity than that of the Nitre. But whatever the Nature of the Acid contained in Animals be, it has been already observed, that the Difficulty of discovering it sufficiently proves it to be strongly envelop'd; and as the nitrous Acid there naturally forms a Sal Ammoniac, or a Saltpetre, according to the Nature of the Substances in which it is engag'd, we have Reason to believe, that all other Acids are conceal'd, at least the greatest Part of them, under the same Substances. This is sufficient for understanding what I am to say hereafter.

Sal Ammoniac is not so common in vegetable, as in animal Substances. They nevertheless contain some of it, but abound much more in a concreted Salt, the Matrix or Basis of which is a fixed Substance; and as there are in Reality many more fixed and earthy Parts in Plants than in Animals, and more volatile Parts in Animals than in Plants, that Acid which in Plants ordinarily produces a Salt of the same Nature with that which would be produced by the artificial Mixture of the said Acid with a fixed Salt, produces, on the contrary, in Animals, as I have already observed, a Salt like that, which would be produced by the Mixture of an Acid and a volatile Salt. As this is the Case, we need not be surpris'd, that some Plants should contain a great deal more of Saltpetre than is to be found in any animal Substance; and that there should be more nitrous Sal Ammoniac in animal Substances, than can possibly be found in any Plant.

It shall be shewn under the Article Nitre, how the Saltpetre of Plants becomes the nitrous Sal Ammoniac in Animals, and how the nitrous Sal Ammoniac may again become Saltpetre in Plants.

But the Saltpetre, and the nitrous Sal Ammoniac, are not the only Species of concreted Salts contained in Plants. There are other Sorts formed indeed by a like Matrix, that is either fixed or volatile, but by an Acid of another Nature, such, for Instance, as that which is yielded either by Vitriol, or common Salt; and all these Salts contained in different Plants, form different Classes of essential Salts, which have different Properties and Effects, according to the Species of that Acid which gives each of them its respective Form. I shall not at present enter deeper into this Subject, but only observe, that in some of these Salts, the Acid is so well envelop'd in its Matrix, that when the Salts themselves are apply'd to the Tongue, they only excite a Sensation of Saltiness, but not at all of any Acidity. I must also observe, that upon mixing some of them with an alkaline Salt, neither a Fermentation, nor a Coalescence of the two Salts ensue; such is the essential Salt of Borrage, and that of Purslane, which, to speak properly, are a true Saltpetre. But there are other essential Salts, the Acids of which, being less closely envelop'd in their Matrices, appear, as it were, on the Surfaces, and present the Extremities of their Points, which being free and disengaged at that particular Part, excite, by that means, the Sensation occasioned by an Acid, upon their being applied to the Tongue. By the same Principles of Mechanism these Salts ferment, and unite with alkaline Salts; an Instance of this Species of Salt, we find in the Crystals of Tartar.

Having examined the Character, the State, and the natural Composition of those Salts, which are ordinarily found in vegetable Substances, let us now inquire what becomes of them when they have been subjected to the Fire, commonly employed in the ordinary Analyses; and let us begin with the Sal Ammoniac contained in Plants and Animals.

As the two Parts of which this Salt is composed, are both of such a Nature, as that whether separately, or in Con-

junction, they may be elevated by the Fire in such a manner, as that after their Elevation they preserve the Union they had before the Operation; I say, as this is the Case, it should seem probable, that the Sal Ammoniac contained in Plants and Animals, should be raised in the same manner by the Action of the Fire, that is, entire. But yet it is not raised so; it first suffers a Disunion of the Parts which compose it, and each of these Parts rise separately by Distillation. We even observe in the ordinary Analyses of Animals, that all which rises in this manner is not, or, at least, does not appear to be any more than a volatile alkaline Salt, that is, the most volatile Portion of the Sal Ammoniac separated from the Acid, which is so little discoverable in the Substances raised by the Fire, that it has for a long time been thought, that animal Substances contained no Acid; and it is but lately, that the contrary has been found true, which is look'd upon as a Discovery so much the more curious, because it destroys a Prejudice founded upon the Analyses of a great Number of animal Substances. It is true, that by only considering these Analyses, one falls into two very palpable Errors; the one is, that there is no Acid in Animals; though there is in Reality a great deal; the other is, that their Salts are lodged in them under the Form of a volatile alkaline Salt, though from other Circumstances, we know very certainly, that these Sorts of Salts, like fixed alkaline Salts, have not been rendered alkaline; but by the Fire, which has in a manner half un-compounded them, by depriving them of a Part of their Acids; so that by restoring these very Acids to them, they are perfectly restored to the State and Condition in which they were in the compound Body, before it was subjected to the Action of the Fire.

I proceed to explain why an Analysis only discovers a Part of the Sal Ammoniac contained in Animals, what becomes of the acrid Part of that Salt, how the one is separated from the other, and why they do not rise with each other, as it usually happens in the ordinary Sublimation of Sal Ammoniac.

In order to solve all these seemingly perplexing Phenomena, I lay it down as a Maxim, that *When Circumstances vary, then, and in that Case, Effects must also be different*: For Instance, Experience teaches us, that volatile alkaline Salts are more volatile than the Particles of Water, that is, they are more easily raised by the Fire; and yet in the Distillation of the Viper, and a great many other animal Substances, the Phlegm, which is less adherent to the other Parts, mounts first, and before the volatile Salt; but when this same volatile Salt is once unfetter'd, and set at Liberty from the Bonds which, as it were, held it in the compound Body, and when the Business is to separate it from the Phlegm, with which it has mixed and blended itself in the Recipient, it is not the Phlegm, but the volatile Salt, which the Fire raises and sublimes first.

Something similar to this happens in Sal Ammoniac, when it is alone, adherent to nothing, and quite disentangled; for then the Fire surrounds it, and raises it entire, without any Difficulty, and without the Trouble of two Attempts. But when that Salt is in a compound Body, it is then intimately united with its earthy Parts, which fix it, render it heavy, and hinder it from yielding to the Action of the Fire so easily as in other Circumstances it would have done; so that the Fire not being able at that time to raise all the Salt, disengages and raises the most volatile Parts of it; which lays a Foundation for the acid Part to blend itself more and more with the earthy Part of the compound Body, in proportion as the volatile Salt quits and forsakes it. This Reasoning is sufficiently justified by Experience; since by mixing a sufficient Quantity of an alkaline Substance with common Sal Ammoniac, and subjecting the Whole to the Fire, that Salt does not in that Case rise entire, as it does when alone, and only its volatile and alkaline Parts yield first to the Fire, and fly off, whilst the Acid of the Salt deeply insinuates itself into the Pores of the alkaline Matter, from which it does not afterwards disentangle itself, but by an Effort of the Fire more considerable than that of which we now speak. This is precisely what happens in the ordinary Distillation or Analysis of an animal Substance; for the Fire used in that Operation is sufficient to disengage the volatile Salt, the Phlegm, and a considerable Part of the Oil; but 'tis not sufficient to produce such an Effect upon the Acid, especially since it is more deeply entangled in the earthy Part of the compound Body; and it is for this Reason, that one perceives none of it in the different Portions which are raised during the Analysis; or if these Portions contain any of it, it is in so small a Quantity, and so strongly envelop'd in oily Matrices, that it cannot be discovered; and what proves the Truth of this Reasoning is, that if the Matter is subjected to a more violent Fire than usual, there rises a Liquor which has manifest Marks of Acidity; and one may observe upon this Occasion a curious Phenomenon, which has already been taken Notice of by the late Mr. Homberg, which is, that the Acids we are now speaking of, after being obliged to yield to the Force of the Fire, return, and are again found in the same Liquor with the alkaline Salts, which were before united with them; and notwithstanding the

the new Mixture of these Acids with their alkaline Salts in the same Place, there is neither a sensible Fermentation raised, nor does there happen a Reunion of the two Bodies, which, on this Occasion, preserve their respective Properties, the one of an acid, and the other of an alkaline Salt.

Mr. *Homburg* is of Opinion, that we ought to ascribe the Peculiarity of this Circumstance, to the small Quantity of Phlegm contained in the Mixture; since in Cases of a like Nature, we often see Acids and Alkalies remain together in a State of Inaction; but I likewise think, that the oily Parts, which are scattered up and down in the Liquor, and which may have contracted a particular Union with the Acids during the Operation, which perhaps hinders us from distinguishing the true Character of them in the manner hereafter to be explained, I say, that these oily Parts, by enveloping the Acids, contribute very much to hinder their Action upon the volatile alkaline Salt. And indeed, if we were only to be swayed by the Reason which Mr. *Homburg* advances, we should be at a Loss to get over one Difficulty, which is, that there is often a Quantity of aqueous Parts in the Liquor, sufficient at least for a small Effervescence, which would very soon be succeeded by a sensible Reunion of the Acids and Alkalies.

As we have good Reason to believe, that in the Analysis of compound Bodies charg'd with Sal Ammoniac, the Decomposition of that Salt is not made, but in Proportion to the fixed and earthy Parts contained naturally in these Bodies, I cannot help imagining, that those animal Substances, which particularly abound in volatile Parts, may well be supposed not to contain a sufficient Quantity of earthy Parts for all the Sal Ammoniac contained in these Substances; and consequently, that all that Sal Ammoniac was not decomposed in the Analysis; but that Part of it either remained with the Caput Mortuum of the Substance, or lost only a moderate Quantity of its Acids; and becoming, by that means, less volatile than those volatile Salts which are better separated from their Acids, but at the same time more volatile than the Sal Ammoniac which has lost none of them, it was in a middle State betwixt the two, and might be said to be on the same Level of Volatility with the aqueous Parts in which it had sheltered itself during the Operation, and from which we cannot afterwards separate it by Distillation, because being neither heavier, nor lighter than the Water, it neither rises before it, as the ordinary volatile alkaline Salts do, nor after it, as the Sal Ammoniac, which is entire, does. And as that Liquor, which constitutes what we commonly call a Spirit, ferments with Acids, whether by means of some volatile Salts it has retain'd, or on account of the Acids, which the Sal Ammoniac of the Liquor has lost, in whose Place new Acids are lodged; I say, upon some of these Accounts, some have thought they had a Right to conclude from this Fermentation, that the Spirit was only a Phlegm impregnated with the same volatile Salts, which are drawn from the Substance under a concrete Form: But if this is the Case, why cannot we totally, or at least in a certain Degree, deprive this Spirit of its volatile Salts, by putting it into a Matraass with a long Neck, with a Head and a Recipient; and paving the way by a gentle Heat for these Salts, which should happen to be lighter than the Water, to separate themselves from that Liquid, and rise to the Top, as a volatile concreted Salt, dissolved in Water, or even in a Spirit, uses to do under such Circumstances? We may therefore believe, upon very probable Grounds, that in the ordinary Analysis of animal Substances, all the Quantity of their Sal Ammoniac is not equally decomposed; that is, in the different Portions of that Salt, an equal Separation is not made of the Acid from its alkaline Part or Matrix, which is what is commonly called the *Volatile Salt of Animals*; so that certain Portions of that Salt free themselves to a certain Degree from the Acids, which they contained in the compound Body; other Portions retain more of their Acids, and others perhaps lose still less; and, notwithstanding the Operation, remain almost under the same natural Form they had in the compound Body, as happens in certain Distillations of the volatile Spirit of Sal Ammoniac, where for want of a sufficient Quantity of an absorbent Medium, there is only a Part of that Salt from which the volatile alkaline Salts are detached, and rise at first, whilst the other Portion of the Sal Ammoniac remains entire at the Bottom of the Vessel; and being afterwards subjected to a greater Fire, it rises in the Form of Flowers, which are nothing but an entire Sal Ammoniac, or at least a Sal Ammoniac with the greatest Part of its Acids.

What seems to confirm this Opinion, that all the Sal Ammoniac of animal Substances is not equally decomposed during their Analysis, and that, because they do not naturally contain a sufficient Quantity of earthy Parts; what, I say, seems to confirm this Opinion is, that by supplying that Defect, that is, by mixing with these Substances a sufficient Quantity of fresh earthy Parts, to produce the Decomposition of a greater Quantity of Sal Ammoniac, we at last disunite, and set at Liberty, a great Number of Acids, and volatile Salts, the Union of which would have still subsisted, without such an

Addition; and by this new way of Proceeding, we not only obtain more volatile alkaline Salts, but also the Liquor, which towards the End of the Distillation, is carried up by a proper Degree of Fire, is much more sour, and more impregnated with Acids, than when we do not mix an earthy Medium with the animal Substances before Distillation.

'Tis then certain, that animal Substances contain a great deal of Acids, of which the ordinary Analyses do not discover the least Marks; and this Circumstance shews us how little Confidence is to be reposed in them: But we must also own, that the new Method of discovering the Acids of Animals, is not without its Defects, even with respect to the Acid discovered; for if, by disentangling this Acid, it discovers one where none was before perceived, then as the Disengagement of this Acid is carried on in the very Bosom of the compound Body, and in the very middle of the Parts of which it is composed, the Acid, after its Separation from the volatile alkaline Salt, which envelop'd it, is ever after confounded, and mixed with Parts of a different Nature, in the same Fluid, which indeed may permit it to be discovered an Acid in general, but, by their Mixture, prevent our knowing the specific and distinguishing Character of the Acid; so that we cannot ascertain the particular Class of Acids to which it belongs: a Circumstance, which is nevertheless of great Importance, when we want to know the genuine Nature of the saline Part of any compound Body.

I shall endeavour to remedy this Inconvenience, when I come to propose Processes for the Analysis of compound Bodies. *Memoires de l'Academie Royale des Sciences, 1719.*

Having now considered the Action of the Fire upon that Species of Salt, with which animal Substances are principally impregnated, I mean Sal Ammoniac;

We are now to examine the Alteration produced by Analyses in another kind of Salt, found particularly in Vegetables, and differing from *Sal Ammoniac* only as to its Matrix, which is fix'd. This Difference, with respect to the Matrix, does not hinder the Fire from producing, upon the greatest Part of the Salts of this kind, the same Effects which it usually does upon *Sal Ammoniac*; that is, it disengages a great Quantity of the Acids of those Salts from the Matrix in which they were lodged, and for the same Reason that *Sal Ammoniac* is reduced by Analysis to an acid, and an alkaline volatile Salt: That kind of Salt, of which we now treat, must be reduced, and in effect is reduced, the same way, to an acid, and to an alkaline fixed Salt: But as the fixed Salt, for that very Reason because it is fixed, makes infinitely more Resistance to the Action of the Fire than the volatile Salt, there occur two different Things in the Dislodgment of the Acids of each of these Salts from their particular Matrix; which are, first, that in the *Sal Ammoniac*, the Matrix being much more volatile than the Acid, it rises first, and leaves Part of the Acid disengaged from it at the Bottom of the Vessel; whereas, on the contrary, in the other Species of Salt, the Matrix being very fixed, and making much more Resistance to the Efforts of the Fire than the Acid, it of consequence remains at the Bottom of the Vessel, and the Acid quits it, and flies up, tho' not indeed so readily, and with such a Degree of Volatility, as the Matrix of the *Sal Ammoniac* leaves its Acid; and evaporates into the Air.

The other Difference, which merits a particular Attention in this Place, is, that the volatile Matrix rises pretty quick, and by no considerable Fire, and consequently is not much exposed to the Force of that Agent; but the fixed Matrix, on the contrary, remains always exposed thereto, because it is not elevated, and besides has need of a pretty considerable Fire, which must continue a good while, in order to separate from it a great Quantity of Acids, that it might become an alkaline Salt: These Things consider'd, the Fire has all the Time and Convenience of working a very considerable Alteration in the fixed Salt, while it cannot, and in fact does not, communicate the same to the volatile Salts. We shall in the Sequel explain wherein that Alteration consists, and what is the immediate Cause of it, in discoursing more particularly of alkaline fixed Salts.

Tho' the Salts which have a fixed Matrix for their Base, do all resemble one another in one Point, that is, in powerfully resisting, at least by their Matrix, the violent Efforts of the Fire, we ought not, however, to believe they are alike in all Things, and that the Fire produces the same Effect in every one of them; for tho' they agree in the common Circumstance of the Fixedness of their Matrix, they may yet greatly differ from one another, not only by the particular Character of their Acids, but even by the very Nature of their Matrices, which, tho' fixed, and consequently like one another in that respect, yet differ very considerably on other accounts, which is the Reason, that tho' the Action of the Fire, with respect to the different Salts we are speaking of, be always the same, yet as the different Particles, of which these Salts are composed, do not give way to that Action in an equal Manner, and are more or less susceptible of certain Modifications, there must result from thence as different Effects.

We know, for Instance, that different Acids, independent of any solid Matrix capable of detaining them, and swimming in an aqueous Liquid, have not all the same Degree of Volatility; that there are even some of them, such as those in Oil of Vitriol, and Spirit of Alum, which rise but very slowly, and with great Difficulty, by the Violence of a very strong Fire; whence we may judge, that if these Acids should take up their Residence in a fixed Matrix, and in Conjunction with it form a concrete Salt, they would in such a State make a yet greater Resistance to the Efforts of the Fire.

We are assured, on the other hand, that the Fire elevates with much greater Ease, and in a much shorter Time, the Acids contained in Spirit of Nitre and common Salt; and that it would also find a less Resistance from the Acids contained in the volatile Spirits of Vitriol, and those of common Sulphur, extracted by the Process described by Stahl; inasmuch that when, for Example, the Acids of the Spirit of Nitre, or those of Oil of Vitriol are united in the same Matrix, in Conjunction with which they form a concrete Salt, the Fire will with much more Ease dispossess the nitrous Acids than those of the Oil of Vitriol, provided that the Circumstances are all equal, and a due Medium is employ'd when necessary; for without that there are Instances, where the Fire would have no more Power to separate the nitrous Acid from its Matrix, than to separate the Acid of the Oil of Vitriol, as we shall see hereafter.

So much as to what regards the different Resistance of the concrete Salts to the Action of the Fire, with respect to the Acids of which they are composed: But what contributes infinitely more to diversify the Effect of this Agent upon each of these Salts is, the particular Nature of the Matrix with which these different Acids are united and combined, for the Formation of such or such a Species of concrete Salt; and we are convinced, that there are a very great Number of fixed Bodies capable of absorbing Acids, and forming with them a concrete neutral Salt, or *Sal Salsum*: Of this Kind are not only all the fixed alkaline Salts, but many of the different Kinds of Earth, as well as metalline Substances, and Metals.

Hence it appears, that Acids do not enter with the same Facility into the Pores of every one of those Substances; that they penetrate farther into some than into others; that the Pores of those different Substances embrace and retain them with more or less Streightness, according to their natural Capacities, and perhaps also according to the stronger or weaker Spring or Elasticity of their Strata; for I have observed, that when foreign Bodies enter with Violence and Difficulty the Pores of some Substances, there necessarily follows a Dilatation of these Pores produced by the heaving up of their Sides or Strata, which afterwards sink down again of themselves, by their proper Spring, as soon as the Body which kept them in that elevated State quitted its Place: Consequently, when the Acids, introduced into the Pores of different Alkalies, have dilated those Pores by elevating their Sides to a certain Point, as these Sides, by virtue of their Spring, make continual Efforts to lower themselves, and resume their former Situation, the greater the Spring, the greater is the Effort, and the more are the Acids contained in the Pores compressed and freighten'd by the Sides of these Pores, and the more Obstacles has the Fire, which afterwards acts upon the Composition of Acids and Alkalies, to surmount, in dislodging the Acids. Hence it follows, that the same Acid residing in different Matrices, be they purely terrene, metalline, or of other Kinds, will make a greater or less Resistance to the Action of the Fire, according to the particular Nature of each of those Matrices. It is also observed, that the same Acid which may, with more or less Facility, be dislodg'd from several Sorts of Matrices, will not be made to quit some certain Kinds, whatever Violence of Fire be used for that Purpose, at least, without having recourse to some proper Medium. We have a sensible Proof of this Truth in several natural and artificial neutral Salts, and, among others, in common Saltpetre, and in that Sort which we can make at Pleasure in an Instant, by the Mixture of a nitrous Acid with an alkaline fixed Salt; for it is certain, and I have several times had Experience of it, that how violent soever the Fire be which you use about each of these Salts, they will sooner be dissipated whole and entire, either into the Air, or through the Pores of the Vessel, than admit of Decomposition, or the Separation of their Matrix from their Acids, that is, a parting with their Acids, and remaining behind at the Bottom of the Vessel, in the Form of an alkaline fixed Salt, such, for Example, as that used in making the artificial Saltpetre. But when to the Action of the Fire we join the Assistance of a convenient Medium, the Separation of the Acid from the Alkali soon commences; and in this Operation there happen two different Effects according to the particular Nature of the Medium. If the Medium be purely sulphureous, and nothing is to be done but to assist the Exaltation of the nitrous Acid, without communicating any thing new to the Matrix of the Saltpetre, this Matrix, after the Operation, appears under the Form of an alkaline fixed Salt, such as that used in making artificial Saltpetre. We have an Example of this Truth in a very common Operation, which is the

Fixation of Saltpetre by Charcoal. But if the Medium itself contains a good Quantity of Acids more fixed than those of Saltpetre, and of a vitriolic Nature, it much contributes to the Separation and Exaltation of the nitrous Acid, but it substitutes other Acids in the room of the nitrous ones; in which Case, the Matrix of the Saltpetre, which after the Loss of its Acids ought to have appeared under the Form of an alkaline fixed Salt, always shews itself under that of a neutral Salt, which is no longer true Saltpetre, but is become a real vitriolic Tartar, wholly resembling that which may be made with an alkaline fixed Salt, and a vitriolic Acid.

In short, as the vitriolic Acid, such, for Instance, as that contained in Oil of Vitriol, in Spirits of Sulphur, or Alum, &c. considered independently of any Matrix, is the most fixed of all Acids, when it becomes united to one of these fixed and saline Matrices, which never let go a nitrous Acid, unless forced to it by an Intermedium, it must make a much greater Resistance to the common Efforts of the Fire and the Medium, than the nitrous Acid would do in the like Case. And this is no more than what really happens; for if you mix Tartar vitriolated and Powder of Charcoal in a red-hot Crucible, the vitriolic Acid will by no means fly off, as the nitrous Acid, join'd to the same Matrix, would not fail to do by a like Procedure. One might even totally consume all the oily Part of the Charcoal, mixed with the Salt, over the Fire, without separating the vitriolic Acid from its Matrix; in short, after the Operation, and the total Deflagration of the Oil of the Charcoal, we shall always find the vitriolated Tartar in the same State as it was before, and without any sensible Loss of its Acids. And, in fact, if we are resolved it shall lose them, we must, besides the Fire and sulphureous Medium, which are sufficient for the Acid of Saltpetre, make use of other Assistances both in proper Time and Place, and of another Method of Process; that is, when the oily Body has been mixed with the vitriolated Tartar in the red-hot Crucible, and, having closed with the vitriolic Acids, has not indeed been able to hurry them into the Air, but has always had Strength sufficient to disengage them in some Degree from the Pores of the alkaline Salt, (which produces a new Compound of a yellow or red Colour, and of the Smell of common Sulphur, that dissolves in Water, and in which the Acid lays hold, at the same time, of the fixed Salt of the vitriolated Tartar, and of the Oil of the Charcoal) we must then lay hold of the Opportunity, when these vitriolic Acids begin to be disengaged, to put a Stop to the Action of the Fire, without which Precaution the oily Part would be dissipated, and the Acid, being left to itself, would reunite, as before, by Help even of the Action of the Fire, to the interior Parts of the Alkali, whence the oily Body had begun to dislodge it: We must then dissolve the new Compound in Water; and since the vitriolic Acid, being united to an oily Substance, has not in that State so fast a Hold of its Matrix as before, because it has been half-disengaged by that Substance which absorbs it, and which envelopes it, at least in Part, we have no more to do but to pour upon that Dissolution a free Acid, which, in proportion as it insinuates into the fixed Salt, easily drives out and dislodges the vitriolic Acid, which being separated from its saline Matrix, and only attach'd at that Time to the oily Substance, forms a true common Sulphur, which is precipitated to the Bottom of the Vessel.

Thus much then we know in general, concerning the different Alterations which Fire produces in several Kinds of concrete Salts, which have for their Basis a fixed Matrix; at least it is what we have been able to learn of them from Experiments and Operations made upon a good Number of Salts of that Kind, as well natural, and extracted from several Earths, Stones, Marchasites, &c. as artificial, and form'd by the Union of different Acids with a very great Number of fixed Alkalies. But in order to be perfectly instructed, and to have an exact and complete Idea of the Confusion produced by Analyses in the different Parts of all these Salts, which have for their Base a fixed Matrix, and are contained in Animals and Vegetables, but especially the last, it is necessary to extract from every one of these Compounds the Salts which they contain, and to extract them entire, that is, such as they were in the very Compound; and after that to separate the Acid from the Matrix of these Salts, and upon every one of these Parts to make the necessary Experiments for knowing the particular Character both of the Acid and the Matrix; and, lastly, after we are come to understand the Nature of these Kinds of essential Salts, and the Form under which they reside in the Compound, we must compare them with what they are in the State to which they are brought, after they have passed through the ordinary Analyses.

This Undertaking, which is of a vast Extent, and requires a very particular Detail of the Experiments, is exactly what we have already spoken of in the preceding Memoir. Mean time, the great Number of Analyses which have been made, and the Reflections which naturally result from hence, the Discoveries that have been made, and the Knowledge we already have of several essential Salts of Plants, and the Comparison of those

Salts with such as are extracted from the Plants by the ordinary Analyses; and, lastly, the Experiments which have already been related upon several other Salts, which never lodg'd in the Plants, but which we certainly know are, several of them, analogous to those Salts which reside there, and susceptible of the same Alterations; all these Matters of Fact, of which we shall make a proper Use hereafter, will be more than sufficient to assure us not only that the Fire disguises and considerably alters the Salts we are speaking of, but also to instruct us in the Nature and Manner of this Disguisement and Alteration.

As the Salts we speak of reside principally in vegetable Substances, we shall mostly enlarge on the Analysis of these Substances, and the rather, because there are usually but small Quantities of these Salts in Animals, and the Alteration which they there receive by means of the Fire, is the same as they receive in Vegetables by the same Agent. Wherefore, what shall be said of this Kind of Salts which are contained in vegetable Substances, may be apply'd to the same Salts, consider'd as residing in Animals. But as the great Number of Observations I have made upon the Analyses of Plants afford too much Matter to be contained in this Memoir, I shall refer myself to these which follow. *Memoires de l'Acad. Roy. des Scienc. 1720.*

When we consider the Analyses of a great Number of Plants, and the different Particles which the *gradually increas'd* Fire in a Distillation raises from them, we observe that there are some Plants, which, besides their aqueous and oily Parts, afford sensible Proofs of a good Quantity of Acids, others promise less, some very little, and, in short, some there are, whose Number indeed is very small, which yield no more than an animal Substance, analysed according to the ordinary Method of proceeding, might be supposed to do. These Differences arise from several Circumstances; as, from the greater or less Quantity of Salt naturally contained in each Plant; for as this Salt is formed of Acids lodged in a fixed or volatile Alkali, the more a Plant contains of that Salt, the more Acids it contains, and consequently the more it can send off and elevate in Distillation, all due Allowances being made. Besides, these Acids are raised more or less easily and copiously in Distillation, according to their different Degree of Volatility, and the particular Character of the Matrix which contains and envelops them, as has been shewn in the preceding Memoir; and, in short, these Acids render themselves more or less perceptible by known Characters, as they are more or less cover'd and concealed by other Corpuacles which rise with them, and which are found with them in the Receiver. Having already spoken of the alkaline volatile Salts which rise in the Analysis of Vegetables and Animals, we shall only make this farther Reflection on them with respect to the Acids we just now spoke of, which is, that as they rise with these Acids, they more or less prevent them from appearing, or making themselves taken Notice of by their proper Characters, according as they are more or less strictly united with them; and as the Quantity of volatile Salts, with regard to that of the Acids, is more or less considerable in every Portion of the distilled Liquor: For tho' we, as well as others, have observ'd in the first Memoir, that it sometimes happen'd in the Analysis of several Substances, that Acids and volatile Salts, when driven by the Fire, were collected together in the same Portion of Liquor, without reuniting one with another, but there preserving each of them their particular Properties, one of an Acid, the other of an Alkali, of which they gave distinct and evident Marks; we did not, however, pretend to conclude from that Observation, that all the Acids and volatile Salts which rose together, or which were found again in the same Portion of Liquor, were or remained in the same Estate of Division. And, indeed, we made it appear, in speaking of the *Sal Ammoniac* contained in Animals, that the volatile Salt, which is separated from it by the Analysis, and is found in what they commonly call Spirit of Animals, had retained and carry'd up with itself a good Part of the Acid of the *Sal Ammoniac*; that this Acid did not render itself perceptible in that State, because it was surrounded on all Sides with a very great Quantity of volatile Salts; that, on the contrary, these volatile Salts, in spite of the Acids which they had retained, being by no means entirely saturated, were still proper for Fermentation with new Acids, and consequently made themselves known by that Character; and that, in short, if the Acid we speak of did not manifest itself by the ordinary Proofs, it might always be clearly perceived by means of an Analysis made with an earthy Medium; and that in another respect we were obliged to this Acid for the Degree of Volatility in the volatile Salt contained in the Spirit of Animals; for this Salt has one thing in particular, which is, that in point of Volatility it is perfectly on a Level with those Parts of Water from which it cannot be separated by way of Evaporation, and from which it is easy to separate the common *Sal Ammoniac* and volatile Salts; the former, loaden with Acids, being less volatile than Phlegm, and always rising after it; the others, on the contrary, which are depriv'd of their Acids as much as is possible, being by that means more volatile than Phlegm, rise, and are sublim'd before it, as it appears in the common Operation of the Rectification of volatile

Salts; or when, after dissolving volatile Salts in a certain Quantity of Water, we urge the Liquor with a proper Heat. Another thing which proves, that the volatile Salt contained in the Spirit of Animals is a Mean betwixt a complete *Sal Ammoniac* and the common volatile Salts, on account of the particular Quantity of Acids it retains, which renders it incapable of being separated by way of Evaporation, is, that if you add to this Salt a sufficient Quantity of new Acids to render it less volatile than Phlegm, you by that means revive it into what it was before, that is, into a kind of *Sal Ammoniac*, which, being urged by a gentle and convenient Heat, does no longer accompany the aqueous Particles as before, but lets them fly off, remaining itself at the Bottom of the Vessel under a dry Form; which it would not do, were it less charged with Acids.

In short, if we use the ordinary Methods of exactly depriving this new *Sal Ammoniac* both of the new Acids which it had received, and of those which it had retained in too great a Quantity before, there will result from that Operation a volatile Salt, whose Volatility will no longer be on a Level with the aqueous Particles as before, but will be sublim'd before them, and with a less Heat.

You see by this Example, and it will appear more clearly by what follows, that a Quantity of distill'd Liquor, which shews Marks only of an alkaline volatile Salt, may yet contain also a considerable Quantity of Acids. But it will be said, that the Acids in the Example propos'd are not intimately united with the volatile Salts, during or since the Operation of the Analysis; that they were combin'd in the Compound itself, where they made Part of its *Sal Ammoniac*; and that it is not at all surprising, that this Union, which always subsisted since the Operation, should be capable of keeping them under Covert, and in a manner remov'd not only from our Taste, but also from the Influence of some Chymical Essays; but this Difficulty, will it be added, does not concern these Acids, which never forsook their volatile Matrix, but the Acids that belong to the concrete Salts, which have a fixed Matrix: For when once the Acids of those Salts have been loosed from their Matrix, and carry'd off by the Fire, as they are then free, and without Covert, they may be easily known by different Proofs; and if they find any alkaline volatile Salts, either in their Way, or in that Part of the Liquor which is transmitted to the Receiver, there is Reason to think, that they will avoid being envelop'd by them; first, because we are assured, from the Analyses of a very great Number of Plants, that one and the same Part of these Analyses very frequently afforded sure Proofs of Acids and alkaline volatile Salts at the same time; which could never happen, if from any Circumstance, or the favourable Opportunity of being in the same Place, these Bodies had contracted some Union. Secondly, because in analysing some animal Substances with more than common Exactness, it is observ'd, that Acids, which were united in the Compound with volatile Salts, and being separated from them in the Analysis, were afterwards again found with them in the same Part of the Liquor, did not, however, reunite, tho' they were at least as fit to lodge themselves in their volatile Matrix, and to resume the Place which they possessed there before, as other Acids, which at first belong'd to a fixed Matrix, and were separated from it by the Fire.

In Answer to this Objection, which appears founded on an incontestable Observation, I shall give an Account of some other Observations, which will perfectly clear up the Difficulty propounded. Soon after the Academy had done me the Honour to receive me as a Member, I set myself to analyse a good Number of Plants, and made some of my Analyses in the Assemblies at that Time; but reflecting afterwards on the little Fruit I reap'd of my Labour, which besides had been undertaken before my Time in the same Place, I left it off, and did not then imagine, that some Remarks, which the Analyses had occasioned, would have been of Service in this Case. These Remarks regard the Alteration which happens to several Parts of analysed Plants, when these Parts have been kept a certain Time; for the ordinary Chymical Essays do then often work Effects in them quite different from such as they produce immediately after the Analysis has been made; and this Difference made me believe, at first, that I had been mistaken, and that I had been careless in examining for the first time the Part where I found nothing afterwards like what I had seen in the Beginning. But I was convinced of the contrary by several times repeating the same Observations upon different Plants; and besides, I found, a little while since, in some Manuscript Analyses of the late Mr. *Bourdelin*, that this worthy Member was well apprised, that some Sorts of analysed Plants did not always act after the same Manner, at different Times, under the same Chymical Essays.

I observed then, that in the Number of Plants which I analysed, there were many of them which in Distillation yielded some Quantities of Liquors, which shew'd, at one time, sensible and distinct Marks both of Acids, and of alkaline volatile Salts, but still more of Acids than Alkali; and that when these Liquors had been kept a certain Time, which was necessary for their volatile Salts, in some measure, to saturate themselves with the

Acids,

Acids, they shew'd no more Signs of volatile Salts, but still gave manifest Tokens of Acids, on account of the Redundancy of those which remained in the Liquor, or, if you will, on account of the Overplus of Acids, which had not been able to find out a *Sal Alkali* in which they might take up their Quarters, and so, remaining free and uncover'd, might easily make themselves perceptible.

In the second Place I observed, that there is requir'd more or less Time for the total disappearing of the Signs of the volatile Salts, of which we have been speaking, according to the greater or less Quantity of those Salts, and in proportion as the Acids of the Liquor have more or less Disposition to lodge themselves in those Salts.

Thirdly, This Disappearing proceeds by little and little, and by Degrees, and you may observe every Day the successive Diminution of the Signs of the volatile Salt, which disappear sooner or later, in proportion as they are more or less strong and vigorous in the Beginning. This may often be observ'd in the Analysis of a single Plant, which sometimes afforded two or three Parcels, which were of the Nature of those we have been speaking of, but had not the Signs of the volatile Salt equally strong and lively in all of them immediately after the Analysis. Whence these Signs often became annihilated in one Parcel, and still subsisted in the other, where, tho' diminished, they were still perceptible, either by an Ebullition caused in the Liquor by the Mixture of an acid Spirit, or by a white Precipitation resulting from the Mixture of that Liquor with a Solution of corrosive Sublimate.

Fourthly, When the same Parcel of distill'd Liquor, which afforded sensible and distinct Marks both of Acids and volatile Salts at the same time, contained a greater Proportion of volatile Salts than Acids, it often happen'd, that after a certain Time, that is, when all the Acid of the Liquor had been absorb'd by a sufficient Quantity of volatile Salts, the Liquor shew'd no more Signs of an Acid as before, but still gave Tokens of volatile Salts, in proportion to the Excess of these Salts, which remained free, and uncover'd, for want of finding a sufficient Quantity of Acids in the Liquor, with which it might unite; and it appeared to me, that in this Case the Signs of the Acids disappear'd after the same Manner, and with the same Circumstances, as did those of the volatile Salts in the preceding Observations.

Fifthly, In all the Portions of distill'd Plants which I have observed, and in which there becomes, in Process of Time, an Union of Acids and volatile Salts, which at first were lodg'd separately, I found none, which, after a Junction of the Acids and volatile Alkali, ceas'd to afford Marks both of the one, and the other; which is no more than what might seem necessary to happen on some Occasions, that is, when we find in the Liquor no greater Quantity of Acids than is requisite to saturate the volatile Salts therein contained. But as it is not impossible but such a just Proportion of Acids and Alkalies might meet together, I will not deny the Matter of Fact, which may possibly be observed hereafter by some others: I only made on this Occasion the following Experiment. In the Analysis of several Plants it is observed, that some Portions of the distill'd Liquor, and oftentimes all of them, except the last, or two last, of the Distillation, shew no Signs but of Acids, and those in Plenty; and that the last Portions, on the contrary, afford no Marks but of volatile Salt, which is there found in great Quantity. I mixed together Portions of Acids and Alkalies in different Proportions, and I found, that all these Mixtures, immediately after they had been made, shew'd Signs at once both of Acids and Alkalies; and that after they had been kept a sufficient Time, they gave Marks but of one, that is, either of the Alkali, or the Acid; but I never found out the Point necessary for the disappearing of both. I do not, however, pretend to conclude any thing from this last Observation.

Sixthly, In my Examination of the Portions of different analysed Plants, in which after an Union of the acid and volatile Salts contained in the Liquor, one of these two Bodies was still perceptible by its proper Marks, it seem'd to me, that the disappearing of the Signs of the volatile Salt happen'd much more frequently than that of the Acid. 'Tis possible that in the Number of Plants which I analysed, there might offer too many Cases of a particular Kind, which hinders me from concluding so strongly in favour of my Observation, as if I had made a much greater Number of Analyses. However, what, among others, may sometimes justly be drawn as a Consequence of my Observation, is, that, in general, the Sum of the Acids in Plants surpasses that of the volatile Salts, as we shall prove more particularly by what follows. Hence it appears, that Plants in general will afford more Acids than volatile Salts in Distillation, and that it is the Overplus of these Acids that renders them thus perceptible, as we have already explained. In that Case also, where no more Acids are elevated in Distillation than volatile Salts, it is possible, that after that Union the Acid should still seem to prevail; as the common *Sal Ammoniac* colours blue Paper with a dark Red, and after twenty-four Hours gives a reddish Brown to a Solution of Turnsole. But it

is easy to distinguish this Effect from that of an Acid when free and disencumber'd, at least to a certain Point, from other Bodies in which it may be engaged, as the Acid of *Sal Ammoniac* is in the volatile Matrix, which makes the other Part of that Salt.

Seventhly, I have often observed in examining some Parts of analysed Plants, that they contained an Acid more or less envelop'd with oily Particles, which sustained themselves in the aqueous Part of the Liquor by favour of that Acid; that these two Bodies rising together in Distillation, and remaining afterwards united, at least for a certain Time, it happen'd that the Acid in that State either did not appear at all, or render'd itself perceptible by very obscure Signs. But as the Liquors impregnated with different Particles are always subject to an internal Fermentation, this Fermentation, paving the Way for the Acid of the distilled Portion to disengage itself, makes it then manifestly appear, that the Inferences from this way of Reasoning are just; that is, that the Acid did not shew itself, because it was envelop'd with oily Particles. And that it is discovered afterwards only by getting rid of them, appears, if we observe, that during all the Time in which the Acid begins to shew itself, and continues more and more so to do, the Oil, which, separated from the Acid, and left to itself, can no longer, in such a State, support itself in the Liquor, but is precipitated commonly in the Form of a mucilaginous Substance, increases in Quantity always in proportion as the Acid of the Liquor makes the greater Appearance. One might also observe the same Effect in several distilled Waters, which at first, and even for a considerable time, remain of a limpid Clearness, and shew no Signs of Acids; but after being kept a sufficient time, not only grow sour, but also deposit at Bottom a slimy Matter, which is so thick, and in so considerable a Quantity, as would hardly be believ'd, did we not see it. See the Article ACETUM.

To proceed, We ought not to be surpris'd, that Acids, the most Part of which in a Plant belong to a fixed Matrix, being urged by the Fire, abandon their Matrix to enter into an intimate Union with oily Particles with which they rise, and by which they are envelop'd, as it has been said. For we have shewn in other Memoirs, and in the Beginning of this, that oily Substances have a Property of strongly seizing upon Acids that are lodged in fixed Matrices, by which means, when they rise in the Air they draw out and carry up with them the Acids in which they have fixed; and that they contribute infinitely to the Disengagement of a great Number of Acids, which without that Assistance, and with the bare Action of the Fire, would never be brought to quit their Matrix, or at least would not do it, but with a great deal of Time and Difficulty. Plants then actually containing Plenty of oily Particles, which have a Faculty of fastening themselves upon the Acids of their Salts, and acting upon them after the same manner, as we shall describe more particularly, when we come to speak of the saline Substance which remains in the Retort after the Distillation of the Plant, it will not at all seem surprisng, but is, on the contrary, very natural to think, that vegetable Acids always rise in Company with oily Particles, with which they afterwards remain more or less intimately united, according to the Diversity of the particular Circumstances which concurr'd to that Union, and which it is impossible to enumerate.

The Union of vegetable Acids being such as has been said, we may easily conceive why these Acids sometimes subsist for a considerable Space of Time in the same Liquor with alkaline volatile Salts, without penetrating and uniting with them, and how they came afterwards to do so. For, first, as long as these Acids are envelop'd, in a certain Degree, with oily Particles, they are incapacitated, by this Involvement, to pierce and open themselves a Way into the interior Parts of these Salts: One might even venture to say, that however free and bare vegetable Acids might become in general, they always preserve an Allay of oily Particles, which tempers their natural Vivacity, and thus prevents them from being so corrosive, and from acting with so much Force and Violence, as they would do without such a Mixture, and as mineral Acids do in fact, which contain fewer oily Particles. And it is really possible sometimes so well to disengage the Salts of Vegetables from their oily Particles, that the Acids which result from thence become infinitely more active and corrosive, than otherwise they would ever have been. If then but a small Share of oily Particles can so effectually diminish the natural Action of vegetable Acids on all alkaline Bodies in general, it is plain, that by increasing the Quantity you may at last render it sufficient for entirely preventing all Acids from entering into the Pores of volatile Salts; and that when afterwards this Quantity shall have had Time to diminish by the Assistance of a Fermentation, which shall occasion the Disunion of a certain Quantity of oily Particles, the Acids being more free and disclosed, and making a less Bulk, will in that State insinuate with more Force and Facility into the Pores, into which before they could not obtain a Passage.

All that we have just now said and observed is of great Use for the understanding of the following Observation, which I made.

made on the first Portions of some Analyses, in which, tho' immediately after the Distillation I had only perceived the Marks of volatile Salts, and no Sign of Acids, after they had been kept a sufficient Time, I could no longer perceive the Marks of volatile Salt, but only of Acids. The Reason of this, in my Opinion, was, that these Acids, tho' considerable enough for Quantity in the Parcel of Liquor, were yet in a manner, enveloped by the oily Particles, that in this State they could neither shew themselves, nor cause the volatile Salts to disappear by mixing with them. But when Fermentation has had Time to disengage the Acids from a certain Quantity of oily Particles, which in this as well as in the preceding Observation are commonly precipitated to the Bottom of the Liquor under the Form of a Mass of a greater or a less Thickness, these Acids being more free, and more developed, will not fail in that Condition to obliterate the Marks of the volatile Salt in the Liquor, by uniting itself to that Salt; and as the Quantity of Acids surpasses that of volatile Salts, the Overplus of those Acids, which, not being combined with volatile Salts, remains in this State of Developement, must under the Operation give evident Tokens of Acidity, which the Mixture of oily Particles hinder'd it from shewing before.

To conclude, I made one Observation more upon the first Portions of some Analyses of Plants, which was, that though neither the Acids nor the volatile Salts were perceptible in the Operation, they yet excited an acrimonious and pungent Savour upon the Tongue, which left no room to doubt but that these Portions contained a considerable Quantity of Salt. It appearing therefore by these Experiments, that this Salt was neither an Acid developed, nor an alkaline volatile Salt, it can be no other than a complete Sal Ammoniac; that is, it has undergone no such thing as a Decomposition by Analysis, but contains in itself the Acids and volatile Salts as intimately united together as they were in the Plant itself: For we cannot say, that this Salt was compounded of Acids, and a fixed Matrix, because this Matrix was hinder'd from rising with it, at least entire, in the Distillation, especially in the first Portions of the Analysis, where but a moderate Fire is used. There can be none then but a Sal Ammoniac that can rise in the Case before us, which consequently is the true Cause of that acrimonious and pungent Savour in the first Portions. It is true, and we have already observ'd it, that common Sal Ammoniac will in time dye a reddish Brown with Turnsole, which I never perceived in the Sal Ammoniac of our first Portions; but the oily Particles, which are always mix'd with the Salts of distill'd Portions, might on that occasion hinder the Sal Ammoniac from exciting that reddish-brown Colour, and so much the rather, because it does not excite this Colour but after a good deal of Time and Pains, even when it is in its natural State, that is, when it is free and disengaged from every oily Substance. *Memoires de l'Acad. Roy. des Scienc. 1720.*

It appears by the Observations already made, upon the Analyses of animal and vegetable Substances, and particularly from the Alterations, of which several Parts of analysed Plants are susceptible, that the volatile Salts, scattered in the different Portions of analysed Plants, may absorb, and keep conceal'd, those Acids which did not belong to them in the compound Body, as well as those which were naturally united to them before the Analyses, and which have risen along with them in Distillation. It appears also, that the Observation with respect to Acids, which on certain Occasions subsist together with volatile Salts, without being join'd to them, does not prove, that there are not other more disentangled Acids, which may sometimes be join'd to them; and that the less, because I have shewn that these very Acids, which had not as yet contracted an Union with these Salts, did not fail to do so afterwards, when they had arrived at the same Degree of Freedom and Disengagement. It moreover follows from what has been said, that independently of volatile Salts, which very often are not found in several Portions of distilled Liquors, a great many Acids may be sheathed up in the said Liquors by simple oily Particles: Consequently, if no Acids appear, or an inconsiderable Quantity of them, in certain Portions of analysed Substances, which are impregnated with volatile Salts, or oily Substances, we have not from thence a Right to conclude, either that such Portions contain no Acids at all, or that they contain none but such as appear. We should often fall into palpable Mistakes, if, in computing the Degrees of Acidity in a Plant, we should take our Estimate from those Acids discovered by the Analysis of that Plant; for Instance, the Leaves of Sorrel yield a very sour Juice, in which, if one was to judge by the Taste alone, he would conclude there was a great Quantity of Acid: Besides, when the essential Salt is drawn from that Juice, its Crystals are four, and resemble Cream of Tartar. In a word, every Circumstance declares, that this Plant yields Acids, and that in the different Portions of Liquor, raised by the Distillation of it, Acids will always be particularly discovered; yet as Sorrel also yields a great deal of volatile Salts, which diffusing them-

selves almost every-where, as I shall afterwards shew, cover and sheath up at least a large Share of the Acids, with which they ascend, if one was to over-look this Circumstance of the Salts, and allow one's self only to be guided by Appearances, we might possibly be induced to think in examining the different distill'd Portions of several Sorts of Sorrel analysed at different times, and at different Ages, that this Species of Plant contained fewer Acids, or yielded less of them in Distillation, than other Plants, which in reality contain a great deal less, and in Distillation yield a smaller Quantity, but in such a manner, that each Acid at that time finds nothing in the distill'd Liquor, which can hinder it from appearing what it really is: And what, in my Opinion, plainly proves that according as the volatile Salts of the Sorrel are more or less diffused and distributed with the Acids in the different Portions of the Analysis, so the fewer or more Marks of an Acid this Plant must afford; what, I say, in my Opinion, proves this, is a Reflection upon the two following Experiments; an Account of which will not perhaps be disagreeable. When we analyse the Leaves of Sorrel by means of a Retort, and a common Fire augmented by Degrees, after the first Portions are drawn away, the distill'd Liquor ordinarily has the Marks of volatile Salts, which rise at first, which continue to do so afterwards, and which towards the Close of the Distillation come in still greater Abundance, either under a liquid or a dry Form. As for the Acids, the first Portions of the distill'd Liquor have no Marks of them. The succeeding Portions have also very often but faint Marks of them, and, after they are kept for some time, none at all, and that for the Reasons already assign'd. But if instead of a common Fire we use a Bath-heat for the Distillation of the Leaves or Juice of Sorrel, the gentle Heat of it, sufficient for the first volatile Salts which have been mentioned, that is, for those which rise first, and with most Ease, but insufficient to disengage, and raise, at least to any considerable Degree, the Acids of the Plant, will by that very means lay a Foundation for both to rise at different times; for by still carrying on the Distillation with a stronger Fire, the Liquor which will next succeed, and contains fewer volatile Salts, because a great Quantity of them have already been raised in the first Portion of the Distillation will give more considerable Marks of Acidity, than if the Analysis of the same Plant had been carry'd on in the ordinary manner.

The other Experiment is this: If instead of analysing fresh Sorrel-leaves, we begin by allowing them to macerate for a considerable time, so that the Fermentation, which is often a sort of, or Beginning of, the Analysis, may have laid a Foundation for the Disengagement and Evaporation of a certain Number of volatile Salts; and if after this natural Operation we proceed to distil the Leaves of Sorrel, whilst they are in this State, in the ordinary manner; and if we compare this Analysis with that of the same fresh Sorrel which has suffer'd no Maceration, we must acknowledge, that the macerated Sorrel affords, both in the Beginning and whole Course of the Analysis, not only a great many more Marks of Acids than the other, but that it also affords fewer Marks of volatile Salts, and that only towards the last Portions; whereas without Maceration it would have yielded volatile Salts from the very first, as I have already observed. In a Word, these two Analyses of the same Plant resemble one another so little, that one would readily take them for the Analyses of two different Plants, which may indeed differ less from each other, than these different Analyses of the same Plant. We have still a great many more Plants naturally loaded with Sal Ammoniac, the Fermentation of which causes a great Quantity of volatile Salts to exhale, and by that means lays a Foundation for a great deal of the Acids of the Plants to be discover'd in the Analysis. This Fermentation also often is the Cause that a particular Plant analysed, gives some Marks of Acids, which without this Assistance would have afforded none, as I shall shew in another Place, where an additional Proof may be found, that there are a great many Acids so well wrapt up by the great Number of volatile Salts, which have ascended with them in the Distillation of the Plant, that one could not have suspected them to be lodged in the same Place without that Train of Reflections which naturally give Rise to the Experiments and Observations to be made in their proper Place.

The Case is not the same with the Juice of Lemon, as with that of Sorrel; for though they be both very sour, yet that of the Lemon differs from the other, as it affords very few Marks of a volatile Salt; from which Circumstance two very considerable Differences result, in the Analysis of each of the Juices. The first is, that, in the Lemon Juice, the Acids, rising alone, and without any Mixture capable of absorbing them, are infinitely better discovered, and, appearing from the very first Portion, continue to augment to the very last: Whereas Sorrel, when analysed, ordinarily gives no Marks of Acids, or very faint ones; but, in Recompence, it is richly impregnated with volatile Salts. The other Difference is this, that tho' the Lemon Juice has been left in Maceration for a considerable

derable time, yet the Acids, afterwards drawn from it by Distillation, do not, upon that Account, appear either more disentangled, or in greater Abundance, than those which come from it before it is subjected to Maceration; which is quite the Reverse of what we have observed in the Analysis of fermented Sorrel. This may be very well accounted for, from what has been said; for if it is true, that the Fermentation, preceding the Analysis of the Sorrel Juice, does not lay a Foundation for a greater Number of Acids appearing, but because it dissipates a great deal of the volatile Salts, which would have covered and sheathed up a good Part of these Acids; this Fermentation, I say, which is necessary for discovering the Acids of the Sorrel, is of no Effect for discovering those of the Lemon; which not being in the same State with those of the Sorrel, in point of the volatile Salts, and which rising naturally in Distillation, without being accompanied with volatile Salts, have no Need, like the Acids of Sorrel, of the Assistance of Fermentation, to give another Direction to these Salts, and turn their Effects another way. Hence we see, that the Analysis of Lemon Juice newly extracted, and of that which has been macerated, should not sensibly differ from each other, with regard to the Disentanglement and Quantity of the Acids, which are yielded by their respective Juices; and, consequently, what I have observed on the different Analyses of the Juices of Sorrel and Lemon, should naturally happen in the same manner, according to my Reasoning, which, in some measure, justifies it.

Moreover, in examining a great Number of Plants, naturally loaded with a great deal of essential Salt, and which was such, that its Acid, or at least a Part of its Acid, might easily be disengaged from its Matrix, during the Distillation of the Plant, and discover itself in the different Portions of the Analysis; provided it finds nothing there to hinder it, it appeared to me, that we might properly enough reduce to four Classes all the Differences observable in the Analyses of Plants, with regard to their Acids, and their volatile Salts, which do not always appear disseminated and scattered, in the same manner, in the different Portions of each Analysis; and which, in every Species of Distribution, have appeared, to me, to preserve a certain Order. 'Tis principally from the Analyses which the late Mr. *Bourdelin* has made, that I have drawn the following Observations.

I make the first Class to consist of those Plants, which, in the Analysis, do not ordinarily give Marks of a volatile Salt, or at least give but very faint and languid ones, which may pass for nothing; such are Rennets and Calville Apples, dry Martin-pears, and Frankreal-pears, &c. In these kinds of Plants the Acid appears sensibly, from the first Portion of the Analysis, and continues to appear all along, more and more, to the very End, when it still abounds more, and is better discover'd, because it has nothing to hinder it from so doing.

The second Class consists of such Plants as give more or less volatile Salts, but do not yield them till towards the End of the Operation. In this sort of Plants, the Acid generally discovers itself from the Beginning of the Analysis, and continues to do so still more and more, till it arrives at that Portion in which the volatile Salt begins to rise; and then the Acid either appears no more at all, if the volatile Salt is in great Quantity, or appears always much less than it would have done without the Company of the volatile Salt. It even often happens, that we discover Marks of a volatile Salt, and an Acid, in one or two Portions which come before the last: And for the last Portion itself, which is far more richly impregnated with volatile Salts than the other two, and which boils and ferments very strongly, as soon as the least Acid is poured into it, it so well conceals the Acids it has received from the Plant, that they cannot be perceived; tho', from other Circumstances, we have strong Proofs that it really contains more of them than any of the preceding Portions. We find Examples of this second Class, in the Analyses of the white Leaves of the Wild and Garden Succory, of Periwinkle, of Chervil beginning to flower, of Celery, of Roman Lettice, of Fumitory become hard, and beginning to bear Flowers and Seed, of Peruvian Bark infused in Water, of Gentian-roots, of Polypody, of Turneps, of Rampions, of Dwarf Sun-flower, of Liquorice, of Violet-flowers, of Colts-foot, of Elder, of Peaches, of Roses, of Artichoke Bottoms, of Melons, of Cucumbers, of Chestnuts, of Apricocks, of red Goose-berries, of fresh, but ripe Elder-berries, of unripe Grapes, of Buckthorn, and many others.

The third Class does not differ from the second, but in this; that the volatile Salt which, in the former, did not discover itself till towards the End of the Operation, discovers itself in the Beginning in this. As for the Acid, it often appears from the first Portion, notwithstanding the Mixture of the volatile Salt, and often it cannot be discovered at that time; but in the remaining Course of the Analysis it is found alone, or, at least, we observe nothing along with it; and that even to the End of the Process, when the volatile Salt begins again to appear, and produce the same Effects, attended with the same Circumstances as in the former Class. If any one desires Examples of this third Class, he needs only consult the ordinary Analysis of white Suc-

cory, of *Carduus Benedictus*, of the red Beet, of Spinage, of young Onions, of Sage, of Parsley-leaves, of the Flowers of Lilly of the Valley, of Cherries, of Heart-cherries, and several others.

The fourth Class differs from the preceding, not only because the Plants, which are comprehended under it, yield, in Distillation, much more volatile Salt than those comprehended under the other Classes; but also, because that Salt is more diffused through the succeeding different Portions of each Analysis, of which there are few in which it does not discover itself; and of which there is not, for the most part, one which is not very much impregnated with volatile Salt, or which does not give evident Marks of it. As for the Acid, it shews itself, more or less, in every Portion of the Analysis, in Proportion to the Quantity of volatile Salt with which it is lodged. For Instance, tho' the Analysis of Wheat, of Rice, of Barley, and of Oats, yield, almost in all their distill'd Portions, Marks of a volatile Salt, yet the Acid does not fail to appear also, and even often continues to shew itself, from the first Portion to the End of the Process; at which time the volatile Salt abounds so much, that it entirely sheaths up the Acid which is in them. Borrage, on the other hand, and Bugloss, which, from the Beginning of their Analysis, give strong Proofs of a volatile Salt, do not discover their Acid till towards the Middle of the Operation; that is, about the middle Portions of the Analysis, when the volatile Salt begins to abound less. It sometimes happens, that in one, or, at most, two of these Portions, the Acid appears alone; but if it appears afterwards, 'tis always accompanied with a volatile Salt, and that to the very Portion which comes last, or last but one, in which the volatile Salt is found in great Abundance, and makes the Acid entirely disappear. Some other Plants which still yield, in Distillation, more volatile Salts than Borrage and Bugloss, give, for the same Reason, much fewer Marks of Acids than those Plants do, as may be seen by the Analysis of the Leaves and Stalks of white Garden Orache, when it is young, and only four or five Inches high. This may be likewise seen in the Analysis of Radish, of Hops that are young, tender, and only five or six Inches high, of the speckled Nettle, of Pellitory of the Wall, of Colly-flowers, of the Stalks of Artichokes, of Gourd-seeds, and several others.

However, 'tis in vain to examine, with all imaginable Care, all the Portions of the Analysis of certain Plants, which, to speak the Truth, have, to me, appeared very few in Number; and which, containing naturally more Sal Ammoniac than those preceding, yield also, in Distillation, more volatile Salts, since we find that they discover no Marks of an Acid; and if we did not know, that these Portions of distill'd Liquor were the Product of a vegetable Substance, and were to reflect only on the prodigious Quantity of volatile Salt which they contain, and their entire Privation of Acids, we should make no manner of Doubt, but they belonged to some animal Substance. The Plants I have in View are Mushrooms; Garden Purslane, very tender, and about two Inches high; the Stalks and Leaves of Fumitory that is young, tender, beginning to flower, and about ten or twelve Inches high. Yet tho' these Plants do not, in their Analysis, discover any Acid, we have proved, that no one has a Right, from that Circumstance, to conclude that they contain none; since the volatile Salt, which is found in great Quantity, in the different Portions of the Analysis, may cause the Acid contain'd in them to disappear. And, without having recourse, at present, to the strong Reasons which will be alledged in their proper Places, and by which we shall see plainly, that there is neither Plant nor Animal, from which the ordinary Analysis does not make an Acid rise, and sometimes in very great Quantities, tho' there afterwards appears to be very little, or none at all, in the distilled Portions, we may convince ourselves of this Truth, by considering what happens in Fumitory, Pellitory, and Mushrooms, when allowed to ferment before they are analysed; for when the Fermentation has had time to detach, from the Sal Ammoniac of these Plants, a certain Quantity of volatile Salts, and keep them from being subjected to the Analysis which is to succeed the Maceration, this Analysis does not then fail to give Marks of Acids, which, indeed, are faint and languid; but which, at the same time, it would never have given, if it had been allowed to have all the Store of volatile Salts, which it must have naturally had, without the Maceration. There is also an Observation upon Lettice, which, in my Opinion, deserves our Consideration, since it has a very near Relation to the Subject in hand.

The Analysis of this Plant, like the Analysis of many others, varies in Proportion to the Age, and different Parts of the Plant: For Instance, its Root and Stalk yield much less volatile Salt, and give much stronger Marks of Acids than the Leaves; and the younger the Lettice is, the more volatile Salt it yields, and the fewer Marks of Acids it affords in Distillation; so that we find a very considerable Difference betwixt the Analysis of small young Lettice, and that of the very same Lettice when full grown and flowering; yet as this Plant, in all its different States, never fails to yield a great Quantity of volatile Salt,

Salt; the Quantity of that Salt lays a Foundation for our thinking, that the Analysis of Lettice allows fewer Acids to appear than it really contains; that is, fewer are actually raised in its Distillation. This may be sufficiently proved by the following Observation upon the Leaves of Lettice, in two different States; in which, when analysed in the ordinary manner, they yield the strongest Marks of a volatile Salt, and the least Signs of Acids. First, when the Plant is very small, and ready to be transplanted in Ranks, in order to be made to cabbage: Secondly, when it is just cabbaged, tender, and in its best State for Sallad. This Plant, analysed in these two different States, yields very faint Marks of Acids, till the last Portion but one; but yields, thro' the whole Operation, a great deal of volatile Salt; and the young Kind yields still more than the other, as I have already observed; which Circumstance inclines me to place it in the fourth Class of Plants, in the Analysis of which the Acid appears very little, or not at all. But the following is a new, and hitherto unknown, Method of making the Acid of the Leaves of Lettice appear vastly more than it does by any other Process. Instead of carrying on the Analysis of the Leaves all at once, by a single Operation, and in one Retort, the Juice must first be strongly expressed, and put into a Retort; and the bruised Leaves, after Expression, are to be put into another; and then both must be subjected to Distillation; thus performing by two Operations what others do by one. In examining each of these Analyses, I have observed that of the Juice of the Leaves of cabbaged Lettice to bear a strong Resemblance to that of the entire Leaves, when full of their Juice; that is, this Analysis yields, thro' all its Stages, a great deal of volatile Salt, and very few Marks of Acid; and that only in one Portion; whereas the Analysis of the expressed Leaves, being divided into thirteen Portions, shews no strong Signs of a volatile Salt but in the last, and some slight Marks of it in the last but one, and in the three first; but the Acid shewed itself in all the Portions except the last, and in several of them it appeared very evident, and in great Quantity.

I observed very near the same Differences in the Distillation of the Juice, and the expressed Leaves of the small Lettice; whence it appears very plainly, that if the whole Quantity of Acid, which discovers itself so clearly in the Analysis of the expressed Leaves of Lettice, be so obscurely perceived in the Analysis of the same Leaves, when entire and full of Juice, the Reason is, not because all that Quantity of Acid is less really existing in the different Portions of this last Analysis, than in that of the expressed Leaves; but because it is suppressed and absorbed by the great Number of volatile Salts, afforded by the Juice of the Plant, which must, of necessity, be wanting in the Analysis of the expressed Leaves, these being deprived of their Juice.

To proceed; what more augments the Quantity of Acids, concealed and contained in the different Portions of the Analysis of the Leaves of the Lettice, is, that besides those just now observed, which the expressed Plant affords to those Portions, they will receive a considerable Increase from the Juice: For tho' this Juice, analysed by itself, manifests but very little Acid, it will be easy to perceive a greater Quantity of them, if you cause this Analysis to be preceded by such an Operation as was performed upon the Juice of Sorrel, and upon several other Plants; which is, to let the Juice macerate for a sufficient time, or to evaporate a good Part of it in Balneo Mariæ.

If then Lettice, in which the Taste and common Analysis indicate so few Acids, do yet contain, and actually yield a great Quantity of them in the different Portions of their Analysis, as has been proved, we have Reason to suppose the same thing of several other Plants, which are in the same Circumstance with the Lettice, with respect to the volatile Salts, which abound in their Analyses, and the Quantity of essential Salts, with which these Plants are naturally impregnated; for the Quantity of Acids must bear a Proportion to that of these Salts, as we shall now shew, in giving the Reasons of a very common Observation upon the Analyses of vegetable and animal Substances compar'd together.

We have already observed in the preceding Memoir, and the Beginning of this, that animal Substances in general shew so few Signs of Acids, in all the Portions of their Analysis, performed in the common way, that if we were not otherwise convinced, that they really contained a great Quantity, but were to refer ourselves for Proof wholly to these Analyses, we should absolutely deny, that there was any Acid, if not in all, at least in the greatest Part of these Substances: But the Case is not the same with vegetable Substances, analysed like the preceding; for it is observed, that the greatest Number of these Substances disclose a good Quantity of Acid; that there are but few of them which manifest but a very small Quantity, and yet fewer which exhibit none at all.

The most easy and obvious Hypothesis, to account for this Difference in the Analyses of Plants and Animals, is, that Plants in general contain a far greater Quantity of Acids than Animals; and consequently the Portions of their Analyses being much more impregnated with them, it is natural, that they

should also manifest them much more. But we have already shewed, both in this and the preceding Memoir, that if we always judge of the Quantity of Acids contained in any Substance, by the Signs of it which appear in the Analysis, we should frequently be exposed to Mistakes; and so much the more, because there may be a Substance which discovers little or nothing of Acid in Distillation, and yet may contain more, or at least as much of it, as another Substance, whose Acid manifests and displays itself in every Portion of its Analysis. This may well be the Case of animal Substances, with respect to Vegetables; and, indeed, there are few Plants from which we can extract more Acids than from a great Number of animal Substances, by means of certain Processes. We shall not here enter into a nice Detail of Acids, which is so much the less necessary, as our Business is not to compare Plants with Animals in particular, but to make a general Comparison of all vegetable with all animal Substances: But we may always know in general, by what Rule to guide our Judgments on that Subject, by considering the natural Composition; and relative Quantity of the two Salts, which prevail in both the Substances in Question. As to what regards the natural Composition of these Salts, we have shewn, that what abounds in Animals is a true Sal Ammoniac, that is, a Compound of Acids lodged in a volatile Matrix; and that the Salt which prevails in Vegetables, is also a Compound of Acids lodged in a fixed Matrix. The Matrix of each of these Salts, then, being a kind of Magazine of Acids, and those very numerous, as Experience demonstrates, tho' we had not found the Secret of extracting a great Quantity of Acids from animal Substances, they may yet be supposed to contain a good Quantity of them, merely from this Consideration, that they are impregnated with a great deal of Sal Ammoniac. To know whether they contain less than Vegetables, let us consider, first, that Animals being nourish'd with Plants, or other Animals who themselves lived on Plants, the Parts of the Vegetables pass with their Salts into the proper Substance of the Animals; consequently the Acids pass thither, and may there be found again. This being the Case, we see no Reason why there should be a less Quantity of Acids in the animal than in the vegetable Kingdom; or, to render the Comparison more sensible, why an Animal which lives but upon one or two sorts of Plants, and receives into himself all that is in these Plants, should contain fewer Acids in all his Parts, than an equal Weight of Vegetables in all their Parts. In short, all the Alteration that happens to Salts of Vegetables, in their passing into Nutriment for Animals, is, that their Matrix, which was fixed in the Plant, becomes volatile in the Animal; and for the same Reason, that the Matrix of Sal Ammoniac becomes fixed, in passing from Animals into Plants. But this Change in the Matrix of vegetable Salts has no relation to the Quantity of their Acids, which may as well reside in a volatile as in a fixed Matrix; and it should seem even possible for them to be contained in greater Quantities in a volatile than in a fixed Matrix, as we shall presently shew by sensible Experiment.

We shall observe, in the second Place, that when we consider, and compare together, the Juices of Animals and Plants, which are our ordinary Nourishment, it does not appear, that Plants are more impregnated with Salt than Animals; the Taste might even seem to indicate, that there are more aqueous Parts, and less Salt, in Plants than in Animals. But supposing the Quantity of Salt to be equal in both, it is easy to shew, that any Portion of the Salt, which is predominant in Animals, contains as much Acid as the like Portion of the Salt which abounds in Vegetables. Experience might even make us believe, that it contained much more; and that, even when the Portion of Sal Ammoniac contained, for Instance, in a Pound of animal Substance, is less, by half, than that of another kind of Salt lodged in a Pound of vegetable Substance, the animal Substance, by virtue of its Salt, should contain more Acids than the vegetable. There is no other way to come to a Certainty in this Matter, than to chuse two highly alkaline Salts, one fixed, and the other volatile; for Example, the Salt of Tartar, which is known to be the most powerful Alkali among fixed Salts, and the volatile Salt of Peach-flowers, which is also one of the most powerful Alkalies amongst volatile Salts. If an equal Quantity of these two Salts be saturated with the same acid Spirit, the Spirit of Salt, for Instance, you will find, that one Dram of Salt of Tartar requires two Drams and a half of Spirit of Salt; and one Dram of volatile Salt of Peach-flowers requires eight Drams of the same Spirit: Hence it appears, that, taking equal Quantities, a volatile Matrix absorbs and contains abundantly more Acids than a fixed Matrix; and, consequently, that a Quantity of the Sal Ammoniac, which is predominant in Animals, is so far from containing fewer Acids, that, on the contrary, it contains more, than the same Quantity of Salt which resides particularly in Plants.

In short, tho' one should suppose gratis, and without solid Foundation, I might even venture to say, in spite of Experiments to the contrary, that there are generally more Acids in Vegetables than in Animals, the Supposition must be carried to

to an excessive Length, and beyond all Probability, to account for what we commonly observe in the Analyses of Animals; that is, why the same Process always shews, or very seldom fails to shew, the Acid in Vegetables, and commonly in great Quantity, and seldom or never shews it in Animals. One might even say, that if there were no other Difference between Plants and Animals, than that of their being more or less stocked with Acids, Animals might not indeed afford so many Marks of them in their Analyses, as Vegetables, but they would always give Marks of some Acids, either more or less, and their Analyses would not be so uniform as they are, without discovering any at all, without the Help of Mediums, of which we shall take Notice hereafter. We must then have recourse to another Cause than what has been assigned, to explain the Difference which we find between the Analyses of Plants and Animals; and we shall now shew, that, supposing as great a Quantity of Acids, at least, in Animals as in Vegetables, all that we observe in their Analyses ought necessarily thus to happen, according to our way of Reasoning, which is a natural Consequence from what has been said in this and the preceding Memoirs.

That the Acids, contained in the Compound, might shew themselves in the several distilled Portions of its Analysis, it is not sufficient, that each Portion be really much impregnated with it, but it is also necessary, that the Acids should be more free and disengaged in every Portion of the Analysis, than they were in the very Bosom of the Compound. To give an Example: As long as the Acids of Saltpetre are lodged in their natural Matrix, they shew no Signs of Acidity; but they exhibit very many when the Distillation has disengaged them from that Matrix, which remaining at the Bottom of the Vessel because of its Fixity, resides no more with them in the same Place. For it is to be observed, that if this Matrix, instead of being fixed, had been volatile, it would have risen with them, and always have rendered the Acids imperceptible; which is easily proved, by urging with Fire Sal Ammoniac after two different manners, that is, alone; and with a fixed and alkaline Medium. And, indeed, if we suppose the Operation to be made without a Medium, the Sal Ammoniac will rise entire; and the Acids not having been disunited from their Matrix, they will be found again together on the Sides of the Head, nearly in the same State, and as much encumber'd as they were before the Sublimation; and if, before you subject the Matter to the Fire, you mix it with Water and a Medium, a great Part of the Acids will remain at the Bottom of the Vessel with the Medium; and if the volatile Salt should carry off some Acids with it, they will be less in a Condition to appear after, than before the Operation, because the Quantity of these Acids will be then much inferior to those which resided in the Matrix. Hence it follows, that if we suppose a Mass of Sal Ammoniac to contain twice or thrice as many Acids as another Mass of Salt, such as Saltpetre, that is, such a one as shall have a fixed Matrix, all that shall be elevated from the Saltpetre by the Action of the Fire, will give infinitely more inconsiderable Tokens of Acids, than what shall proceed by Distillation from a Mass of Saltpetre mixed with a convenient Medium, beforehand.

This is exactly what happens in the ordinary Analyses of Vegetables and Animals; and tho' we should suppose in these last as many or more Acids than in the others, and should imagine, that there arise from them in Distillation, as many and more Acids than from Vegetables, yet, as the Salt of which they are particularly composed is Sal Ammoniac, the greatest Part of the Acids, which rise by means of the Distillation, thus rise with their proper Matrix, from which they were never separated; for which Reason, the Operation contributes nothing at all to the making of them more perceptible than they were before. As for the Acids which were separated from their Matrix, and were sublimed by themselves, and commonly at the End of the Operation, they always find in the Receiver a much greater Quantity of volatile Salts than is necessary to absorb them; and they never fail of being absorb'd, if you don't take care expeditiously to separate these Acids by way of Rectification; and oftentimes, how speedy soever you are, either the Acids have already disappeared, or you can perceive but very few of them. This gives Occasion to observe, that when the Analyses of Animals manifest some visible Acids, they are never such as rise with their Matrix, and never abandon it, but such as, after having been separated from it, came over at the End of the Operation, in proportion to the Heat of the Fire. Therefore if you have a mind to have a greater Quantity of these Acids appear, you must labour to disunite a great Number of them from their Matrix, to make them rise separately, and to prevent their Reunion. A Method not commonly used in analysing animal Substances, the Neglect of which will render a Part of their Acids imperceptible, is as follows:

The first Step in this Process is Maceration, which produces in animal Substances what we have already observed it to produce in Vegetables, that is, it makes way for a great Number of volatile Salts to disengage themselves from their Acids, and

to disperse themselves in the Air, or renders them more disposed so to do upon the least Heat. By this means you set at Liberty a certain Quantity of Acids, which could never have been done without it. For Example: It is observed, that when Urine is new, and has not fermented, its Phlegm rises before its volatile Salt, and that it shews no Sign of Acids; but when it has fermented, its volatile Salts rise first, then its Phlegm, and, lastly, a red Liquor, which is manifestly pregnant with Acids.

The second Step is, to intermix a fixed and alkaline Medium with the animal Substance which is to be analysed, in order to disengage a greater Quantity of Acids from their volatile Matrix, and to put them in a Condition of rising afterwards separately, and to be distinguished from it.

The third is, in the Beginning of the Distillation to make use of a Heat so gentle as to be only capable, as I may say, of raising the volatile Salts, with Intent that the Acids, which will come over afterwards with a stronger Heat, may be accompanied with a less Quantity of volatile Salts; and so being less confounded with them, may make themselves more easily known.

The fourth is, to increase and continue the Fire for a long time, and at last to carry it to the utmost Degree of Violence, in order to release the Acids which were detained by the earthy Part of the Compound, and without this Assistance would never rise, or rise in so small a Quantity as hardly to be distinguished. 'Tis oftentimes for want of this Circumstance, that the Acids of animal Substances fail of appearing in their Analysis; for those Acids which come over towards the End of the Operation, are the only ones which can be made to appear, because no others have been well disengaged from their volatile Matrix.

Lastly, As soon as Distillation is finished, we must set about Rectification, especially of the last Portions, in order to separate as speedily as possible the Acids, which lie there confounded with the volatile Salts, and not give them time to reunite with their first Matrix.

This Method being regularly observed in the Analysis of animal Substances, if we should not be able to extricate all the Acids, we shall however always discover a great Part of them.

As to what regards, at present, the Analyses of Vegetables, the greatest Part of their Salt being the Opposite of Sal Ammoniac, or, what amounts the same, the most part of their Acids being naturally engaged in a fixed Matrix, when the Fire has disengaged and carried them aloft, they don't find their Matrix again in the Receiver, nor rise with it, as do the Acids of Animals; hence they lie more open than those Acids, and more easily preserve themselves in that bare and open Condition in which they were put by the Fire. 'Tis true, however, and we have already observed it, that several Plants yield volatile Salt in the Analysis, and oftentimes enough even to make great Part of their Acids to disappear. But it must be considered, that as Plants naturally impregnated with Sal Ammoniac never contain so much of it as Animals, and that as their Sal Ammoniac is always joined with a much greater Quantity of another Kind of Salt, which is not in Animals, so they not only have always fewer volatile Salts, but also the Proportion or Quantity of these Salts, with respect to that of the Acids, is always less in the different Portions of the Analyses of Plants than of Animals. And indeed the volatile Salts raised from an animal Substance by Distillation, have scarcely, to speak properly, any thing in the distilled Liquor to balance them, except the Acids, which they before contained in the Compound, and which, in this very Liquor, are found in less Quantity, in proportion to the volatile Salts, than in the Compound itself, as we said before; whence it comes to pass, that these Salts are always more than sufficient to answer the Acids, and consequently to make them disappear. But for those volatile Salts, which come over from a vegetable Substance, besides the Acids which they contained in the Vegetable itself, they are also to answer to those which proceeded from another Matrix, I mean a fixed Matrix, which is the most plentiful Source of Acids in the vegetable Kingdom. Wherefore as these Salts are not sufficient at once for two Sources of Acids, so the same Process, that will hardly render manifest any Acids in animal Substance, shall commonly make them appear in Plants which yield the most volatile Salts. And if it happens, in some Analyses of Plants, that the Quantity of volatile Salts is large enough to hinder the Acids from rendering themselves perceptible in the Process just before-mentioned, which very seldom happens if we use the same Method upon those Species of Plants, which we before recommended for discovering the Acids of Animals, we shall find by Experience, that this Method will still meet with fewer Obstacles, and consequently still operate with more Dispatch, both upon Vegetables and Animals.

We have no more to do at present, but to make some critical Reflections on the Analyses of Plants, with respect to the Acids raised from them by Distillation. And, first, when we consider only the Acids which offer themselves to View in these Analyses, without looking any farther, or at least with-

out duly reflecting, that there are always in a Plant concrete and essential Salts, which actually contain large Quantities of Acids, such as Saltpetre, from whose Bosom the Acids we speak of proceed, we might be ready to imagine, that those Acids, which the Analysis represents to us under a fluid Form, disengaged from earthy Matter, and sufficiently free and disclosed, were after the same manner in the Plant itself; and that they were not there lodged, as they really are, in a solid Matrix, in Conjunction with which they formed a concrete Salt.

A second Error into which the Analysis might be ready to lead us, is concerning the Quantity of Acids which offer themselves to our Senses. Here perhaps we may inconsiderately assure ourselves, that some Plants contain more or fewer Acids than others, according to the Measure of what we see in them; but how 'tis possible for us to be mistaken on this Subject, has been sufficiently proved in the Course of this Memoir.

We shall observe, in the third place, that the Acids which are dislodged by the Analysis from the fixed Matrix, do not always remain in that destitute State, but frequently possess themselves, as we have said, of other Matrices, either saline and volatile, or purely sulphureous, with which they form new Compositions. So that all these Metamorphoses, which are the Effects of the Analysis, cannot chuse but deceive us as to the natural Order and Disposition of the Parts of the Plant.

Lastly, the Analysis of Plants plainly lets us see the Acids in them; but these Acids are so much blended and confounded with other Substances, that it is impossible to distinguish their particular Character; and thus all Plants appear to us, by this way, to contain the same Acid. It is however a Matter of Importance to understand and distinguish the particular Nature of the Acids of Plants, such a Knowledge having a great Influence towards an Insight into their Virtues; for it is very true, that different Acids, lodged in the same Matrix, form Compounds of very different Properties; for Example, natural or artificial Saltpetre, and vitriolated Tartar, have the same Matrix, but by no means the same Virtues. Mercury, penetrated by the Acids of Spirit of Salt, is much more corrosive than when it is impregnated and covered with those of Spirit of Nitre; consequently two Plants, whose Effects are different, and, which in regard to their Analyses, do not appear to differ in Nature, nor even in the Quantity of their Acids, may yet differ very much in this respect, and to this Difference be accountable, if not wholly, at least in part, for the Difference of their Effects. If to what has been said on the Comparison of the Acids of several Plants, we add the false Resemblance which Analyses may represent to us, in comparing other Substances of which each of those Plants are compounded, and which, tho' really different in the natural State of every one of those Plants which are thus compared, do yet appear, after the Analysis, under a like Form, this Reflection may perhaps serve to account for the Observation made on *Solanum furiosum*, and the *Brassica capitata*; one of which is Poison, and the other Aliment, and yet in their Analysis they produce Substances so much alike in Appearance, that you would say, these two Analyses were made of one and the same Plant. *Memoires de l'Acad. Roy. des Scienc. 1721.*

In the Course of this Work, I have been obliged to give such Analyses of Plants, Animals, and Minerals, as I could find in the best Authors; and amongst others, in *Tournefort*, who has employed some Methods of examining into the specific Natures of Plants, with which the Reader must be made acquainted, in order to his understanding the Inferences from the Experiments he will meet with. I shall therefore insert the following Extract from the Preface to Dr. Martyn's *Tournefort*.

1. By the Chymical Analysis of Plants is meant, the Separation of their Principles, by means of Fire, and proper Vessels; to which End we distil fresh Plants in an Alembic, or in *Balneo Mariae*: Or before you proceed to distil them, they are to macerate or digest for some time, according to the Nature of the Plants, or the Intention that you have: It is proper to separate the Substances which are obtained from it, into Portions of four or six Ounces, the better to examine separately their Characters. You commonly draw off by this means the Phlegm, the spirituous Water, or the burning Spirit of Plants; when the Distillation is ended, you put the *Residuum* into a Retort, and giving Fire by Degrees, you draw off from the generality of Plants an urinous Spirit, a volatile concrete Salt, and a fetid Oil.

From the Caput Mortuum lixiviated, we separate by Filtration and Evaporation the Salt that was mixed with the Earth.

2. By acid and alkaline Salts, are meant those two Kinds of Salt, to which the Physicians and modern Chymists have given these Names. See the Articles ACID and ALCALI.

3. By essential Salt, is meant that which forms itself by the Crystallization of the Juice of Plants: We find this essential Salt in the Extracts of such whose Juice does not crystallize.

4. By the volatile Salt of Plants, is meant the Salt, which, in the Distillation of Plants by the Retort, sticks to the Sides of the Receiver.

5. By the fixed Salt of Plants, is meant the Salt which is made by Elixivation of the Ashes of Plants burnt, or from the Caput Mortuum of those which are analysed.

6. To discover the Acids, we have not only made use of Salt of Tartar, Lime-water, Spirit of Sal Ammoniac, and such-like Substances, with which Acids generally ferment; we use likewise the Solution of Turnsole, or blue Paper, which is nothing else but common Paper, coloured with Turnsole, dissolved in common Water; the alkaline Salts make no Change on the Turnsole; the Acids, according to their Strength, reddens it by Degrees, from a very faint Red to a very lively one: You meet with the Turnsole commonly at the Colour-shops; they are little Cubes of a deep-violet Colour, and give a blue Tincture; but it is a Colour the most susceptible of Alteration that I have yet found; for the weakest Acid will change it: Milk is also sometimes made use of, to try if certain Acids will curdle it.

7. To discover the alkaline Salts, we have used not only the Spirit of Nitre, of Salt, of Sulphur, of Vitriol, and other Acids, with which Alkalies commonly ferment; but also of corrosive Sublimate dissolved in common Water: Acids do not at all change the Colour of this Solution; but it becomes obscure, milky, yellow-orange-coloured, and curdles according to the Strength of the alkaline Salts: These Salts also change white, green, or curdle the Solution of Galls, and that of Copperas; but these two last Experiments are not so certain as those of the Sublimate; for there are some Acids, as we shall see hereafter, that change also the Solution of Copperas, and the Infusion of Galls.

8. As Sal Ammoniac discovers itself by its volatile or urinous Salt, Oil of Tartar, or Lime-water, has been used to discover whether there be any Sal Ammoniac in certain Plants; for then they emit an urinous Spirit, like that which exhales from Urine, or Sal Ammoniac, when they are mixed with Oil of Tartar, or Lime-water: Lime-water and corrosive Sublimate, combined in a certain manner, with a Solution of Sal Ammoniac, distinguish also the Nature of the Sal Ammoniac; for the Solution of this Salt, mixed with Lime-water, hinders its becoming Yellow, or Red-orange: When we pour on the Solution of Sublimate corrosive, the Whole becomes white as Milk; on the contrary, Lime-water, mixed with the Solution of Sublimate, turns yellow or red as before, altho' it is join'd to that of Sal Ammoniac. Thus, as the urinous Salt of Plants is not altogether without Acid, I believe it is better to say, that a Plant acts by a Salt approaching to Sal Ammoniac, than by a pure volatile Salt; and so much the more, because the Plants which yield a concrete volatile Salt, reddens the blue Paper in like manner as Sal Ammoniac does, except where a great Quantity of Oil smothers the Acid, and hinders its Appearance.

9. As Nitre discovers itself by Detonation, I believe the best means to know nitrous Substances certainly, is to throw them upon burning Coals.

10. Every body knows, that the most remarkable Property of Vitriol is to blacken the Infusion of Galls; therefore we ought to mix the Bodies which we examine, with this Infusion.

11. To know whether there be Sulphur in any particular Body, it seems to be the best way, to put it in Digestion in good Spirit of Wine, to see if it draws any Tincture: The Readiness which these Bodies have to catch Fire, is also an Indication of Sulphur. The dry *Elatarium* burns at a Candle; the Extract of *Sedum majus vulgare*, C. B. does not burn at all; therefore the first contains a resinous Matter, which we do not find in the other. The oily Substances become soapy when they are mixed with Lime-water, or Oil of Tartar.

The following Experiments may serve to shew the Nature of that Salt, which we can draw from the Earth, without the Help of Fire.

Take Plaster into a low Place, where there has not been any Chimney; pound it, and put it into a Pail of Water, covering it half a Foot: After an Infusion of four Days, if the Water does not afford any Sign of Saltiness, and does not change it at all by the forementioned Experiments, let it be put again upon fresh Plaster taken from the same Place.

The second Infusion grows a little reddish, acrid, saline and bitter.

1. It made but a faint Impression of Violet upon the blue Paper.

2. It did not curdle Milk at all.

3. It did not receive any Change from Spirit of Nitre.

4. It made the Infusion of Galls muddy, and rendered it whitish; afterwards it made a pretty thick Coagulum, followed with a Precipitation.

5. When it was mixed with Infusion of Vitriol, it became a dark, tawny Colour.

6. It rendered obscure a Solution of Sublimate corrosive.

7. The same Infusion, mixed with Oil of Tartar, instantly made a white Coagulum; immediately after was perceived a very considerable urinous Spirit. Mixed with Lime-water, it did the very same, without finding in either of these Experiments either Effervescence or Heat.

8. Substituted in the room of Sal Ammoniac, it whitened Lime-water, when it was added to the Solution of corrosive Sublimate; this White was not so lively as that which appeared by means of the Solution of Sal Ammoniac.

It appears by the fourth, fifth, and sixth Experiments, that the Infusion of Plaster contained an alkaline Salt; and by the seventh and eighth, that it contained Sal Ammoniac. The first discovered some Acid in the same Salt: This seems to be scattered through the Whole; for when they whiten old Houses with Lime, one may perceive an urinous Smell for a Day or two.

Beside Sal Ammoniac, the Infusion of Plaster evaporated yields Nitre, which discovers itself by Detonation: It is separated also from a marine Salt.

The Infusion of Earth, scraped from the high Roofs of Vaults, is found to be of the same Nature with that of Plaster. The Infusions used by the Saltpetre-makers of Paris, contain a fixed Salt, because they put a certain Quantity of Ashes in the Bottom of their Bucking-tubs, in order to purify the Saltpetre.

Beside the Infusion of Plaster, I made others with Earth of different Natures. To twenty-five Quarts of Water, I put to infuse twenty Pounds of Mould, from a Garden which had been neglected for many Years; after four Days Infusion, I passed it through a Strainer of Hair-cloth, and poured the Infusion again upon fresh Earth. The first and second Infusion did not undergo any Change with the common Trials. It was put again upon another Portion of Earth. I designed to have made still more Infusions, but the thing was hardly possible, because the Earth had consumed a great deal of the Water, notwithstanding the Precaution used to filtre it.

This last Infusion of the Earth was a little reddish, salt, and bitter; being half evaporated, it became like that of Plaster.

The Infusion of Earth taken from a Piece of Ground not dunged, that of Kitchen-garden Earth and Mould, afforded nearly the same Characters as that of Plaster, except that these last Earths sent forth an urinous Spirit more penetrating than that of the first: Besides, the Infusion of all these Earths whitened the Solution of corrosive Sublimate a great deal more than the Infusion of Plaster.

The *Natrum* or *Anatron* of Egypt made the same Alteration upon the Solution of Sublimate; and as in the *Levant* we find this Salt naturally in the Ground, it is no Wonder that it should have some Similitude with the Infusion of that of this Country.

The *Natrum* seems to be nothing else but a marine Salt, mixed with a natural alkaline Salt. These Salts are not perfectly united together; for if you go to steep a Piece of *Natrum* in Water, it dissolves at first only that which makes the least Resistance; and that Part being dissolved, you may see, in that which remains, a great many Cavities something like those of Sponges.

Natrum has the Taste of marine Salt, and crackles in the Fire; it makes no more Impression upon blue Paper, than marine Salt; it does not at all ferment with Spirit of Sal Ammoniac; it makes a white Coagulum with the Infusion of Galls; mixed with Lime-water, it does not hinder its turning yellow, when mixed with a Solution of Sublimate; marine Salt does the same; it ferments considerably with Spirit of Nitre, which marine Salt does not.

The Solution of *Natrum* renders that of Copperas of a very dirty Green, like Sea-green. This Change seems to indicate an alkaline Salt, since it comes to the same when mixed with Oil of Tartar, or Lime-water, with a Solution of Copperas; and this Sea-green is wholly destroy'd by the Mixture of Spirit of Nitre, which, uniting itself with the Oil of Tartar, causes it to part with the Copperas.

Upon these Experiments we have related touching the Infusion of Plaster, and of the different Sorts of Earth, we may reasonably advance,

1. That there is in all Earth, what we may call a natural Salt, whether the Earth has always been impregnated with it, or it is continually made by the Mixture of rotten Plants, the Dung of Animals, the Air, or other Causes which we are ignorant of. This Salt participates of Nitre, of marine Salt, or Sal Ammoniac, of Alum, and of Vitriol.

2. That in the Salt of the Earth there is an alkaline Salt, different from the Sal Ammoniac; for the Infusion of various Earths, and the Solution of *Natrum*, whitens the Solution of Sublimate corrosive, which the Solution of Sal Ammoniac will not do; on the other hand, the *Natrum* ferments considerably with Spirit of Nitre, and the Infusion of Earth, boiled a little with the same Spirit, which we do not find when we mix the Solution of Sal Ammoniac with Spirit of Nitre.

3. It appears also, that the Bodies which we draw from Earth, without the Help of Fire, afford us but small Signs of

Acid, except Alum and Vitriol. The following Observations are relating to common Salts.

I.

N I T R E.

1. Nitre makes no Impression upon the blue Paper, nor upon Solution of Turnsole, nor upon Syrup of Violets.

2. One cannot draw a Spirit of Nitre, without a very violent Fire: This Spirit reddens very lively the blue Paper, Solution of Turnsole, and Syrup of Violets.

3. Nitre inflames upon the Fire, and kindles readily: The Spirit of Nitre extinguishes it.

4. It does not curdle Milk: The Spirit of Nitre curdles it instantly.

5. It does not change the Colour of Ox's Gall: The Spirit of Nitre makes it red. I suppose, by the uniting itself with the acrid Salts, which had perhaps contributed to yellow the Sulphur of the Blood, it is a Means of making this Liquor return to its natural Colour.

6. It makes a white or greyish Coagulum, with Infusion of Galls: The Spirit of Nitre does not alter this Infusion.

7. Neither Nitre, nor its Spirit, alter the Solution of Copperas.

8. Nitre, and Oil of Tartar, make an almost insensible Ebullition, wherein there appears to be an Agitation of the Parts, like those of Dust, which you may see move about the Air in a very light Place: The Spirit of Nitre, and Oil of Tartar, ferment without Heat, but with a great Froth, and afterwards it becomes a very thick Coagulum.

9. Nitre does not hinder Lime-water becoming yellow, when mixed with the Solution of Sublimate: The Spirit of Nitre only raises a few Bubbles in the Lime-water, all appearing as transparent as before, although the Sublimate corrosive be poured upon it.

10. The Solution of Nitre, and the Spirit of Sal Ammoniac, do nothing at all: The Spirit of Nitre, and Spirit of Sal Ammoniac, ferment.

11. The Solution of Nitre, and that of corrosive Sublimate, do not immediately change; but about a Quarter of an Hour after they are mixed, they become white.

12. The Solution of Nitre, and Spirit of Salt, do not change at all. None of these Experiments discover any Signs of Acidity in the Nitre; for that which happens in the ninth is insensible; the sixth and eleventh rather shew, that it contains an alkaline Salt; nevertheless Fire draws from Nitre one of the strongest Acids that we know.

II.

S E A - S A L T.

1. Marine Salt does not alter the blue Paper, nor Solution of Turnsole, nor Syrup of Violets.

2. One cannot draw the Spirit of Salt without a violent Fire; this Spirit tinges blue Paper, and the Solution of Turnsole, of a lively Red.

3. The Solution of marine Salt whitens a little the Solution of Sublimate.

4. It muddies the Infusion of Galls, and afterwards occasions it to precipitate a little: The Spirit of Salt muddies it also, and renders it whitish.

5. It makes the Spirit of Sal Ammoniac obscure, and increases the strong Smell: The Spirit of Salt, and that of Sal Ammoniac, ferment with Smoke, and great Heat.

6. It does nothing at all with Oil of Tartar, nor with Lime-water: Spirit of Salt ferments very much with Oil of Tartar, but without sensible Heat. This Spirit does not ferment at all with Lime-water.

7. It does not hinder Lime-water from turning yellow, when mixed with Sublimate: The Spirit of Salt hinders it entirely; and the Liquor, after the Mixture of Sublimate, is more transparent than before.

It appears by the third and fourth Experiments, that marine Salt contains an alkaline Salt; and by the fifth, that it is somewhat acid.

III.

V I T R I O L.

1. The Solution of Copperas, or common Vitriol, is saline, styptic, afterwards sweetish.

2. It reddens the Solution of Turnsole, and blue Paper; but this is not a lively Red.

3. It gives Syrup of Violets a small greenish Cast, far from reddening it.

4. We cannot draw the Spirit and Oil of Vitriol without an intense Heat; the Spirit and Oil redden the Syrup of Violets to the Colour of Ox's Blood.

5. The Spirit of Vitriol colours the Paper of a very lively Red, and the Solution of Turnsole of a Red somewhat less lively: The Oil does the same, but it ferments and grows hot with Solution of Turnsole.

6. Every

A N A

6. Every body knows, that Copperas, mixed with Infusion of Galls, makes Ink ; but every body perhaps does not know, that Ink reddens blue Paper : Mixed in a very little Quantity with Solution of Turnsole, it gives it a little reddish Cast ; but this Colour is less sensible, than upon the blue Paper.

7. The Spirit of Vitriol muddies and whitens a little the Infusion of Galls : The Oil of Vitriol thickens it, makes it of an ash Colour, and it makes a thick Precipitation.

8. The Solution of Copperas, its Spirit and Oil, curdle Milk.

9. It does not change at all that of Sublimate corrosive.

10. It becomes a grey-brown and like Sea-green, mixed with Oil of Tartar, or with Lime-water. This Colour does not change, although it be mixed with corrosive Sublimate. Spirit of Vitriol, and Oil of Tartar, ferment with a great deal of Froth, and a considerable Heat ; but all these augment, if instead of Spirit you use the Oil of Vitriol, and all their Mixtures become a white Coagulum.

11. Common Water, and Oil of Vitriol, grow also very hot, and generally make a Noise ; there is no Fluid, that more easily grows hot with the Mixture of others, than the Oil of Vitriol.

It appears, by all these Experiments, that Vitriol naturally affords a great many Signs of Acidity.

IV.

A L U M.

1. Alum is a little saline, and very styptic.

2. The Solution of Alum tinges of a fiery Red the blue Paper, and Solution of Turnsole.

3. It does not alter the Colour of Syrup of Violets.

4. It curdles Milk.

5. It instantly makes a white Coagulum, with Oil of Tartar, but without Heat or Smoke.

6. It does not alter the Solution of Sublimate.

7. It makes the Infusion of Galls muddy, and whitens it considerably, throwing down a Precipitation.

8. It whitens Lime-water a little, and this Mixture does not turn yellow, when mixed with Sublimate corrosive, but it forms little white Clots like Starch ; this is perhaps occasioned by the Urine, which is employed in the Crystallization of Alum ; so we cannot conclude any thing from all these Experiments, except that Alum contains a good deal of Acid.

V.

S A L A M M O N I A C.

1. Sal Ammoniac is acrid and saline.

2. Its Solution tinges blue Paper of a dark Red : It does not at first change the Solution of Turnsole, but a Day after this Mixture becomes a reddish Brown.

3. It does not curdle Milk.

4. It does not alter the Solution of Sublimate corrosive.

5. Mixed with Oil of Tartar, or with Lime-water, it emits an urinous Spirit.

6. This Spirit coagulates, and whitens the Solution of Sublimate. From Sal Ammoniac one may also draw an acid Spirit, like the Spirit of Salt ; thus the Sal Ammoniac appears to be a marine Salt united with an urinous one.

7. The acid Spirit of Sal Ammoniac hinders the Lime-water's changing Colour, when it is mixed with the Solution of Sublimate ; but the whole Mixture becomes white as Milk, if you pour on the urinous Spirit of this same Salt, the Sal Ammoniac thus causing the same Effect upon Lime-water and Sublimate, as its urinous Spirit does. It is certain, that this is the urinous Part, and not the acid Part of this same Salt, which whitens the Lime-water, when mixed with Solution of Sublimate. Urine whitens it more faintly than the Solution of Sal Ammoniac.

8. The acid and urinous Spirit of Sal Ammoniac ferments with Heat.

9. If you pour the acid Spirit of Sal Ammoniac upon Lime-water tinged by the Sublimate corrosive, the Whole becomes transparent ; and all this becomes white as Milk, if you add the urinous Spirit of Sal Ammoniac. The Spirits of Salt, of Vitriol, of Sulphur, perform the same as the acid Spirit of Sal Ammoniac.

VI.

T A R T A R.

1. Tartar, which is nothing else but the essential Salt of Wine, is sourish.

2. Its Solution reddens the blue Paper, and the Solution of Turnsole, as lively as Alum.

3. It whitens Lime-water, but it does not hinder its becoming a Red-orange, when mixed with the Solution of corrosive Sublimate.

4. It makes no Change when mixed with corrosive Sublimate, or with Infusion of Galls.

5. It does not change with Spirit of Sal Ammoniac.

A N A

6. Mixed with Oil of Tartar, it does not receive any Change.

7. The Spirit of Tartar contains a good deal of Acid ; it gives a lively Red to the Solution of Turnsole, and renders the Syrup of Violets of a reddish Brown.

8. It makes a Coagulum with *Oleum Tartari per Deliquium*.

9. Mixed with Lime-water, it does not change Colour ; but if you pour upon the Mixture a good deal of the Solution of Sublimate, the Whole becomes whitish. Thus it is probable, that beside the Acid, this Spirit contains an urinous Part ; but it does not appear so strong as one would judge at first by its Smell.

10. Mixed with the urinous Spirit of Sal Ammoniac, it thickens, becomes whitish, and makes a thick Coagulum.

11. It renders whitish the Solution of corrosive Sublimate, and makes a Coagulum, the Grumes of which are of the same Colour.

12. It does nothing at all with the acid Spirit of Sal Ammoniac.

13. The Salt of Tartar dry, or dissolved into Liquor, which is called Oil of Tartar, is acrid, and very bitter ; this Bitterness does not go away but by the Mixture of a great Quantity of acid Salt.

14. The Oil of Tartar, and Solution of corrosive Sublimate, make an orange Colour, which approaches more or less to a Yellow, according as the one or the other of the Liquors predominate ; but the Whole becomes transparent by the Mixture of an acid, corrosive Spirit.

15. It does not give any considerable Change to Spirit of Vinegar ; one discovers only that Kind of trembling, where some Parts are stirred like the Appearance of Dust in the Sun.

16. Oil of Tartar, and Spirit of Vinegar, mixed, don't forbear turning yellow, when mixed with Solution of Sublimate.

17. Oil of Tartar ferments with the corrosive acid Spirits.

18. Oil of Tartar, and acid corrosive Spirits, don't forbear turning yellow, when mixed with Solution of Sublimate.

19. Oil of Tartar, and the urinous Spirit of Sal Ammoniac, don't change when mixed ; but the Whole becomes thick, and white as Milk, when you pour on the Solution of Sublimate.

20. Oil of Tartar turns Syrup of Violets green.

21. Oil of Tartar thickens the Infusion of Galls.

VII.

L I M E - W A T E R.

It is not necessary to repeat here what we have already said concerning Lime-water : We will only remark,

1. That it becomes very white, when mixed with Oil of Tartar ; it makes a very thick Coagulum, which seems to indicate some Acid in Lime.

2. Mixed with the corrosive Acids, it becomes more clear ; the same also when mixed with distilled Vinegar.

3. Mixed with the urinous Spirit of Sal Ammoniac, it turns white.

4. Mixed with a strong Infusion of Galls, it becomes thick, greyish, approaching to brown ; and one may observe upon its Surface a black Spot, like a Drop of Ink : Thus Lime-water seems to have something of Vitriol.

VIII.

E A R T H.

One may see by all these Experiments, what Affinity there is between the natural Salt of the Earth, and the other Salts whereof we have been speaking ; but moreover that of the Earth is wrapped up with a great deal of Sulphur.

The mineral Sulphur, Bitumens, Pit-coal, Jett, and Petroleum, prove, that the Earth is not without a natural Sulphur.

By the Chymical Analysis the pure Earth, without Dung or Rubbish, yields a foetid Oil, and an urinous Spirit ; the Remainder, which you draw, participates more of Alkali than Acid.

Garden Mould, well dried and sifted, gives Spirit of Wine a lemon Colour, after five or six Days Infusion upon warm Ashes.

1. This Spirit of Wine does not presently change the Colour of Solution of Turnsole ; but soon after it precipitates, and the Remainder becomes grideline. Common Spirit makes the same Precipitation, but the Liquor remains blue.

2. It becomes pretty white and thick by the Mixture of Water ; but some time after it becomes grumous, and precipitates in form of a yellowish Refin ; all which does not happen to the common Spirit of Wine.

3. It becomes very white with Solution of Sublimate, and grows warm ; this Solution, mixed with common Spirit of Wine, grows warm also, but the Whole remains clear.

4. It whitens likewise by the Mixture of Lime-water, and precipitates a resinous Matter.

5. It

5. It mixes but very indifferently with Oil of Tartar; and after these two Liquors have been well shaken together, they become thick.

6. It occasions no Change with urinous Spirit of Sal Ammoniac, nor with the corrosive Spirits, except that it heats them a little; but that is the same with the common Spirit of Wine.

7. It grows hot with Lime-water, and hinders its turning yellow with corrosive Sublimate; these Liquors make just such a dirty White, as you may observe when you mix Urine with Lime-water, and add Sublimate to it. The common Spirit of Wine grows hot also with Lime-water; but the Whole becomes a Red-orange, when you pour on the Solution of Sublimate.

These Experiments shew, that there is a Sulphur, an alkaline Salt, and Sal Ammoniac in Earth. Sulphur also appears in the Extract that remains after Evaporation of the Infusions of Earth; for this Extract makes a kind of Soap, very thick, when mixed with Oil of Tartar.

After all these Experiments, we have made no great Difficulty, first, to compare to Sal Ammoniac, those Salts of Plants, which, by a Mixture of Oil of Tartar, or Lime-water, emit an urinous Spirit; and which, by Chymical Analysis, produce also a volatile crystallized Salt; for it is probable, that the volatile Salt is nothing but the urinous Part of the Sal Ammoniac of the Plant, which leaves its acid Parts by Force of Fire: Thus, by the Mixture of Oil of Tartar, or Lime-water, the urinous Spirits appear to be nothing but part of the same volatile Salt dissolved in Phlegm, and the foetid Oil is as much loaded with the same Salt. We must not therefore wonder, that these Sorts of Plants are aperitive, deterfive, febrifugous, vulnerary, and the like; for Sal Ammoniac has all these Qualities.

It is proper to observe, that although Sal Ammoniac seems to be but in very small Quantity in Infusions of Earth, yet it is very considerable; for the urinous Spirit, which by the Mixture of Oil of Tartar separates itself from these Infusions, is only a Part of the Sal Ammoniac; and the white Colour which the same Infusion gave to the Lime-water and corrosive Sublimate, denotes that this Part is very considerable. On the other hand, this Salt is insensibly gathering several Days in Plants; and the Quantity of volatile Salt, which is obtained from four or five Pounds of a Plant, is commonly only from half a Dram to six Drams. Of all the Parts of Plants, the Leaves are most fit to be loaded with Sal Ammoniac; for the Roots, Flowers, and Fruit, retain more properly Acids. The Oil is commonly distributed in the Seeds, and the Phlegm diffuses itself through the whole Plant.

2. Alum seems the most proper to explain the Virtue of such Plants as are styptic, astringent, and which, by Chymical Analysis, afford a great deal of Acid, and much Earth; for these two Parts must make a Salt analogous to Alum. There are a great many of these Sorts of Plants, which also afford a little urinous Spirit; and this seems to denote, that besides the Alum, there is some Sal Ammoniac in their Composition.

3. Those which are aperitive, and from which a great deal of Acid and Earth is drawn, have perhaps a Salt not much different from that of Coral.

4. It is supposed, that the Plants which, besides the Acid and Earth, yield alkaline Liquors, or Signs of Sal Alkali, do contain a Salt like to *Tartarus Vitriolatus*, or to that Preparation of Salt of Tartar, which *Mullerus* and *Sennertus* have called *Terra foliata Tartari*, or *Tartarum foliatum*. Sometimes we have compared the Salt of these Plants to that which *Angelus Sala* has named *Oxysal Diaphoreticum*; but all these Salts, in the same manner as *Sal Ammoniac*, are modified in Plants by different Portions of Sulphur and Phlegm. See *TARTARUS VITRIOLATUS*, *TARTARUS REGENERATUS*, and *OXYSAL DIAPHORETICUM*.

5. It is probable, that in aromatic Plants, as several skilful Persons have proposed, there is something like that Chymical Preparation, which is called the volatile, aromatic, oily Salt; or oily, volatile, aromatic Spirit; for both of them are drawn at the same time. See *AMMONIACUM*.

We commonly draw less concrete volatile Salt from these Sorts of Plants, than the others: It seems that Sal Ammoniac dissolves itself in their Texture; and then the urinous Part being separated from the Acid, and uniting itself to the essential oily Parts, that little which remains of the concrete urinous Salt insensibly evaporates. *Martyn's Tournefort*.

ANA-MALLU. The Name of a leguminous Shrub, which grows in the *Brasil*. The Natives make use of the Thorns of this Plant, after taking off the Bark, to bore their Ears with. They also make a Decoction of the Leaves, in Water wherein Rice has been washed, or in Whey, which they use by way of Bath, in case of an Intumescence of the Belly, either from Wind or extravasated Lymph. It is taken Notice of in the *Historia Malabaricus*.

ANAMIX, *ἀναμίξ*, an Adverb used by *Hippocrates* to express promiscuously, or the mixing Ingredients together.

ANAMNESIS, a Recollection, or Remembrance.

Hence *ANAMNESTICA SIGNA*, commemorative Signs; that is, Signs by which we discover the preceding State of the Body; as demonstrative Signs are those which shew the present, and prognostic Signs those which shew the future State. It is derived from the Greek Preposition *ἀνά*, and *μνήμηναι*, to remember.

Blancard explains *ANAMNESTICA*, Remedies which restore the Memory.

ANANAS, the Pine-apple.

The Characters are;

It hath a Flower consisting of one Leaf, which is divided into three Parts, and is Funnel-shaped; the Embryo's are produced in the Tubercles; these afterwards become a fleshy Fruit, full of Juice; the Seeds, which are lodged in the Tubercles, are very small, and almost Kidney-shaped.

The Species are,

1. *Ananas aculeatus, fructu ovato, carne albida*, Plum. OVAL-SHAPED PINE-APPLE, WITH A WHITISH FLESH.

2. *Ananas aculeatus, fructu pyramidato, carne aurea*, Plum. PYRAMIDAL PINE-APPLE, WITH A YELLOW FLESH.

3. *Ananas folio vix serrato*, Boerh. Ind. Alt. 2. 83. PINE-APPLE, WITH SMOOTH LEAVES.

4. *Ananas lucide virens, folio vix serrato*, Hort. Elth. PINE-APPLE WITH SHINING GREEN LEAVES, AND SCARCE ANY SPINES ON THEIR EDGES.

5. *Ananas aculeatus, fructu pyramidato virescente, carne aurea*. THE GREEN PINE-APPLE, WITH A PYRAMIDAL FRUIT, COMMONLY CALLED THE SUGAR-LOAF-PINE IN *BARBADOES*.

6. *Ananas fructu ovato ex luteo virescente, carne lutea*. THE OLIVE-COLOURED PINE.

The first Sort is the most common in *Europe*; but the second Sort is much preferable to it, the Fruit of this being larger, and much better flavoured; the Juice of this Sort is not so astringent as is that of the first, so that this Fruit may be eaten in great Quantity, with less Danger. This Sort generally produces six or seven Suckers, immediately under the Fruit, whereby it may be increased much faster than the common Sort; so that, in a few Years, it may be the most common Sort in *England*.

The third Sort is preferred by some curious Persons, for the sake of Variety; but the Fruit is not near so good as either of the former.

The fifth Sort is, at present, the most rare in *Europe*; there being very few of the Plants at present: This is esteemed the best Sort, yet known, by some of the most curious Persons in *America*, who have thrown out all the other Sorts from their Gardens, and cultivate only this Kind. The Plants of this Sort may be procured from *Barbadoes* and *Montserrat*, in both which Places it is cultivated. The sixth Sort was brought from *Jamaica*; this is not very common in *England* as yet; it is esteem'd a very good-flavour'd Fruit, by those who have tasted it; but it being a very backward Sort, will render it less valuable in our Climate; for this Sort will require a Month longer time to ripen, from the first Appearance of the Fruit to its Maturity, than most of the other Sorts. I have also heard of another kind of Pine; whose Flesh is very green, and the Outside yellow; but having never seen the Sort, I cannot give any Account of it. There are many other Kinds to be found in the several Countries where they are cultivated, which have arisen from Seeds, which differ in their Shape, Colour, and the Flavour of their Fruit; so that as these Fruits become common in *Europe*, all the bad Sorts should be rejected, and such only as produce fine Fruit should be cultivated.

This Fruit, which is justly esteemed for the Richness of its Flavour, (as it surpasses all the known Fruits in the World) is produced from an herbaceous Plant, which hath Leaves somewhat resembling those of an Aloe, and are, for the most part, saw'd on their Edges; but are much thinner, and not so juicy as the Aloe: The Fruit resembles the Cones of the Pine-tree, from whence it is supposed to have its Name.

Where this Plant is a Native, I believe it is hard to determine; but it was brought from the Factories in the *East-Indies*, and planted in the hottest Islands of the *West-Indies*, where they are in great Plenty, and extraordinary Goodness; but it hath been very lately that it was introduced into the *European* Gardens, so as to produce Fruit: The first Person who succeeded in this Affair, was *Monfieur Le Cour*, of *Leyden* in *Holland*, who, after a great many Trials with little or no Success, did, at length, hit upon a proper Degree of Heat and Management, so as to produce Fruit equally as good (tho' not so large) as those which are produced in the *West-Indies*, as hath been often affirm'd by Persons who have lived many Years there: And 'tis to this worthy Cultivator of Gardening, who did not spare any Pains or Expence to accomplish it, that all the Lovers thereof are obliged, for introducing this King of Fruits amongst them; and it was from him that our Gardens in *England* were first supplied,

plied, tho' we have since had large Quantities brought from America.

The Time of this Fruit's ripening is, from the Beginning of July till September; after which time, the Fruits that ripen are seldom well-tasted, the Season being so far spent, that we have not Heat enough to correct the Crudities, which are imbibed in the long Nights, from the Vapours of the Bed, and their own Perspiration in the Day-time.

The Manner of judging when they are mature, is, by the strong Smell they emit, like that of ripe Fruits, and by gently pressing the Protuberances of the Fruit with your Thumb and Finger; and if they give way, it is a certain Sign of Ripeness: Nor will this Fruit keep above three or four Days at most, if suffered to remain on the Plant, before its high Flavour will be lost; and if cut, it should not be kept above twenty-four Hours at most, if you would eat it in Perfection. *Miller's Dictionary*.

They press out the Juice, and make of it an excellent Wine, almost as strong as Malmsey, and which intoxicates.

It is proper to fortify the Heart, and good to exhilarate the Spirits when oppress'd; it cures a Nausea, and provokes Urine; but Women with Child ought to abstain from it, because it will endanger a Miscarriage.

They make a Confection of the Ananas upon the Spot where it grows, which is brought hither whole: This is good to warm and restore a weak Constitution. *Lemery de Drogues*.

ANANCE, ἀνάγκη, properly Necessity, but by *Hippocrates* it is used generally to express Force, or Violence; such as is used in the Distention of a dislocated Limb, in order to reduce it.

ANANDREIS, ἀνδρείς, from a Negative, and ἀνὴρ, a Man. *Hippocrates*, in his Treatise de Aere, Locis & Aquis, calls certain People amongst the Scythians by this Name. The Interpreters translate it Effeminate. I have rendered it Impotent. See the Passage in the Translation of this Treatise, under the Article AER.

ANANDROI, ἀνδρεί, of the same Derivation as the former, tho' of a very different Signification: For *Hippocrates* uses this, joined with γυναῖκες, Women, to express their never having known Man.

ANANTHOCYCLUS. This is a kind of Plant mention'd by Mr. Vaillant, and by him called *Couronne effleurée*.

It takes its Name from the Greek Words ἀνθός, without, ἀνθός, a Flower, and κύκλος, a Circle; because the Flower of this Sort of Plant is surrounded, or crown'd, with one or more circular Ranks of Ovaries, destitute of Fleurets.

The Species of it are,

1. *Ananthocyclus coronopi Chrysanthemum exoticum minus, capitulo apophyllo*; *Chamæmeli nudi facie*, Breyn. Cent. 1. Tab. 76.
2. *Ananthocyclus chamæmeli folio. An Chrysanthemum exoticum perpusillum nudum, foliis Coronopi*, Pluck. Alm. 101. Tab. 274. Fig. 6. *Memoires de l' Acad. Royale, A. 1719*.

I can find no Virtues that are particularly attributed to this Plant.

ANAPALIN, ἀνάπαλιν, on the contrary, on the opposite Side, over-against. This Word has a direct contrary Signification to κατ' ἑξιν, on the same Side, and εὐθυαία, Rectitude.

These Words are very much used by *Hippocrates*, in speaking of the Transmutations and Fluxes of the Humours. For, in the Motions of Nature, he teaches us always to regard the εὐθυαία, "the Direction, and strait Situation of the Parts," and the κατ' ἑξιν, "the Situation on the same Side." Whatever Symptoms happen ἀνάπαλιν, that is, on the opposite and contrary Side, are always judged bad. So, in an Hemorrhage, τὰ ἀνάπαλιν αἱμορραγέοντα, "all Fluxes of Blood on the contrary Side," are condemned by *Hippocrates*. And in his Doctrine of Abscesses, *Epid. Lib. 2.* he passes the same Censure on τὰ ἐπὶ τ' ἀνὰ πλάτη βέποντα, "those which verge to the contrary Side." But of these some are reckoned good, others bad, from Experience rather than any Reason that can be given for it. In a Crisis, the Blood ought to flow from the Nostril on the same Side with the labouring Part; as, for Instance, from the Left Nostril when the Spleen is inflamed, and from the Right Nostril in an Inflammation of the Liver. It is a thing so fully proved by long Experience, as to be taken by Physicians for an undoubted Truth, that Nature struggles with more Vigour, and better Success, in the Passages that run directly on the same Side, or ἐν εὐθυαίᾳ, than in those which lie ἀνάπαλιν, "on the contrary Side," where she seems as if she acted symptomatically, and were disabled from restraining the inordinate and unruly Motion of the peccant Matter, by making a Transition from one of the Viscera to another Part opposite to it. *Gorræus*.

ANAP AUSIS, ἀνάπαυσις, from ἀναπαύω, properly to rest again from Labour. It signifies Rest after Exercise or Labour, Ease from Pain, or Remission.

ANAPETIA, ἀναπέτεια, from ἀναπετάσθαι, to expand. It signifies an Expansion of the Passages, through which the Blood or Juices circulate.

ANAPHALANTIASIS, ἀναφαλαντίασις, from ἀναφαλαν-

τῆς, a bald Person. Baldness, properly, of the Eye-brows. *Aristot. Hist. Animal. Lib. 3. Cap. 7.*

ANAPHONESIS, ἀναφωνία, a Species of Exercise. It consisted in Vociferation.

The first Condition, or Quality, ascribed to Vociferation, of what Kind soever, by *Antyllus*, *Plutarch*, *Paulus*, *Aetius*, and *Avicenna*, is, that it exercises, exceedingly well, the Breast and Vocal Organs. *Averroes* says, that the Lungs are properly concerned in the Exercise of the Voice; and that the Use of it, upon Occasions, increases the natural Heat, cleanses, strengthens, and attenuates, and renders the solid Parts of the Body robust, pure, and not liable to be injured. *Avicenna* adds, that this Exercise improves the Complexion: The natural Heat is increased, because the Breath is in constant Motion, as well in Inspiration as in Expiration, and suffers an Attrition and Collision, by which Heat is excited. This Exercise cleanses, as it makes the Flesh more rare; and also, because by the Motion of the Vocal Instruments the internal Humidities are consumed; as is very evident from the thick Vapour which exhales out of the Mouth in Vociferation, and the Superfluities of the stale Humours which adhere to all the Canals, discharged as well in this manner as many other ways. And, lastly, the natural Heat is strengthen'd and attenuated; because the Vessels are absterged, and many Humours, as Spit, Mucus, and Phlegm, are consum'd, which, as before they obscured, debilitated, and condensed that Heat; so, by their Dispersal and Evacuation, it acquires a new Strength and Purity, and the Solids become more firm, and less liable to be affected.

The Premises being granted, it stands to Reason, that Vociferation becomes a noble Support to such as have their inward Parts affected with Humidity, and whose whole Constitution is become frigid.

For these Reasons we find it recommended by *Antyllus*, *Cælius Aurelianus*, and *Aetius*, to People subject to Heart-burning, frequent Vomiting, habitual acid Eructations, Indigestion, Inappetency; to those who labour under an Atrophy, or are languid, cachectic, hydropic, asthmatic, consumptive; to Persons affected with Pains in the Thorax, or Diaphragm, or Abscesses in the Thorax; to pregnant Women, or those that labour under a Pica, that is, an inordinate Appetite for incongruous Food; and *Alexander* says it is good for Women in Labour, as it promotes Delivery: It is farther recommended by the above-quoted Authors, for Quartans, pituitous Disorders, and for People on the Recovery from almost any Disorder.

I must remark here, that there is scarce any vulgar Custom, let it seem never so trifling, but what may be found recommended by one or other of the antient Medicinal Authors. The Advice of *Alexander*, above-quoted, is followed by almost all the common Midwives in the World, who advise frequent Vociferation to the Women in Labour, under their Care, and it seems not unlikely to have a very good Effect.

Galen, 8. de Med. Local. Cap. 4. recommends Unctions, Exercises, and Vociferation, applied by an experienced Artist, for Pains in the Stomach. It is the Judgment of that antient and most excellent Physician *Aretæus*, that Vociferation is an excellent Exercise, not only in Leprous Cases, but also in the Coeliac Passion.

Aetius was of Opinion, that Vociferation was of Service in Hoarsenesses, occasioned by superfluous Humidity, in Resolutions of the Organs of Voice, and a Cachexy; and if the Voice is affected by some Distemper, or becomes spontaneously bad, *Antyllus* advises this Exercise. But as the Voice itself receives Injury not only from too long continued, or too loud Talking, but also from too much Silence, whereby the Organs of Voice forget, as it were, their Functions by Disuse; in both these Cases the proper Exercise of the Voice may be of Service; for, by this, the Defects contracted by too long and loud Talking, may be moderated; and a Shrikeness in the Tone of Voice may be remedied by an Intermixture of deeper Notes; and the Exercise of the Voice may be rationally supposed to mend Defects thereof, caused by too much Silence, and the Disuse of the Organs subservient thereto.

Hippocrates asserts, that the Exercise of the Voice, after Supper, is beneficial in Cases where the Flesh has been wasted by too strong Labour and Exercise.

It is however to be remark'd, that Vociferation is not accommodated to Disorders of the Head, because it has a Faculty of filling the Head with Humours, and thereby affecting the Organs of Sense contained therein.

Hence it is, that *Cælius Aurelianus*, approving of it for the Epilepsy, in the Declension of the Disease, prudently adds, "provided the Patient can bear it." For the violent Vociferation, which sometimes is call'd ἀναύδισις, by *Aretæus* φωνασκία, is said by *Hippocrates* to afflict (λυπεῖν); besides that, it fills the Head, and renders it more heavy, as *Aretæus* and *Galen* testify: It is also in an extraordinary manner, according to his Opinion, pernicious to the Voice, and also makes the Veins burst: And *Cælius*, for the same Reason, disapproves Exclamation for Persons affected with the Epilepsy, as too violently straining the Parts affected; and *Pliny* the younger, with Justice, complained

plained that *Zosimus*, his Freed-man, whilst he studied the Recovery of his Voice, fell into a fresh Hæmorrhage, after the Vessel, which used to discharge the Blood, had been stopp'd. *Aræteus*, however, advises it in stomachic Disorders; and *Aetius* for suppressing the Hickup: But it is observable, that almost all Authors remark, that Vociferations were never rashly or unadvisedly to be used, especially by such Persons who commence, whilst they are unacquainted with this Exercise; nor ought any Person to use it who abounds with bad and corrupt Humours: Moreover, the Voice is not to be exercised, if the Stomach is disordered with many and manifest Crudities, left by the Action of Inspiration and Expiration, which becomes more strong and quick, whilst the Voice is increased, both with respect to Frequency and Loudness; the corrupt Vapours be more widely distributed through the Body: Wherefore it was the Advice of *Aræteus* to exercise the Voice gently, and to utter deep Sounds; because shrill Notes occasion Distentions of the Head, Palpitations at the Temples, Pulsations of the Brain, Strainings of the Eyes, and Ringing of the Ears; but the Voice, gently used, does Good to the Head. We must beware also of Vociferation after Meals, because by these the Voice is very much disorder'd: Whence *Aristotle* advised Actors, Singers, and others of such Professions, to exercise their Voices with an empty Stomach; otherwise the Breath, being heated, as well by the undigested Food, as by their Exclamations, exulcerates the Aspera Arteria as it passes thro' it, and so the Voice is spoiled: In short, we must take care, according to *Plutarch's* Opinion, that no one, conscious of a Plenitude, or of immoderate Lust, or Fatigue, strains his Voice; nor uses too violent Vociferations, and brawling Clamours; since such unequal Strainings of the Voice, and Violence, produce Ruptures of the Vessels, and Convulsions.

Next to Vociferation succeeds Singing, differing from it in this, that it consists in a certain Harmony, nor is it perform'd with so much straining of the Voice; for which Reason, besides other Advantages, it is productive of a certain Pleasure, which Vociferation has not. For *Alexander* writes, "That Porters, if they sing, feel their Burden the less," because the Mind, soothed with the Notes and Harmony of Numbers, is insensible of the Weight, and so becomes less affected. For similar Reasons the Antients generally made use of Pipes and Music for Persons mourning, and otherwise disturbed (which *Aristotle* also acknowledged); and it was customary to have Men assembled and talk of indifferent Subjects to such as were grieved at the Death of their Relations, and mourned: Since the Mind, when it turns itself to talking, is less affected with Grief; which the Antients well understanding, invented different Scenes of Diversions, in order to divert the Mind, and disengage it from the Subject of Grief, sometimes with one, sometimes with another Entertainment. With respect to Singing or Vociferation with Harmony, *Antyllus*, *Aetius*, and *Paulus* are of Opinion, that it contributes nothing to Health: But I find it sometimes apply'd in Distempers; for *Cælius Aurelianus* writes, that the Exercise of the Voice compos'd in a musical Strain was found useful for mad People in the Decline of their Disorder.

Besides, *Aulus Gellius* relates, that he found it written by *Theophrastus* and *Democritus*, that playing upon Pipes, and Singing, cured the Bites of Vipers and of Men; and moreover, it was believed, and has been handed down to Posterity, that such as have the Sciatica, when in the Violence of their Pain, if they themselves, or a Musician plays soft Music, (which we read to be the constant Practice of *Ismenius the Theban*), their Pain was abated, as the Brother of *Philistion* has also acknowledged. This kind of Remedy some have thought to be the Invention of *Pythagoras*: Tho' *Soranus*, who is Author of those three Books concerning acute Distempers, translated into Latin by *Cælius Aurelianus*, reflecting upon *Asclepiades*, who profess'd to cure phrenetic Patients by Singing, very justly said, "That they are possessed with a strange conceited Opinion, who believed that Excess of Pain can be removed by playing on Music or Singing." If therefore Singing conduces little towards the Preservation of Health, and the Sound of deeper Notes is useful, Persons studious of their Health ought rather to study Vociferation than Singing: Because a Quantity of Air thus attracted defends the Thorax, opens or dilates the Belly, and all the Passages dispersed thro' the whole Body; when in Singing there can only a more useless Amusement be found, more fit to render robust Bodies effeminate, than to preserve or strengthen them. Whence I have often admired why *Socrates* (as *Plutarch* relates) us'd to exercise himself with Singing, and not with Vociferations, since by these, and by reading fast, the Excretions of redundant Humours are promoted; and those who read faster are more affected, and principally by Sweats, whilst those who read more leisurely, and less loud, are reliev'd by means of insensible Perspiration. Nevertheless, we ought always to remember the saying of *Avicenna*, That it is dangerous to strain the Voice a long time, and that, from Exercises of the Voice, Herniæ and Ruptures of the Vessels are often caused. *Hieron. Mercurialis de Arte Gymnastica*.

ANAPHORA; ἀναφορά, from ἀναφέρειν, to bring up, or upwards. In a Medicinal Sense it imports a Spitting of Blood, if join'd with ἀίματι. But *Hippocrates*, in his Treatise de Arte, uses it to express an Obligation, or Thanks due for an Obligation. Hence,

ANAPHORICOL, ἀναφορικοί, those who spit Blood; or, according to *Aëtius*, those who expectorate with Difficulty. The Word in itself, according to Etymology, seems to signify no other than those who cast or throw up any thing from the lower Parts: *Dioscorides*, Lib. 2. de Materia Medica, as he is translated by *Cornarius*, seems to understand by it those who throw up Blood from the lower Parts at the Mouth. But *Marcellus Virgil*, restrains the Word, in the Place before cited, to a painful and difficult throwing up, or vomiting; wherein he follows *P. Ægineta*, who, Lib. 3. Cap. 28. of the Affections of the Arteries, as *Goupylus* renders him, seems barely to understand those who expectorate with Pain and Difficulty. And, indeed, the Greeks by these Words ἀναγερν, ἀνάσσειν, ἀναφέρειν, when put absolutely, without any Addition, usually mean not so much a bringing up of Blood, as of any other Humour, or Collection of purulent Matter contained in the Breast or Lungs, which are to be evacuated by the Mouth; so that those whom *Dioscorides*, Lib. 2. τῶν ἐν πύλιν, and everywhere in his Book de Materia Medica, calls ἀναφορικοί, are by *Hermolaus Barbarus* rightly translated "such as bring up corrupt Matter," where he has taken the Author's Sense much better than *Cornarius*.

I am, however, aware, that most Authors use this Word to signify such as spit Blood. *Serapion* restrain'd its Meaning to an Expectoration of Sanies; but to this Word most added ἀίματι. How great the Differences are between Hæmoptoici, or Spitters of Blood, and Anaphorici, appears from the different Remedies which they require. *Gorraeus*.

ANAPHRA, ἀναφρα, from ἀ Negative, and ἀφρός, Froth. It is used by *Hippocrates* as an Epithet to Stools, in order to express their being not Frothy.

ANAPHRODISIA, ἀναφροδισία, from ἀ Negative, and ἀφροδισία, Venery. Impotence with respect to venereal Commerce.

ANAPHROMELI, from ἀ Negative, ἀρής, Froth, and μέλι, Honey. Despumated Honey, or Honey boil'd till it will no longer froth. *Blancard*.

ANAPLASIS, ἀνάπλασις, from ἀναπλάσσειν, to restore to the original Form. *Hippocrates*, in his Treatise de Officina Medici, uses this Word to express the replacing a fractur'd Bone in the same Situation it obtain'd before it was broken. In the same Treatise also, it signifies a Restoration or Renu-trition of the extenuated Flesh.

ANAPLEROSIS, ἀναπλήρωσις, Repletion in general. But it also signifies that Part of Surgery which is concern'd in restoring Deficiencies, and in this Sense is the same as PROSTHESIS, which see. Hence, ANAPLEROTICA are Applications which encourage the Growth of Flesh in Wounds or Ulcers. Incarnatives.

ANAPLEUSIS, ἀνάπλευσις, from ἀναπλέω, to fluctuate, or float upon. *Hippocrates* sometimes uses this Word to express the Redundance of Humours fixing on a Bone, which makes it rot, exfoliate, and fall off, as is sometimes the Case of the Bones of the Jaws.

ANAPNEUSIS, ἀνάπνευσις, from ἀναπνέω, to respire. Respiration. But *Aræteus* uses it to express a Truce from Pain; as *Homer* uses it also to express a Truce from War. It signifies also Transpiration.

ANAPODOPHYLLON, (of *Anas*, a Duck, πῆξ, a Foot, and φύλλον, a Leaf). Duck's-foot, or Pomum Maiale, May Apple.

The Characters are;

The Cup of the Flower consists of one Leaf: The Flowers are hexapetalous. The Foot-stalk of the Flower comes out from the Stalk of the Leaf. The Fruit is in the Shape of an Urn, in which are contained many roundish substriated Seeds.

This Plant was brought from America, and is by some of the Inhabitants called Black Snake-root, and by others the May Apple; I suppose, because in that Month the Fruit of this Plant is nearly ripe, and is of an oval Shape, in some measure resembling a small Apple. We have but one Species of this Plant in England, which is the *Anapodophyllon, Canadense Morini*. Tourn.

This Plant is very hardy, enduring our sharpest Winters in the open Ground: It is increased by parting the Roots in August, after the green Leaves decay: It loves a moderate Soil, and for the Oddness of the Plant may merit a Place in a good Garden, although it is of no great Beauty nor Use. *Millar's Diet*. Vol. I.

ANAPSYXIS, ἀνάψυξις, Refrigeration.

ANARISTESIS, ἀναρίστησις, from ἀ Negative, and ἄριστον, a Dinner. *Hippocrates*, in his Treatise de Insomniis, uses this Word to express the Subtraction of Dinner from a Patient.

ANARRHOEA, ἀναρροια, from ἀνα, upwards, and ῥοια, to flow. A Flux of Humours, tending from the inferior Parts, upwards. *Castellus* from *Schneider. de Catarrho.*

ANARRHOPIA, ἀναρροπια, from ἀνα, upwards, and ῥοπια, to verge. A Tendency of the Humours to verge or incline upwards, or towards the superior Parts; as *καταρροπια* is a Tendency of the Humours to the inferior Parts. See CATARRHOPIA.

ANARTHROI, ἀναρθροι. *Hippocrates*, in his *Treatise de Aere, Locis, & Aquis*, says, that a certain People amongst the *Scythians* are ἀναρθροι, to express their being so fat and bloated, that their Joints are obliterated, and not discernible. It is derived from a Negative, and ἄρθρον, a Joint.

ANAS, the Duck, distinguished into the Wild and the Tame. The Tame Duck is thus named:

ANAS, *Offic. Bellon. des Oyse. 160. Anas domestica, Aldrov. de Ornith. 3. 188. Jonf. de Avib. 95. Schrod. 5. 314. Charlt. Exer. 104. Anas domestica vulgaris, Will. Ornith. 293. Raii Ornith. 380. Ejusd. Synop. A. 150. Circur. Gesn. de Avib. 83. THE DUCK OR DRAKE.*

The whole Duck alive, the Fat, Blood, and Dung are used.

A living Duck, stript Part of it bare of Feathers, and apply'd to the Belly, eases the Pain of the Colic. It is useful in external and internal Pains, as of the Sides, Joints, and in a cold Distemper of the Nerves. The Blood is an Alexipharmic, and therefore sometime used in Antidotes. The Dung is apply'd to the Bites of venomous Creatures, *Schrod. Dale.*

The Flesh of the Tame Duck is not esteem'd very good Aliment for sedentary People, those whose digestive Organs are weak, or for such as confine themselves to a Regimen, either on account of preventing Diseases, or for the Re-establishment of Health, because it is not very easily digested, nor does it afford very good Juices.

The Wild Duck is thus distinguished:

ANAS SYLVESTRIS, *Offic. Schrod. 5. 314. Anas torquata minor, Raii Synop. A. 145. Aldrov. Ornith. 3. 212. Anas fera torquata minor, Gesn. de Avib. 99. Anas fera, Charlt. Exer. 104. Mer. Pin. 180. Boscas major, Jonf. de Avib. 97. Will. Ornith. 284. Raii Ornith. 371. THE WILD DUCK AND MALARD.* They live in Rivers. The Fat, Blood, and Dung are in use. As for the Virtues, they agree with those of the common Duck. *Dale.*

The Salts of the Wild Duck are much more exalted than those of the Tame Duck, both on account of the habitual Exercise and Aliment of the wild Species, for these live much on Fish and aquatic Insects. The Wild Duck therefore must be a proper Aliment, when an Acefcence prevails in the Stomach and Intestines, or in the Juices; but the contrary, where there is any Tendency to an alkaline Putrefaction.

Lemery, in his *Treatise on Aliments*, makes the following Observations on Ducks.

There are two Sorts of Ducks, the Tame and the Wild Duck; the last of which has brown and reddish Flesh, more valued for the Goodness of its Taste than that of the Tame Duck. Whether you make Choice of the one or the other, you are to pitch upon those that are tender, young, fat, fed with good Food, and bred in a pure and serene Air.

Duck is nourishing enough, and is a Food that is solid and durable. Some Authors think, that the eating of it puts a good Colour into the Face, and makes the Voice pleasant and agreeable.

The Duck, and especially the Tame one, is hard of Digestion, and breeds dull and gross Humours.

The Tame Duck contains much Oil, volatile Salt, and Phlegm; and the Wild ones have more volatile Salt than the other, but less Phlegm.

Both the one and the other agree, in cold Weather, with young hail People, who are used to much Exercise, and have a good Appetite.

REMARKS.

A Duck is an amphibious Animal; for she lives by Land and Water. The Tame one is not so well tasted, nor so wholesome as the Wild Duck; and the Reason is, because she has not near so much Motion, and consequently abounds with dull, viscous, and gross Humours. Moreover, the Tame Duck lives among Mire, and feeds upon filthy things, such as Mire and Ordure, dead and rotten Fish, Frogs and Toads; whereas the Wild ones live upon Foods which they seek for every-where: They have also a freer Transpiration, by reason of the Exercise they have, which helps to attenuate and drive out the gross Humours they may have in them, and, lastly, more and more to exalt the Principles of their Fluids, and for that reason they abound more with volatile Salt, than the Tame ones do.

The Goose and Duck are much like one another in respect to the Substance of their Flesh, and very near produce the same Effects. The Wing of a Duck, as well as that of a Goose, is excellent Food; and *Martial*, by the following

Lines, shows what were the Parts of a Duck most in Esteem, for the Goodness of their Taste:

*Tota mihi ponatur anas, sed pectore tantum
Et cervice sapit; cetera redde coquo.*

The Tame Duck raises itself but a little from the Earth, and walks slowly, because she is very heavy; but in lieu of that, she swims very easily, and fast, and can for a long time hold her Head, and the rest of her Body, under Water, either to seek for somewhat to eat, or to conceal herself.

The Liver of a Duck, besides that it hath a very good Relish, is also to be looked upon to be good for stopping the Flowing of the Liver.

The Fat of a Duck is of a mollifying, dissolving, and softening Nature.

They open the Body of a Duck, and apply it warm to the Belly in the Wind Colic.

There are several sorts of Wild Ducks, that differ from one another in Bigness, Form, Cry, and Colour. There are some of them which fly slow, and others very swiftly: However, we may say in general, that Wild Ducks, for the most part, fly faster than Tame ones: They usually live where there are Rivers, Marshes and Lakes.

ANASARCA, ἀνασarca, or, as it is sometimes wrote in two Words, ἀνα σarca, in the Flesh.

A Species of Dropsy, wherein the Flesh appears puff'd up and swell'd, and yields to the Impression of the Fingers like Dough. See HYDROPS.

ANASPISIS, ἀνασπισις, from ἀνα, and σπιδω, to draw, *Hippocrates*, in his *Treatise de Prisca Medicina*, uses this Word to express the Contraction of the Stomach. He says, *These Stomachs digest much slower, and want a greater Degree of Contraction, ἀνασπισις*. I suppose he means, that the Stomach wants a greater Degree of Elasticity and Tension; and we know, that when the Fibres of the Stomach are relaxed, Digestion is neither performed so speedily, nor in any respect so well as it ought to be.

ANASSUTOS, ἀνασutos, from ἀνα, for ἀνω, upwards, and στω, to move. The Word is, I think, peculiar to *Hippocrates*. He uses it in his second Book de *Morbis Mulierum*, as an Epithet to Air, where speaking of a Suffocation of the Uterus, call'd by the Moderns *Hysterics*, he says, *if the Uteri*, (in the Plural Number) *approaching the Heart, cause a Suffocation, and the Air in Expiration is forced out with Violence, ἀνασutos*. *in ὁ δὲ βιάμενος*, the Patients perceive a great Anxiety, and vomit. In Hysteric Fits we frequently see a Patient labour for breath, the Air being a long time in entering the Lungs during Inspiration, and immediately after rushing out with great Velocity, so that the Inspiration is not proportion'd to the Expiration with respect to Time; something of this Kind happens in that Action of the Lungs usually call'd *sighing*. Physicians who have seen Women in Hysteric Fits, will readily understand what *Hippocrates* means by this, the Thing itself being the best Explication of the Word.

ANASTALTICA, from ἀναστήλλω, to contract. Styptic, or restraining Medicines.

ANASTASIS, ἀνάστασις, from ἀνίστημι, to cause to rise. In the Classics this Word usually imports a Resurrection, or the Removal of a Camp or People from one Place or Country to another. But *Hippocrates* uses it in two Senses, both somewhat different from these. The first is a Rising up, in order to go to Stool. The second is the Migration of Humours, when expell'd from one Part and oblig'd to remove to another.

It is also sometimes used to express a Rising up on the Recovery from Sickness, or the Recovery itself.

ANASTOICHEIOSIS, ἀναστοicheiosis, from σπιδω, a Principle or Element of which Bodies are composed. *Castellus* explains this very properly by Re-ementation, or a Resolution of the Solids and Fluids of the Body into their first Elements. It is principally used to express a Colliquation of the Solids or Fluids, when in a morbid State, in order for their Expulsion out of the Body.

ANASTOMOSIS, ἀναστομωσις, from ἀναστομω, to relax or open the Mouths of the Vessels. This Word imports the opening of the Mouths of the Vessels, in order to discharge their contain'd Fluids. Thus the Menfes, Hæmorrhoids, and Blood from the Nose, are said to be discharg'd *par Anastomosis*, that is, by an Aperture, or Opening of the Mouths of the Vessels; whereas, when the Fluids contain'd in the Vessels transude thro' the Sides, the Discharge is said to be *per Diapedesin*; but if the Vessels have been corroded by acrimonious Humours, the Evacuation is said to be *per Diabrosin*, διαβρωσις, by Exection; and if the Contents of a Vessel are let out by a Rupture thereof, it is said to be *per ῥήγμονα*, *Celsus, L. 4. C. 4.*

Hence ANASTOMOTICA, are aperitive Remedies, or Medicines which have the Power of opening the Mouths of the Vessels, in the Sense of *Hippocrates, Celsus, and Caelius Aurelianus*.

But ANASTOMOSIS also implies *Inosculation*. Thus the ANASTOMOSIS of the Arteries and Veins, is their Inosculation, or their Communication together, at their Extremities.

ANATASIS,

ANATASIS, ἀνάστασις, from ἀνίστημι, to extend upwards, or lift up. An Extension of the Body upwards. It is opposed to Catatasis, which is an Extension of the Body downwards. *Galen.*

ANATES, a Disease of the Anus. *Castellus* from *Laurentius bergius.*

ANATHLASIS, ἀνάθλασις, from ἀνά and θλάω, to confuse, or break. *Erotian* explains this by ἐκθλάω, Expression.

ANATHREPSIS, ἀνάθρεψις, from ἀνατρέφω, to renourish, or reconvey Nourishment to Bodies wasted by Sickness. Renutrition.

ANATHRON, a sort of Salt, which vegetates upon Rocks, in the Form of a white stony Moss. It is a sort of Nitre. *Johnson.*

ANATHYMIASIS, ἀναθυμίασις, from θυμιάω, to fumigate. It signifies Evaporation.

ANATICA PROPORATIO, from *Ana.* See A; and *ANA.* Anatic Proportion, it implies equal Parts.

ANATOME, ἀνάτομή, from ἀνατέμνω, to dissect. Anatomy.

The Sect among the ancient Physicians, called *Rationalists*, held it necessary for a Professor of the Art of Medicine, to be acquainted with the interior Parts of the human Body. For since many Pains and Diseases are incident to these inner Regions, how shall a Person, say they, administer Remedies well adapted to those Parts of which he has no Notion? It is necessary therefore to dissect dead Bodies, and to inspect and search into the Viscera and Intestines. *Herophilus* and *Erasistratus* were very much in the right, in receiving Malefactors presented by their Kings, and cutting them up alive, that they might have an Opportunity, while there was yet Breath remaining, of considering those things which Nature had before locked up and concealed, and of examining their Situation, Colour, Figure, Magnitude, Order, Hardness, Softness, Smoothness, and Roughness, their Situation, and their Connections and Communications with each other. For suppose an inward Pain, how shall a Physician know the affected Part, if he be ignorant where any one of the Intestines or Viscera lies? And how can the diseased Part be cured by one who does not know what it is? And when the Viscera happen to be laid open by a Wound, one who never saw the Colour of a sound Part, cannot know the sound from the corrupted, and consequently must be incapable of applying a Remedy to what is corrupted. Besides, the Knowledge of the Figure, Situation, and Magnitude of the interior Parts, renders a Person better qualified for the Application of external Remedies. Nor can it be deemed Cruelty, by the Punishment of Malefactors, and but a few of them neither, to search out Remedies for innocent Persons to all future Ages.

On the contrary, they who called themselves ἐμπειροί, "Empirics," from their experimental Knowledge, maintained, that it was not only unnecessary, like many other things insisted on by the Rationalists, but also great Cruelty, to cut open the Breasts and Bellies of living Men, and to turn that Art which professes the Guardianship of human Health, to the Destruction of Individuals, and that in the most barbarous manner that can be devised; especially when the things which are inquired after by such violent means, are, some of them, impossible to be known at all, and others may be known without such Barbarity. For as to the Colour, Smoothness, Softness, Hardness, and all such-like Qualities, they are quite different in a dissected, from what they were in an entire Body. Even while Bodies remain untouched, these Properties often suffer Alterations; by Fear, Pain, Hunger, Indigestion, Weariness, and a thousand other less violent Affections. How much more probable then is it, that the interior Parts, which have a greater Degree of Softness, and which are Strangers even to the Light, should undergo a Change from such desperate Wounds, and downright Murder? Nor can we do more absurdly than to imagine any thing in a Man to be just the same whilst he is alive, as it is when he is expiring, or even dead. For even the Belly, though it may contain Air, cannot be divided without immediate Death; but as soon as the Knife comes to the Region of the Heart, and the *Septum transversum*, which by a certain Membrane, called by the *Greeks* the *Diaphragm*, separates the upper Parts from the lower, is divided, the Man loses his Life that very Moment, and so the butcherly Physician comes to have a full Prospect of the Heart and its Appendages, with all the Viscera of a dead Man, which can be no other than such as belong to the dead Man, and not such as were belonging to the living Man. So that all the Physician gains, is barbarously to commit Murder, without being the wiser with respect to the State of the Viscera during Life. However, if there be any thing of this Nature that can be the Object of our Sight, while the Breath is in the Body, Chance often subjects the same to our View, when we attend the Sick. Sometimes, for Instance, a Gladiator in the public Shews, a Soldier in a Battle, or a Traveller fallen among Thieves, receive such Wounds as lay open the interior Parts, some one Part, some another, where the sagacious Physician, whose Mind is set on curing his Patients, not on Blood and Slaughter,

VOL. I.

may behold the Situation, Posture, Order, Figure, and the like, and attain the same Knowledge by the way of Pity and Compassion, which others reap from their detestable Cruelty. If these Reasons be considered, even the Mangling of dead Bodies, which if not cruel, is at least filthy, will appear unnecessary; since most things are found in dead Carcasses in a manner different from what they were in the living Body; and all that can be known in living Bodies is evidently shewn in the Cures which are made upon them.

Celsus concludes with giving his Opinion as a Moderator in these Words: To dissect the Bodies of living Persons, is both cruel and unnecessary; to anatomize dead Bodies, is necessary for a Learner; for he ought to know the Posture and Order of the Parts, which are better represented in a Carcase than in a wounded living Person. As to the rest, which can only be learnt in living Bodies, Practice will, tho' by a slower, yet in a more merciful way, demonstrate them in the Operations on wounded Persons. *Celsus in Præfat.*

I am sensible there have been modern Physicians, who, ignorant of Anatomy themselves, by a Piece of Policy, not altogether free from Guilt, have represented an Accuracy in this Science as trifling, and of no great Use towards the Cure of Distempers. I believe the following Dissertation will set every reasonable Man right, as to the Uses of Anatomy in Medicine; and certainly every Man of Capacity, and a right Turn, must in proportion be qualify'd to cure Distempers, as he understands the Structure of the internal Parts.

It must however be confess'd, that Anatomical Knowledge has sometimes fallen to the Share of People, who by a Misapplication of it have rendered themselves worse Physicians, than they would have been without it. Such are those of whom *Doctor Friend* speaks, "who, though they have been exact enough in the dissecting Part, yet, without any regard to Nature, or right Philosophy, are for advancing every trifling Discovery into a more trifling Hypothesis." This is, however, no rational Objection to the Art itself, but to an ill Use of it.

I must remark, that in refuting the Arguments against Anatomy, in the first Part of this Dissertation, *Hoffman*, who is the Author of it, had *Stahl* in View, who was a sort of Rival to him, both being Professors in the same University, and both eminent for their great Knowledge in the practical, as well as theoretical Part of Physic. But *Stahl*, it seems, had some extraordinary Notions concerning Nature. See *NATURA*.

Of the Use of Anatomy in the Practice of Medicine.

Those who apply themselves to the Study of Politics, are obliged to make themselves acquainted with Geography, a Science, highly necessary for the Illustration and Improvement of that Kind of Knowledge. Of the same Service is Anatomy, or the Knowledge of the human Body, in Medicine; and he who enters himself in the Mysteries of this Art, well furnished with anatomical Knowledge, can scarcely fail of Success in his Practice.

Now, in the Study of Geography, it is not enough to know the Situation and Position of Places, with their Rivers and Mountains, but we ought to have clear Notions of other things, which principally recommend this Branch of Learning. We must be acquainted with the natural Genius of the Inhabitants, their Customs and Manners, in what Arts, or in what Branches of Commerce they principally excel. We ought to know farther in what the Riches of the Country consist; what Plants and Animals are produced in it, what are the Qualities of the Air and Waters; and, in short, what Stones and Minerals the Earth conceals within its Bowels. Whoever observes these things in his Study of Geography, and makes it his Business to attain just Ideas of them, may reasonably expect from thence no small Help and Advancement in his political Studies.

The like Observation may be made with respect to Anatomy, the exact and curious Knowledge of which does not barely include the Situation of one or other of the Viscera; or the Magnitude, Colour, Figure, and Order of the internal Parts, but is of very wide Extent. For it is necessary to inspect, with all our Curiosity, the peculiar Structure of each Part; which is formed with the highest Art and Skill, to find out its Use, what Function it performs in the Body, what Connexion it has with other Members; and to comprehend what Influence it has, after a wonderful manner, on different and remote Parts.

Such a Knowledge of Anatomy is a most firm Foundation, on which the whole Body of Medicine may securely rest; if this be removed, all rational Explications in medicinal Matters, shake and give way, Practice is in Danger, and even Medicine itself falls all to Ruin. The Use of Anatomy in Surgery is so undoubted, that none but such as are little versed in the medicinal Art, will have the Rashness to deny it. This Part of Medicine, in order to be rightly and successfully exercised, requires a perfect Knowledge of the external Part, for which it is extremely obliged to Anatomy, and, by means thereof, may be carry'd to the highest Perfection. Perhaps it may be doubted by some Physicians, who employ themselves more in exercising

cising than in studying the Art, whether Anatomy promises any Advantages to us in Practice. We must declare, that we are wholly of Opinion, that a solid and skilful Physician is principally obliged to Anatomy for these Qualifications; and therefore can by no means be excused from having them. For the fuller Confirmation of our Assertion, especially in this Age, wherein the Sciences have received so much Light and Improvement, we shall, in the following Dissertation, assert the Usefulness of Anatomy in Practice; in which we shall be a little prolix, that we may the better do Justice to so noble a Subject.

To come immediately to the Matter in hand, we shall first consider the Arguments of those who are of a different Opinion as to the Excellency of Anatomy, and account it of little Use in practical Medicine. These People, that they may confirm their Opinion, constitute in the human Body a *Nature*; by which they mean a Soul. From this Principle they suppose every Motion to flow, as from its first Spring; by this, all Effects produced in the Body, are disposed and regulated, since the Body is an Instrument merely passive, and only qualified to receive those Motions.

This *Nature*, or Soul, according to them, renders the Body sound and vigorous, guards it against Diseases, and expels them when contracted. For since this *Nature* is endued with an exact Knowledge of the Body, it must act in certain Order, Measure, Time, Degree, and Place, and for a certain End, so as to be sufficient, not only for preserving the Body in Health, but for expelling any Disease which may happen to infect it, since the most savage and illiterate Nations, who neither know the Virtues of Herbs, nor are acquainted with any other Remedies against Distempers, will sometimes recover their lost Health by the sole Benefit of Nature. Hence they conclude, that the chief Duty of a Physician is to acquire the Knowledge of the Powers, Ways, and Intentions of *Nature* alone, neglecting the Care of the Body, because it is merely passive. In Confirmation of their Opinion, they add, that Medicine had a Being, and flourished too, in former Times, when Anatomy and natural Philosophy were very little cultivated; and that the Art of Healing, in some who lived in those Times, surpassed the Skill and Address of our Days, though the Physicians of those Ages, being contented with simple Remedies, knew nothing of the medicinal Virtues of Metals and Minerals, nor the artificial Preparations of Remedies. As for Anatomy in particular, in order to depreciate it, they add, that the most complete and accomplish'd Anatomist, who very well understood all the Muscles, and their Texture, would succeed no better in his Attempts to cure them of any Disorder, than one of the most superficial Knowledge in this Part of Medicine. For it is the Soul which puts together the Parts of the Body, and is the Contriver of this wonderful Structure; and if any thing happens to be broken or damaged, the same Power will take care to restore it, and set all things to rights, without the Help of a Physician. Since therefore these things are all at the Disposal of the Soul, Anatomy can be of no Advantage in practical Physic.

Having thus proposed the Arguments which are brought against Anatomy, we are next, according to our Method above declared, to vindicate the Dignity and extensive Usefulness of Anatomy by examining these Reasons, and giving a full Answer to all these Objections. Here first we think ourselves obliged, in few Words, to explain what is meant by *Nature* among the Antients. For our Ancestors, though, on other Accounts, very wise Persons, and highly to be revered, both for their good Parts, and long Experience, yet in rational Medicine, and natural Knowledge, I won't say they were inferior to the Moderns, but that, for want of these Improvements, they took their Measures of the salutary Art, only from Effects and Experiments. Hence it is, that in those Times, the Art of Medicine was taught in a rude and imperfect manner; because the most noble Branches of Learning, that of the Nature and Motion of Bodies, lay in a manner buried; and as for Chymistry, it was wholly unknown; for which Reason, our Indulgence is due to the Simplicity of those Ages for the many unaccountable Stories and idle Dreams they have left us upon Record. They are often talking of several Sorts of active Beings; they considered Matter as passive and inert; and look'd upon the human Body as a mere Instrument. The Soul, or Nature, they supposed to be an incorporeal, wise Being, endu'd with Reason, and Author and Governor of all the Motions of the Body. Having laid this Foundation, it was necessary, that since the Principle was obscure and unknown, all Science and Demonstration should be extremely precarious. How great Detriment must result from hence to the Art of Medicine, and how great a Hindrance, on the other side, it must be to the Improvement of the practical Part, is manifest from the Lights we have received in this present Age, which shall be further explained. For when neither the Powers nor Effects of corporeal things, which yet act upon us after a wonderful manner, can be explain'd or demonstrated from an unknown Principle, it easily appears in how great Darkness these Times were in-

volved; when they were obliged, for the Solution of Phenomena in Medicine, to have recourse to an unknown *Nature* as their only Refuge. I therefore think we have good Reason to congratulate the present Age, upon account of its being blest'd with a sound and rational System of Philosophy, by which we are taught, that all Bodies, of whatever Kind, are in a State of Action, and that Motion is no more than the Excess or Difference of Action and Force in any two given Bodies; for when two Bodies mutually resist each other, and when the one yields to the other in Consequence of that active Force, originally impress'd upon, and communicated to them by the all-powerful Author of Nature, then and in that Case, Motion is produced; and, *vice versa*, when the Forces of Action happen to prove a precise Balance to each other, then both Bodies remain in a State of Rest; and even those very Motions which are most regularly perform'd, and carried on by the strictest and most uniform Laws of Order, Harmony and Proportion, are no more than the beautiful Result of the various Situations and Combinations of different Bodies mutually acting upon, and resisting each other; for 'tis surprising what considerable Effects may be produced only by the Situation of Bodies: A familiar Illustration of this Point may be drawn from the Action of the Lever; for no incorporeal external Principle, much less a certain *Wisdom of Nature*, whereby she is enabled to produce Motion, is requisite for carrying on the regular and orderly Motions of Bodies; but a certain moving Force is originally impress'd upon these Bodies themselves, which may be either augmented or diminished according to their Situation and Disposition. Since in Productions of human Art, so wonderful and curious Effects flow only from the Action of Bodies upon one another, this must necessarily happen in a greater Degree in the Fabric of the human Body, that incomparable Machine, so delicately form'd, and exquisitely finish'd, by the all-powerful Hand of God; for the human Body must, in Dignity of Structure, excel all Productions of human Art, in the same Degree, that its august and venerable Architect surpasses frail and imperfect Mortals in Grandeur, Power and Skill: Since this Body is a Machine, in the Formation of which, the richest Stores of infinite Art have, if I may be allowed the Expression, been exhausted: Since 'tis a Machine formed by the nicest Art, and in which, almost all the Laws of Mechanics, Statics, Hydraulics, and Optics, take Place, a vast and amazing Variety of every Species of Motion must happen in it. A Physician must, for this Reason, make it his principal Care to understand the Texture of this Machine, and to know the Laws of the several Motions produced in it, whether by the Air, Aliments, or Medicines. When a Physician thoroughly comprehends these things, he can scarcely be ignorant of the genuine Bent and Tendency of Nature, but must plainly see, that she is not only the bountiful Source of Life and Health, but that she likewise governs and directs the Operation of Medicines, and all the several Motions that happen in the Body. When the Word *Nature* is taken in this Acceptation, as indeed it ought to be, then Physic is placed upon a true Foundation, and stands secure upon a Rock that cannot be shaken by the vain Efforts of Imagination and Error. And indeed a Physician who goes thus to work, cannot be ignorant when Nature is well disposed, and when otherwise; but must know in what Life, Health, Diseases, and Death itself consist; nor can the Reasons for a right Method of Cure, and a proper Choise of Medicines, escape him.

If on the other hand, Nature should, as with some of the Antients, be styled *Medicatrix Morborum*, or *The Curer of Diseases*, then nothing more is meant, than the Body itself, adapted with singular Art and Contrivance, for the Production of certain Motions; for by this peculiar Benefit and Assistance of the solid and fluid Parts, of which it is composed, as well as by the Qualities of the Elements and Food, it is enabled expeditiously to perform certain regular and stated Motions, which conduce very much not only to the Preservation of Life, but also the Removal of the Causes of Diseases. For this Reason, that this beautiful and curious Fabric of the Body may be thoroughly known, and its minute Parts discovered, Anatomy is to be carefully study'd, since it is the only Branch of Learning which can supply us with an accurate Knowledge of its Structure. Besides, the Body can neither subsist, preserve Life, nor escape the Fury of Diseases, unless it be guarded and fortified by external Means, such as Air, Food, and Medicines; and from this Circumstance arises the indispensable Necessity of Physic, which is, as it were, an Assistant to *Nature*, considers and governs her several Motions, discovers what occasions a good, and what a bad State of Health, and takes care, that things of hurtful Qualities be avoided and removed from the Body. And altho' many have been blest'd with a long and prosperous Life without the Assistance of Physicians, yet they never arrived at that happy State without the Assistance of Physic itself, that is, without Remedies, or proper Food, and Regimen. How daring a Piece of Insolence must it then be to affirm, that Nature alone is sufficient for the Cure of Diseases, since in many, both of the acute and chronical Kind, she can do

do little or nothing without the Aid of a Physician? It is not therefore sufficient, that the Physician has the Advantage of long Practice, and great Experience; that he knows what things are advantageous, and what are prejudicial; that he knows the Symptoms of a beginning Disease, or the precise Form and Manner in which it quits the Patient; but he must carefully weigh Circumstances and Reasons, and from them form his Judgment of Diseases, foretel their Events, and take rational and prudent Steps for their Cure. If any one follows this Method, he cannot so far miscarry in the Practice of Physic, which is a Work of the highest Importance, as to be of no Use to the Patient; for 'tis abundantly plain, that a Reliance upon Experience alone has too often imposed both on the Physician, and the Patient; wherefore in so great a Concurrency of Causes, 'tis proper to call in Reason and Philosophy to our Assistance, that so the true one may be discovered. Hence arises the Necessity of rational Medicine, which, being founded upon the Principles of Philosophy, must of Consequence be preferable to that which is circumscribed within the scanty Bounds of Practice and Observation. But such a Physic as is supported upon the Principles of Reason and Philosophy, not only deduces and solves the Phenomena occurring in Practice, from sure and uncontested Principles, but likewise greatly assists Practice itself, by suggesting the most salutary Maxims, for discovering a safe and easy Method of Cure. It is not indeed to be denied, that Physic drew her illustrious Origin from Experience; but it must at the same time be owned, that she received her most striking Charms, and all those Degrees of Beauty and Perfection, which at present set her at the Head of all her *Sister Arts*, from Reason and Philosophy. But for acquiring a Knowledge of this rational Medicine, Anatomy is absolutely and indispensably necessary, since without the latter, the former cannot possibly be obtain'd.

It must indeed be confess'd, that Anatomy does not directly and immediately cure the Sick; but yet it has a happy Tendency to make the Cure proceed more safely and agreeably, than it would otherwise do. *Celsus*, in his Preface, very justly observes, that *though there are many things which do not belong to the Arts themselves, yet these very things prove useful to them, by quickening and improving the Genius and Taste of the Artiste*. Thus, tho' a Contemplation of the Works of Nature may not form a Physician, yet it renders him better qualified for the Practice of Physic. In like manner, tho' Anatomy does not constitute a Physician, yet it proves at once an Ornament and an Assistance to him, by supplying him with wholesome and salutary Maxims, for the Direction and Regulation of his Practice; for no Branch of Learning is of greater Use and Advantage for discovering Errors in Practice, applying Remedies, and giving just Prognostics, than Anatomy is, as I shall shew more fully in the Course of this Dissertation.

I shall begin with that divine and noble Discovery the Circulation of the Blood; and indeed he must be blind, who does not perceive the Clouds of Darkness that have been dispell'd, and the glorious Light that has been shed upon Physic, by this celestial Discovery; for when, by an accurate Inspection of the human Body, we find that the Blood, and other Humours, are continually carried through numberless small Meanders, by the Vibration and Tone of the solid and muscular Parts; then we come to know wherein Life consists. We shall likewise be convinced of the Excellency of Anatomy, if we allow ourselves to consider, how egregiously the Antients, who neglected the Improvement of this useful Art, blundered in defining *Life*; for they vainly amused themselves with idle Whims and Conceits in this important Affair, asserting the Cause of Life to be *the Action of the Soul, or Nature, upon the Body; a vital Spirit; a small Flame in the Heart; an innate Heat; the Temperament of the four Humours; and an implanted and influencing Spirit*. These useless and unmeaning Dreams receiv'd a fatal Blow, and fell to the Ground at once, upon the Discovery of the Circulation of the Blood, which, so long as it washes the Body with its perpetual Stream, affords us the Evidence of our Senses for the Existence of Life; for 'tis the bountiful Office of this salutary Motion, to keep the Body safe and free from Corruption, to which 'tis otherwise very much subject. Neither are we to forget, that the Life of the Body is not, properly and strictly speaking, the Duration or Preservation of a compound Substance; for if this was the Case, and if Life was sustained in this manner, a Stone, or a Piece of Bread, might be said to live, so long as its respective Mixture or Composition remained. Life is more properly and accurately defined, a perpetual Action and Motion, by which the Body is principally preserved from Filth and Corruption. For as Putrefaction is no more than an intestine Motion produced in the Fluids by some external Cause, and destroying the Moisture of the Parts, so 'tis plain, that it can only be check'd by their internal, which is promoted by their progressive Motion; and this Motion wonderfully resists the circumambient Atmosphere, and its external Action upon the State and intimate Mixture of the Blood; for the Body is immediately exposed to the Injuries of the Air, as soon as the fluid Particles of the Blood come to be in a

State of Rest. As Medicine in general, so more especially the pathologic and therapeutic Branches of it, have received incredible Advantages from this Discovery; since by it we come to know, that nothing can be more fatal to Life, or more repugnant to Health, than those things which either hinder, or in the least disturb the free and salutary Circulation of the Blood. 'Tis no hard Task to find the Reason, why violent Cold is so prejudicial to the Body, or why Draughts of cold Liquors, drank by Persons over-heated, produce Death. Hence 'tis likewise plain, why polypous Concretions adhering to the Orifices of the Vessels near to the Heart and Lungs, produce sudden and unexpected Death, by intercepting the Course of the Blood. From the Circulation of the Blood, we are also enabled to assign a Reason, why Poisons prove so fatal to the Body; for, in my Opinion, they can scarce produce their Effects in any other way, than by exciting violent Spasms in the Vessels, contracting them, and so hindering the free Course of the Blood through them. We likewise know from this, that all acid and viscid Substances, as also too plentiful Feeding, are destructive of Health, and hurtful to the Body, because, either by insipifating or augmenting the Juices, they hinder their free Circulation, and produce immediate Loss of Health. As this is the Case, we may easily, from the Doctrine of the Blood's Circulation, deduce the most wholesome and salutary Rules for the Preservation of Health and Life; for every one who is fond of a long and happy Life, must by the Benefit of this Discovery perceive, that it is his chief and principal Interest to preserve the Circulation of his Blood uninterrupted, safe, and entire. Hence he must see the Necessity of abstaining both from such things as coagulate his Blood, and from such as, by augmenting its Quantity beyond a proper Degree, render it less fit for making its way through the several Vessels of his Body. He ought, on the other hand, to use all such things as have a Tendency to preserve his vital Juices in a due State of Fluidity, such as volatile Salts, Aromatics, and warm Infusions of balsamic Herbs, by means of which, the due Motion of the Blood is most effectually preserved. From this Discovery we must likewise perceive, that in case of too great an Affluence of Blood, its Quantity must be diminished; and that, in such Cases, Bleeding must not only be proper, but even prove the sole and only Preservative of Life.

Besides, Anatomy furnishes us with abundance of Reasons, why Death, in Spite of all the Medicines in the World, must prove the Fate of every Individual; for Life, which is no more than the perpetual Motion of the Fluids, not only depends upon their due Temperament, but also, and that more especially, upon a certain Motion of the solid Parts. Now when old Age begins to approach, the moving Fibres gradually become hard, thick, and immoveable, the Pores are shut up, and the Vessels are too full. Hence the Fibres, not being sufficiently animated by the subtle nervous Fluid, become stiff, inflexible, and unfit for protruding the Blood thro' the Body. Besides, when the cutaneous Pores are obstructed, the several Excretions must of course be retarded, and recrementitious Filth must be accumulated in the Body; the Consequence of which is, first, a bad Habit of Body, and, not long after, inevitable Death. If we reflect with a little Attention upon this Circumstance, the most effectual Means of obtaining a long Life cannot fail to suggest themselves to us, and convince us, that we ought to place our principal Care in preserving our several Juices in a due State of Fluidity, lest, thro' a Defect in that Point, the Pores should be block'd up, and the Fibres become gross and rigid. For preventing this, Motion and Exercise are very proper, since they are exquisitely calculated for preserving our Fluids in their due State. A pure and serene Air, thin and light Water, good small Wine, Food which contains little of an earthy and compact Substance, and which is light, and of easy Digestion, and Composure of Mind, contribute also to this End. When these Things are diligently attended to, and Health regulated by these Measures, Life must be preserved the longest that the Condition of our Natures will admit of. Nor is frequent Phlebotomy to be neglected, the Usefulness of which, for protracting Life, is sufficiently shewn by the Discovery of the Blood's Circulation; for 'tis plain, that by this means Blood, which by reason of its Abundance, is become thick and slow in its Motion, must be restored to its due and regular Course thro' the Body: Neither have we any Reason to be afraid of exhausting this rich Fountain of Life, since, as *Galen* has observed, the Antients took whole Pounds, instead of Ounces, as the Moderns do.

By the Help of Anatomy we likewise become acquainted with the formal Cause of Death, which, in whatever Shape it deprives a Man of Life, may be distributed into four Classes; for there must be either an Inflammation of the more noble Parts, such as the Meninges, Lungs, Stomach, and Intestines; or extravasated Blood or Serum, as usually happens in the Brain, Thorax, and Abdomen; or some of the Viscera must be corrupted; or a Polypus must be formed among the Vessels of the Heart or Lungs, obstructing the free Circulation of the Blood. I say, where-ever Death happens, it must be owing to one or other of these Causes,

Causes, as is plain from all Dissections. And, indeed, an Inflammation is the Cause of Death in acute Disorders; and a Corruption of the Viscera, or an Extravasation of Blood or Serum, produces the same Effect in chronical Cases: But a Polypus is generally found to be, of all others, the most speedy Cause of Death. These several Causes of Death plainly shew, that it is nothing more than a Destruction of the Circulation of the Blood. From the joint Consideration of these Circumstances, it follows, that he who intends to ward off Death, must be at due Pains to prevent Inflammations of the internal Parts of his Body, Weaknesses or Obstructions of his Viscera, and Extravasations of his Blood and other Juices.

This same Discovery, I mean that of the Circulation of the Blood, which is, without Doubt, the surest Prop, and the noblest Ground-work of all Medicine, clearly accounts for the Causes of Health, and sufficiently shews, that it can only be expected from a free and due Circulation of the Blood and Humours, and the several Excretions being carried on with Regularity: For when the Blood is carried thro' the Body in a calm, regular, and uniform Manner, then the several Elements of which it consists, are not only duly mixed with each other, but every thing that is of a recrementitious Nature, every thing that offends either in Quantity or Quality, is by that means evacuated, and drawn out of the Body. Thus all the animal Functions are performed, according to the Order and stated Laws of Nature; thus Health, and thus the Vigour of Health, are preserved: Those must therefore err, who maintain, that Life consists in the Excretions being duly made; because Life, even when the Excretions are entirely out of the Account, may cease; and Experience proves, that many die at the very time their Excretions are performed. We therefore, with better Reason, affirm that Health depends upon the Circulation of the Blood, which, when duly carried thro' the Body, renders the several Excretions regular and natural; whereas, when its Motion is too languid, or impair'd by any Disease, the Excretions are interrupted; nor, indeed, can there be any Disease in which the Excretions do not suffer. We even often see Patients die, rather from the Excretions being too copious, than from their being deficient; as may be observed in acute Disorders, hectic Cases, Dysenteries, and other Diseases of a like Nature. That Physician, therefore, acts a Part entirely consistent with the Dignity of his Character, who, in the Cure of Distempers, has a Regard not only to the Circulation of the Blood, but also to the several Excretions, especially that of Transpiration.

Since our Fluids pass thro' the Body very often every Day, and since indulgent Nature has every-where bountifully provided proper Emunctories for the Excretion of the recrementitious Matter, we must take care, that these Emunctories be always kept open; for by this means the Blood is rendered limpid, pure, and balsamic; and all such things as are capable of laying a Foundation for Diseases, are eliminated out of the Body. Among the several Emunctories, which are evidently to be found in the Body, those of the Skin, by which, as *Celsus* says, Transpiration is carried on, as it were, thro' so many invisible little Holes, are the most considerable; for what friendly Offices Transpiration performs to the Body, and how much it contributes to the Preservation of Health, may be conceived from this Circumstance; that more recrementitious Matter, and that too of a more virulent Quality, is discharged from the Body in this way, than by all the other Excretions together. Hence 'tis plain, that nothing can have a more direct and immediate Tendency to bring on Diseases, than a Suppression of the several Excretions, especially that by which the Filth and Sordes of the Body are carried off by Transpiration. As this is the Case, the Practice of that Physician must be rational, who, when he is perfectly acquainted with the Origin of the Disorder, restores the usual Excretions, opens the obstructed Emunctories, and disposes them to afford a free and easy Passage to the malignant and virulent Sordes: But this is most effectually brought about by means of a pretty quick and accelerated Motion in the Fluids; which, when it happens in acute Disorders, and especially in Fevers, sufficiently accounts for the Patient's recovering Health only by the Benefit of Nature, without any great Trouble to the Physician: For this intense Motion expels the Cause of the Disease, opens the Emunctories, attenuates the Humours, and soon restores perfect Health. The Reverse of this happens in Diseases of the chronical Kind, and of long Continuance, where the Motions, being sluggishly carried on, are to be accelerated by Art, and the Weakness of Nature is by that means to be assisted. In Disorders therefore of this Kind, Sudorifics, Chalybeats, Bitters, Salts, Purgatives, warm Baths, and mineral Waters, are of singular Advantage; and the Virtues of these Remedies, in Cases of this Nature, are to be accounted for only from this, That by their quick and accelerated Motion they remove the Obstructions of the Body, and, by restoring the several Excretions, reduce the Fluids to a natural and orderly State. The same Reason may be assigned, why Motion and Exercise, the Drinking of wholesome mineral Waters, and the Clemency of the Air and Climate, have so

happy an Influence upon chronical Disorders, and prove so effectual in carrying them off.

But since the Antients were ignorant of the Blood's Circulation, we need not be much surpris'd, that they fell into various Errors in Practice; but, to pass over others of their Blunders, 'tis well known how careful, or, to speak more properly, how whimsical and superstitious they were in opening certain Veins, being groundlessly persuaded, that this or that particular Vein was appropriated or consecrated to this or that particular Part; the Head, for Instance, the Heart, or the Liver; and that, in the Diseases of those Parts, it was necessary to open their respective Veins. In Process of Time, when Anatomy began to be improved, these wild Chimeras were entirely banished; for we have learned, that there are two Uses in Bleeding, that is, Evacuation and Derivation; the former of which is serviceable in case of too great a Quantity of Blood, and 'tis no great Matter which Vein be opened: But, in order to make a Derivation, we are taught to open a Vein in the upper or lower Parts of the Body, as the Nature and Circumstances of the Disorder shall require.

From Anatomy 'tis also plain, that the four Humours, and their Intemperies, were, by the Antients, falsely proposed as the Causes of Diseases; for these very Humours appear no-where in the Body, so that their Theory must, of course, fall to the Ground, since it was built upon a Foundation so precarious and uncertain: Hence it happened, that the principal Part of their Medicines consisted generally of strong Purges, whilst they supposed, that Purgatives had an *elective Quality*; and idly imagined, that one was proper for purging Bile, another Melancholy, and another Phlegm. And although I willingly allow, that one of these Medicines may be preferable to another, and better calculated for breaking the Force, and removing the Cause of certain Distempers, yet I cannot approve of their Opinion, since it is entirely inconsistent with the Circulation of the Blood, from which alone the Causes both of Life and Diseases are derived: For whatever Purges act strongly and violently, must throw out whatever kinds of Humours are lodged in the Body, whether they be viscid or bilious; and, for this very Reason, the Antients were faulty in their Practice, since they made so frequent Use of the strongest Purgatives: For in the Days of *Galen*, and more especially in those of *Hippocrates*, the more gentle Laxatives had no Place in Practice, but the Patients were racked with Hellebore, Colocynth, Scammony, Elaterium, and other Purgatives of a like Stamp. Yet Experience has taught us, that these Medicines are so far from being beneficial, that they are very noxious and hurtful to our Constitutions; for they destroy the Tone, and impair the Strength of the Intestines, which are so necessary for the Preservation of Life; they diminish the Force and Strength of the Membranes by spasmodic Constrictions, exhaust and carry off the balsamic Bile, and disturb the salutary Excretions, by drawing that Humour which should be discharged through the Skin, from the Circumference to the Centre of the Body. Nor can any other Cause be assigned for this Error in Practice, than their Ignorance of Anatomy, which, as soon as she rear'd her Head above those Clouds of Darknefs, with which she had, till then, been incircled, detected these Errors, and instructed us to beware of them for the future.

Besides, their immense Number of Medicines sufficiently proves, that their Practice was confused, and their Industry, in some Degree, superfluous; for what is the Design of so many Cordials, Hepatics, Splenetics, Uterines, Antiepileptics, Anthelmintics, and Remedies appropriated to each Part of the Body? What can be the End of such a Multitude of Remedies, but to convince us, that the Physician, amidst such a Store of various Medicines, knew only the Virtues and Qualities of a few? For Diseases are cured with a few, but well-chosen Medicines, which the Antients being ignorant of, contrived such a cumbersome *Materia Medica*, under so many trifling and inconsistent Forms. It was likewise their Misfortune, that the richer and more noble Medicines were not known in their Days, such as volatile Salts, neutral Salts, the right Use of Anodynes; as also the several Preparations of Steel, Antimony, and Mercury. As it was their Misfortune to be ignorant of these Things, they must of consequence be very ill qualified for the Cure of chronical Disorders; or if they attempted a Cure in Cases of this Nature, it was done by Regimen, Abstinence, Phlebotomy, Frictions, Baths, Exercise, Change of Air, and their last Resource was the Knife, and Fire. The very Nature of the Climate, in which some of the ancient Physicians lived, was also a Circumstance which very much contributed to the Cure of some Diseases; for in those warm Countries, such as *Greece* and *Italy*, Diseases are not very deeply rooted, and are therefore cured with little Pains and Trouble: But in acute Disorders, as Nature always challenges a greater Share of the Cure than Art, so 'tis not to be doubted but, among the Antients, these short-lived Disorders have been removed by the Force of Nature, aided by the Temperature of the Climate, and the Clemency of the Air. Now that we stand in need of fewer Medicines, and are Masters of

of a Method of Cure which is safe, easy, and simple in Comparison of theirs, is, in my Opinion, owing to our Knowledge of Anatomy; for since 'tis the principal Business of every Physician to take care, that the Quantity, Temperament, and Mixture of the several Humours, be duly proportioned to the Vessels and Strength of the Patient; and that these Humours be kept continually circulating, whilst, at the same time, the Excretions are regularly made; since this is the whole Business of a Physician, every one must see, how few Medicines are requisite to answer these several Ends.

Having thus considered, how useful a Knowledge of the Blood's Circulation is in Practice, I now come to take a View of the Advantages accruing to it, from our Acquaintance with the Structure of some other Parts. The first I shall mention, is that common Covering of the Body, the Skin, the Texture of which if we understand, by means of Anatomy, we shall not only shun the Errors commonly received with regard to it, but likewise be greatly assisted in the Cure of Diseases: In the Skin various Vessels, Tendons, and Nerves terminate, with which some small Glands, or small villose Bodies, are interwove, that the thick Serum, and the salt, agile, and aerial Principle, may be the more commodiously secreted. If a practical Physician rightly understands this Structure of the Skin, which is only fit for the Excretion of very small Particles, he must be convinced, that the Pores of the Skin, destined for a Discharge of the finest Particles, must be very ill-adapted to carry off the viscid and bilious Sordes collected in the *Primæ Viæ*. Whenever, therefore, the Stomach and Intestines are become turgid with Humours of this Kind, as it usually happens in intermittent Fevers, Quartans, hysterical and hypochondriac Disorders, the Physician is carefully to avoid prescribing all hot Medicines, and the stronger Sudorifics; for these, instead of procuring Stools, which indeed ought to be done, rather make the Patient costive, by driving the Load of recrementitious Matter from the Centre to the Circumference of the Body, and mixing it with the Mass of Blood. This Practice is likewise to be shunn'd, when the Bile, in consequence of a sudden Sally of Passion, has quitted its proper Channels, and lodged itself in the Stomach and Intestines; for if, being put into a Commotion by warm Medicines, it should pass into the Blood, it resembles the Nature of Poison, produces the same deleterious Effects, and threatens the Patient with imminent Danger. In such a Case, therefore, the Physician must, if he pretends to act up to the Principles of his Art, take care to evacuate that Load of Humours lodged in the Stomach and Intestines, by the proper Emunctories, and with the Assistance of gentle Laxatives.

By this same Anatomical Observation we are taught, that this Method of Evacuation is less proper when saline, caustic, and subtle Sordes are mixed with the Blood; for these should have a way made for them thro' the Skin; the Pores are therefore, in such a Case, to be kept open by a due Degree of Heat, and proper Medicines: And this is to be carefully attended to, in all Diseases where Sordes of this Kind are offensive, as Erysipelas, Itch, Purple Fever, Petechial Fever, Small-pox, Measles, and Gout, especially if the Pustules are struck back into the Body. All these Things plainly shew a Physician, who ought to be the Assistant of Nature, that nothing can better qualify him for being so, than a Knowledge of Anatomy; but because the Skin is, upon account of the Nerves and Tendons which terminate in it, of a very quick and exquisite Sensation, and consequently very easily constricted, a Physician ought to guard against all those things which contract the Pores, and prevent a free and wholesome Transpiration. This is principally to be regarded in Diseases where the Blood abounds with impure and saltish Recrements; and all possible Care is to be taken, that the sharp and noxious Matter, which should be discharged thro' the Skin, be not imprudently struck back into the Body, and Mass of Blood: For this Reason we are to avoid cold and moist Applications, Ointments, Plaisters, and whatever may contract the Skin; but this Caution is particularly necessary in pustular Disorders, such as Itches, Gout, scald Heads, Leprosies, Erysipelas; and also in critical Sweats, lest by the rash Use of these things we precipitate the Fate of the Patient.

Next to the Skin the Fat presents itself, from an accurate Contemplation of which, the practical Physician must likewise receive Advantages, that will more than counterbalance his Toil in the Research; for as this Substance is laid thicker upon some Parts of the Body than others, so, by this very Circumstance, it points out to us the true Method of applying external Remedies, or, as we commonly call them, Topics. Thus, for Instance, the Person who applies external Medicines to his Hip or Thigh, in order to remove the Agonies of Sciatic Pains, will find his Expedient attended with very little Success; because the Abundance of the Fat, and the Thickness of the Muscles, prevent, in a great measure, the Medicines from reaching the Part affected. Nor will he act more rationally, who, in order to cure the Disorders of his Stomach, applies Plaisters to his Sternum or Abdomen; because, in these Parts, such Remedies produce very little Effect on account of the Fat, with which the Abdomen is covered. (*It is necessary to remark here, that tho'*

Hoffman may be right in the general upon this Subject, yet, with respect to Applications to the Hips, Abdomen and Stomach, Experience manifestly contradicts him, since there are Topics which exert considerable Effects when applied to those Parts. Our Author here, in defending Theory, which may be rendered extremely useful, has given us an Instance of its Misapplication, thro' the Rashness and Self-sufficiency of human Wisdom. In Philosophy, as well as Divinity, we are subject to arrogate to ourselves supreme Knowledge, and, in consequence of that, rashly to deny the Existence of Things and Effects, unless we can comprehend them, and conceive in what manner they are brought about; whereas Nature, or its all-powerful Author, has ways of acting to which we are, at present, Strangers, and Resources with which we are utterly unacquainted.) We therefore learn from the Principles of Anatomy, that in applying Topics, such Parts of the Body must be chosen as are covered with the slenderest Muscles, and the smallest Quantity of Fat: For this Reason, the nervous and tendinous Parts are, of all others, the most proper; such as the Soles of the Feet, the Palms and Wrists of the Hands, the Temples; and the Nape of the Neck: Medicines of this Kind may be also applied, with Advantage, under the Arm-pits, and to the Hollows of the Ham; from which Parts their Virtues are sensibly diffused thro' all the Body. When therefore, in case of too great a Heat and Fervor, the Body is to be cooled, it is proper to apply, to the above-mentioned Parts, Liquors that are somewhat acid, and gently repressing; for, by the Use of these, the Body is surprisngly refreshed. The same Practice is to be followed in allaying Spasms in Fevers, in which Case also corroborative and subastrigent Plaisters may, with Success, be applied to the Nape of the Neck, the Temples, and the Wrists: But when the nervous System is to be strengthened, 'tis proper, now-and-then, to warm and cherish the Nape of the Neck; and the Sutures of the Head, with mild and balsamic Corroboratives. When the Force of the languid and unactive Nerves is to be excited, or a viscid Humour to be dislodged from some particular Part, the Intention is best answered by Vesicatories, applied to the Nape of the Neck. Lastly, in a *Lues Venerea*, or an Itch, which Disorders are often happily carried off by a seasonable Salivation, it is most safely raised by applying mercurial Ointments to the Arm-pits.

An accurate Knowledge of the Structure of the Navel will also qualify a Physician for the Application of Topics, with equal Prudence and Success; for 'tis known, that the *Linea Alba* is contiguous to the Navel; which, of itself, is a Part most sensible of Impressions: In this *Linea Alba* many considerable Tendons centre; so that 'tis plain, that Part must be endowed with a very quick and exquisite Sense, and therefore have a Consent with the whole Body; for 'tis very remarkable, that all the nervous Parts of the Body, if strongly irritated, or otherwise affected, do at the same time put the whole Body into a Commotion, by reason of the mutual and uninterrupted Connection of the Nerves dispersed up and down it: For this Reason we are not to wonder, if Medicines applied to the Navel do not confine their Efficacy to that particular Part, but convey it to the most distant and remote Quarters of the Body, by means of the many considerable Nerves which run thro' the Navel. Thus 'tis known, from a celebrated Family Experiment, that the Quantity of a Nut, of fresh Butter, applied to the Navels of Children, procures them Stools: And if Worms are lodged in the Intestines, if the Navel is anointed with Bull's-gall insipidated with the Ointment of Sow-bread, and mixed with Oil of Colocynth, it stimulates the Intestines to expel the Worms. In the convulsive Colic, which is indeed a very terrible Disorder, the Agonies of Pain are surprisngly allay'd by anointing the Navel with a few Grains of Civet. Nor is less Relief to be expected in a Suppression of Urine, from carefully anointing the Navel with Oil of Turpentine; for the Discharge of the Urine will be wonderfully promoted by that means, since the Umbilical Arteries adhere to the Sides of the Bladder.

The Diseases of the internal Parts, and the most proper Methods of curing them, must be made known to us by considering their Situations, and the several Parts where they are placed: Thus we know, that the Stomach is inclined to the Left Side; and that its upper Orifice adheres to the *Spina Dorsæ*, whereas its inferior Orifice is covered with the *Scrobiculum Cordis*. From this Circumstance it is very plain, that the most intense Pain, which has erroneously got its Denomination from the Heart, proceeds entirely from the Stomach; and that the Seat of a *Cardialgia*, as is groundlessly thought, is not in the Left, but rather in the Right Side of the Stomach: For leaving the Seat of the Pain, which is under the *Scrobiculum Cordis*, entirely out of the Question, this appears plainly from this Circumstance, that the Bile, which frequently excites the Pain, lies nearer to the Right than to the Left Orifice: Hence those, who labour under Obstructions of the Liver, are most frequently troubled with this Disorder. Now when the Pain itself has reached the very Back, the Left Mouth or Orifice must also inevitably suffer: Anatomy therefore teaches us, that, in this Case, Plaisters, spirituous Substances, Balsamics, and such things as are calculated for strengthening the Stomach, and allaying Pain, are to be externally

externally applied to the *Scrobiculum Cordis*, and the Left Side under the false Ribs. From Anatomy we also learn, that this Disorder is most effectually relieved by such Medicines as correct the Acrimony of the Humours, and discuss Flatulencies. Besides, because the Stomach, as Anatomy teaches us, lies under the Diaphragm, it often happens, that its being inflated produces the greatest Uneasiness, and Difficulty of breathing; in which Case, the Physician, who is ignorant of Anatomy, would commit an egregious Blunder, if he prescribed sweet and emollient Pectorals, imagining the Cause of the Disorder to reside in the Lungs; whereas the Cause itself, which is a thick Phlegm, and an Inflation, ought rather to be taken away, and the Spasms of the Stomach should be removed; both which are often happily effected by gentle Emetics and Laxatives.

The Situation of the Colon, and its sinuous Structure, of which the Antients were ignorant, by reason of their Neglect of Anatomy, has so deceived them, and even some of the Moderns, that they ascribed to a Fault of the Spleen, those Tumours; especially of the Left Side, which, in Hypochondriacal Cases, proceed from a Flatus, and Ordure pent up in the Foldings of the Colon. If these Men had learn'd, that the Spleen lay under the Diaphragm, and that it was nearer to the Spine, they might have easily shunn'd so palpable an Error. For 'tis well known; that the Pains, the parching Heats, and the Tumours, under the false Ribs of Hypochondriac Persons, appear principally in the Left Side. Add to this, that the Spleen has a less exquisite Sensation; and by reason of its Bulk, the Circumstance which generally renders it troublesome, excites a very heavy and fixed Pain, whereas in Hypochondriac Disorders we observe, that the Pain is intense, but soon goes off. As this is the Case, 'tis plain, that in the Cure of that Disease, carminative Clysters, which dilute the Acrimony of the Humours, and defend the nervous Membranes of the Colon, are deservedly preferable to all others. In this Case Carminative Plaisters are not to be neglected, which, when apply'd to the Left Side, strengthen the Tone of the Colon, and afford surprizing Relief.

Another Disorder, which draws its Origin also from the Colon, sometimes perplexes the Physician who is ignorant of Anatomy; for it sometimes happens, that a violent Pain suddenly arises near the Costa of the Right Ilium, accompanied with an obstinate Constipation of the Belly. The Cause of this Disorder is this: The Beginning of the Colon is situated there, and consists of very strong Ligaments and Membranes, that so it may the more speedily protrude the Fæces upwards. But when, in Persons that are reduc'd by the Violence of some Disease, the Tone and Strength of this Intestine are impair'd, Flatuosities and Fæces retain'd in it distend it, resemble a Tumour, and subject the Patient to the most excruciating Agonies. The Cause then of this Disorder plainly demonstrates, that in this Case the only things which can afford Relief are Cataplasms of Carminative Seeds and Herbs; and that 'tis likewise very proper to wash the Intestines with oily Clysters; for when these arrive at the Beginning of the Colon, they powerfully soften the indurated Fæces, and by that means forward their Expulsion.

Violent Pains often arise about the Navel, which, being really in the Ilium, are, by some Physicians, who are ignorant of Anatomy, erroneously taken for Colics. This Disorder is certainly very frequent, but it was still more so in the Days of *Hippocrates*, who often makes mention of it, but never of a Colic; which seems to be owing to this, that on account of the Salubrity of the *Grecian* Climate, Colics, as well as Hypochondriac Disorders, were not frequent. 'Tis therefore highly proper, that in the Cure of this Disease we should know the Situation of the Intestines, lest we should otherwise apply Medicines to no Purpose. For tho' in Colics Clysters are very proper, yet 'tis very plain they do little Service in the Iliac Passion, since they never reach beyond the Valve of the Colon. 'Tis therefore in vain to have recourse to Clysters for the Cure of this Disease; we are rather to use Plaisters and Ointments externally, and internally Oil of sweet Almonds, mixt with Oil of Anise.

In this Case also nervous Medicines, and Preparations of Castor, are very properly used, because they wonderfully mitigate the Violence of the Spasms. (*See ILIACA PASSIO, where the Reasons will be given why emollient Clysters are useful in this Case, tho' they should not pass the Valve of the Colon*).

He who is acquainted with the Situation of the Intestinum Rectum, and its close Connection with the Bladder, must perceive the Reason why a Difficulty in making Water, especially if it proceeds from a Wound, or the Stone, is always accompanied with a Tenesmus, and very often with a Prolapsus Ani. The Physician who knows the Situation of this Intestine, will also be able to assign a Reason, why, in a Tenesmus, the Bladder is reciprocally stimulated to discharge its Contents. In such a Case therefore 'tis carefully to be inquir'd into, whether the Fault lies in the Bladder, or in the Intestinum Rectum, lest whilst the Cause is unknown, the Cure should miscarry; for Remedies would be very improperly apply'd to the Bladder, if the Intestinum Rectum should happen to be the Seat of the Disorder.

It is equally necessary to consider the Situation of the Bladder, which is placed in the very Bosom or upper Part of the Pelvis, and is join'd to the *Os Pubis*. A numerous and manifest Series of fleshy Fibres run along it, by the Contraction of which the Urine is discharg'd, and which being again distended by too great a Quantity of Liquor in the Bladder, their Elasticity is proportionably destroy'd, and the Urine suppressed. Hence we learn, that for relieving this Disorder, we must apply to the Region of the Pubis such Medicines as stimulate the Fibres to a Contraction, that so the Efflux of the Urine may be restored. For answering this Intention, some Oils are very proper, such as Oil of Scorpions, and Juniper, Garlick also, roasted Onions, and other Medicines, which have a Tendency to raise and strengthen the weakened Tone of the Bladder.

The Course of the Ureters is towards the Bladder, and passing in an oblique Direction over the Psoas Muscles, are inserted into its posterior Part. These; I mean the Ureters, consisting of muscular and tendinous Fibres, must necessarily be violently irritated by Stones falling down into them, and remaining there. That the Physician may also receive Advantage from this Anatomical Observation, it will not be amiss to inform him, that in this Case he is carefully to avoid prescribing Oils of Juniper and Turpentine, Balsam of Sulphur, and all Medicines that are of a forcing Nature, because in this Disorder 'tis his Business to relax the Parts contracted by the Violence of the Spasms; for which Reason he will, with more Advantage, have recourse to the express'd Oils, such as Oil of sweet Almonds, Nutmegs; Oil of white Lillies, Scorpions, Poppy-seeds, Caraway, and others; for these, when apply'd to the Region of the Loins and Ureters, surprizingly assuage the Pains produced by this Cause.

The like Advantages in curing Diseases flow from considering that exquisite Congeries of Nerves, that Variety of Arteries, Veins and Tendons, which are interwove with the Mesentery about the last Vertebra of the Back, and first of the Loins; for hence we may reasonably conjecture, that the intense Pain which seizes People in the Beginning of Intermitting Fevers, in the Small-Pox, in the Measles, in the Hysterical Passion also, and other acute Disorders, does not arise from a Stone in the Kidneys, as is generally thought, but from the Congeries of Nerves in the Mesentery: For if these be distended or vellicated by Flatulencies, or Blood stagnating in the Intestines, there immediately arises a Pain in the *Spina Dorsii*. I once knew a Physician very successful in curing this Disease, who for that Purpose very often used Plaister of Frog's-spawn, with Oil of Henbane and Camphire. On the other hand, narcotic astringent Remedies, and Lead-plaisters, instead of affording Relief, rather hasten the Destruction of the Patient. I have also often observed, that such Applications, when used with a View to check the menstrual Discharge, not only restrain'd, but entirely stopp'd it, to the great Prejudice of the Patient, the Blood being by these Means forc'd upon other Parts.

I now come to take a Survey of the genuine Structure of the Viscera, that we may thence see how useful the Knowledge of Anatomy is in the Practice of Physic. To begin therefore with the Lungs, 'tis sufficiently evident, that since they are composed of mere Vessels, they must abound with Blood; for innumerable Branches of Vessels, winding in a great many various Directions, pass thro' them, and thro' the Whole of their Course embrace the *Bronchia*. The Pulmonary Artery also, by which the Blood is convey'd from the Right Ventricle of the Heart into the Lungs, appears to be larger than the Aorta itself. Besides, the Pulmonary Vein sends so many wonderful and curious Branches thro' them, that if melted Wax is injected into these Branches, a very considerable Number of them may be seen. This may furnish us with an Argument, that the Diseases of the Lungs proceed principally from a Stagnation of the Blood, and a Prevention of its free Circulation thro' them. This is confirmed by a Spitting of Blood, a Peripneumony, a Pleurisy, a Phthisis, and all the fatal Train of Diseases which prey upon the Lungs.

If we allow these Considerations their due Weight, we must evidently see, that in Disorders of the Lungs Phlebotomy not only affords Relief, but is absolutely necessary, both for the Cure and Preservation of the Patient. Hence we see with how great Propriety all those Medicines are prescribed in Diseases of the Lungs, which dissolve and attenuate the Blood lodg'd in them. The best and most effectual Remedies of this Class are warm Infusions of Herbs that are balsamic, and contain a subtile nitrous Salt. 'Tis hence also plain to a Demonstration, that in Disorders of the Lungs nothing can be more hurtful and pernicious, than astringent Acids, Styptics, viscid Substances, and all such Medicines as retard the free Course and Circulation of the Blood; and because the *Aspera Arteria* enters the Lungs, and is itself lin'd with a nervous Membrane, all acid and sharp Substances are therefore to be avoided, as hurtful in Disorders of the Breast; for these not only draw too great a Quantity of Blood to the Part affected, which is already too full, but, which is still worse, stop the Motion and Circulation of the Blood.

It now remains, that we take a View of the Structure of the Liver, which, of all the Viscera, abounds most with Blood, and presents us with various Vessels, the precise Number of which 'tis no easy Task to determine: Even the very Glands which are found in the Liver, are no more than the numberless Branches of Vessels; which, arising from the *Vena Portæ* and *Vena Cava*, form themselves into membranous Cells of an oval Figure, as has been ingeniously observ'd by *Vieussens*, in his Treatise *De novo Vasorum Systemate*; for the Glands of the Liver secrete the Bile, which is collected together from various little Vessels interwoven with, and adhering to one another.

Now if we consider, that the Liver is furnish'd with the greatest Part of its Blood from the Spleen; the Omentum, the Stomach, the Intestines, and other Contents of the Abdomen; by means of the *Vena Portæ*, and that this Vein is destitute of a Pulse to propel its Contents forwards, we shall be at no Loss to conceive why the Liver should be very obnoxious to Stagnations of the Blood, and all the dismal Train of Consequences that follow it; for Obstructions of the Vessels; Infarctions, Indurations, and most chronical Disorders, are the Results of a weak and languid Circulation of the Blood thro' the Liver; for if a Passage is deny'd the Blood thro' the *Vena Portæ*, and the *Vena Cava*, it returns to the Viscera whence it came, and is deriv'd to the Spleen, the Pancreas, the Mesentery, and other Parts. By this means it happens, that, so long as it lodges there, it distends the Vessels, and by stimulating the nervous Membranes occasions various Spasmodic Disorders, and Obstructions. Upon this Occasion the Lymph is extravasated, and hence arise Tumours, Piles, Vomitings of Blood, the *Morbus Niger* mentioned by *Hippocrates*, and a numerous Train of such-like Disorders: That these may be expell'd from the Body, the prudent Physician informs himself from Anatomy, that the chief Intention of Cure consists in rendering the Motion of the Blood thro' the Liver free and easy. In Cases of this Nature therefore, Mineral Waters, warm Baths, wholesome Waters liberally drank, all Bitters likewise, saline Substances, fix'd neutral Salts, and in a Word all such things as attenuate the Blood, strengthen the Solids, and restore the Blood, to its usual Circulation, are of Service: And when the Blood accumulated in too great Abundance, which is often the Case, proves hurtful, we may easily imagine, that Phlebotomy must be proper and beneficial, because by means of it the too great Quantity of Blood which distress'd the Patient, by distending his Vessels, and breeding Obstructions, is happily diminished.

Besides, by Anatomy we discover, that the Liver adheres to the Diaphragm, which particular Structure, like all the other Works of the supreme Creator, was design'd to answer a noble and important End, which is, that by the frequent Motion of the Diaphragm in Respiration, the Liver, which adheres to it, might be agitated and put into Motion; and by that means the languid Motion of the Blood quickened and accelerated; which is a sure Proof, that in Diseases of this Kind, Motion is a proper Remedy, and that for this Reason, Exercise, Walking, Riding, and other Species of Motion, are deservedly prescribed. If we farther consider, that the Hemorrhoidal Vessels, which are extended longitudinally upon the Colon and Intestinum Rectum, are at a vast Distance from the Trunk of the *Vena Portæ*, and that all perpendicular Ascents, as they are called, are performed with Difficulty, we must easily perceive, that since the Blood passes with Difficulty thro' the *Vena Portæ*, and the Viscera of the Abdomen, it must readily stagnate, and, having burst the Vessels, especially if the Patient is seiz'd with Spasms, flow from the Mouths of the Veins. Hence it must be proper in Disorders of this Kind to corroborate the solid Parts, to restore the Motion of the Blood by Diluents, and to abstain from smart Purges, aloetic Preparations and Astringents; for these, by irritating the Intestinum Rectum, render this Discharge, which is sometimes salutary and wholesome, hurtful and injurious.

Having said enough of the Liver, I now proceed to take a View of the Uterus, a perfect Knowledge of which is of vast Importance in the Cure of those Diseases which are peculiarly incident to the Female Sex. The Uterus, according to the Discoveries of Anatomy, is likewise one of those Viscera which contains Blood, and which, besides its muscular and fibrous Substance, has a considerable Number of winding Vessels carried to it from the Hypogastric and Spermatic Vessels. Now since these Vessels are in various Places interwoven with and adherent to each other, it must necessarily happen, that the Blood, especially when in too great a Quantity, must, by reason of these winding Canals, make its way, in a languid manner, thro' this Part. Hence we may reasonably conclude, that if the Blood stagnates there, and is not duly return'd thro' the crooked Windings of the Veins, very terrible Disorders must ensue; for hence, as from a fruitful Source, proceed Effusions of Blood, viscid Concretions of Blood, commonly known by the Name of Polypuses, and innumerable other Disorders. Hence likewise proceed frequent Miscarriages; hence Dropsies,

Tumours, Cachexies, Obstructions, and all the Train of Disorders peculiar to the Female Sex.

As this is the Case, we may reasonably maintain, that in these Disorders all such things as retard the Motion of the Blood are carefully to be avoided, such as Acids, Styptics, and Astringents, because these Disorders are exasperated and increased by such Medicines. Those Medicines, on the other hand, are proper, which render the Blood fluid, florid, and susceptible of an easy Motion. Such Remedies are likewise proper as strengthen the solid Parts, that so the vital Juices may the more speedily convey their benign and salutary Influences thro' the whole Body; to this Class belong Baths, volatile oily Salts, and balsamic Bitters; which Medicines, if used sometimes, and with proper Caution, afford singular Relief in the above-mentioned Disorders. Allow me also to recommend Phlebotomy, which is an excellent Preservative against Abortion, and other Disorders peculiar to that Sex.

I now come to consider how beneficial a strict and anatomical Knowledge of the Structure of the Spleen is in the Practice of Physic. *D. Spigelius* long ago observed, and *Ruyssch*, the Glory and Ornament of our own Age, has proved by several Experiments, that the Spleen is composed of a vast Number of Vessels, Veins and Arteries, which has induced some of the Moderns to think it almost a vascular Substance, and, as it were, a sanguineous Gland. Hence we easily see, that the Spleen was originally design'd for attenuating the thick Blood convey'd to it, that so it might be transmitted in a purer and more florid State to the Liver. These Circumstances being discovered, we cannot fail to perceive what Injuries must ensue to Health from its being obstructed, becoming tumid, or stuffed with Blood; because by these means a thick and viscid Blood is from it convey'd to the other Parts, which, whilst it passes with Difficulty through the narrow Parts of the Vessels, settles in them, and becomes the Source of various Disorders. Hence 'tis to be observed in Practice, that in Disorders of this Kind, no Medicines are either so powerful, or so speedy in their Effects, as those which attenuate the Blood, open the Vessels, remove Obstructions, and strengthen the Tone of the Solids; for by these the languid Motion of the Blood is augmented, and its Circulation carried on without Interruption. For attenuating viscid Blood therefore, the plentiful drinking of wholesome Water is very proper; and the Reason is plain, why warm Baths, and Mineral Waters, are not only useful, but of all other Remedies the most sovereign in Disorders of this Kind. Now as the Circulation of the Blood is assisted by the Tone of the solid Parts, and as this Tone is proportionably destroy'd by the Distention of the Vessels, it plainly follows, that gentle Astringents, such as Chalybeats, and what we commonly call Splenetics, are not to be neglected in Disorders of this Nature.

Among the Number of sanguineous Viscera we may justly reckon the Kidneys, the Knowledge of whose Structure, as 'tis highly useful in Practice, deserves our most attentive Consideration; for the Secretion of the saltish Serum depends entirely upon the free Circulation of the Blood thro' the Kidneys. Now that this Circulation is naturally very expeditiously performed, may be proved by two Arguments: First, the emulgent Arteries are not far distant from the Heart, near which the *Systole* of the Arteries is very strong. Secondly, the Fluids taken into the Stomach are very quickly discharged by the Bladder. This principally happens upon drinking warm Liquors, such as Small-beer, and Infusions of Tea, and Paul's Betony, after plentiful Draughts of which, the Urine is very soon discharged in great Plenty. All the Disorders then incident to the Kidneys, such as Exulcerations, Inflammations, Paroxysms of the Stone, Suppressions, immoderate Fluxes of Urine, proceed from a Stagnation of the Blood. Hence the Physician may learn, that too great a Quantity of Blood, or a Plethora, is the Cause of these Disorders; and that Phlebotomy must of Consequence be very proper for the Relief of the Patient, and the Removal of the Disease. Hence we are also taught, that warm Baths, Mineral Waters, warm Infusions of Paul's Betony, and Ground-ivy, and all other Medicines which attenuate coagulated Blood, are beneficial in Disorders of the Kidneys.

The membranous Parts of the Body likewise claim our particular Regard, since, being endow'd with a most quick and exquisite Sense, 'tis of vast Importance for the Physician to understand their Structure. The Viscera then, which principally consist of Membranes, are the Stomach, the Oesophagus, the Intestines, and the Bladder. Now we learn from Anatomy, that such Parts as consist of Membranes, contain little Blood; but that they are furnished with a great many Branches of Nerves, and fleshy Fibres, that so they may both contract and dilate themselves. For these Reasons they are very subject to Spasms: Hence the Blood, flowing slowly thro' the compress'd and obstructed Veins, easily stagnates, and produces the most fatal Disorders; for from this Cause we find the most dangerous Inflammations arise, because the nervous Parts, on account of their incredible Connection and Communication with one another, at once irritate and affect the whole nervous System; so that

that a Complication of very terrible Symptoms are generally observed to accompany such Disorders, as acute Fevers, Watchings, Loathing of Food, Heat of the internal, and Coldness of the external Parts, Restlessness, Convulsions, and in some Degree Loss of Reason. Hence it likewise follows, that the more noble and valuable the Part affected is, the more terrible and dangerous the Inflammation ought to be judged; and that the Endeavours of the Physician to procure a speedy and seasonable Relief, ought to bear a direct Proportion to the Weakness and Danger of his Patients. This Theory plainly demonstrates, that, in order to protect the Body against the violent Assaults of such a Disorder, all those Remedies are proper, which preserve the Tone and Strength of the solid Parts, and are neither too astringent, nor too relaxing; among which I cannot help recommending nervous Medicines, temperate Balsamics, warm Infusions of Herbs, volatile oily Salts, alexipharmic Essences, &c. In case of a Plethora, or too great a Quantity of Blood, Phlebotomy is also necessary; and all Purgatives, Emetics, Styptics, and Opiates, are to be avoided. Acids in Food, viscid Substances, and such as induce a Coldness of the Body, are likewise to be shunn'd, because, by stimulating the Fibres into Spasms, they augment the Disorder. But the Importance and Largeness of the Stomach calls upon me to say something particular upon its Structure; one Peculiarity of which is, that, in the superior Cavity of its Left Part, the Blood-vessels are defended with a very thin Membrane, whilst at the same time their canous and villous Membranes are extremely slender in the same Place. Hence a Reason may plainly be assigned, why, in Hypochondriac Disorders, and Obstructions of the Spleen, these Vessels, being distended with Blood, should be easily burst, the Consequence of which is, a plentiful Effusion of Blood from the Mouth. These Vomittings of Blood are also very common to Women, for no other Reason than that the Blood, which should have been carried off by the menstrual Discharge, is retained; and being convey'd to the Stomach, first distends, and then bursts these Vessels. Moreover, the Bottom of the Stomach, and its inferior Orifice, together with the Duodenum, are cover'd with a very thick and villous Coat, which covers the nervous sensible Coat; so that we have no great Reason to wonder why these Parts of the Intestines are endow'd with a less exquisite Sense than others, since Anatomy demonstrates, that the latter are entirely destitute of the above-mentioned Coat. This plainly appears to be the noble Result of exquisite Contrivance, and unerring Wisdom; for 'tis without Doubt intended to hinder the Bile and Aliments, which are principally lodged in these Parts, from irritating this nervous Coat, and thereby proving prejudicial to Health. Hence we may lay this down as a Rule in Practice, that saline Purges, and gentle Openers of the Belly, are of no Use in Disorders where a Load of acid or bilious Matter is lodg'd in the Bottom of the Stomach, in the Duodenum, or the Beginning of the Jejunum; for these Parts, being only endowed with a dull and heavy Sensation, resist the faint and languid Stimulus of such weak and ill-chosen Medicines. But no Medicines are better calculated for dislodging these remote and deep-rooted Sordes, than gentle Emetics; for these, by the Sulphur, and subtiler caustic Salt, of which they consist, penetrate the Tunica Villosa, or villous Coat, and by stimulating the nervous Coat, easily excite Spasmodic Contractions of the Parts; whence the Sordes, lodg'd within them, are drawn forth, as it were, by the Energy of the Medicine.

Whilst I am speaking of the Duodenum, it will not be amiss briefly to touch upon the more curious Circumstances of its Structure, which few have as yet sufficiently adverted to. Heaven then, whose Works are always perfect, has bountifully contriv'd, that this Intestine should resemble a little Bag, or Stomach, that so the Bile, pour'd from its respective Ducts into this Intestine, may remain the longer in it, and by that means be the more intimately mixed with our Food; a Circumstance which is absolutely necessary to Health. As this is the Case, it is not to be doubted but a great many Disorders proceed from this Intestine, if too large a Quantity of Bile is lodged in it; and especially if thro' the Languidness of its Motion, and the Length of its Stay there, it becomes corrupt, and assumes a virulent Quality. Certain it is, and I only affirm what I know from Observation, that this Intestine, as above circumstanc'd, contains the latent Causes of many terrible Disorders; for to it we may principally refer Intermitting, Tertian, Burning, and Bilious Fevers, Dysenteries, Diarrhoeas, and Cardialgias. In this Intestine also lurks that malignant Matter, which, being afterwards translated to the Blood, occasions Small-Pox, Purple Fevers, and Disorders of various Kinds. Hence we may rationally conclude, that no Medicines are more efficacious, either for preventing these Disorders when dreaded, or removing them when present, than gentle Emetics, whereby the Seeds of the Disease may be dislodg'd, and the Sordes duly evacuated, lest they should communicate a Taint to the Blood. This Intention is also answer'd by nitrous absorbent Abstersives, which act immediately on the Matter of the Disease, and break the pungent Spiculae which prove its Cause.

I should be guilty of an unpardonable Neglect, if in this Place I fail'd to take Notice of the Bile, that Humour so necessary for the Welfare of the Body, and of which the Abundance loudly calls for our Admiration and Surprise, since in the Liver it is plentifully generated, and convey'd to the Intestines by two Ducts; for which no other Cause can be assign'd, than that this Humour is absolutely necessary for the Body, since it enters the Duodenum and first Intestines, mixes with the Chyle, and proves a proper Stimulus for discharging the Contents of the Intestines. Hence we learn, that the Bile is vastly conducive to Health, and that its being either corrupted, or deficient in Quantity, produces various Disorders. Hence we also learn an useful Maxim in Practice, which is, That all those Substances are excellent Preservatives of Health, which either recruit the diminish'd Bile, or restore its Temperament, and balsamic Bitterness. This Intention is excellently answer'd by bitter Extracts of Wormwood, lesser Centaury, Carduus Benedictus, Extract of Aloe, and other Substances of a like Nature; for as the Bile, in its natural State, strengthens the Motion of the Intestines, proves a proper Stimulus for the Discharge of the Excrements, and incides the acid and viscid Humours of the Body, and by that means preserves it from cold Disorders, we have no Reason to doubt, but that, in Cases of this Nature, Bitters, administer'd in Conjunction with Balsamics, are highly proper and expedient: For this Reason these Medicines are greatly beneficial in Cachexies, Dropsies, Hysterics and Hypochondriac Disorders.

It will not, on this Occasion, be improper to say somewhat of the Circulation of the Lymph, and shew what an Advantage the Knowledge of it must be to the Practitioner. We must first then consider, that the Lymph, or most thin and refin'd Part of the Serum, is secreted from the Arteries, convey'd by means of the lymphatic Vessels to the thoracic Duct, and returned to the Heart, with this View, that the Blood may be sufficiently attenuated by a proper Fluid; for we learn, that our Bodies are supported and maintain'd by a due and proper Quantity of Fluids; and 'tis plain from Chymical and Statical Experiments, that our Bodies in the Complex contain eleven Parts of Fluid to one that is Solid. Hence a Fluid must necessarily be the principal Element of the Blood, whereby 'tis preserved, and so diluted, as to pass easily thro' the narrow Channels of the Vessels. Hence we must know, what Fluid, even when taken in the greatest Quantity, must be conducive to Health, which must be that which is lightest, thinnest, and best calculated for mixing with the Blood. For this Reason a Physician ought carefully to inquire into the Qualities of different Waters, that so he may know which are best calculated for the State of his Patient, and most conducive to Health. Hence the Physician must also perceive, that nothing is so effectual for attenuating a thick Blood, as an Abundance of Fluids; and that in the most obstinate Disorders arising from Obstructions of the Viscera, and Viscidity of the Blood, hot Baths, and Mineral Waters, afford the noblest Relief, provided they are liberally drank.

The Anatomical Contemplation of the Lymph also teaches us, that its retrograde Course is perform'd with a great deal of Difficulty; for which Reason bountiful Nature has lent her skilful Aid, and furnish'd the lymphatic Vessels with many bye Passages, whilst she has at the same time fortify'd the conglobate Glands, thro' which the lymphatic Vessels pass, with nervous Fibres, that by their Strength and Impulse, the Course of the Lymph to the Heart may be the more readily performed. Hence *Nuck*, that ingenious Inquirer into the Structure of the lymphatic Vessels, judiciously compares them to Siphons. But if this Motion should prove languid; if the Lymph should be viscid, or the Strength defective, the Lymph itself settles about the Glands, and obstructs them. Now if the Lymph should want a due Degree of Motion, it corrupts, turns rapid, and lays a Foundation for a great many, and those very terrible Disorders; such as those, which, from an Impurity of the Lymph, deform and spoil the Skin; among which are Leprosies, Herpes, Pustules, Itches, Scabies, and the Lues Venerea. Having then found out the Cause of Disorders of this Nature, which without Anatomy we cannot possibly do, the Physician is to endeavour to restore the Lymph to its Circulation; or, in other Words, to open the obstructed Glands, that the Motion of the Lymph may be increased. In a Case therefore of this Nature, Bleedings, Purgatives, Absorbents, or Salts prove ineffectual, and more powerful Medicines must be applied; such as penetrate, whose Texture remains sound and entire, and which, by stimulating the Fibres, open the Glands and Vessels. The Mineral Kingdom supplies us with Medicines of this Kind, such as Sulphurs of Metals, Antimonial and Mercurial Preparations, the wonderful Efficacy of which upon the Glands, and Motion of the Lymph, cannot be sufficiently extoll'd.

If the free Circulation of the Lymph is prevented, especially from Obstructions of the Liver, the lymphatic Vessels first swell, and then break. Hence the Serum, being extravasated in Abundance, produces various Species of Dropsies, which receive

ceive their different Denominations from the respective Parts they affect: Whence it is evident to a Demonstration, that these Disorders admit of a Cure with Difficulty; for it requires no great Labour to shew how hard a Task it is to soften indurated Viscera, and consolidate burst Vessels.

I now come to consider the Brain and Nervous System, with a View to illustrate the extensive Use that an accurate Anatomical Knowledge of these Parts is of in Practice. And, indeed, the Antients called these Parts cold, not because they wanted their proper Degree of Heat, but because, when compar'd with other Members, they were furnish'd with a proportionably smaller Quantity of Blood. Besides, the Substance of the Brain is of itself void of all Sensation: hence it plainly appears, that the *Deficiency of the Blood has a very considerable Influence upon those Parts*; since in Bleeding, or where a large Hæmorrhage happens, we observe the Patient to faint away, which is a convincing Proof, that by that means the Nourishment, as it may be called, is drawn away from this Part. Hence we learn, that warm Medicines are particularly beneficial in Disorders of the Brain, because, by strengthening its Membranes, they occasion a quicker and more expeditious Circulation of the Blood thro' it. For this Intention Cephalics, as they are commonly called, are deservedly commended; such as Oils distilled from aromatic Herbs, apoplectic Balsams, and volatile oily Salts; for if the Membranes of the Brain are not sufficiently strong, the Blood is easily retained in them; and hence very terrible Disorders arise, such as Apoplexies, Loss of Voice, Melancholy, Difficulty of Sight and Hearing, Gutta Serenas, Incubi, frightful Watchings, Sleep, Disorders and Diminutions of the several Senses and Motions of the Body. But as Corroboratives are excellently calculated for the Cure of these Disorders, so no Medicines are more fatal to the Brain than those which induce too great a Relaxation, Coldness, or Heaviness upon it. Of this Kind are all Substances that abound in Vapours, as moist Air, too much Sleep, the Affections of the Mind, and especially Sorrow, together with all such Things as strike the Nerves of the Head with their sulphureous Effluvia; such as Opiates, Narcotics, as also Acids, refrigerating Medicines, and autumnal Fruits. In these Disorders, on the other hand, volatile, oily, and balsamic Salts, are beneficial; the principal of which is my liquid Balsam, which since 'tis compos'd of the best and most genuine Oils, scarcely to be found in any other Composition, affords a surprising Relief in Disorders of the Brain and Nerves. In Disorders, therefore, which proceed from Obstructions of the Head and Nerves, such as a Palsy, I must for the same Reason recommend balsamic Medicines apply'd externally, not so much to the affected Part, as to the Origin of the Nerves, and the Nape of the Neck.

I should now handle the Doctrine of the Nerves at large; did I not think it sufficient to touch upon it on this Occasion: and without Doubt, if a Physician lies under Obligations perfectly to know any Part of Anatomy, 'tis certainly that of the wonderful Structure and Consent of the Nerves; for unless he knows this, he can never discern whence any given Series of Symptoms draw their Origin; nor what Disorders affect only by Consent. Whence the many Errors that might slip into Practice, may be easily conceived; for this is to be laid down as a general Caution, that the Cause of the Disease is to be removed, and that the Physician goes preposterously to work, who being ignorant of Anatomy, and overlooking the Cause, directs his Views only to the Symptoms. Now the Reason or Cause of these Symptoms is no other than that the nervous Parts are intimately connected with one another, whence their surprising Consent arises; for 'tis certainly wonderful, that when one nervous Part should be disturbed, the whole Body should, in Consequence of it, be affected. Thus from intense Pains, even of distant Parts, from a wounded Nerve or Tendon, from the Stone, the Colic, or Hic Passioni, proceed Fevers, Deliriums, Convulsions, and some other most terrible Disorders.

The intercostal Branch, and the eighth Pair of Nerves, run almost thro' all the Parts of the Body; whence it generally happens, that Vomitings, Diarrhoeas, Asthmæ, Constipations of the Belly, Suppressions of Urine, a Difficulty of Breathing, and a Pain in the Breast, succeed Disorders of the Head, Apoplexies, Epilepsies, or Contusions. The same happens in Hypochondriac or Hysteric Disorders; for if, in this Case, the nervous Foldings of the Mesentery, and the Nerves of the Stomach and Lungs, should happen to be distorted by Flatulencies, or any acrid Matter, Suffocation, Palpitation of the Heart, Vertigo, Pain of the Head, Fainting, Pain of the Neck, Asthma, Cataplexis, and Convulsions, threaten the Patient. Now the Physician would do nothing, who, only taking the Symptoms into Consideration, should prescribe Remedies against these Disorders; whereas, if the real Cause was once thoroughly known, such a Complication of Disorders might often be removed by a single carminative Clyster, or an antispasmodic Medicine. With a Paroxysm of the Stone are frequently join'd Vomitings, the Colic, Stupor of the Thigh, Retraction of the Testes, and what is still more remarkable, Epilepsy, and an uncommon

Pain of the Breast; for which Symptoms no other Cause can be assign'd, than that the intercostal Nerves, and those of the eighth Pair, are inserted into the Bladder and Kidneys. Over-looking Symptoms then, the Physician is to make it his chief Business to remove the Pain of the Stone, which being once done, the other Disorders will disappear with it; for which Intention Baths, oily Ointments, and gentle Anodynes, are to be prescribed, that by relaxing the Passages the Pain may be mitigated or removed. Equally necessary is that Observation concerning Worms, which, if lodg'd in the Intestinum Ileum of Children, corrode its Membrane, and produce Spasms and Convulsions: Which Symptoms will nevertheless easily cease, if the Physician makes a right Judgment of the Cause, and endeavours to kill the Worms by proper Anthelmintics. Intense Pain, Tenesmus, Loathing of Food, Watchings, and cold Sweats, often succeed an Erosion of the Bladder from the Stone. If by the Assistance of Anatomy we are directed to the Cause of this Distemper, it will easily appear, that in order to remove its concomitant Symptoms, the Physician's first and principal Care ought to be placed in removing the Stone, which is best and most effectually done by oily and balsamic Medicines; or, if the Case is very urgent, by extracting the Stone by a skilful Hand.

It would be tedious to mention the other Parts which are subjected to the most violent Torments, in Consequence of the incredible Connection and Communication of the Nerves: It will not, however, be improper to say something upon this Head. The most violent Disorders then, such as Diarrhoeas, Coughs, Fevers, Constipations of the Belly, Heaviness about the Breast, Convulsions, and other Disorders, accompany the Tooth-ach, and difficult Breeding of Teeth in Children; but these Symptoms, when they are not very violent, immediately remit, upon the Pain being allay'd, or the faulty Tooth pull'd out, which was the Cause of the Disorder: But 'tis surprising, what racking Pains accompany an Inflammation of the Stomach; because this Part, having very considerable Nerves, affects at once the whole Body. Hence by taking Poison, or by some acrid Matter lodging in the Stomach, intolerable Heart-burnings, Deliriums, and Uneasinesses, which in the Issue prove fatal, are produced; the internal Parts, but especially the Region of the Breast, are burn'd as it were in a Flame; the external Parts are cold, and the Pulse unequal; which Symptoms, as they are very terrible and dangerous, may justly alarm the Physician; yet they disappear, if the State of the Stomach is duly adverted to, and the Poison thrown out by means of Oil or Milk; or the Acrimony of the Matter destroy'd by proper Remedies. Nor is this less subject to happen in Wounds of the Tendons; for sometimes a Train of Disorders are the Consequences of a wounded Finger or Toe, or a Corn unskilfully cut; for then Cynic Spasms, Convulsions, Pains, and other Symptoms, afflict the Patient, and put him in the highest Danger; but the Fury and Violence of the Symptoms remit, if, by a seasonable Remedy, the Pain of the Nerves is mitigated.

In the Hysteric Passion, that Disease peculiar to the Female Sex, the Patients fall down as if they were Thunder-struck, or in an Apoplexy, since on account of the Nerves of the eighth Pair, and the Par Vagum, which are inserted in the Uterus, the Membranes of the Brain are at the same time seiz'd with Spasms. But, not to mention other Disorders, which in this Disease afflict the tender Sex, they all proceed from no other Cause than this; that the Nerves are carry'd in one uninterrupted Course thro' the Whole of the Body.

From this surprising Consent of Nerves, we are often to account for the Diseases, in which the Bile is justly accused as faulty; for as the hepatic Congeries of Nerves, which goes to the Gall-bladder, passes also thro' the Pylorus, the Pancreas, and the Duodenum; the Reason is plain, why, the Stomach being irritated, the Bile should be discharged both from its Ducts and Cystis; and why the Jaundice stimulates and provokes the Stomach itself to Nausea and Vomiting.

There is also a great Consent between the Bladder and Ureters, because the same Nerves pass thro' these Parts in one uninterrupted Course. Hence if the Beginning of the Ureters is afflicted with a Stone or Spasms, there very often happens at the same time a Suppression of Urine, a Strangury, and a fruitless and ineffectual Endeavour to make Water.

But enough on the Consent of the Nerves, which, if every thing was to be suggested, would detain us too long: The Physician in the mean while may profit so far from this, as to be able to distinguish the Cause from the Symptoms of a Disease. If any one desires to read more upon this Subject, he may consult that excellent Writer, *Kiussens*, who has laid down the Doctrine of the Nerves at greater Length. Tho' all I have advanced has a most direct Tendency to shew the Use of Anatomy in Practice, yet if I was to launch out into Surgery, Anatomical Knowledge would still be found more beneficial to it: For the Effects of Surgery are the most evident of any in Medicine; whereas in the Cure of internal Disorders there is at least a Possibility of doubting whether the Cure be performed by the Benefit of Nature, or the Virtues of the Medicine. But

in that Branch of the Art, by which Cures are performed by the Surgeon's, it is evidently and immediately perceptible to the Eye, that the Patient receives Assistance from his Hand. Hence it easily appears how great Praise a practical Physician may reap from the joint Knowledge of Anatomy and Surgery. I shall at present add no more concerning the Use of Anatomy in Surgery, since the Subject is of such Importance and Extent as to deserve a more particular Discussion. *Hoffman Medicina Rationalis Systematica*, Vol. 6.

Hoffman, tho' no inconsiderable Writer, has, however, in the preceding Dissertation, given a very confus'd Account of the Practice of the Antients. If amongst these he includes *Hippocrates*, he has done him great Injustice, by charging him with using too copious a *Materia Medica*, with a Neglect of gentle Laxatives, and with all the Errors and Dreams of later Physicians, who built their Theories upon the Peripatetic and Chymical Philosophy.

The HISTORY of ANATOMY.

With respect to the Antiquity of Anatomy, it seems scarcely possible, but that the Slaughter of Beasts for the Use of Man, Casualties, Murders, and the Accidents of War, must have furnished Mankind with a general Knowledge of the Structure of the Parts, in very early Ages of the World. But it is not very certain at what Period it began to be cultivated as a Science. This, however, must have been very early, especially if we pay any Regard to *Manetho*, the famous Egyptian Writer, who, according to the Report of *Eusebius*, relates, that *Athotis* an Egyptian King wrote some Treatises of Anatomy. This King, if the Egyptian Chronology was to be depended on, liv'd many Ages before *Adam*. This, however false with respect to Time, amounts to a sort of Proof of the Antiquity of the Science I am speaking of.

It is inferred, that *Solomon* was no Stranger to the Structure of the human Body, from a Passage in the twelfth Chapter of *Ecclesiastes*, which is thus:

Remember now thy Creator in the Days of thy Youth, while the evil Days come not, nor the Years draw nigh, when thou shalt say, I have no Pleasure in them;

While the Sun, or the Light, or the Moon, or the Stars, be not darkened, nor the Clouds return after the Rain:

In the Day when the Keepers of the House shall tremble, and the strong Men shall bow themselves, and the Grinders cease, because they are few, and those that look out of the Windows be darkened:

And the Doors shall be shut in the Streets, when the Sound of the Grinding is low, and he shall rise up at the Voice of the Bird, and all the Daughters of Music shall be brought low;

Also when they shall be afraid of that which is high, and Fears shall be in the Way, and the Almond-tree shall flourish, and the Grasshopper shall be a Burden, and Desire shall fail: Because Man goeth to his long Home, and the Mourners go about the Streets:

Or ever the Silver Cord be loosed, or the Golden Bowl be broken, or the Pitcher be broken at the Fountain, or the Wheel broken at the Cistern:

Then shall the Dust return to the Earth as it was; and the Spirit shall return unto God, who gave it.

It is evident, that *Solomon* is describing figuratively the Decays of the several Parts, which happen in old Age. But the whole Passage is too enigmatical to determine how far the Author was acquainted with the Structure of the Body.

It is very certain, that before, or, at least, in the Days of *Homer*, Anatomy was much cultivated, since this Author appears to have had a competent Knowledge of the Parts, and to have been very well vers'd in the Renunciation of Wounds, as the Moderns call it, so as to give an accurate Account of their Effects in almost all Parts of the Body.

But *Hippocrates* is the first Author at least extant, who treated of Anatomy scientifically. This divine Writer, conscious of his noble and exalted Genius, published many Anatomical Observations, which, tho' disjointed and scatter'd here and there in his Works, yet make up an entire Body of Anatomy, when taken together; But that he made it his principal Business to understand and explain the Bones of the human Body, is plain from those valuable and well-wrote Books upon Fractures, and the Joints, which evidently discover his perfect Knowledge of, and intimate Acquaintance with, the Bones; and that his Diligence, his Industry, and Skill in this Way, might the more effectually be transmitted to future Ages, he consecrated, if we may believe *Pausanias*, a brazen Skeleton to the Delphian *Apollo*.

The Writings of this great Man are interspersed with many Things relating to the Blood, which as they seem to shew his Knowledge of its Circulation, and also of the Secretions of the Humours, Dr. *Douglas* has pointed out such of them as seem to be the most glaring and unexceptionable Proofs of this Point.

The first of these Passages runs thus: *The Veins diffused thro' the Body supply it with Spirit, Fluidity ψύμα, and Mo-*

tion; whilst many of them branch out from one. But 'tis to be observed, that by Veins *Hippocrates* in this Passage means Arteries.

The second is in his Book *de Alimento*: *The Liver*, says he, *is the Root of the Veins, and the Heart that of the Arteries; from these the Blood and Spirits flow, and thro' these the Heat is diffused.*

The third is in his second Book *de Morbis*: *And if he recover, or get the better of his Disease, so that the Blood becomes warm, whether of itself, or by means of such Things as are administered; it ferments, is attenuated, and put into Motion, carries Spirits along with it, despumates itself, and is separated from the Bile, and so the Patient becomes sound.*

And again, *But*, says he, *whilst the Blood does not move, it cannot be but the Body must remain in a State of Rest and Sluggishness; and a little after, If the Coldness and Coagulation of the Blood are perfect, the Patient dies.*

The fourth Passage is in his second Book *de Dieta*: *For the Blood being warm'd and attracted, those Things which are in the Body perform a quick Circulation, [αἰεὶδὼν] and then the rest of the Body is purg'd by means of the Spirits; then that which is compact, becoming warm, is attenuated and eliminated from the Body thro' the Skin, and this is called a warm Sweat: And after this Excretion, the Blood is restored to its natural State, and the Fever remits.*

The fifth Passage is in his Book *de Insomniis*: *All these Symptoms, appearing, are the Signs of Health, and that the Body, together with all its Ingestions and Secretions, [ἀπορροιαί] are sound.* And again, *But Rivers, not flowing in their usual Manner, may be compared to the Circulation of the Blood, [αἷμα] when they overflow their Banks, they resemble the Excess; and when they cease to fill their Channels, they resemble the Deficiency of the Blood.*

The sixth Passage is in his first Book *de Dieta*: *For when the Circulation is slow, the Senses are lost by little and little, and those who are most acute are a little put out of Order, by reason of the Slowness of the Circulation.*

The seventh is in his Book *de Flatibus*: *For the Blood itself, being naturally warm, and propell'd by a certain Force, cannot soon make its Way thro' a narrow Passage, since it may meet with many Letts and Hindrances, whence Fevers, Pains, and other Disorders, arise.*

These Sentiments favour very much of the modern Theory of Fevers, arising from Obstructions of the Capillary Vessels.

The eight Passage is in his Book *de Morbo Sacro*: *The Spirit rests, the Brain is compress'd, and the Blood (ἐν) stands still.*

Many Passages, enumerated at large by *Joh. Ant. Vander Linden*, in a Treatise intitled, *Hippocrates de Circuitu Sanguinis*, might be subjoined to these; from which we may infer, that he had some Notion of the Circulation of the Blood.

Thus far Dr. *Douglas*. It cannot be doubted but *Hippocrates*, and all the Antients, knew that the Blood circulated; but it is certain, that they did not know how, or in what manner, the Circulation was performed; this Discovery being reserved for the great *Harvey*.

It would be superfluous to give a particular Detail of the Anatomy of *Hippocrates* in this Place; because whatever is remarkable, is taken Notice of under the respective Articles to which they belong. I must, however, observe that *Le Clerc* is far from thinking, with Dr. *Douglas*, that all the Anatomical Observations dispersed in the Works of *Hippocrates*, amount to an entire System. He says, that it is no easy Task to give a just Extract of the Anatomy of *Hippocrates*. Three things concur to deprive us of the Light that were to be desired in this Point. In the first Place, there are several Contradictions in what *Hippocrates* has wrote upon this Subject, or rather in the Books ascribed to him as their Author. Secondly, though one should collect all that he has said concerning each Part, yet still it would amount to nothing complete or coherent. In fine, tho' so many Faults had not crept into the Text, or tho' there were less Variety in the original Manuscripts, yet his Style is so concise, and some Passages in him are so obscure, and conceived in Terms so peculiar to himself, that 'tis not always easy, even for the greatest Masters of the Greek Language, to comprehend his Meaning.

For these Reasons, one might justly lament the Loss of a Book wrote by *Galen* on the Anatomy of *Hippocrates*, were not this Author to be suspected, on account of his Partiality, with regard to that ancient Physician: Instances of which, even in point of Anatomy, are to be met with.

The Assistance which, upon this Occasion, one might expect from Translators, and modern Commentators, is also very inconsiderable: If any Light is to be got from them, we ought to depend less upon these of the present, than those of preceding Ages; since 'tis to be dreaded, that the former, full of their new Discoveries, imagine they see them every-where; falling into the like ridiculous Error with those who find in *Homer* the most exquisite Delicacies, and refin'd Improvements of all the Arts and Sciences; or into the still more unaccountable Enthusiasm of others, who find the *Philosopher's Stone* in all the

the Books of the Antients; whatever the Subject handled should happen to be.

It is remarkable, that *Hippocrates*, in his Treatise *de Locis in Homine*, says, *That the Nature of the Body is the Principle, or Foundation, on which all medicinal Reasoning ought to be supported.* But in his Book *de Prisca Medicina*, there is a Passage which appears to be contradictory to the preceding: *Some Physicians*, says he, *and some Philosophers, affirm, that one cannot be Master of the medicinal Art, without knowing what Man is, what his first Formation, and the Manner in which his Body is composed, are. All that these Men have said, or wrote, concerning the Body, seems to me rather to belong to the Art of Painting than to that of Medicine; and I am persuaded, that one cannot have a more distinct Knowledge of the Nature of the Body, than by Medicine, as those who are Masters of that Art must easily perceive.*

These Passages, tho' seemingly inconsistent with each other, are, in my Apprehension, however, to be reconciled. It appears by many Passages in *Hippocrates*, that some Philosophers, in his Days, set up for a Knowledge in Medicine, merely upon the Strength of Hypothesis, and the Dreams of Theory, supported, in their Opinion, by the Structure of the Parts, without consulting Nature, and her Method of operating. Instead, therefore, of observing diligently how Nature really acts in producing and curing Diseases, they determined, *a priori*, how the necessarily must act, according to their Principles, which they seem to have taken for granted. In this last Quotation, then, our Author has these Philosophers in view, and their Abuse of Anatomy; and, indeed, there seems a great deal of good Sense in what he insinuates, which is, that Anatomy, supported by Observation, lays a noble Foundation for rational Medicine; whereas all rash Conclusions, drawn from the Structure of the Parts, before Experience has confirmed them, are at best precarious, and generally pernicious to the Practice of Physic.

Democritus was cotemporary with *Hippocrates*: With respect to his Knowledge of Anatomy, we learn no more, than that when the People of *Abdera* called *Hippocrates* to cure him of a supposed Madness, this Physician found him dissecting Animals, in order to discover the Cause of Madness, which he apprehended had its Residence in the Bile; upon which *Hippocrates* reported to those who employ'd him, that *Democritus* was not only in his Senses, but was the wisest of Men.

Diogenes Laertius gives the Title of a Book wrote by *Democritus*, which should seem to be Anatomical, as it is *Of the Nature of Man, or of the Flesh*.

Pythagoras, according to the Report of the same *Diogenes Laertius*, had some crude Notions of Anatomy, which are not of Importance enough to relate, since they are drawn from Speculation more than Reality.

Empedocles, a Scholar of *Pythagoras*, as we learn from *Galen*, had some very singular Notions of the Structure and Uses of the Parts of Animals; for he imagined, that certain particular Parts of their Bodies were contained in the Seed of the Male, and others in that of the Female; and that, from this Circumstance, the Venereal Desires of both Sexes were to be accounted for; foolishly imagining, that the Parts, thus separated, had a natural Tendency to join, and be again united with, each other.

With regard to Respiration, he thought it was performed in this manner: *As soon, said he, as that Humidity, of which there is great Store on the first Formation of the Fœtus, begins to be diminished, the Air, insinuating itself thro' the Pores of the Body, succeeds it: After that the natural Heat, by its Tendency to make its Escape, drives the Air out; and when this natural Heat enters the Body again, the Air follows it afresh.* The former of these Actions is called Inspiration, and the latter Expiration. The Fœtus, according to this Philosopher, respired in the Belly of the Mother.

The Sense of Hearing was, according to him, excited by the Air striking on the Inner-side of the Ear, which is wreath'd in form of a Shell, and fixed to the most elevated Part of the Body, as it were like a small Bell, which was sensible of all the Undulations and Impulses of the Air which should enter it.

The *Flesh* was, according to him, composed of an equal Portion of the four Elements. The *Nerves* consisted of Fire, Earth, and two Parts of Water. The Nails were formed by the Extremities of the Nerves, cool'd and harden'd by their Contact with the ambient Air. The Bones appeared to him to be composed of equal Parts of Water and Earth; or, at least, he thought, that these two Elements predominated over the other two in their Composition. Sweat and Tears he took to be Blood attenuated, and rendered thin.

The Seeds of Plants he esteemed analogous to the Eggs of Animals, which drop at the Time of their Maturity.

Alcæon of *Crotone*, who was also a Disciple of *Pythagoras*, deserves to have his Name handed down to future Ages, if, as *Chalcidius* in his Commentaries upon the *Timæus* of *Plato*, assures us, he was the first who dissected Animals, in order to know the Parts of which their Bodies consist: But Time having robb'd us of his Writings, we know no more of his Anatomy

than what we find in some antient Authors; and even what we meet with in them, seems rather to relate to Physiology than Anatomy. He imagined, that the Sense of Hearing was occasioned by the Ears being hollow within; and that all hollow Places resounded when any Sound enter'd them; and that Goats breath'd partly by their Ears.

With regard to the Sense of Smelling, he maintained, that the Soul, of which the principal Part is, according to him, lodged in the Brain, received the Smells drawn in, in Respiration. He imagined, that the Tongue distinguished Tastes by its Humidity, its moderate Heat, and its Softness. He thought the Seed was a Part of the Brain; and that the Fœtus was nourished in the Womb, by drawing a Supply at all the Parts of the Body, which is externally porous like a Sponge. Health, in his Opinion, depends on the Equality of Heat and Dryness, of Coldness and Humidity, and even of Sweetness and Bitterness, and other sensible Qualities. Maladies, on the other hand, he thought arose, when one of these Qualities predominated, and by that means broke the Union and Connection.

That *Aristotle* applied himself diligently to Anatomical Studies, is sufficiently plain from his Writings; for they abundantly convince us, that he does not relate every thing on the Authority of others, but that he was an immediate Spectator of them; tho', in his Days, Dissections of the human Body were very rare and uncommon. It must, however, be owned, that he borrowed many things from *Hippocrates*, which will not fail to appear, upon comparing the two Authors together: But *Hieron. Mercurialis* affirms, without Reason, that he borrowed all his Sentiments on Anatomy from others.

Alexander the Great, whose Preceptor *Aristotle* was, being desirous to know the Nature, and different Properties, of Animals, ordered him to bend his Thoughts that way; and for that Purpose furnished him with eight hundred Talents, which amount to about a hundred and fifty-five thousand Pounds sterling. That Prince supplied him also with several Thousands of Men from the different Quarters of *Greece* and *Asia*, who had Orders to obey him, to communicate to him all they had learn'd from Hunting and Fishing, and even to nourish and bring up all sorts of Animals, with no other View but to discover the Peculiarities of each Species, and communicate them to him.

One might justly think, that, with so considerable Assistances, *Aristotle* should not have failed to produce something very exact and accurate upon this Subject; and yet even the Antients observed, that he had advanced several things contrary to Truth. He may be excused, in this Point, by saying, that, in this Case, he was obliged to rely on the Authority of others, since he could not possibly see and do every thing himself. But suppose he had been obliged, on some Occasions, to rely on the Relations and Accounts of these Men; for Instance, in what relates to certain Properties of Animals, discovered by chance; yet there are other Occasions, on which he must have been an Operator himself, or, at least, must have been present, and given Directions to another. Of this Kind are the things relating to Anatomy. What Opinion, then, must we have of the Accuracy of this Philosopher, when we find him maintaining, that all Animals have their Necks flexible, and consisting of Vertebrae, except Wolves and Lions, whose Necks, he says, consist of one Bone? What Notion shall we also entertain of him, when he assures us, that the Bones of Lions contain no Marrow? a thing contrary to all the Experiments that have hitherto been made. The Curious may consult the learned *Borrichius*, with regard to the other Errors into which *Aristotle* has fallen, in respect of the Anatomy of the Lion, the Eagle, and the Crocodile. *Aristotle*, however, has had Errors laid to his Charge, of which he never was guilty. Those, for Instance, who publish'd the Account of a Dissection of a Lion at *Paris*, in the Academy of Sciences, have also been at some Pains to point out the Blunders of this Philosopher, with regard to the Anatomy of that Animal; and all they advance, on that head, may possibly be true; but, in one Passage, they seem to make *Aristotle* say what he never so much as dream'd of. We find these Words in his Book *de Physiognomia*: *παύεται δὲ τὸν ζῶον ἐπ' αὐτὸν τελευτάῃ μετεκτρέφει τὴν τὴν ἀπὸ τοῦ ἰδίου*. Which the Latin Interpreter translates thus: *Videtur Leo omnium animalium perfectissimum animal in assumendo maris formam.* Here *Aristotle's* Words are explained as if he meant, that the *He-Lion* has, by way of Eminence, and beyond all other Animals, the visible and apparent Marks of his Sex. This is the Interpretation of these Gentlemen, and, in order to prove that *Aristotle* was mistaken, they add, that the Urethra of the Lion, that is to say, the Canal of his Penis, together with its Ligaments, appears externally to be only three Inches and an half in Length: Their Conclusion had been just, if *Aristotle*, as they and *Borrichius* imagined, had meant, that the Lion, of all other Animals, has that Part which distinguishes the Sex the largest, and most apparent: But, in my Opinion, this was not so much as in his Mind; and, I believe, he meant no more, than that the Lion does, of all other Male Animals, distinguish himself the most easily from the Female, by a grand and masculine Air peculiar to himself.

I trans-

I translate the *Greek Word* *ἰσμία* by the *English Word* *Air*, or the *Latin Word* *Species*, which precisely corresponds to the *Greek Word*.

The several Dissections which *Aristotle* made of the different Species of Quadrupeds, Birds, Fishes, and Insects, taught him many things concerning the Uses of the several Parts of each Species. I shall not, here, examine every Particular he advances upon this Head, or upon the Differences that are found among these Parts, and their respective Uses; but I shall give his Sentiments, with respect to the Construction and Uses of the Parts, which are common to the Animals commonly called perfect, such as Man and Quadrupeds.

Aristotle looked upon the Heart as the Source and Principle of the Veins and Blood. The Blood, says he, passes from the Heart into the Veins; but he says, that it comes from no Part to the Heart. He moreover maintained, that two Veins proceeded from the Heart, the one from the Right Side, which is the larger, the other from the Left, which is lesser, and which he called the Aorta. Here 'tis proper to observe, that this Philosopher, according to *Galen*, (*de Venar. & Arteriar. Diffect.*) was the first who gave this Name to the great Artery; which proves, that *Hippocrates's* fourth Book *de Corde*, where this Word is found, was not wrote by him. *Aristotle* thought that these two Veins convey'd the Blood to all the Parts of the Body. He also imagined, that there were three Cavities in the Heart, which he calls Ventricles. Of these three Ventricles, that in the Middle, the precise Situation of which he does not determine, is, according to him, the common Principle of all the rest, tho' it be the smallest; the Blood which it contains is also the most temperate, and most pure. The Blood of the Right Ventricle is warmest, that of the Left coldest; and this last Ventricle is the largest of the three. All these Ventricles have a Communication with the Lungs by Vessels, which are quite different from the two great Veins already mentioned, which Vessels distribute themselves thro' all the Substance of the Lungs.

Aristotle not only made the Veins, or Blood-vessels, but also the Nerves, to derive their Origin from the Heart; and he founded his Opinion upon this, that the largest of the Ventricles of the Heart, according to him, contains small Nerves: The Vein which he calls the Aorta is nervous, and is itself like a true Nerve towards its Extremities, since it has no Cavity, and is stretch'd out in the same manner with Nerves, where it terminates near the Articulations of the Bones. He also maintains, that there are a Number of Nerves in the Heart, and that they are of singular Use there, since its Contraction and Dilatation depend upon them. He seems, in this last Passage, to mean the Tendons or Fibres which contract and dilate the Heart; and if *Hippocrates* confounded the Nerves with the Tendons and Ligaments, it does not appear, that *Aristotle* better distinguished these Parts, nor that he knew the Use of the real Nerves. He maintains, that the Nerves are not continued like the Veins, but that they are scattered here-and-there, and distributed to the Parts where the Articulations are; by which 'tis plain, that he still means the Tendons. If he had understood the Use of the Nerves, he had never asserted, in another Passage, that no Parts, but such as contain Blood, were capable of Sensation; and he would never have maintained, as he does, that the Flesh is the proper Organ of Sensation. As for Motion, if he ascribes it to the Nerves, it is evident, that the Nerves he means are also Tendons or Ligaments.

The common Principle of Motion and Sensation is, according to *Aristotle*, lodged in the Heart; which he makes to be the Principle of Nourishment to the whole Body; by the Blood which it sends to all its Parts. It contains the natural Fire, is the Seat of the Passions, the Point, as it were, in which all the Sensations terminate as in a common Centre, and the true Seat of the Soul; and all this, not because the Nerves draw their Origin from it, as one might be induced to think by what has been said, but because the Heart is the Reservoir, or Store-house, of the Blood and Spirits. *Aristotle* even maintains, in plain Terms, that the Spirits cannot be contained in the Nerves.

But if he ascribed so noble Uses to the Heart, he imagined, that the Brain was only a Mass of Earth and Water, void of Blood, and destitute of Sensation. The Office of this cold Mass was, says he, to balance and correct the Heat of the Heart: But, besides his ascribing this Office elsewhere to the Lungs, he does not specify the Manner in which he imagined the Brain could answer this End. Tho' the Brain be placed immediately above the *Medulla Spinalis*, and is joined with it, yet *Aristotle* imagined, that this Marrow was quite a different Substance from that of the Brain, being only a Species of Blood prepared for the Nourishment of the Bones, and consequently hot; whereas the Brain was, in his Opinion, very cold. Besides, he thought the Brain of so little Importance, as to place it only next in Rank to the Excrements; and imagined, that it ought not to be rank'd among the Parts of the Body, which are united and connected with one another; but that it ought to be look'd upon

as a Substance of a particular Nature, quite different from all the rest of the Parts.

With regard to the other Viscera, such as the Liver, the Spleen, and the Kidneys, he imagined, their chief and principal Use was to support the Veins, which, without them, would be loose and pendent, and to fix them in their proper Places. Besides this general Use, he assigned some particular one to each of them. The Liver, for Instance, assists the Concoction of the Aliment in the Stomach and Intestines, by the Heat which it communicates to these Parts. The Spleen is not of so great Use; it is only, in our Philosopher's Opinion, accidentally necessary to collect, prepare, and give a different Direction to the moist Vapours which rise from the Belly; and hence those Animals, in which these Vapours take a different Course, have only very small Spleens. Of this Class are Fowls and Fishes, whose Feathers and Scales are nourished by this Humidity; and for this very Reason, says he, these Animals have neither Kidneys nor Bladder. The Kidneys also are, according to him, only designed for a Piece of Convenience; since their Office is to imbibe a Part of the Excrement, which is carried to the Bladders of these Animals, in which it abounds too much, that the Bladder may be eased of a Part of its Burden. He adds, a little after, that the Humours filtrate themselves, or flow thro' the Substance of the Kidneys; in which, indeed, he has come somewhat nearer to the Use generally ascribed to these Parts; but he talks at the same time very obscurely on the Point.

The Testicles are also, according to him, Parts form'd by Nature for Convenience; but are not absolutely necessary. He also affirmed, that two Veins came from the Aorta, and were inserted into the Testicles; and that two other Veins came to them from the Kidneys; and that these latter Veins contained Blood, but the former none. That there came from the Head of each Testicle, or, at least, from some one of its Extremities, another larger and more nervous Canal, which, bending itself, and lessening by degrees, ascends to the two others; and, being wrapt up in a Membrane, terminates at the Root of the Penis. He adds, that this last Canal contains no Blood, but a white Liquor; and that terminating at the Penis, or towards the Neck of the Bladder, it there finds an Opening, which leads to the Penis; about which Opening there is a kind of Husk *δεν Κέλυφος*, or Bark.

Taking this for granted, he maintained, that when the Testicles were cut from any Animal, all the above-mention'd Canals shrivel'd up; and that it was for this Reason that castrated Animals could not, for the future, propagate their Species. For a Proof of this, he adduces an Instance of a Cow, which conceived after Copulation with a Bull immediately after his Castration, and before the Seminal Vessels had shrivel'd up. In another Passage he explains himself still more particularly, with regard to the Use of the Testicles, when he maintains, that they are no Part of the Canals or Reservoirs of the Seed, and that they have nothing in common with them; but that they only serve as a Counter-poise to draw them downwards, and to retard the Motion of the Seed, almost in the same manner with those Stones which Weavers tie to their Webs. He advanced farther, as a Proof of the Uselessness of the Testicles, with regard to Generation, the Instances of Fishes, and Serpents, which being, to all Appearance, deprived of these Parts, did nevertheless propagate their Species.

He also thought, that Conception was occasioned by a Mixture of the Male Seed with the Menstrual Blood, in the Matrix; and ascribed no other Part in Generation to the Female Seed, which, according to him, was only the Excrement of the Matrix, which some Females discharged, and some not; and that these last were not, on that Account, less fit for Generation, or more deprived of the Sensation of venereal Enjoyments, since it proceeded from the Afflux of Spirits to the Parts of Generation.

As to the Place where the Concoction of the Aliments was perform'd, and the Manner in which it was brought about, he imagined, that the Aliments were first prepared in the Mouth of such Animals as used any kind of Food, which stood in need of Mastication. But we must not imagine, that, in that Place, any sort of Concoction is made; the Food is only reduced into small Parts, that it may the more easily be prepared and penetrated, after it has descended into the Stomach, and lower Belly, which are both designed for the Preparation of the Aliments; and as the Mouth is the Opening at which the unprepared Aliments enter, and the Oesophagus the Duct by which it is convey'd to the Stomach, there must, in like manner, be other Openings, by means of which, all the Parts of the Body receive the Degrees of Nourishment of which they stand in need: These last Openings are the Mesenteric Veins, which draw what is necessary for them from the Stomach and Intestines, in the same manner as Horses draw Hay from a Rack.

Aristotle imagined also, that as Plants received their Nourishment from their Roots, which were spread in the Earth, so Animals

Animals received theirs by the Mesenteric Veins; which may be compared to so many Roots, designed for drawing the Juice from the Stomach and Intestines; these last Parts being, with regard to Animals, what the Earth is in respect of Plants. I must also observe, with regard to the Anatomy of *Aristotle*, that he himself never dissected any thing but Beasts, and that in his Days they had not ventured on the Dissection of human Subjects. This he himself seems to insinuate, when he says, *That the internal Parts of Man's Body are unknown, or that we have nothing certain relating to them; but that we must judge of them by the Resemblance they bear to those of other Animals which correspond to them.*

By these Sketches of the Anatomy of *Aristotle*, we may form a Judgment of his Knowledge in this Science, and conclude, that he knew very little, or nothing, of the true Uses of the Parts. It must, however, be remarked, that he mentions the Intestine *Jejunum*; and distinguishes the *Colon*, *Cæcum*, and *Rectum*; whereas *Hippocrates* only takes Notice of the *Colon* and *Rectum*.

Le Clerc gives some more Particulars relating to the Anatomy of *Aristotle*, which may be consulted by the Curious; but it will give no great Information to Anatomists.

Diocles Carystius is said to have lived some little Time after *Aristotle*, that is, under the Reign of *Antigonius*. *Galen* informs us, that he was the first who wrote upon the Method of dissecting Bodies; this Art, before his Days, being confin'd to private Families, and only taught to the Children and Pupils of those who possess'd the Secret: But the same Author tells us, that *Diocles* made no great Advances in Anatomy.

But much greater Progresses were made in this Science by *Herophilus* and *Erasistratus*. *Herophilus* is said to have lived during the Reign of *Ptolemy Soter*, and to have been born at *Carthage*.

Herophilus and *Erasistratus* are reported to have had this in common, that both of them dissected living Subjects. Of the former, *Tertullian* talks in this manner: *Herophilus, that Physician, or rather Butcher, who dissected six hundred Men, in order to find out Nature; who hated Man, in order to know the Construction of his Body, could not, by that means, come to a more perfect Knowledge of his internal Parts, since Death induces a great Change on all the Parts, as they are not the same after Death that they were before, especially since they did not die a natural Death, but under all the Agonies to which the Curiosity of the Anatomist was pleased to subject them.*

The Fact may possibly be true; the Possibility of it is not to be disputed, since, in these Days, we meet with Instances of the like Inhumanity. But may we not suspect, that since *Herophilus* and *Erasistratus* were the first who dissected human Bodies, the Novelty of the Attempt forcibly struck the Minds of the Vulgar, and laid a Foundation for groundless Exaggerations, and a Publication of more than was really Truth? a thing very common upon Occasions of a like Nature; witness the Story of *Medea*, who was branded with the Inhumanity of boiling Men alive, for no other Reason but because she invented warm Baths: And who, to this very Day, can persuade the Vulgar, but the Pupils of Anatomical Schools secretly convey off People, in order to dissect them?

'Tis, however, certain, that *Herophilus* and *Erasistratus* had really dissected many human Bodies. This last speaks, in a Fragment of his Anatomical Works, of the Brain of a Man whom he had dissected; and of *Herophilus*, *Galen* talks in this manner (*de Diss. Vulvæ*, Cap. 5.): *He was, says he, an accomplished Man in all the Branches of Physic; but he was particularly knowing in Anatomy, which he had learned not, by the Dissection of Beasts alone, as Physicians usually do, but principally by the Dissection of Men.*

The same *Galen* observes, (*Administ. Anatomic. Lib. 7. Cap. 5.*) that it was at *Alexandria*, the Capital of *Egypt*, where *Herophilus* made his Dissections; which renders it probable, that it was owing to the Curiosity of the Kings, and their Inclination to encourage the Arts, that these two Physicians had the Liberty granted them of instructing themselves by dissecting human Bodies: A Liberty which those of succeeding Times very rarely enjoy'd for many Ages, whether thro' a Defect of Kings of equal Courage and Learning with the first *Ptolemies*, or thro' the scrupulous Disposition of the People passing to the Sovereigns, or getting the better of their Authority. I am not ignorant, that *Riolanus* has maintained, in Opposition to this, that they not only dissected Men before this Time, but that this Practice was even continued down to the very Days of *Galen*. He also maintained, that *Aristotle* practised the same kind of Dissection; but this learned Anatomist proves no more, than that *Aristotle* really dissected Animals, and composed some Books of Anatomy, to which he often refers his Readers. This cannot be denied; but that he dissected Men, cannot be proved, since we find *Aristotle* himself confessing, that he never dissected any thing but Beasts.

This Anatomist succeeds no better, when he attempts to prove, that *Hippocrates* had dissected human Bodies; but his Arguments for this will, upon an impartial Review, be found

so weak and inconclusive, that we may safely infer, that *Herophilus* and *Erasistratus* were the first who were known to dissect human Bodies.

As for *Herophilus*, one of the principal Proofs of his Accuracy is this, that he addicted himself to those Parts of Anatomy which had not before been touched upon. Neurology, or the Dissection of the Nerves, was in his Days a Part of Anatomy, not as yet well known. *Galen* informs us, that *Herophilus* was the first after *Hippocrates*, who handled this Matter with Accuracy; but he shares the Praise, due to him in this respect, with another Physician, *Eudemus*. As for *Hippocrates*, who likewise comes into the Account upon this Occasion, *Galen*, being resolved to extol him above all the antient Physicians, honours him with a Degree of Knowledge in this respect, which his Writings no where discover.

It is very probable, that *Herophilus* was the first who was known to discover the Nerves; properly so called; and who knew how to demonstrate them: According to *Rufus Ephesus*, he divided the Nerves into three Kinds. The first he called *Ἀσθητικὰ καὶ παρὰσθητικὰ νεῦρα*, or those Nerves which are the immediate Instruments of Sensation, and the Ministers of the Will. These, according to him, derived their Origin from the Brain, from which they rose like so many Branches, and were a Part of the *Medulla Spinalis*. The second proceeded from some of the Bones, and terminated at others of them. The third arose from some of the Muscles, and terminated at others. By this we see, that *Herophilus* gave the Name of Nerves to those Parts, which were afterwards called *Ligaments* and *Tendons*; but 'tis a Matter of little Moment, what Names Things receive, provided they be sufficiently distinguished: In Reality, this Distinction of three Sorts of Nerves, ascribed to this antient Anatomist, is a Proof, that no such Distinction was made before his Time, and that these Parts were confounded with one another. The Writings of *Herophilus* being lost, we know no more of his Sentiments, with regard to the true Nerves; but that he gave the Name of *Optic Pores* to those Nerves which reach to the Bottom of the Eye, and which now are called *Optic Nerves*; and maintain'd, that they had a sensible Cavity, which was not to be met with in other Nerves.

There is nothing remarkable with respect to his Notions of the Uses of the Brain, except that we are told, he imagined the reasonable Soul was lodged in its Ventricles.

But one of his principal Discoveries; which, though look'd upon to be the Product of our own Age, is nevertheless very antient; is, his finding certain Veins in the Mesentery, which according to him, were destin'd to nourish the Intestines; which do not, like the other Veins, go to the *Vena Portæ*, but terminate in certain glandular Bodies. *Erasistratus* likewise discovered something of this Nature.

Besides, as *Herophilus* had learned Anatomy, not by reading the Books of his Predecessors only, and form'd particular Ideas of the Parts; from what he had seen in Dissections, especially those of human Bodies, he expressed these Ideas by Words, which appeared to him most proper for that Purpose; that is, he invented new Names; and gave Names to Parts, which before had none.

For Instance, he called the first of the Intestines, or that which is next to the Stomach; *Δωδεκάδακτυλον*, because it is twelve Inches in Length.

Having also observed, that the Vessel which passes from the right Ventricle of the Heart to the Lungs; and which he took for a Vein, had a thick Coat like that of an Artery, he called it, if we may believe *Rufus Ephesus*, the *Arterial Vein*; and for the quite contrary Reason, he called the Vessel which comes from the Lungs to the Left Ventricle of the Heart, the *Venous Artery*. But though the Names he gave to those Vessels, point out the Knowledge he had of the Heart, and the Vessels with which it is immediately connected; yet *Galen* (*De Hippocrat. & Platon. Decret. Lib. 1. Cap. 10.*) observes, that he has been very negligent in describing the Membranes of the Heart, to which he had nevertheless given a Name, calling them *Nervous Separations*, or *Partitions*.

It was also *Herophilus* who first called two Coats of the Eye, the *Tunica Retina*; and the *Tunica Arachnoides*. He also called that Membrane which lines the Ventricles of the Brain, the *Membrana Choroides*, because he saw, that it resembled the Chorion which covers the Fœtus in the Matrix.

He also compared the Cavity, which forms the fourth Ventricle of the Brain, *Ἀναγλυφὴ τοῦ καλάρου*, to the Concavity of a writing Pen, or Reed, used for that Purpose in *Egypt*. He has in like manner given the Name of *Λυγρὸς*, *Torcular*, to that Place where all the Sinuses of the *Dura Mater* unite.

It was he likewise who gave the Name of *Glandula Parastata* to those Glands which lie about the Root of the Penis.

He styl'd these *Parastata glandulous*, in order to distinguish them from other *Parastata*, which he called *Varicose*, and which he placed at the Extremity of those Vessels which convey the Seed from the Testicles, or rather, as he thought, which serve to prepare it; for though he did not deny, that the Testicles served, in some measure, to the Generation of Seed, yet

he believed, that the above-mentioned Vessels contributed much more to that Purpose. The Word *Parastata* imports any thing situated near another. Some antient Physicians have also given the Name of *Parastata* to the Epididymis. It is plain, that *Hippocrates* and *Aristotle* knew the Varicose Parastatae of *Herophilus*, though they did not give them the same Name.

The Authority of *Herophilus*, in point of Anatomy, was so great, that almost all the Names he assign'd to the different Parts, are still preserved. The Testimony of Antiquity is so strong in the Favour of *Herophilus*, that we cannot, without injuring his Character, deny him to be the best Anatomist of the Times in which he lived. If his Writings had reached our Hands, we might have been able to have judged of his Sentiments for ourselves. But as they are lost, we can say no more, than that what is preserved in Quotations is sufficient to give us a great Idea of his Exactness and his Skill, especially if we consider, that he lived at a time when Anatomy was only in its Infancy, and that his whole Stock of Knowledge, in this Particular, was principally of his own acquiring. *Fallopian*, a knowing Anatomist of the last Age, was so superstitious an Admirer of *Herophilus*, that he laid it down as a Maxim, that it was as unreasonable to contradict him in point of Anatomy, as to contradict the Gospel; but the Encomium is a little too extravagant.

It is generally thought, that *Erasistratus* was contemporary with *Herophilus*, or liv'd very soon after him.

It was by means of Anatomy, that this Physician first became considerable in the World; and *Galen*, who upon many Occasions talks unfavourably enough of him, yet confesses that *Erasistratus* had contributed a great deal to the Re-establishment of Anatomy, which, as he says, had been in a great measure lost for some time before. But 'tis no easy Matter to find out what particular Period of Time he has in View: However, that we may understand the Passage the better, it is necessary to relate the Whole of it. Those, says he, who are not ashamed to speak against Evidence, are the Cause of the Length of this Dispute [the Dispute betwixt him and *Chrysippus* the Stoic, who maintain'd, that the Seat of the Soul, and the Origin of the Nerves, was in the Heart]. We ought not to accuse either *Hippocrates*, or *Eudemus*, or *Herophilus*, or *Marinus*, who since the Days of the Antients have re-established the Science of Anatomy, which had been neglected in *ῥημελαῖον χρόνον*, in the intermediate Space of Time between them.

Galen at first seems to hint at the Time which passed between *Esculapius*, or his first Descendants, and *Hippocrates*; which is that dark Period, during which, the State of Physic was not known. But we shall see by what he says elsewhere, that he meant no such thing. In order then to prevent the Contradiction betwixt the Passage now quoted, and some others of the same Author, we must necessarily put a Point after the Word *Hippocrates*, and begin another Period thus: We ought not to lay the Blame upon *Hippocrates*. Neither ought we to accuse *Erasistratus*, nor *Eudemus*, nor *Herophilus*, nor *Marinus*, who after the Antients have re-established the Science of Anatomy, which had been neglected in the Time intervening between them. Or this Sentence of *Galen* may be translated thus: We ought neither to accuse *Hippocrates*, nor those who have re-established Anatomy, which had been neglected in the Interval between them and him, such as *Erasistratus*, *Eudemus*, *Herophilus*, &c. According to this Explication, which is the genuine Sense of *Galen*, *Hippocrates* will not be rank'd among the Restorers of Anatomy, which would not agree with what the same Author says in another Passage, [De Administ. Anatom. Lib. 2. Cap. 1.] "That the antient Physicians, and even the antient Philosophers, were very much addicted to the Study of Anatomy, and that in these Days Fathers not only train'd up their Children in it, by obliging them to read and write upon the Subjects, but also by making them dissect Subjects themselves; so that having learned the thing from their Infancy, it was impossible they should forget it. But, continues he, it was not so afterwards, when Physic came to be out of the Hands of the *Aschypiadean* Family, and when Physicians began to teach their Art to Strangers, especially to Men advanced in Years, for whom they had an Esteem, and whom they revered on account of their Virtue. These Men, not being young enough to labour at Anatomy with Success themselves, or to inform themselves of the Parts of the Body by their own Sight, and by putting their Hands to the Work, could only learn Anatomy very imperfectly. Hence it was, that, in Process of Time, the necessary Instructions in this Branch of Learning passing often from one hand to another, Anatomy grew still worse and worse."

Thus *Galen* supposes, that Anatomy was in a flourishing State whilst Physic was confin'd to the *Aschypiadean* Family; he even fixes, in express Terms, the Beginning of its Declension, at the particular Time when Physic began to be practis'd by others, than those of that Family. Now we are no-where inform'd, that Physic was practis'd out of this Family, till the Philosophers began to encroach upon the Art, or, at least, till *Hippocrates* began to teach Disciples, as *Galen* elsewhere observes.

As this is the Case, it is scarce to be believ'd, that the Philosophers were the Cause of the Decay of Anatomy, since it was their Interest to carry it to its Perfection, even though they had not had the Interest of Physic in View. *Galen* himself does not think, that this was the Case, since he joins the Philosophers and Physicians together, when he speaks of the Time wherein Anatomy was in its Perfection; and by the Philosophers, he undoubtedly meant *Democritus*, and others who preceded *Hippocrates*. So that the Time spoke of, must be that which followed the Death of *Hippocrates*.

But there is a considerable Difficulty in this Point; for if *Hippocrates* was so skilful an Anatomist as *Galen* represents him, who can possibly believe, that his Knowledge in this Particular should have been so soon lost, or rased from the Memories of Men, that *Diocles*, *Praxagoras*, and the other Physicians of their Time, were so little improved by his Discoveries, or the Traditions of them, that *Galen* has with Justice styled them [De Dissert. Vulva, Cap. 9.] unskilful Anatomists? Before this could happen, a great Time must have intervened between *Hippocrates*, and these Physicians. But where shall we find all these Successions, or that great Number of Generations, since all the Authors agree, that *Diocles* followed not long after *Hippocrates*; so that he must have been contemporary with *Plato*? As this is the Case, if he did not see *Hippocrates* himself, he must, at least, have seen his Sons, or his Son-in-law, who may reasonably be presumed to inherit the Knowledge of their Father, in point of Anatomy, as well as of the other Branches of Physic. And as for *Praxagoras*, who lived almost in the same Time with *Diocles*, though he had not had an Opportunity of instructing himself in the same way, that is, by the Traditions of *Hippocrates* and his Disciples, yet, according to *Galen* himself, he was one of the Descendants of *Esculapius*, the Children of whose Family were train'd up to Anatomy from their Infancy; so that, in this respect, *Hippocrates* could enjoy no greater Advantages than he. *Galen* would not have involved himself in this Difficulty, if he had not been unreasonably prepossess'd in favour of the *Aschypiadean* Family, as may be easily seen by his Works.

It is certain, that *Erasistratus* and *Herophilus* carried Anatomy to a higher Pitch of Perfection. But *Galen*, who look'd upon the former of these as the Rival of *Hippocrates*, was unwilling to confess this, but declares all along in favour of the latter.

It is also certain, that before *Erasistratus* and *Herophilus*, Anatomists had never ventured to dissect human Bodies; and that in the Times of *Aristotle*, who lived not long before these two Physicians, they had only dissected Beasts. It must be own'd, that in Egypt they had long before a Custom of embalming their dead Bodies, which could not be done without opening them; and *Galen* himself confesses, that this Custom might have furnished the Physicians of that Country with a favourable Opportunity of instructing themselves.

But as it is not probable, that those Persons who were employ'd in Embalming, durst satisfy their Curiosity entirely, and search as narrowly as was necessary into the human Body, which was look'd upon as something sacred, Anatomy could not possibly arrive at any considerable Pitch of Perfection, whilst no other Means were employ'd in its Cultivation. Carcases, upon which every thing might be attempted, were absolutely necessary for that Purpose. These were probably first granted in Consequence of the Inclination which the Kings of these Times had to advance the Arts and Sciences. *Alexander the Great* first began to patronize those who apply'd themselves to Natural History, by ordering *Aristotle* to labour at that of Animals, and their several Parts; and without Doubt, *Ptolemy Soter*, or *Ptolemy* the Son of *Lagus*, succeeded *Alexander*, as well with regard to this Inclination, as with regard to that Part of his Empire, which fell to his Share. This appears still the more probable, if we consider, that *Ptolemy* was a Man of Learning, and wrote himself a History of *Alexander*, as we learn from *Arrian*. *Ptolemy Philadelphus*, Son of the preceding *Ptolemy*, was no less industrious in promoting Arts and Sciences; since he invited to his Capital all the learned Men of his Time, and collected, at an extraordinary Expence, a Library of Books from all Parts of the World, in order to form a Library, which was still augmented by his Successors.

It is probable, that these two Kings, getting over the Scruple which had till then reign'd, of dissecting human Bodies, not only granted the Physicians the Bodies of Criminals after their Death, but, if we may give Credit to some Authors, put into their Hands many of these wretched Creatures, to be dissected, imagining, that they might by that means discover things, which otherwise they could not do. *Herophilus* and *Erasistratus*, says *Celsus*, have dissected living Criminals, condemn'd to Death, and dragg'd from their Prisons by the Order of their Kings, for that very Purpose.

Which ever of these two Princes *Erasistratus* lived under, 'tis probable, that he laid hold of this favourable Opportunity, and made those Discoveries in Anatomy which gain'd him so high a Reputation. But as his Writings have not reached us,

we know no more of his Sentiments than what are transmitted to us by *Galen*, who generally quotes him with no other View but to refute him.

The principal of *Erasistratus's* Discoveries, which, by the way, was not made upon human Bodies, but which at the same time acquir'd him abundance of Honour, was his finding out [*Galen. an Sanguis sit Naturâ in Arteriis, Cap. 5. & Administrat. Anatom. Lib. 7. Cap. ultim.*] certain white Vessels in the Mesentery of sucking Kids, which he believed to be Arteries. He added, That these Vessels seem'd at first to be full of Air, and afterwards of Chyle.

Erasistratus and *Herophilus* were the first who knew the true and genuine Use of the Brain and Nerves, or, at least, the Uses ascribed to them by all succeeding Anatomists. *Rufus Ephesus* says, that *Erasistratus* owned two Sorts of Nerves, those which are the Instruments of Sensation, and those that are the Instruments of Motion. He maintained, according to *Galen*, that the former were hollow, and drew their Origin from the Membranes of the Brain, whereas the other sprung from the Brain itself, and the Cerebellum. But *Galen* [*De Hippocrat. & Platon. Decret. Lib. 7. Cap. 3.*] informs us, that *Erasistratus*, having inquir'd more accurately into the Matter, was at last convinced, that all the Nerves proceed equally from the Brain. This may be gathered from a Passage of this antient Anatomist, related by *Galen*, the Whole of which I shall translate, that we may see what Notions he entertain'd with respect to the Brain, the Cerebellum, the Nerves, and all the several Parts connected with each of them. "We examined, says *Erasistratus*, what the Nature of the human Brain was, and we found it divided into two Parts, as it is in all other Animals. It had a Ventricle or Cavity of a longitudinal Form. [*Here there seems to be a Chasm, or Defect in the Text.*] These Ventricles had a Communication with one another, and terminated in a common Opening, according to the Contiguity of their Parts, reaching afterwards to the Cerebellum, where there was also a small Cavity. But each Part was separated from the other, and shut up in its proper Membranes, and the Cerebellum in particular was wrapt up by itself, as well as the Brain, which by its various Windings and Turnings, resembled the Intestinum Jejunum. The Cerebellum was in like manner folded and twisted different ways, so that it was easy to know by seeing it, that as in the Legs of swift-running Animals, such as the Hart, the Hare, and some others, we observe Tendons and Muscles well calculated for that Purpose; so in Man, who has a larger Share of Understanding than other Animals, this great Variety and Multiplicity of Foldings in the human Brain, was undoubtedly design'd for some particular End. Besides, we observ'd, continues *Erasistratus*, all the Apophyses or Productions of the Nerves which come from the Brain; so that, to say all at once, the Brain is visibly the Principle of every thing that passes in the Body; for the Sense of Smelling proceeds from the Nostrils, being pierced in order to have a Communication with the Nerves. The Sense of Hearing is also produced by the like Communication of Nerves with the Ears. The Tongue and the Eyes receive also the Productions of the Nerves of the Brain."

Here we see, by the Confession of *Erasistratus* himself, that he had dissected Men. *Erasistratus* had also very accurately described, in *Galen's* Opinion, [*De Hippocr. & Platon. Decret. Lib. 1. Cap. 10. & Lib. 6. Cap. 6.*] the Membranes which are found at the Orifices of the Heart; and he maintain'd with *Aristotle*, that the Veins and Arteries drew their Origin from it. There are, says he, certain Membranes inserted in the Orifices of the Vessels of the Heart, of which the Heart makes use, either for the Reception or the Expulsion of such Substances, as either enter into it, or come out of it. Some, adds *Galen*, have been so rash as to deny, that there were such Membranes, and have look'd upon them as Fictions of *Erasistratus*, or a kind of Hypothesis invented to support his own System: But these Membranes are so well known by Anatomists, that none but Novices in the Art are ignorant of them. There are, continues *Galen*, three of these Membranes at the Orifice of the *Vena Cava*, which resemble the Points of Arrows; whence some of the Disciples of *Erasistratus* have called them *τετραόχυνες, Tricuspides*. There are also at the Orifice of the *Arteria Venosa* (for so I call that Artery, which rising from the left Ventricle, disperses itself in the Lungs) Membranes of a like Form, but of different Names; for that Orifice has only two Membranes. The other two Orifices, I mean, that of the *Vena Arteriosa*, and that of the *Arteria Magna*, have also each of them three Membranes, resembling the Sigma of the Greeks, which resembled our C. Here *Galen*, ceasing himself to speak, again introduces *Erasistratus*, saying, "That these two last Orifices are equally disposed to convey any thing from the Heart; that thro' the former the Blood flows to the Lungs, and thro' the latter the Spirits, in order to be distributed thro' the whole Body. [*Here some part of the Greek Text seems to be wanting.*] Thus it happens, continues *Erasistratus*, that these Membranes alternately perform opposite Offices to the Heart.

Those which are adherent to the Vessels, by which Substances are carried into the Heart, bend inwards, that they may yield to the Impetuosity of such things as are carried towards them, and, lying in the very Cavities of the Heart, may open its Entry for the Introduction of such Substances as are attracted to it; for we have no Reason to imagine, that such Substances enter the Heart of their own Accord, as if it were an inanimate Receptacle; but the Heart, by its Diastole or Dilatation, draws them to it, as the Blacksmith's Bellows does the Air; and in this manner the Heart is fill'd. The Membranes of those Vessels, on the other hand, which serve to convey things from the Heart, are quite differently disposed and situated; so that yielding easily to the Substances coming from the Heart, they open their Orifices at the time it thrusts out such Substances; whereas at other times they shut up these Orifices, and allow nothing to return which is once thrust out, just as the Membranes of the Vessels, which serve to introduce things into the Heart, shut the Orifices of these Vessels upon the Heart's contracting itself, and allow nothing to be carried out which is once thrown in."

It were to be wish'd, that *Galen* had left us more Fragments of *Erasistratus*, of the same Nature with these two.

Besides, what he elsewhere says, that some thought the Membranes of the Heart a Fiction of *Erasistratus*, is a sure Proof, that the Book *De Corde*, ascribed to *Hippocrates*, was not really wrote by him, since in it these Membranes are made Mention of. If this Book had been wrote by the Author whose Name it bears, *Galen* would not have fail'd to take Notice of it; for his Honour, and in order to stop the Mouths of those who thought, that these Membranes were an Invention of *Erasistratus*. He had nothing to do but to let these People see, that *Hippocrates* had wrote before on the same Subject.

But 'tis surprising, that this same *Erasistratus*, who had so accurately examined the Heart, and dissected so many living Animals, should yet embrace an Opinion, with regard to the Arteries, which all other Anatomists have look'd upon as absurd. He affirm'd, as did *Praxagoras* before him, [*Galen. an Sanguis sit Naturâ in Arteriis*] that in a natural State, the Arteries contained no Blood, and that they, as well as the left Ventricle of the Heart, were only filled with Air. It was an easy matter to give him the Testimony of his own Eyes for his Error; but he had recourse to this Subterfuge [*Galen. an Sanguis sit Natura in Arteriis, & Platon. Decret. Lib. 1. Cap. 6. & de Venâsect. adv. Erasistratum, Cap. 3.*]: As soon, said he, as we open the left Ventricle of the Heart, that Air or Spirit is evaporated before we can observe it, and the Ventricle is instantly filled with Blood. He asserted the same thing with regard to the Arteries.

What engaged him to entertain this Opinion, with regard to the Arteries, was, as *Galen* informs us, because he could not conceive how there should be two Kinds of Vessels destin'd for the Conveyance of the same Liquor, that is, why both the Veins and Arteries should contain and convey the Blood. If he had known the Secret of the Blood's Circulation, which some learned Men imagine is plainly found in the Writings of *Hippocrates*, he had not been so much puzzled and perplexed with regard to this Point; he might even have inform'd himself of it, by the Knowledge he had of the Membranes or Valves of the Heart, if he had not been mistaken with regard to one of them. What follows, will illustrate this Anatomist's Opinion, and at the same time inform us what his Sentiments were, with regard to the Causes of Diseases.

Galen, de Venâsect. advers. Erasistratum, says, that *Erasistratus* maintain'd, "That the great Vein was the Reservoir of the Blood, and the great Artery that of the Spirits." He added, "That after these Reservoirs had divided themselves into many Branches, they became smaller, and their Number greater; and that as there is no Place in all the Body where any of these Branches terminate, that has not a smaller Branch which receives what was brought to it by the larger; so it happens, that before these Vessels arrive at the Surface of the Body, they divide themselves into Branches so small and minute, that the Blood they contain cannot pass through them; so that, adds our Author, though the Mouths of the Arteries and Veins be very near each other, yet the Blood keeps itself within its proper Bounds, without entering the Vessels in which the Spirits flow; and in this Case, the Animal remains in its natural State. But when any violent Cause happens to disturb this Economy, the Blood forces itself into the Arteries, and proves the Source of Disorders. Among the Causes now mentioned, too great a Quantity of Blood is the principal; for in that Case; the Coats of the Veins are dilated more than ordinarily; and their Extremities, which were formerly shut up, are open'd; whence follows a Transfusion of the Blood from the Veins into the Arteries. And this Blood, by its Irruption, opposing the Course and Motion of the Spirits, which come from the Heart, if this Opposition is direct and immediate, or if the Blood stops in a principal Part, this causes a Fever; but

" if

" if the Spirits should happen to drive it backwards, so that it
 " does not pass the Extremity of the Artery, in that Case,
 " an Inflammation of the Part is only produced. As to the
 " Inflammation and Fever which happen in Wounds, they
 " are also occasioned by the sudden Evacuation of Spirits,
 " which is the Consequence of the cutting of the Artery, and
 " forces the Blood continually into the Place of the Spirits,
 " left there should be a Vacuum."

Erasistratus made use of this Comparison to support his System. [*Galen. Histor. Philosoph. Plutarch. Celsus.*] As the Sea, says he, which remains in a Calm, when she is not ruffled by Winds, swells in an extraordinary manner, and overflows her Shores, when the Winds blow hard, so the Blood, moving in the Body, departs from its ordinary Canals, and enters into the Reservoirs of the Spirits, where it afterwards becomes warm, and puts all the Body, as it were, on a Fire.

These are the Notions which *Erasistratus* entertained with regard to the Causes of Diseases in general, which at the same time are very different from those attributed to him by the Author of a Treatise ascribed to *Galen*, intitled, *The Introduction*; who assures us, that this Physician did not search for the Causes of Diseases in the Humours, or the Spirits, but in the solid Parts; whereas *Hippocrates* look'd upon these three Substances as the Causes of Health and Diseases. I think, that Author only means, that *Erasistratus* did not admit of the different Humours mentioned by *Hippocrates*, or, at least, seem'd to think them of so little Importance, as not to ascribe the Causes of Diseases to them. This is what *Galen* himself confirms; but he asserts at the same time, that though *Erasistratus* overlook'd and neglected the Humours, he was nevertheless obliged to speak of them on some Occasions, as for Instance, [*De atra Bile*]; when he says, that a Palsy proceeds from the Humour, which nourishes the Nerves, being stopped on account of its too great Viscidity. And when he talks of the Bile and black Urine.

With regard to Respiration, [*Galen. de usu Respirat. Cap. 1.*] he maintain'd, that it was only useful to Animals by filling their Arteries with Air, which is a Consequence of his former Hypothesis; and he imagin'd, that the thing was done in this manner: When the Thorax, [*Galen. de usu Respirat. & de Locis Affect.*] or the Breast, dilates itself, the Lungs are also dilated, and filled with Air. This Air passes to the very Extremities of the Aspera Arteria, and from them to those of the smooth Arteries of the Lungs, from which the Heart draws it when it dilates itself, to carry it afterwards through all the Parts of the Body, by means of the great Artery. When it was objected to him, that the Heart moved in its ordinary manner, when a Person retains his Breath, he answered, That, upon that Occasion, the Heart drew Air from the great Artery. To this it was reply'd, That the Membranes which adhere to the Orifice of this Artery, will not so much as allow it to return from it to the Heart. But he thought to extricate himself by saying, That though this was the Case in a natural State, yet it did not follow, that it must be so during the Time a Person retains his Breath, which is a State of Violence, and consequently cannot last very long.

Erasistratus also entertained a very singular Opinion, with regard to the Manner in which the Aliments were prepared in the Stomach. He thought, that the Stomach contracts itself, that it may the more closely embrace the Food, and break its Texture; that Trituration corresponding, according to him, to the Concoction of which *Hippocrates* speaks. And with regard to the Chyle, that is, the Juice of the Aliments extracted in the Stomach, he maintain'd, [*Galen. de Facultat. Natur. Lib. 2. Cap. 9.*] that passing from the Stomach to the Liver, it arrived at a certain Place, where the Branches of the Vena Cava, and the Extremities of the Vessels, which are connected with the Reservoirs of the Bile, equally terminate; so that the Parts of the Bile insinuate themselves into the Orifices of these two Kinds of Vessels, according as these Orifices are disposed to receive them; that is, every thing of a bilious Quality in the Chyle, passes into the Canals connected with the Reservoir of the Bile, and the pure Blood passes into the Branches of the Vena Cava, and, taking another Course, is separated from the Bile. *Galen* [*De usu Part. Lib. 4. Cap. 13.*] makes *Erasistratus* say, that the Veins are divided in the Liver for the Separation of the Bile.

Besides, we must observe, [*Galen. de Facult. Natur. Lib. 2. Cap. 9. & de atra Bile, Cap. 5.*] that neither *Erasistratus*, nor his Successors, pretended to account for the Causes of certain Effects, Researches of which Kind they thought belonged more properly to the Philosophers than to the Physicians. Tho' they believed, for Instance, that the Stomach contracts itself for the embracing the Food the more closely, yet they were not at the Pains to enter into minute Explications of the particular Causes and Manner of this Contraction. Neither did they hesitate to own, that they were uncertain whether the Bile was produced in the Body, or if it was before contain'd in the Aliment.

Another Proof of the Ingenuity of *Erasistratus* we have in *Aulus Gellius*, [*Lib. 16. Cap. 3.*] who informs us, that he frankly own'd, when talking of unfatiable Hunger, or a *Boulimia*, (a Word not to be found in *Hippocrates*, but of which all the Greek Physicians after him have made use) that he did not know why this Disease happen'd rather during great Cold, than in hot Weather; tho' he imagin'd, that Hunger, in general, proceeded from the Stomach and Intestines being empty; and that a long and unpainful Abstinence was owing to the Stomach's being strongly contracted and shrivelled up. It was for this Reason, added he, that those who fast voluntarily feel Hunger towards the Beginning of their Course, but not after they have fasted for some time. He brought, in Support of his Opinion, the Example of the *Scythians*, [*Galen. de Natural. Facultat. Lib. 1. Cap. ult.*] who, when they were obliged to fast, swaddled themselves up with large Rowlers, with a View to contract or strengthen their Stomachs.

Erasistratus own'd, that the Urine was separated in the Kidneys; but he did not acknowledge, with *Hippocrates*, that it was done by Attraction; for he entirely rejected this Sort of Attraction, tho' he no-where explains himself with regard to the Manner in which this Separation is made. Some of his first Followers believed, as *Galen* informs us, that the Parts above the Kidneys received only pure Blood; that what is aqueous, or charged with Serosities, tends downwards by its own Weight; and that after this Blood is separated from the aqueous and useless Part, it is carried to the Parts above the Reins, to nourish them.

It is also necessary to observe, that *Erasistratus* rectified *Plato* with regard to the Use of the *Arteria Trachea*, thro' which *Plato* imagined the Drink was carried, in order to water the Lungs (see *Aulus Gellius*, *Plutarch*, and *Macrobius*). This Opinion was common to *Plato*, with *Philistion*, *Hippocrates*, and the most of the Physicians of these Days.

Lycus and *Quintus* are also mentioned as two antient Anatomists, but nothing particular is known of their Discoveries.

Marinus is also mentioned, as an Author who wrote well on the Anatomy of the Muscles, after the Time of *Erasistratus*. *Galen* is said to have epitomiz'd his Works.

Aurelius Cornelius Celsus is also an Author of too distinguish'd Merit to be pass'd over in Silence. He was born at Rome, and, in all Probability, flourish'd under *Tiberius*, *Caligula*, *Claudius*, and *Nero*. Many things are found dispersed in his Writings, from which we may gather, that he rarely employ'd himself in Dissections; but that he had, at the same time, a very high Veneration for Anatomy.

Besides his Books *De re Medica*, he also wrote concerning the Figure and Situation of all the Bones of the human Body; which, indeed, is the principal Reason why he should not be overlook'd, upon an Occasion of this Nature.

His Sentiments, with respect to Anatomy, are specify'd in the Beginning of this Article.

Caius Plinius Secundus was, according to some, born in *Novocomum*; others will have him to be a Native of *Verona*; but, however this be, 'tis certain, that he lived under the Emperor *Vespasian*, about the Year 72. His Writings are interspersed with many curious Observations, relating both to the Anatomy of Men, and other Animals; but as he was no profess'd Anatomist, and never appears to have been exercised in Dissections, he took, and inserted in his Works, Truth and Fiction indiscriminately, as he met with them in the Writings of others.

Dr. Wigan, as well as all Authors who have mention'd the incomparable *Aretaeus*, have been sensible of the Difficulty of fixing the Time in which he liv'd, but concludes it probable, that he wrote after the Beginning of *Nero's* Reign, and before that of *Domitian*. His Taste may be judg'd from this, that he thought a Knowledge of Anatomy so necessary, both for discovering the true Causes of Diseases, and the proper Methods of Cure, that in the Beginning almost of every Chapter he premises something concerning the Structure of the Part affected. In this Instance he seems to have pursued the Steps of *Erasistratus* and *Herophilus*, who were the Chiefs of the Dogmatic Sect, and maintain'd, that without a Knowledge of Anatomy no one could possibly be a skilful Physician. So that *Aretaeus*, tho' a concise and compendious Writer, has yet insisted upon this Branch of Medicine more copiously, and with more Accuracy, than any of the antient Physicians.

The Heart is, according to him, the Principle of Life and Strength, in which the Soul and Nature of Man reside in a particular manner. This was also the Doctrine of *Hippocrates*, and *Chrysippus* the Stoic. For this Reason a *Syncope*, as it is a Disease of the Heart, and consequently must have an immediate Influence upon Life, is unfriendly to the human Constitution, and in some measure dissolves and destroys that Connection by which the vital Faculty is maintained. He also asserted, that the Heart was a warm Part of the Body, and the Principle of Life and Respiration; that it is situated in the Middle of the Lungs; and that the Heart inspires the Lungs with a Desire of fresh Air, as it heated the Lungs, but that the Heart itself attracts it.

The Lungs were, according to him, naturally incapable of Pain, because they consisted of a loose sort of Substance resembling Wool. He also maintain'd, that rough cartilaginous Arteries, incapable of Pain, were distributed thro' them, and that they had no Muscles, but only some small and slender Nerves, by means of which their Motion was produced. And this, according to him, was the true Reason why in a *Peripneumony*, which is no more than an Inflammation of the Lungs, the Lungs themselves are insensible of Pain; and only a sort of Heaviness at the Breast, which is nevertheless free from Pain, afflicts the Patient; but that all those Membranes, by which the Lungs are connected to the Breast, are endow'd with a most exquisite Sensation; and if they are inflam'd, together with the Lungs, the Patient is pain'd as in the Case of a *Pleurisy*, accompanied with a *Peripneumony*.

This, according to him, is also the Reason why in Spitting of Blood, where the Blood, being immediately discharg'd from the Lungs, creates the most dangerous of all Disorders, the Patients never cease to hope, even in the very last Stages of the Disorder, because the Lungs themselves are insensible of Pain; for under every trifling Degree of Pain, the Patients become afraid of Death, and most People are more frightened for the Consequences, than hurt by the Disease itself; whereas, in the most terrible Disorders, when unaccompani'd with Pain, the Patient is not rack'd with the Fears of Death; and indeed this Distemper is more fatal than frightful to the Patient.

The Pulsation of the Arteries, according to him, propelled the Blood; for which Reason, if the Arteries are wounded, the Lips of the Wound are with Difficulty brought together, and kept in Contact. The *Arteria Crassa*, or the *Aorta*, which runs near the *Vena Cava*, in the same Direction with the *Spina Dorsi*, and by *Aretæus*, after *Praxagoras*, called *ἀρεταία πᾶχυν*, suffers Inflammation along with the *Vena Cava*, which Inflammation was by the Antients called a Species of *Causus*, since in both the same Symptoms appear, and the Fever in the one Case tends to a *Syncope*, as well as in the other; for the Liver is the Root of the Veins, and the Heart the Source and Origin of the Arteries. It is therefore probable, that the superior Parts of these Viscera are affected; for the Heart imparts Warmth to the Arteries, and the Liver conveys Blood to the Veins. Now since both these Viscera are very large, the Inflammations to which they are subject, must of course be very considerable. But this same Artery, in Inflammations of the *Vena Cava*, palpitates near the *Spina Dorsi*, which appears from the Pulsation in the other Part of the *Præcordia*; for the Artery, lying close by the Vein on its Left Side, is drawn into Consent with it, as being dispersed thro' the whole Body.

Those of the Antients, whose Writings have been handed down to us, scarce make any mention of this Disorder of this Artery and Vein. But whoever have handled this Subject, have follow'd the Opinion of *Praxagoras*, who, as we learn from *Rufus Ephesius*, affirm'd, that the Origin of Fevers was in that Vein which sends Branches from the Liver to the Kidneys, and which alone he called the *καίαν*, *Cava*, tho' others also gave the same Name to that which rises upwards to the Heart thro' the *Septum Transversum*; so *Aretæus* likewise calls it, and says, that both these are only a Continuation of one and the same Vein.

The Veins rise from the Liver, as from their common Root, and receive the Blood they contain from it. From the Porta of the Liver, betwixt its Extremities, a large Vein arises; which, dividing itself still more and more, is at last dispersed thro' the Liver, in Veins so small and minute, as to become invisible. The Extremities of these Veins are inserted into the Mouths of others, which, growing gradually larger, and fewer in Number, at last terminate in the Liver in one great Vein, which, dividing itself again into two Branches, reach beyond the Liver. One of these Branches, penetrating the first Lobe of the Liver, again emerges in its gibbous Part; and having afterwards perforated the *Septum Transversum*, extends itself within the Breast, but adheres to no other Part; and being suspended there, is inserted into the Heart; this is called the *Vena Cava*. Another, penetrating through the fifth and inferior Lobe of the Liver, as far as its gibbous Part, goes out near the Spine, and runs along it to the *Coxæ*. This is also the *Vena Cava*; for it receives the same Name, because it is the same Vein arising also from the Liver: For if any one has a Mind, he may pass a Probe from the upper Part of the *Vena Cava*, which reaches to the Heart, into that Part of it which creeps along the Spina; and back again from the Spina, thro' the Liver, into the Heart, for the Passage is the same.

In this Vein, besides the above-mentioned Inflammation, those Disorders which the *Greeks* called *Κεῖματα*, arise; in which Case the Hæmorrhage consequent upon its Rupture, soon puts an End to the Life of the Patient.

The Blood is convey'd from all the principal Viscera to the hollow Vein at the Cubit; for this Vein, and that which lies above it, are Branches of one and the same Vein in the Arm: Hence it is of no greater Service to open the superior Vein

than this; for they are entirely ignorant of the Sources of the Veins, who appropriate the superior Vein to the Stomach and Liver. But if there should happen any Effusion of Blood from the Spleen, some Physicians order the Vein lying betwixt the little Finger and the Ring-finger to be open'd, because they imagine, that it reaches to the Spleen; but this is also a Branch of the inferior Vein of the Cubit. Why then should any one choose to open it so near the Fingers, since at the Bending of the Elbow it is much larger; and permits the Blood to flow out more readily?

The Work of Sanguification belongs to the Liver, which is the Source of the Veins; and for that Reason the greatest Part of it is no more than a certain Concretion of Blood; for as the Aliments have Access to the Liver, and as there is no other way by which the Food is convey'd thro' the whole Body from the Stomach and Intestines, so the Blood passes from this Bowel to all the Parts of the Body. This was also the Sentiment of *Erasistratus*. The *Portæ Jecoris* consist of Nerves and Membranes, which are indeed small of themselves, but of great Importance to the Functions of Life; and of large Veins, for which Reason they are very subject to small Inflammations. Besides, some Philosophers have affirmed, that the Appetites of the Soul were lodg'd in this Place.

Now the Bile is formed in the Liver, and is secreted by means of a Cystis or Bladder situated there for that Purpose; and afterwards is convey'd to the Intestines by certain Ducts; and if they should be obstructed by a Scirrhus, or an Inflammation, or if the Contents of this Bladder should overflow, the Bile returns backwards, and is mix'd with the Blood, which, flowing thro' the whole Body, carries likewise the Bile along with it: Hence in Jaundices the Skin seems, as it were, ting'd with Bile, and the Excrements are white like Clay, and unting'd with the Colour of the Bile, because none of that Humour flows to them: Hence also Icteric Patients are costive, because their Bellies are neither moistened nor stimulated by the Bile.

The Aliment of the Spleen is black; and the Spleen itself deterges and refines the black Blood. It is a Bowel of a rare Contexture, and of a dissoluble Nature, and for this Reason subject to Impostumations and Abscesses.

The Stomach presides over Pleasure and Uneasiness, and because it is adjacent to the Heart, the common Source of all the Faculties, (for it is connected to the Middle of the Heart and Lungs, and with them adheres to the *Spina Dorsi*) it contributes very much to Strength, and to Composure or Dejection of Mind, upon account of its Consent with the Soul. This is the principal Faculty of the Stomach. From Pleasure arises a good Digestion, a full and fleshy Habit of Body, and a fresh and lively Colour. From Uneasiness the Contraries of these arise, and sometimes Dejection of Mind, when the Stomach is empty. The Disorders of the Stomach are, properly speaking, Nauseas, Vomitings, Loathings of Food, Hiccups, Eructations, and these too sometimes acid; and tho' in People labouring under Disorders of the Stomach, it is generally free from Thirst, yet in it the Source and Origin of Thirst is contained.

The Colon also contributes to the Concoction of the Food, as well as the Stomach, and the Aliments are convey'd from it to the Liver: Neither do all the Aliments pass thro' visible Canals, for Nature distributes the far greater Part of them thro' the whole Body by Vapours, which easily pass from one Part of the Body to another; and these very Vapours are also by Nature carried thro' the compact and solid Parts of the Body. The Colon is a very large Intestine, wide enough in all its Parts, and form'd into Sinuses, more thick and fleshy than the small Intestines, and more capable of bearing Injuries; and for this Reason, when this Intestine is the Seat of Colic Pains, the Danger is the less: For when the small Intestines are affected, a sharp and pungent Pain is felt; but when the Colon is affected, there is great Abundance of Humours, and a Sensation of Gravity is perceiv'd in it. By reason of its Situation and Connection, the Pain sometimes reaches to the Ribs, and makes a *Pleurisy* suspected; for even in the Colic a Fever sometimes arises. Sometimes the Pain appears to be on one Side, sometimes on the other, under the spurious Ribs; so that the Liver, or Spleen, seems to be affected, and the Pain falls down again to the *Iliæ*. With some this Pain seizes the *Os Sacrum*, the Thighs, and the *Cremaster* Muscles of the Testicles; so that *Aretæus*, knowing the Reasons of these Symptoms, justly stigmatized the Ignorance of some Physicians, who, in this Case, cut off the *Cremaster* Muscles, as if they had contained the immediate Cause of the Disease. Now can any thing advanced by later Anatomists possibly come nearer the Truth?

There are two Coats of the Intestines, as well as of the Stomach, one of which lies obliquely upon the other. When therefore the Connection of these is dissolved, as it sometimes happens in Dysenteries, the interior Coat, separating lengthways, is discharg'd by Stool, and strikes many, who are unacquainted with the true Cause, with a Dread of having lost their Intestine; and the exterior Coat remaining within, incarns and cicatrizes, and then the Patient becomes sound; but the lower

Intestine is only subject to this Accident, as having its Coats of a fleshy Nature.

The Kidneys are naturally glandular Bodies, of a reddish Colour, resembling rather the Liver, than the Breasts and Testicles. These are Glands, but they are whiter than the Kidneys. The Kidneys indeed resemble the Testicles in Figure, but they are broader, more crooked, and contain small Sinuses, with narrow Necks, for percolating the Urine. From these two small nervous Canals, resembling little Pipes, branch out, which are called the Ureters, and are inserted in the Sides of the Bladder on each Side, and from both Kidneys there is an equal Conveyance of the Urine to the Bladder. Nature has formed the Sinuses of the Kidneys oblong, and by that means adapted them to the Diameters of the Ureters, which are but small.

The Bladder is of a very inconsiderable Thickness, and naturally of a nervous Texture; for which Reason it neither incurs nor cicatrizes easily. When it is full it is distended, and when empty it collapses; so that in case of an Ulcer, it suffers just as much as a Joint does in Extension and Contraction. Now all Ulcers upon Joints are cur'd with the greatest Difficulty. Besides, bilious Urine, and an inveterate Ulcer, must necessarily corrode the Bladder.

The Anus and Bladder are contiguous to each other; and for this Reason in Inflammations of the Rectum, the Bladder with Difficulty discharges its Contents; and in Disorders of the Bladder, the Fæces are not discharg'd, even tho' the Belly should not happen to be costive.

Certain Membranes are affix'd to the Uterus, which are nervous Ligaments of the Uterus. These Membranes, which are inserted in the Bottom of the Uterus, hard by the Loins, are small and slender; the others towards its Neck, and which adhere here-and-there to the Uterus, are very nervous, and spread much after the manner of the Sails of a Ship. Now if all these Membranes are relax'd, the Uterus falls out of its Place. Sometimes the interior of the two Membranes which surround the Uterus appears, and may be separated from the other; for only two of its Membranes can possibly be divided, one of which recedes from the other, by reason of the Fluxion of Humours, as it happens likewise in Miscarriages and hard Labours, in which Case it adheres to the Chorion; for if that is forcibly extracted, the Coat of the Uterus comes along with it; but if the Woman escapes Death, and if it returns to its proper Situation, it reunites exactly, or else hangs a little out. Sometimes the Mouth of the Uterus falls out only as far as its Neck; but it is easily restor'd, if Fumigations are used, and the Midwife uses proper Endeavours to replace it gently, and by Degrees.

The Head is the Origin of the Senses and Nerves, and rather attracts the Blood from the Heart, than conveys it to other Members. When therefore the Cause of any Disorder is lodg'd in the Nerves, the Senses must be injured. Tho' the Nerves arise from all Parts of the Head, yet the anterior Part of the Head is the Store-house, as it were, of all the Senses, and from it all Aids and Injuries are deriv'd. For this Reason, in applying Fomentations, we ought to proceed no farther than the Vertex.

Arctæus, following the Opinion of *Erasistratus*, maintain'd, that the Nerves were not only the Origin of Sensation, but the Source of all Action and Motion of the Members. So that if the Origin of any Nerve below the Head is affected, as the Membrane or Meninx of the Medulla Spinalis, the Parts which come under the same Denomination; and also those which are contiguous, become paralytic; the Parts of the Right Side, if the Nerves on that Side be hurt; and those of the Left, if the Nerves on that Side should happen to be injured. But if the Cause of the Disease be lodg'd in the Head, if the Nerves on the Right Side be affected, the Parts on the Left Side will be paralytic, and vice versa. The Reason of this Phenomenon is, that the Nerves change Sides near their Origin; for those on the Right Side do not go directly all the way to the Parts on the Right Side; but both those on the Right and Left Sides, being inserted in their proper Origins, they immediately cross one another in the Form of the Greek Letter X, sending to opposite Parts. But whether the whole Body, or some of its Members, either on one or both Sides, are paralytic, the Nerves which arise from the Head are sometimes affected, and in short, are easily deprived of their sensitive Faculty, but do not of themselves so readily become incapable of Motion. These Nerves also, if by Consent, they contract any Injury from those destin'd for the Purposes of Motion, lose in some measure their Capacity for Motion, with some Degree of which, tho' a very small one, they are naturally endow'd. Sometimes also the Nerves arising from some Muscles, and terminating in others, are hurt; and these are the Nerves which are chiefly capable of Motion, and convey it to the Nerves of the Head, which derive a great deal of their Motion from them, tho' they have some Degree of it in themselves. These Nerves therefore suffer principally a Decrease of Motion, but they rarely or never lose their sensitive Faculties; and if at any time a Congeries of Nerves rising from any Bone, and terminating in another, should be either

relaxed, or broke, the Parts become impotent and contracted; but they are not depriv'd of Sensation.

According to *Arctæus*, a *Tetanus* is a Disease incident to the Nerves, in which he also taught, that the principal Cause of Melancholy resided; he likewise thought, that they were affected, and often contracted, in a Phrenitis; and that in the Gout all the System of Nerves was affected.

These were the Notions maintain'd by *Arctæus*, with regard to Anatomy, which he made chiefly subservient to Physic, in accounting for the Symptoms and Causes of Diseases. In this he imitated the Sect of the Dogmatists, who maintain'd, That since Pains and Disorders of various Kinds were incident to the internal Parts, no one could apply Remedies to them who was ignorant of their Structure. So that tho' the Notions of *Arctæus* concurr'd sometimes with those of *Hippocrates*, *Erasistratus*, or *Herophilus*; yet he was not the blind Votary of any Party, or the too fond Admirer of any Man; but freely declares what he himself thought Truth. *Wigan's Preface to Arctæus.*

RUFUS EPHESIUS

Is the next Anatomical Author of Note we meet with. He liv'd under the Emperors *Nerva* and *Trajan*, and is esteem'd a very skilful Physician by *Galen*; who also informs us, that he wrote in Verse upon the *Materia Medica*. He also wrote a Treatise upon the *atra Bilis*, or black Bile; and some other Pieces quoted by *Suidas*, but these have not reach'd our Hands; for the only Remains we have of this Author are, a small Treatise on the Greek Names of the several Parts of the human Body, another on the Diseases of the Kidneys and Bladder, and a Fragment relating to purgative Medicines. The principal Design of this Physician, in the first of these Works, was to give a general Idea of Anatomy, and to dissuade those who studied Physic in his own Days from being deceiv'd in reading the ancient Authors, some of whom had describ'd the Parts of the human Body under one Set of Names, and others of them the same Parts under quite different Appellations. Besides, we may fairly gather from what *Rufus* advances in this Treatise, that in his Days all the Anatomical Demonstrations were made upon Beasts. *Make Choice*, says he, *of an Animal as nearly resembling Man as you can possibly meet with. You will not find all the Parts of the Animal exactly, and in every Particular, like those of Man; but there will at least be some Analogy or Similitude betwixt them.* Formerly, continues he, *Anatomy was taught on human Bodies.*

We also learn from the same Book, that those Nerves, which were afterwards distinguished by the Epithet *recurrent*, were but just then discover'd. *The Antients*, says *Rufus*, *call'd the Arteries of the Neck carotid or carotic Arteries, which Epithet, in their Language, imply'd Sleep-inducing, because they imagined, that when these Arteries were strongly compress'd, the Animal was inclined to Sleep, and lost the Use of its Voice: But in this Age we have discover'd, that these Symptoms are not occasioned by the Compression of these Arteries, but by that of the Nerves, which are contiguous to them.*

'Tis also probable, that *Rufus* observed certain Vessels of the Matrix, of which preceding Anatomists had made no mention. *Herophilus*, says he, *did not believe, that Women had any Parastata Varicosa; but upon examining the Matrix of a Beast, I have observed certain Vessels which arise from the Testicles, and which, being folded back upon both Sides in the Form of Varices, terminate in the Cavity of the Matrix. Upon compressing these Vessels, there even flows from them a glutinous Humour; and 'tis thought that they are certainly seminal Vessels of the varicose Kind.* *Rufus* had before observed, that in Men there were four spermatic Vessels, two of the varicose, and two of the glandular Kind; and that the Extremities of the former, which adhered to the Testicles, were call'd *PARASTATAE*.

What he calls in this Passage *Parastata Varicosa*, appear to be the same things, which are now call'd *Tubæ Fallopiæ*, from *Fallopia*, the supposed Discoverer.

GALEN

Is the next and principal Anatomist of Antiquity; to him we are obliged for most we know with respect to the Anatomy of the Antients. As a complete Extract of his Works on this Subject would be too voluminous, I shall in this Place only give some general Remarks on his Anatomy, reserving his particular Discoveries for the Articles to which they properly belong.

Galen maintain'd, that the *Asclepiadae*, or Descendants of *Esculapius*, down to the very Days of *Hippocrates*, who was one of that Race, were perfect Masters of Anatomy; but that none of that Family, except the last, had wrote any thing upon that Subject. The Reason of their not writing was, that their Children, to whom alone they communicated their Art, learn'd Anatomy immediately under themselves, almost as soon as they learn'd the Letters of the Alphabet; and that, by seeing Dissections made, and making them themselves; so that they had no Occasion for Books to instruct them in this Art. It afterwards happened, says *Galen*, that *Hippocrates* having wrote on Anatomy, as well as the other Branches of Physic, and having first made Strangers his Disciples, Anatomy began to decline

space, because the Physicians who came after him, satisfied themselves with reading his Books, without taking the Pains to dissect themselves. *Diocles*, who came almost immediately after *Hippocrates*, wrote also on the same Subject, but in such a manner as discovered abundance of Ignorance.

Things remained in this Situation till the Death of *Diocles*, which happened much about the Time, in which *Herophilus* and *Erasistratus* appear'd. These two Physicians apply'd themselves industriously to Dissections; and had, for that Purpose, as many human Subjects as they desir'd; so that they soon re-established Anatomy, which had been neglected during the above-mentioned Interval. But the Anatomists of succeeding Ages had not the same Opportunities of dissecting human Bodies; the Reasons for which are at Length enumerated by *Riolanus*. Most human Bodies, says he, were burned immediately after Death. There was a Law enacted at Rome, in Consequence of the Disorders which reign'd during the Civil War, which happened under *Marius* and *Sylla*, which discharged and prohibited the committing any Outrages on the Bodies of the Dead. We also know, that in the Days of Antiquity, People were not only afraid of touching, but even of coming near, human Carcases; and for that Reason the *Vespillones*, or those who interr'd the Dead, and even the *Coriarii*, or those who prepared the Skins of Beasts, had their Dwellings without the Gates of Rome; neither had the public Executioners any Residence in it; for the Romans were so delicate in this Point, that they would not so much as allow any one to be punished within their Walls. The Laws of the Jews, relating to those who touched dead Bodies, are too well known to stand in need of an Enumeration; but every one does not know, that the Sentiments of the Greeks, with regard to this Point, were the same with those of the Jews. This *Riolanus* proves by a Passage from the *Iphigenia* of *Euripides*: If any one, says that Poet, stain his Hands by Murder; if any one touch a Carcase, or a Woman immediately after Child-birth; the Gods discharge him from their Altars as impious and profane. The Difficulty which there formerly was, of finding human Bodies for Dissection, appears from a Passage of *Pliny* to the same Purpose, [Lib. 28, Cap. 2.] where he says, that it was against the Laws to look into the Entrails of Men. But these Authorities, and all the others brought by *Riolanus*, cannot hinder him from thinking, that in all Ages Physicians have fallen upon the Means of procuring human Bodies for Dissection. This he endeavours to prove by a Passage of *Pliny*, where [Lib. 19, Cap. 5.] he says, that the Kings of Egypt in antient Times opened the Bodies of the Dead, in order to know of what Distempers they died. The Egyptians also used to embalm their Dead, which they could not possibly do without opening them. There were at *Alexandria* [Galen. *Administrat. Anatom. Lib. 1. Cap. 2.*] human Skeletons, by means of which young Physicians learned to know the Bones: We read in *Rufus Ephesus*, that the Physicians who lived before him, had learned Anatomy upon human Bodies; and the Accounts handed down to us of *Herophilus* and *Erasistratus* will not allow us to doubt of it. *Galen* [De Dissect. *Vulva*, Cap. 5.] pronounces concerning the first of these Physicians, That he had acquired a very exact Knowledge of Anatomy, by dissecting Men, and not Beasts, as most other Physicians used to do. *Seneca*, according to *Riolanus*, affirms, *Medicos, ut vim ignoratam Morbi cognoscerent, Viscera rescidisse; bodie Cadaverum Artus rescindi, ut Nervorum Articulorumque Positio cognosci possit.* That Physicians opened the Bowels of Men, in order to discover the Causes of their Diseases; and that even in his Time they dissected the several Parts of Carcases, in order to know the Situation of the Joints and Nerves. But in the common Edition of *Seneca*, there are only these Words: *Medici, ut vim ignotam Morbi cognoscerent, Viscera hominum resciderunt.* Physicians, that they might know the hidden Natures of Diseases, opened the Bowels of Men. Now *Seneca*, according to *Riolanus*, lived in the Days of *Augustus*, *Tiberius*, and *Nero*; and the Roman Physicians were allow'd to dissect the Carcases of their Enemies, which in Reality they did during the Wars of *Marcus Aurelius* against the Germans, as *Galen* informs us. It was also no difficult Matter to procure the Bodies of such as were put to Death at Rome, since they remained uninterr'd without the *Esquiline Gate*, now called the *Porta di S. Lorenzo*. The Bodies of exposed Children might have also been easily obtained. In short, since in these Days Masters had great Numbers of Slaves, who could hinder them from using any Liberties with the Carcases of these poor Creatures, which they themselves should judge proper? *Riolanus* might have subjoin'd to all these Proofs, what *Cicero* says [Academic. *Quaest. Lib. 4.*]: *Corpora nostra non novimus; qui sint situs Partium, quam Vim quaeque Pars habeat, ignoramus: Itaque Medici ipsi, quorum intererat ea nosse, aperuerunt ut viderentur; nec eo tamen, aium Empirici, notiora esse illa, quia fieri possit, ut patefacta & detecta mutantur.* We know not, says he, our own Bodies; we are ignorant of the Situation of the Parts, and unacquainted with the Powers of each particular Member. For this Reason, the Physicians themselves, whose Interest it was to be thoroughly versed in these things, dissected human Bodies with a View to dis-

cover them: But, say the Empirics, they are not by that means better understood or comprehended by us, because 'tis possible, that so soon as they are discovered, and exposed to View, they may assume a different Nature, than what they had before. The same *Riolanus*, having proved, in general, that the antient Physicians sometimes dissected Men, endeavours to shew in a particular manner, that *Hippocrates*, *Aristotle*, and *Galen*, did so too. As for the two first, they come not under our Consideration at present. I shall therefore only inquire a little into the Truth of his Pretences, with regard to *Galen*, in whose favour he stands up against some Moderns, who have maintain'd the contrary: People, says he, have no Reason to accuse *Galen* of never having dissected human Subjects, and of having taught the Anatomy of an Ape instead of that of a Man. I could easily prove by a great many Quotations from this Author, that he has dissected both Apes and Men; but that he has only taught the Anatomy of Man. Upon this Occasion, he quotes two or three Passages from *Galen*, by which indeed it appears, that this Author treats, or, at least, says he treats, of the Anatomy of Man; and in one Passage, he even promises to publish separately the Anatomy of some other Animals. The Words of this last-mentioned Passage run thus: I have not here a Design to enumerate the Number of Lobes which make up the Livers of other Animals, because I have not as yet described the particular Structure of any of their Organs, except in some Passages; where I have been obliged to do it, in order to illustrate what I say concerning Man: But, if I live, I shall some time or other describe the Structure of the Bodies of Beasts, and furnish out an exact Anatomy of all their Parts, as I have now done with regard to the Parts of Man. *Riolanus* quotes another Passage, wherein *Galen*, when talking of some Anatomists of his Days, says, That it was no wonder if they were deceived, since they only dissected the Hearts and Tongues of Oxen, never considering at the same time, that these Parts are not, in these Animals, the same they are in Men. One may reasonably suppose, that if *Galen* had not himself examined those Parts in Man, he would not have been so forward in censuring those who had not done it more than himself.

After the Passage in which *Galen* commends *Herophilus* for learning Anatomy by dissecting Men, he adds, That most other Physicians dissected only Beasts. This Passage proves, that *Herophilus* was not the only Anatomist who dissected Men; if none, except he, had done so, our Author instead of these Words, Most other Physicians, should have said, All other Physicians. Now, if some of the Physicians of his Time dissected human Bodies, it is very probable, considering the Fondness he discovers for Anatomy, that he was not idle in this respect, whilst others were labouring to improve themselves. I believe then, as well as *Riolanus*, that *Galen* may possibly have dissected human Bodies; but 'tis probable he did so very rarely, and perhaps but imperfectly too. What has already been said upon this Head, proves that the thing could not be undertaken without a great deal of Difficulty; and in this Sentiment *Galen* himself confirms us, by the Pains he is at in speaking of several other Methods, in which he thought Anatomy might be learn'd. He advises (*Anatom. Administrat. Lib. 6. Cap. 1.*) to make choice of that Species of Apes, which bear the nearest Resemblance to Man; or, if such, continues he, cannot be found, we must dissect those whose Heads resemble that of a Dog, or Satyrs, or Lynxes: If these Animals should still be wanting, we must make use of Bears, Lions, Weasels, or Cats, because these Animals have a kind of Fingers resembling those of Men. He goes on thus: I have never made an Attempt to dissect Ants, Gnats, Fleas, or any such minute Insects; but I have often dissected Weasels, Rats, Serpents, and several Species of Birds and Fishes; by which I have discovered, that the same Principle of Intelligence is employed in the Formation of all Animals; every one of which has the Structure and Mechanism of its Body adapted to the State and Condition of its Nature. It also appears, that *Galen* sometimes dissected Hogs and Goats; and he himself (*Anatom. Administrat. Lib. 7. Cap. 10. De Usu Part. Lib. 17. Cap. 1.*) speaks of an Elephant, the Whole, or at least some Parts, of which he had dissected at Rome. It will, no doubt, be said, that our Author advised to begin with dissecting Beasts, and to finish and perfect our Knowledge of Anatomy by dissecting Men. All this is true; but let us see in what Strain he talks of this last Affair (*Administrat. Anatom. Lib. 3. Cap. 5.*): I advise you, says he, first to exercise yourself thoroughly upon Apes; that if you should find an Opportunity of dissecting a human Body, you may be able readily to discover and know each Part of it; in which Case you will be foil'd in your Attempts, unless, before-hand, you have frequently exercised yourself upon other Subjects: For want of such a previous Exercise, those who dissected the Bodies of the Germans, during the War undertaken by that People against *Marcus Aurelius*, reaped no other Advantage from their Labours than a Knowledge of the Situation of the Viscera. But a Physician who has before try'd his Hand upon other Animals, and especially upon Apes, sees at once the Peculiarities of the Parts he dissects. It is more easy for a Man of Skill and Practice in Anatomy, with a single Glance of his Eye, to disco-

ver what he has elsewhere seen before, than for a Novice in the Art to perceive even the most evident Things at his greatest Leisure. Many of this first Class of Men have very quickly discovered what they wanted to see, upon the Bodies of those who were condemned to Death, or exposed to the Fury of wild Beasts, or upon the Carcasses of Robbers, who were denied the Privilege of Burial. Besides, large Wounds, or deep and hollow Ulcers, have sometimes discovered, to these Men of Skill, many Parts of the human Body resembling those they had formerly seen in Apes; whereas those who had never endeavoured to improve themselves upon these Animals, could reap no Advantage upon Occasions of this Nature. Those who have frequently dissected the Bodies of exposed Children, well enough know, that the Bodies of Apes and Men very much resemble each other. It is not to be doubted, but Galen employ'd some of these Means, or others of a like Nature, in order to instruct himself in Anatomy; and the Anatomy acquir'd in this Shape, was by him styled, *Ἀνατομὴ κατὰ ἀνάγκην*, or *Anatomy acquired by Accident*, which was the only Kind approv'd of by the Empirics. That Galen enjoy'd Opportunities of this Nature, is plain from another Passage, where, after having advised young Physicians to travel to *Alexandria*, in order to see the Skeletons, and not to satisfy themselves with what they read in Books upon that Head, he adds these Words: *I have often examined the Bones of Men, when Sepulchres or ruined Monuments have fallen in my way. A Sepulchre, slightly built upon the Brink of a River, happened to be destroy'd by the Impetuosity of the Torrent, which had overflow'd it, so that the Body, which had been laid in this Sepulchre, being carried off by the Current, stopp'd at last in a Place not unlike a Harbour, surrounded with pretty high Banks. I had an Opportunity of seeing this Body, of which the Flesh was already rotten; but the Bones were still connected with one another; so that one would have said it was a Skeleton, prepared for the Instruction of young Physicians. One Day I also saw the Carcase of a Robber lying on a Mountain, far enough from any public Road: This Robber was kill'd by a Traveller, whom he had attack'd; and the Inhabitants of the adjacent Parts refusing to bury him, because they judged a Man so wicked the proper Prey of Vulturs, his Bones were two Days afterwards stripp'd of all their Flesh, and dry, like those prepared for the Instruction of Physicians.* Galen speaks also, in the same Chapter, of a Disease attended with Carbuncles, which had raged in most of the Cities of *Asia*, and afforded him Opportunities of examining the Situation and Disposition of the Muscles of several Parts, which were stripp'd of the Skin, and some Part of the Flesh.

If our Author confin'd himself to the Methods above specified, he cannot sure be said to have made complete and regular Dissections of the human Body. Among all the Subjects, from which he says Anatomy may be learn'd, none, except the expos'd Children, seem calculated for furnishing him with the Materials of a complete Anatomy; because it was no difficult Matter to carry off some of these little Bodies, and afterwards dissect them, with the Leisure necessary for that Purpose: And this, in my Opinion, he himself seems to insinuate, when he says, that *those who frequently dissect exposed Children, well enough know, that the Body of Man very much resembles that of an Ape.* If Dissections of this Nature were often made in the Days of Galen, as we may gather from this Passage, 'tis probable that he, like others, employ'd himself in this way; tho' a Principle of Caution might restrain him from making a public Declaration of it, on account of the Aversion which then reign'd in the Minds of People against Practices of that Nature. It may be said, that it was not much more difficult to get some of the Bodies of executed Criminals carried off; but he no-where insinuates, that any one made the least Attempt of this Kind; for when he speaks of what was learn'd by examining the Bodies of Robbers, or other Carcasses casually found in the Fields, he informs us, that this Examination was made upon the very Spot where such Bodies were found, by endeavouring, as soon as possible, to discover the Part or Circumstance sought for. This may be gather'd from the Passage already quoted, where he says, that those who have dissected Apes are able *speedily* to inform themselves, by means of the Carcasses they find in the Fields, with regard to the Disposition of those Parts which they may have formerly seen by dissecting Animals. In the Course of this Passage, he three or four times repeats the Word *speedily*, which expresses the Shortness of the Time which he himself, or any body else, had to view the Parts of the Carcasses we are now speaking of, for fear, no doubt, of being surpris'd in an Action, which must have struck Terror into the Spectators, and must be own'd to be, in its own Nature, none of the most agreeable. In short, the Pains Galen is at to specify all the other Means of learning Anatomy, which we have mention'd, sufficiently prove, as we have already observed, that, in these Days, regular Dissections of the human Body could be made but very rarely, and with a great deal of Difficulty. A collateral Proof of this is, that such Dissections were not publicly made in the Schools of the Physicians; for we may well suppose, that if they were made in any Part of the World, it must have been at *Alexandria*, the Capital of *Egypt*, where the Custom of open-

ing the Dead, in order to embalm them, might have been supposed, in some measure, to reconcile and inure them to the Horror which attends a complete Dissection: But we do not find, that any thing of this Nature was practised there since the Days of *Herophilus* and *Erasistratus*, or of the antient Kings of that Country: All that was done in this respect, even in that famous Medicinal School which flourished in the Days of *Galen*, was to teach Osteology upon human Skeletons, which might have been very antient. If the Masters of this School had exhibited, upon human Subjects, all the other Parts of the Anatomy of Man, *Galen*, and a great many other Authors, had not fail'd to acquaint us with it, in numberless Passages. As for those Passages from many Authors, which have, since the Time of *Riolanus*, been advanced to prove, that in the Days of Antiquity human Dissections were practised, it is easy to shew, that almost all of them have a Reference to what pass'd long before the Times in which these Authors wrote; and that the Accounts handed down of *Herophilus* and *Erasistratus*, might have laid a Foundation for all that has been said upon that Subject. But, to return to *Galen*; taking it for granted, that he dissected some human Bodies, yet nothing is a more convincing Proof of his not having dissected a sufficient Number, than his describing, in several Passages, the Parts of Apes, or some other Animals, instead of those of a Man. This has been clearly shewn by *Vesalius*; and those who have maintained the contrary, have been miserably blinded and misled by their superstitious Attachment to *Galen*.

But tho' *Galen* has sometimes confounded the Parts of Beasts with those of Men, his Anatomy is nevertheless a very valuable Work, and *Vesalius* himself had a high Veneration for it; and, indeed, it must be own'd, that nothing could set the Merit of its Author in a fairer or truer Light than this Piece; if it be true, as he says, that no one had wrote well on Anatomy before him, and that he had made many important Discoveries in this Branch of Physic. It is, indeed, possible, that, considering his Attachment to Anatomy, he might have made some Discoveries of his own in that Science; tho', at the same time, his Propensity to commend himself must render every thing he says, concerning himself, suspected: But, the Truth is, whether he was the first who placed Anatomy on a good Foundation, or whether he raises his own Character on the Labours of others; from which, at the same time, he has not drawn all the Advantage that could have been wish'd; yet still 'tis very certain, that we should have suffer'd very considerably if all his Anatomical Works had been lost, since they are the only remaining Monuments of all that the Antients wrote upon that Subject; for what else we find, of that Nature, is scarce worth Notice, if we except what *Aristotle* has given us upon that Head. 'Tis true, *Galen* had not attain'd to Perfection; but neither can the Moderns pretend to that; and 'tis probable, that, without those Lights, with which he supplied the very Men who have censur'd him, we should have still been in the Dark, with regard to a great Part of that which he has clearly demonstrated. *Galen's* two principal Treatises upon Anatomy are, his *Anatomical Administrations*, and his Book *On the Use of the Parts of the human Body*. The former contained fifteen Books, of which the six last are lost: The latter, which we have complete, contains seventeen. We have also a Book of his, which treats *Of the Bones* in particular; another, *On the Dissections of the Muscles*; a third, *On the Dissection of the Nerves*; which is imperfect; a fourth, *On the Dissection of the Veins and Arteries*; a fifth, in which the Author proves, in Opposition to *Erasistratus*, *That there is Blood in the Arteries*; a sixth, *On the Anatomy of the Matrix*; a seventh, *On the Organ of Smelling*; an eighth and ninth, *On the Usefulness and Causes of Respiration*; a tenth and an eleventh, *On the Motion of the Muscles*; a twelfth, *On the Formation of the Fetus*; and two others, *Concerning the Seed*; without taking into the Account what we find concerning Anatomy, in his Books *On the Natural Faculties*, and elsewhere, scatter'd up and down his other Works. *Galen* wrote several other Books, which are lost; in some of which he treated of the *Anatomy of Hippocrates*, and in others of that of *Erasistratus*; in a third Work he treated of the *Dissection of dead Bodies*; and in a fourth concerning *that of living Animals*. It were to be wish'd, that all these had reach'd our Hands, but especially those Pieces relating to the Anatomy of *Hippocrates* and *Erasistratus*; as also the Abridgments he made of the Anatomical Works of *Lycus* and *Marinus*; the latter of whom wrote twenty Books, which were abridg'd by *Galen*, and of which he has preserv'd the Titles, which are so curious as to lay a just Foundation for our lamenting the Loss of so great a Work.

But tho' we have not all the Works of *Galen*, yet those we have, happen luckily to comprehend almost the Whole of his Anatomy; and if his *Anatomical Administrations* are not complete, the other Books we have mention'd, and especially those concerning the *Use of the Parts*, supply that Defect; for this Book *on the Use of the Parts*, is a Master-piece, which has been justly admired in all Ages, and which sufficiently discovers the Extent of its Author's Genius; since in it the Physician, as well

well as the Philosopher, may find Satisfaction. But what, in a particular Manner, strikes Christians with Admiration is, that *Galen*, tho' a Heathen, yet acknowledg'd One God, all-wise, all-good, and all-powerful, the Creator of Man, and of all other Animals. The Words he uses, in one Passage of this Book, have not only strong Sense, but also something of a divine and striking Energy in them. [De usu Part. Lib. 3. Cap. 10.] In writing these Books, says he, I compose a true and real Hymn to that awful Being, who formed us all; and, in my Opinion, TRUE RELIGION does not so much consist in sacrificing many Hecatombs on his Altars, or in making him rich and costly Presents of the most fragrant and exquisite Perfumes, as in being persuaded ourselves, and endeavouring to persuade others, that he is possess'd of unerring Wisdom, irresistible Power, and all-diffusive Goodness. For his having ranged all Things in that Order and Disposition, which is best calculated for the Continuation of their respective Beings, and his having condescended to distribute his Favours to all his Works, is a glaring Proof of his Goodness, which calls aloud for our Hymns. His having found the Means necessary for the Establishment and Preservation of this beautiful Order and Disposition, is an incontestable Proof of his Wisdom, as his having done every thing he pleased, is of his Omnipotence. 'Tis not in one Passage only, that *Galen* talks in this exalted Strain; these are so much the genuine Sentiments of his Heart, that he loses no Opportunity of inculcating them, and confuting, at the same time the *Epicureans*, who maintained, that this beautiful and harmonious Frame of Nature was the blind Result of a fortuitous Concourse of Atoms. 'Tis true, that [De usu Part. Lib. 11. Cap. 14.] he opposes *Moses* for having maintain'd, that the Will, or sole Command of God, was the only Cause of all Things. *Galen* does not admit of this Principle of *Moses*, except the Will of God be taken in Conjunction with the Choice which he made of the most proper Materials, for answering the particular Ends he had proposed to himself, after having known what was really best, with regard to the Arrangement of each Body; for, says our Author, God could not have form'd Man out of a Stone, nor an Ox or a Horse out of a Parcel of Ashes. *Galen* did not reflect, that, as God was the Master and Creator of Matter, so his Will was sufficient to make any Part of it assume that particular Form, and all those other Modifications, which were requisite for answering his Ends. If *Epicurus*, bewitch'd as he was with his Atoms, had acknowledg'd the Supreme Cause of their Arrangement, he would have reason'd better upon this Subject than *Galen*; but *Galen* was misled by *Plato*, or *Aristotle*, and not by *Epicurus*.

The younger SORANUS EPHESIUS

was contemporary with *Galen*; he first practis'd Physic at *Alexandria*, and afterwards at *Rome*: He wrote a Treatise on the Disorders of Women.

There is a Treatise on the Uterus, printed in *Greek* at *Paris*, 1551. which is supposed to be a Fragment of the Book of *Soranus* above-mention'd.

In the *Venice* Edition of *Vesalius*, 1604. the Anatomy of the Matrix, from *Soranus*, is publish'd in *Latin*. And the same Treatise was printed, together with the Works of *Theophilus Protaspatarius*, at *Paris*, 1556. 8vo.

THEOPHILUS PROTASPATARIUS, or rather PROTAS-PATHARIUS,

a *Greek* Anatomical Author, lived, according to *Fabricius*, in the Time of the Emperor *Heraclius*: He was undoubtedly a Christian, and probably a Monk, as he is styled in some ancient Manuscripts. He wrote five Books, περὶ κατασκευῆς ἀνθρώπου σώματος, Of the Fabric of the human Body, in which he is said to have epitomiz'd excellently *Galen* of the Use of the Parts; and besides mentions some things not to be found in any preceding Author. Thus he asserts, that the first Pair of Nerves, arising from the first Ventricles of the Brain, is extended to both the Nostrils; and that by means of these, Smells are convey'd to the Brain.

Thus also he says, that two Muscles are concern'd in shutting the Eye-lids, but that they are open'd by one only.

According to him, the Substance of the Tongue is muscular.

He also first described a very strong Ligament, which is common to, and fixes all the Articulations of the Vertebrae. This Passage is very remarkable, and, as it may serve as a Specimen of his Work, I shall insert it: Ἐπειδὴ δὲ καὶ κατέλεον ἐμελλεν ὁ ἀνθρώπος, καὶ ἀνατεῖναι, καὶ ἰσχυρὴν τὴν ἀγὰρ τὴν Θεοῦ πρὸς αὐτὸν εἰς μόνους τὰς κατὰ μέγεθος συνδεῖσθαι δυνάμεις τὰς σπονδυλάς. ἀναγκασία γὰρ ἐστὶ καὶ ἰσχυρὰ ἡ χρεῖα, ἀλλ' ἔξωθεν μὲν τῆς ἀνάγκης τῆς βίτης, ἐπέθηκε συνδεσμον, ἔκωθεν μὲν τῇ χρεῖᾳ, νεύουσαν δὲ τὴν αἰσία, ἀπὸ κεφαλῆς ἀπὸς συνδεῖσθαι ἀπὸς διαφθορὰς τῶν σπονδυλῶν κοινὸν συνδεσμον.

But as it is necessary for a Man to bend himself forwards and backwards, it did not seem sufficient to the good Providence of God to furnish each particular Articulation of the Vertebrae with proper Ligaments, which, however, are very necessary, and of

great Use; but, besides these, it added, on the Outside of the Spine of the Back, a Ligament of a yellow Colour, and of a nerveo-cartilaginous Substance; as a common Ligament to all the Articulations of the Vertebrae of the Spine.

'Tis probable, that this Author also knew, that the Substance of the Testicles is vascular; for he takes Notice of a prodigious Number of capillary Vessels, as fine as a Spider's Web, which, he says, are dispersed in the glandular Substance of these Parts.

This Work of *Theophilus* was publish'd at *Paris* in *Greek*, in 1555. 8vo. Dr. *Douglas* informs us, that it was also publish'd in *Greek* at *Paris*, 1540. But, I am afraid, this may be a Mistake; for *Vander Linden* and *Fabricius* inform us, that the *Paris* Edition of 1540. is only the *Latin* Translation of *Junius Paulus Crassus*; but as I have never seen this Edition, I cannot determine it. *Fabricius* has given this whole Treatise in *Greek* and *Latin*, at the End of the twelfth Volume of his *Bibliotheca Græca*.

The above-mention'd Translation was also publish'd at *Venice*, 1536. 8vo. at *Basil*, 1539. 4to. and, with some other Authors, at *Basil*, 1581.

This *Theophilus* is also Author of several other Medicinal Treatises.

The next Anatomical Author is

ORIBASIVS.

He, in two large Books, has described all the Parts then known, of the human Body, and assign'd the proper Office to each of them; but he has added little to what *Galen* has discoursed of in his Anatomical Works; and upon the account of this Treatise, rather than of any other of his Writings, he deserves the Name given him of *Simia Galeni*, the Ape of *Galen*. Only one thing we find, which is either omitted by *Galen*, or is lost, together with some other of *Galen*'s Works, the first Description of the Salivary Glands, which is this: "On each Side of the Tongue lie the Orifices of the Vessels, which discharge the Spittle, and into which you may put a Probe. These Vessels take their Rise from the Root of the Tongue, where the Glands are situated. They rise from these Glands, in much such a manner as Arteries usually do, and convey the Salivary Liquor, which moistens the Tongue, and all the adjacent Parts of the Mouth." See *ORIBASIVS*.

NEMESIUS

is an Author whose Name must by no means be omitted in a History of Anatomy. He was Bishop of *Emissa*, a City of *Phœnicia*, at the latter End of the fourth Century: He wrote a Treatise περὶ φύσεως ἀνθρώπου, Of the Nature of Man, of which there have been the following Editions:

Antverpiæ, 1565. 8vo. in *Greek*, with the *Latin* Translation of *Nicæsius Ellebodium*.

Oxon, 1671. 8vo. *Greek* and *Latin*.

Vander Linden and *Douglas* mention an Edition at *Antwerp*, 1584. 8vo. but *Fabricius* takes no Notice of it.

A *Latin* Translation by *Georgius Valla*, was printed at *Antwerp*, 1538.

An *English* Translation was printed *London*, 1636. 8vo.

As to the Anatomical Discoveries of *Nemesius*, Dr. *Freind* makes the following Reflections:

The *Oxford* Editor ascribes two Discoveries to him, one of which was the most considerable that ever was made in Physic. The first is concerning the Bile, which is constituted, as *Nemesius* says, not only for itself, but for other Purposes; for it helps Digestion, and contributes to the Expulsion of the Excrements; and therefore it is, in a manner, one of the nourishing Powers; besides, as a vital Faculty, it imparts a Sort of Heat to the Body. And, for these Reasons, it seems to be made for itself; but, because it purges the Blood, it seems to be formed for the sake of the Blood. Here, says the Editor, the System of the Bile is plainly and accurately deliver'd; that very System, which *Sylvius de le Boë*, with so much Vanity, boasted he had invented himself. And, indeed, so far is true, that here is the true Foundation of *Sylvius*'s Reasoning; and if this Theory be of any Use in Physic, *Nemesius* has, I think, a very good Title to the Discovery. But there follows a much more material Point; and the Editor contends, that the Circulation of the Blood, an Invention which the last Century so much bragg'd of, was known to *Nemesius*, and described in very plain and significant Terms, which are these: The Motion of the Pulse takes its Rise from the Heart, and principally from the Left Ventricle of it: The Artery is, with great Vehemence, dilated and contracted, by a Sort of constant Harmony and Order. While it is dilated, it draws the thinner Part of the Blood from the next Veins, the Exhalation or Vapour of which Blood is made the Aliment for the vital Spirit; but while it is contracted, it exhales whatever Fumes it has through the whole Body, and by secret Passages; so that the Heart throws out whatever is fuliginous through the Mouth, and the Nose, by Expiration.

Upon this single slender Proof does he attribute this great Discovery of the Circulation to *Nemesius*; and those who have insisted,

infisted, that it was known both to *Hippocrates* and *Galen*, have full as good Arguments on their Side. I will only say this, that from this very Description, and from what the same Author says of the Liver in the same Chapter, that it ministers Nourishment to the Body by the Veins, one may demonstrably infer, that *Nemesius* had no Idea of the Manner in which the Circulation of the Blood is performed.

It must be remarked, that, from the Time of *Galen*, to the Beginning of the fifteenth Century, Anatomy made but very slow Advances. For most that the lower *Greeks* have said on this Subject, is collected from *Galen*. And the *Arabic* Anatomy must have had the same Source, as Dissections of human Bodies, we are told, were not permitted by the *Mahometan* Religion. The Books of Anatomy, which the *Arabians* call *Taschrib*, most in Esteem amongst the Orientals, are those of *Ben Sina*, whom we call *Avicenna*, of *Rhazes*; and *Ebn Herman*. *Herbelot*.

The next Anatomist which occurs worthy of Remark, is

MUNDINUS,

a *Milanese*, according to *Douglas*, and *Freind*, who made some new, tho' rude Efforts, to improve Anatomy: About 1315. he compos'd a regular Body of that Science; and as he was a Dissector himself, interspers'd several Observations and Discoveries of his own, especially relating to the Uterus. This Book reviv'd, in some measure, the Study of Anatomy; and was so much in Vogue till the Restoration of Learning, that the Statutes of *Padua* allow'd of no other System to be taught in their Schools.

Mundinus, in describing the several Parts of the human Body, specifies their Places, particular Modes of Situation, Number, Appearance, Substance, Qualities, Bulks, Coats, Ligaments, Uses, Inconveniencies, Actions, and the Disorders to which they are subject.

He treats of the Viscera pretty largely, but touches very superficially on the Nerves and Blood-vessels. He only describes the abdominal Muscles, and contents himself barely with making mention of those employ'd in Respiration.

He seems to have been a fond Admirer of the Anatomical Works of *Galen* and *Avicenna*, tho' at the same time he does not fall in with their Sentiments upon every Occasion.

He observes, that larger Veins and Arteries are distributed to the Penis and Tongue, than to any other Parts of the Body of an equal Bulk.

The Testicles of Women were, in his Opinion, full of Cavities and glandular Caruncles, in which a certain salival Humidity was generated, which was the Source or Cause of that Sex's Pleasure in Venereal Enjoyments.

He mentions, that seven Cells are found in the Matrix, the Mouth of which resembles that of a young Whelp, or, rather, that of a grown Tench; and that towards its Surface there was *Velamentum vel Pudicitia*; or, rather, as it is in some Editions, *Velamen Subtile quod in Violatis rumpitur*, a slender Covering, which is burst upon the first Coition; by this he, no doubt, meant the Hymen.

The Neck of the Uterus was, according to him, a Palm in Length, broad and dilatable, with Wrinkles, or *Rugæ*, resembling Horse-leeches, for the sake of Titillation.

He took the *Vulva* for the Extremity of the Neck of the Uterus; upon which Occasion he takes Notice of two Membranes near the Orifice of the Bladder, by which the Nymphæ are in all Probability meant.

The Ducts of the Ureters into the Bladder run, according to him, obliquely, that is, between one Coat and another, that the Return of the Urine to the Kidneys might be prevented.

He calls the Valves, belonging to the Orifices of the Vessels of the Heart, *Ostiola*, or small Doors.

He publish'd a Book under the Title of *Anatome omnium humani Corporis interiorum Membrorum*, or the Anatomy of all the internal Parts of the human Body.

This Piece was printed, *Papia*, 1478. *Fol. Bonon.* 1482. *Fol. Venet.* 1507. *Fol. Argent.* 1509. *Papia*, 1512. *Quart. Lugd.* 1520. *Oct. Marpurgi*, 1541. *Quart. Argent.* 1513. *Quart. Venet.* 16mo. corrected by *Carpus*. It also appeared with *Ketham's Fasciculus Medicinæ*, Anno 1500. *Fol.*

The next Anatomical Author, we meet with, was

JOHANNES DE CONCORIGGIO,

a *Milanese*, who dy'd in 1438. His Works were printed at *Venice* in 1515. and 1521.

ALEXANDER BENEDICTUS

flourished about 1495. He was of *Verona*, and cultivated Anatomy. He wrote a Book under the Title of *Alexandri Benedicti. Physici Anatomia, sive de Historia Corporis humani, Libri 5.* Printed *Basil*, 1527. *Oct. Argentorati*, 1528. *Oct. Parisiis*, 1514. His *Epist. Nuncupat.* was printed *Venet.* 1497. and his *Opera Medica, Venet.* 1535. *Folio. Basil*, 1539. *Quart. & Fol. Ibid.* 1549. *Fol.* His *Historia Corporis humani*, together with some of his Collections, or Apho-

risms, was printed *Anno* 1527. 12mo; but the Place where, is not mentioned.

He mentions, that the yellow Bile flow'd from the Gall-bladder to one particular Part of the Stomach.

He observ'd two Foramina, or little Holes, hard by the Urinary Passage in Women, which he falsely asserts to be the Orifices of Veins, and from which, he said, a certain Humour flow'd, which was not prolific.

About the same Time liv'd

ALEXANDER ACHILINUS,

of *Bologna*. His Annotations on the Anatomy of *Mundinus* were published, together with the *Fasciculus Medicinæ Johannis de Ketam* at *Venice*, 1522. *Fol.* And his Treatise de *humani Corporis Anatomia* was published at *Venice*, 1521. *Quarto.*

He is said to have discover'd the Malleus and Incus of the internal Ear.

JOHANNES DE KETAM

above-mentioned treats on several Anatomical Subjects. His Works are published at *Venice*, 1495. 1500. and 1522. *Fol.*

GABRIEL DE ZERIS,

of *Verona*, flourish'd in the latter End of the fifteenth and Beginning of the sixteenth Century. His Anatomical Pieces were published *Venet.* 1502. and 1533. *Fol.* and *Marpurg.* 1537. and 1545. *Quarto*, together with the Anatomy of *Mundinus*.

GUIDO DE CAULIACO

was a Native of *France*, and study'd at *Montpelier* under *Raymund*. He flourish'd in the Year 1363. at which Time he wrote a large Body of Surgery. His Works, under the Title of *Chirurgia Tractatus Septem cum Antidotario*, were printed *Venetis*, 1490. 1519. 1546. *Fol. Lugd.* 1572. *Oct.* 1585. *Quarto. Venet.* 1499. *Folio. Lugd.* 1559.

He first taught, that Incisions about the Eye-brows should be made in the same longitudinal Direction with the Body itself, and not in that of the *Rugæ*, or Wrinkles of the Forehead; because the Muscles which serve to move the *Supercilia*, or Eye-brows, run in the former and not in the latter Direction.

With regard to the *Os adjutorium*, or *Humerus*, he advanced some Things which had the Appearance of being new; but they may be more justly ascribed to *Galen*, the great Restorer of Anatomy, as will plainly appear from his Works.

I have now trac'd Anatomy from its Origin, to the fifteenth Century. But the Industry of the Revivers of this Science in the sixteenth, which had, from the Time of *Galen*, lain in a great Degree uncultivated, will furnish us with more frequent and ample Discoveries, tho' it must be confessed, that many have been pretended to be made, which were known even in the Infancy of Anatomy.

JACOBUS BERENGARIUS CARPENSIS

was the great Reviver of Anatomy. He is distinguish'd with the Epithet *Carpensis* from the City *Carpi* in *Italy*; he is likewise called *Carpus* alone, and *Jacobus Carpus*, and by *Fallopis*, *Jacobus Carpensius*. But these three last-mention'd Names he assumes to himself in his *Isagoge*. He flourish'd in the Year 1522. and was Professor of Anatomy and Surgery in the University of *Pavia*. His Commentaries upon the Anatomy of *Mundinus* were printed *Bononia*, 1521. *Quarto*. His Anatomy was printed *Bononia*, 1523. *Quarto. Colonia*, 1529. *Oct. Argentorati*, 1533. *Oct. Venet.* 1535. *Quarto*. His Practical Anatomy was translated into English by *H. Jackson*, and printed at *London*, 1664.

He was the first that used Uction with Quicksilver, for the Cure of the *Lues Venerea*, and became immensely rich by his Practice that way.

He first discover'd the *Echphysis*, or Appendix of the *Intestinum Cæcum*, which he calls the *Additamentum Coli*, and under that Name describes it at Length.

He denies that the seven Cells of *Mundinus* are to be found in the Uterus, and admits only of one Cell or Cavity.

He was acquainted with the sublingual Glands, and their Ducts. He thinks that the three Divisions in the *Musculi Recti* of the Abdomen are the Tendons of three Muscles, serving for the Contraction of the Abdomen.

He first discover'd Caruncles in the Kidneys, resembling the Nipples of a Breast.

That Line which now goes by the Name of the *Linea Alba*, was by him called the *Linea Centralis*, because it reach'd along the Middle of the Belly.

He thought that the *Processus Mamillares* were not, on account of their excessive Softness, to be reckon'd among the Nerves.

Concerning the Ear he has these Words: "Two little Bones are adjacent to this Membrane, [he means the Tympanum] which, being mov'd by the undulating Air, mutually ally

A N A

ally strike each other, and, by their Motion, excite what we call Sound in the Ear. This is the real Structure of the Parts, which, though very remarkable, has yet been observed by few."

He is therefore unjustly thought by some to be the Discoverer of these little Bones, since he assigns the same Use to them that others have done before him; and, which is still more, he nowhere pretends to be the Discoverer of them.

JASON A. PRATIS, OF PRATENSIS,

was a Native of Zeland, and flourish'd in the Year 1520. His two Books *De Uteris* were printed Antwerp. 1524. Quarto. *Amstelodami*, 1657. 12mo. His Book *De Parturiente & Partu* was printed Antwerp. 1527. Oct. *Amstelod.* 1657. 12mo.

ANDREAS LACUNA

was a Native of Segovia in Spain, and flourish'd about the Year 1552. His *Anatomica Methodus* was printed Paris. 1535. Octavo. His *Epitome Galeni Pergameni Operum*, in quatuor Partes digesta, was printed Basil. 1551. Folio. *Ibid.* 1571. Folio. *Argentorati*, 1609. Folio. *Lugd.* 1553. 16mo. 4 Vol.

When talking of the Tongue, he expresses himself thus; "Tis a Circumstance which well deserves our Consideration, that Nature only bestow'd a Frenum, or Bridle, upon the Tongue and Privy Parts, as if she had intended, that Men should be modest in the Use of both."

When talking of the Lips, he maintains, that "they are cover'd with the inner Coat of the Stomach: And this, says he, is the Cause, why, when a Nausea affects the Stomach, the Lips become tremulous, and presage a Discharge by Vomit."

When talking of the Stomach, he says, that "its Orifice, which is called the *Pylorus*, is not in its Bottom, but a little higher, that the Part of the Food, which is not sufficiently concocted, may not slip down into the Intestines till it is so." He likewise ascribes to it a *Constrictory Muscle*.

"He denies, that, in a good Habit of Body, the yellow Bile is sent into the Stomach, because it is hurtful to its Functions; whereas the black Bile is friendly and beneficial to them; and tho' in the Stomach there are no biliary Pores, yet bilious Vomitings frequently happen, because the yellow Bile is convey'd by a large Passage into the Intestinum *Jejunum*, which lies next to the Stomach; and hence it happens, that that Part, into which it is inserted, is always observed empty; and if at any time it is irritated by the Acrimony of the Bile, it throws it out from it. Now as the yellow Bile is naturally light and active, it oftentimes flies upwards, and destroys the Functions of the Stomach, unless it be forthwith discharged by Vomit."

The Intestinum *Cœcum*, according to him, hangs like a sort of fill'd Stomach, in the Bottom of which there is no Orifice; but it has two Orifices, one by which it receives, and the other by which it discharges.

NICOLAUS MASSA.

This Anatomist was a Venetian by Birth, and flourish'd about the Year 1530. His *Liber Introductorius Anatomia* was printed Venet. 1536. Quarto. 1559. Quarto. His *Epistolæ Medicinales* were printed Venet. 1542. Quarto. 1550. Quarto. 1558. Quarto.

Riolanus, and some others seduced by his Authority, ascribe the Invention of the *Musculi Pyramidales* to him. But they have nothing to support their Opinion; for that Muscle which is taken for the Pyramidal Muscle of *Massa*, is more properly called the *Cremaster Muscle*, which it really is.

The *Septum Scroti*, which some Moderns boast of as their own Discovery, is elegantly described by him in these Words: "This Bag [he means the Scrotum] has, besides, an intermediate Membrane, which divides the Right Testicle from the Left, so that the Scrotum has two Sinuses. Hence it happens, that it is sometimes distended on one Side by a Deffluxion of Humours, or a falling down of the Intestines, whilst the other Side remains in its natural State."

He deny'd the Existence of the *Panniculus Hymeneus*, which, according to *Mundinus*, block'd up the Mouth of the Matrix; and in its stead maintain'd, that some *Rugæ*, mutually connected with Veins and Ligaments, were relaxed and broke, when a Woman was deflower'd.

He describ'd the Ducts of the renal Caruncles, thro' which the Urine is strain'd, and which are now call'd the *Tubuli Urinarii*. *Carpus*.

Concerning the Anatomy of the Seminal Vessels, he expressly affirms, that the spermatic Vein and Artery do not at all meet, but pass separately to the Testicles.

He demonstrates, that the Substance of the Tongue is muscular, and that it is cover'd with a double Skin.

He also asserted, that the Neck of the Uterus was muscular, and endow'd with a voluntary Faculty. He takes the *Mem-*

A N A

brana Frontis Carnosa for a real Muscle; and asserts, that the *Ossicula auditus*, which strike the Tympanum of the Ear, were known to Anatomists in the Time of *Achillinus*.

JOHANNES GUINTERIUS.

This Anatomist is styl'd *Andernacus*, because he was born in *Andernacum*, a Town of *Ubich* on the Rhine, in the Year 1487. His Works, under the Title of *Anatomicarum Institutionum ex Galeni Sententia, per Johannes Guinterium Andernacum Medicum, Libri quinque*, were printed Basil. 1536. Octavo. 1539. Quarto. *Patauii*, 1558. Oct. *Wittemberg*, 1613. Octavo. And his Piece *De Medicina veteri & nova*, was printed Basil. 1571. Fol. 2 Vol.

He first call'd that glandular Body which is situated in the Middle of the Mesentery, and consists of a soft and yielding Substance, the *Pancreas*.

He boasts of his being the Discoverer of the Complication of the spermatic Vein and Artery, a little before their Infertion into the Testicles; which, he says, was never observ'd before him; and which, he adds, he shew'd to *Vesalius*, when he was studying Anatomy at Paris.

The Uterus, he said, had two Sinuses, corresponding to the Number of the Breasts, not divided by an intermediate Membrane, but terminating in one narrow Cavity, which he call'd the Neck of the Womb, which Neck, he said, terminated at the *Sinus Muliebris*, which he also call'd the *Pudendum*.

He also admitted of the *Membrana Allantois*.

He asserts, that the Muscle which surrounds the Neck of the Bladder, consists of transverse Fibres, and has various Offices; for, first, it shuts the Bladder, and then, after the Discharge of the Urine, contracting itself every Way, it propels what remains in the *Meatus Urinarius*.

LUDOVICUS BONNACIOLUS.

This Anatomist was a Native of *Ferrara*, and flourish'd about the Year 1530. His *Enneas Muliebris* was published *Argentini*. 1537. Octavo.

He first described the Nymphæ and the Clitoris as separate and distinct Parts, which had not been distinguished by the Antients.

He said, that the Mouth of the Uterus resembled in Figure the Glans of the Penis. The Testicles, according to him, were not perfectly spherical, but resembled a Sphere gently compressed on each Side.

JOHANNES FEKNELIUS.

This Author is likewise styl'd *Ambianus*, because his Father was a Native of *Amiens* in France; but he himself was born at *Clermont*, in the Year 1506. according to *Goelicke*; but according to *Douglas*, in his *Bibliogr. Anat. Specim.* in the Year 1485: But as this is a Controversy of too trifling a Nature to deserve Regard, we shall only observe, that he was a Man of extensive Learning, and so successful in his Practice as a Physician, that he became the Oracle of the Age in which he lived. But as he was no profess'd Anatomist, and only casually interspersed some Descriptions of particular Parts of the human Body, with his Physical Writings, he comes not properly under our present Consideration. His Book *De Naturali Parte Medicinæ*, was published Paris. 1542. Venet. 1547. Octavo. *Lugd.* 1551. 16mo. *Lutet.* 1554. Fol. *Mag.* And his *Univerſa Medicinæ, sive Opera Medicinalia*, was printed Venet. 1564. Quarto. *Lutet.* 1567. Fol. *Præfatos*. 1592. Fol. 1603. Octavo. *Hannovia*, 1610. Fol. *Paris*. 1602. Fol. *Lugd. Bat.* 1645. Octavo. 2 Vol. *Træjecti ad Rhenum*, 1656. Quarto. *Genev.* 1644. Oct. 1679. Fol. 1680. Fol.

He advanced nothing remarkable, in point of Anatomy, unless that he deny'd the *Peritonæum* to be perforated with small Holes.

LUDOVICUS VASSÆUS.

This Physician was a Native of *Catalonia*, and the Scholar of *Sylvius*. As he observed, that what *Galen*, and other learned Men, had wrote upon the Subject of Anatomy, was so scatter'd up and down, that it was not easy to come at it, he resolv'd to redress this Grievance, by compiling certain Tables to pave the Way, as it were, to that Divine Work of *Galen*, *De Usu Partium*; and, indeed, the Value of these Tables is enhanced by this Circumstance, that there is scarce a single Part of the human Body, how minute soever it be, that is not described in them. They were published under the Title of *Ludovici Vassæi Catalaunensis in Anatomien Corporis humani Tabulæ Quatuor*, *Lutet.* 1540. 1541. 1553. Fol. *Venet.* 1544. Oct. *Lugd.* 1560. Oct. A French Edition of them was also printed at Paris, 1555. Octavo.

ANDREAS VESALIUS.

This Anatomist was born at *Brussels*, a Town of *Brabant*, in the Year 1514. His superior Genius, in Conjunction with his indefatigable Application and Industry, soon raised

raised him to such a Pitch of Anatomical Knowledge, as render'd him at once the Ornament of his own, and the Admiration of future Ages. As it is the Fate of all Sciences to have their Votaries blindly and superstitiously attached to the Opinions of some particular Author of Note, till some daring Genius ventures to think for himself, and endeavours to make Authority fall a Sacrifice to Truth; so the Anatomists, at the Time *Vesalius* appeared, were so much blindfolded with the Authority of *Galen*, that to have contradicted him had been look'd upon as Heresy. *Vesalius*, regardless of this unhappy State of Things, ventur'd to expose the Mistakes, and correct the Errors, committed by *Galen*, both in Physic and Anatomy; but more especially the latter. But as there is a Principle of Emulation interwoven with the very Frame and Make of human Nature; so it must follow, that uncommon Merit must create, if not Enemies, yet at least Censurers, of Note and Distinction. This was the Fate of *Vesalius*: Some distinguish'd Authors have charged him with Ignorance, Want of Honour, Vain-glory, and Plagiarism.

Piccolhomini, an Author of considerable Note, talks of him in this Strain: "When a proper Opportunity occurs, I shall sufficiently shew, that whatever is good in that large Volume wrote by *Vesalius*, *De Re Anatomica*, is borrow'd from *Hippocrates*, *Aristotle*, *Galen*, and some others of the Antients, without the Author's so much as mentioning their Names; and that whatever Things are false and erroneous, which, indeed, are very many, are the Product of his own Ignorance, and Impetuosity of Temper; and tho' he has secretly stole many Things from *Galen*, yet he never mentions his Name, unless it be with a View to find Fault with him."

The Censure of *Cajus* upon *Vesalius* is still more remarkable. "We both lodg'd, says he, in the same Quarters at *Padua*; at the Time when *Vesalius* wrote and prepar'd his Book *De Corporis humani Fabrica*. One *Aldinus Junta*, a *Venetian* Printer, employ'd him to correct the Anatomical Works of *Galen*, both *Greek* and *Latin*; and for that Purpose several Emendations were sent him; but he render'd *Galen's* Text more corrupt than it was before, with no other View than that he might have something to find Fault with."

And tho' *Fallopian* owns him to be the Father of Anatomy, he yet carps at his Opinions almost every-where.

Columbus talks thus of him: "I can't but be surpris'd, that he, who on all Occasions lashes and chastises *Galen* for his having describ'd Apes and Brutes, instead of Men, should yet himself be so ridiculous as to describe the Larynx, the Tongue, and the Eyes of Oxen, and not of Men, without so much as ever giving a Caution with regard to it. He also ascribed Muscles to the Epiglottis, which are only found in Brutes." *Eustachius* has also observed of him, "That he described and delineated a Dog's Kidney instead of a Man's."

Arantius styles him the common Master of Anatomists, but accuses him of having delineated the Pudenda of Brutes, on account of the Scarcity of the Carcases of Women; whereby it happen'd, that *Valverde*, and those who immediately followed him, taking Things upon Trust, split upon the same Rock.

Johan. Bapt. Carcán. Leon. speaks of him thus: "It is surprising, that *Vesalius*, whilst he accuses *Galen*, the Chief of Physicians and Anatomists, of so many Blunders and Errors, should yet himself be so justly liable to Censure in the same respect: And, what is still worse, by these his Accusations, he seems widely to have mistaken *Galen's* Meaning; ascribing to him Things he never so much as dream'd of, and affirming that he deny'd those very Things which he insisted on in the most distinct and explicit manner; and whilst he so often wonders at, and finds Fault with, *Galen*, he himself deserves to be wonder'd at, and found Fault with."

"The Style of *Vesalius*, says *Riolanus*, is ridiculously pompous, and his Periods by far too long; so that he generally throws a greater Degree of Darkness upon things that are of their own Natures too obscure. Besides, I suspect, that the Latin of that Book is none of *Vesalius's*, but the Language of some other learned Man, since his *Chirurgia Magna*, his *Examen Observationum Fallopii*, and his little Book *de Radice Chinae*, are wrote in a quite different Style." And for this Reason, *Fallopian* thinks that his great Work is only fit for those who are well advanced in Anatomical Studies.

But these sharp and ill-humoured Censures have had not more Influence upon the Fate of *Vesalius's* Works, than a gentle Breeze of Wind would have upon *Mount Caucasus*, or *Athos*; for his Writings ever have been, and for ought I know, ever will be, esteem'd, so long as Anatomy and Physic are thought necessary to the Good and Welfare of Mankind; and that is, so long as human Nature endures.

His Work *De humani Corporis Fabrica*, was printed *Basil* 1543. *Fol.* *ibid.* 1555. *ibid.* 1563. *Venet.* 1568. *Fol.* *Min.* *ibid.* 1604. *Fol.* His *Anatomia* was printed *Francfurti*, 1604-1632. 4to. *Lugd.* 1552. 12mo. His *Epitome de humani Corporis Fabrica*

Librorum, was printed *Basil.* 1543. *Fol.* *Coloniae Agrippinae.* 1600. *Paris.* 1560. 8vo. *Wittebergæ*, 1582. 8vo. *Londini*, 1642. *Fol.* *De modo propinandi Radicis Chinae Decoctum*, was printed *Basil.* 1546. *Fol.* *Lugduni*, 1547. 16mo. His *Examen Anatomicarum Observationum Gabrielis Fallopii* was printed *Venetis*, 1564. 4to. The last Edition was *Vesalii Opera omnia*, *Lugdun. Batav.* 1725. *Fol.* See *Vander Linden de Scriptis Medicis*, and *Douglas's Bibliotheca Anatomica Specimen*.

As for the Discoveries, with which *Vesalius*, by his indefatigable Labour and Industry, enrich'd Anatomy, if I was to enumerate them all, I should not only find the Task difficult in itself, but inconsistent with my present Design; However, not to pass them over altogether, he maintain'd, that "The Penis" was connected at the Union of the *Offa Pubis*, by a certain small Ligament." This Ligament was delineated by *Casseri*, and our Countryman *Cowper* lately described and delineated it under the Name of *Ligamentum Penis Suspensorium*. We are also indebted to *Vesalius* for the first Delineation of the *Auditus Offa*, or Bones appropriated to Hearing.

He first discovered, that the Optic Nerve was not inserted directly in the Centre of the Eye, but a little to one Side. He likewise maintain'd, that the *Ligamentum Teres Femoris* was not inserted into the Middle of the Head of the Femur, but rather into the Side of it. I do not pretend to give the Life of *Vesalius*; for that would require a Volume by itself: My Design was only to shew the State of Anatomy, when he appear'd; which, I hope, may be sufficiently known from the preceding Hints.

CAROLUS STEPHANUS.

This Physician was a Member of the Faculty at *Paris*, and, by the Assistance of *Riverius*, made such Advances in Anatomy, as to acquire Credit enough to introduce *Galen's* Doctrine, which was unknown to the Age in which he lived. He also enriched Anatomy with some Discoveries, such as the membranous Apophysis within the Liver, at the Origin of the Vena Cava, lest the Blood, elaborated there, should regurgitate. He first of all maintain'd, that the *Oesophagus*, and great Artery, passed down through different Holes, though they lay very near to one another, which was quite the reverse of what *Galen* asserted. He says, that the *Membrana Carnosa* is visible in melted Fat; for, if you melt Fat before the Fire, you will observe a thick Membrane remaining. He accurately described the *Septum Scroti*, first observed by *Massa*, and gives it the Names of *Diaphragma* and *Septum*. His Works under this Title, *De Dissectione Partium Corporis humani Libri tres, una cum Figuris et Incisionum Declarationibus a Stephano Riverio Chirurgo compositis*, were printed *Paris.* 1545. *Fol.* and, in *French*, *Paris*, 1546. *Fol.*

This in general is to be remark'd with regard to his Plates, that they are imperfect, and therefore not to be trusted to.

He has six Representations of a human Skeleton, exhibiting the anterior, and posterior Views of the Body. The first and second of which represent only the Bones, the third and fourth the more considerable Ligaments, and the fifth and sixth the Origins and Insertions of the several Muscles. He has also two other Representations of the human Skeleton, exhibiting the Course of the Nerves. Two Figures represent the anterior, and posterior Parts of the Body, covered with their respective Muscles, and every Muscle is besides delineated by itself. He has likewise a Delineation of the Vena Cava and Aorta. He has also given a View of the Body as cover'd with the Skin, illustrated with the genital Parts in Women, in eight Figures; and towards the End of his Work, laid down the several Parts of the human Body in the same Order in which they occurred to him in Dissections.

THOMAS VICARY.

This Author was a Citizen and Surgeon of *London*, and this seems to be the most remarkable Circumstance in his Character, that he was the first who published any thing upon Anatomy in the *English* Language. His Book is called *The Englishman's Treasure, or the true Anatomy of Man's Body*; and was printed *London*, 1548. *ibid.* 1577. 8vo. *ibid.* 1587. 4to. *ibid.* 1633.

THOMAS GEMINI.

This Man was a Foreigner, but settled in *London*, in Quality of an Engraver in Copper. He only comes under our present Consideration, for his having first engrav'd the Figures of *Vesalius* on Brass, two Years after they were done in Wood in *Germany*. Though he was a skilful Artist, and a great Master of his Business, yet he is highly to be blam'd for suppressing the Name of *Vesalius*, and affirming, that the Work was the Product of his own Industry and Labour. By the Assistance of Mr. *Udal*, and other learned Men, (for he himself knew neither *Latin*, *English*, nor Anatomy) he adorned his Plates with *Vesalius's* Descriptions. There are three Editions of this Book, one in the Reign of *Henry* the VIIIth, another under that of *Edward* the VIth, and a third under *Queen Elizabeth*.

The Book is published under the Title of *Compendiosa totius Anatomiae delineatio Aere exarata per Tho. Geminum, Londini, 1545. Fol.* and then in *Engliſh, London, 1553. Fol. ibid. 1559. Fol.*

JACOBUS SYLVIVS.

This Anatomist was born at *Amiens* in *Picardy*, in the Year 1478. and was afterwards the Scholar of *Tagaultius*. He was a great Admirer of *Galen*, and an inveterate Enemy to *Vesalius*. He hath enrich'd Anatomy with many new Discoveries; and, particularly, he was the first who discovered those Valves which he calls *Epiphyſes*, or membranous *Epiphyſes*, in the Mouths of the *Vena Azygos*, the jugular, brachial, and crural Veins; as also at the Trunk of the *Vena Cava*, which rises from the Liver.

Fabricius ab Aquapendente unreasonably claims the Glory of this Discovery; but he only described them more accurately, and from their Use and Structure gave them the Names of Valves, which to this Day they retain.

He was also the first who observed the *Musculus Femoris Quadratus*, and rank'd it among the *Musculi Quadrigemi*, as he calls them.

He accurately describes the Origin of that Muscle in the Thigh, which is call'd the *Musculus Rectus*.

He maintain'd, that the Tendons of the *Musculus Plantaris*, and *Palmaris*, were wanting in some Subjects.

But what is surprising is, his receding from his Master *Galen*, in assigning the Origin of the *Musculus Rectus Abdominis*.

He mentions the large fleshy Substance in the Sole of the Foot, which runs out to the Sides of the Toes, and takes Notice of the *Musculi Pyramidales* arising from the Os Pubis, and calls them the *Musculi Succenturiati*; and indeed he may deservedly be said to be the first Discoverer of them.

He also takes Notice of the Glands at the first Division of the *Aſpera Arteria*, as also of two Glands at the Root of the *Larynx*, and of the glandular Substance of the *Pylorus*.

His *Opera Medica*, &c. were printed *Coloniae Allobrogum*, 1630. Fol.

His *Depulſio Vesani Gujusdam*, &c. was printed *Parisi*. 1561. 8vo.

His *Piece de Mensibus Mulierum*, *Venet.* 1556. 8vo. *Basil* 1556.

His *Piece*, intituled, *Ordo & Ratio Ordinis in Legendis Hippocratis & Galeni Libris*, *Parisi*. 1561. 8vo.

MICHAEL SERVETUS.

This Physician was a Native of *Spain*, and a Man of an uncommon Genius. Happy had it been for him, if he had confin'd his Researches within the Bounds of Physic and Philosophy; but unluckily he went beyond his Sphere, and plung'd himself into the deepest and most abstruse Points of Theology: For he publish'd a Piece against the mysterious Doctrine of the Trinity, and that too at a very unlucky Juncture, I mean the Dawn of the Reformation. Upon this *Calvin*, the great Champion of that Cause, used his Interest to do him all the Injury he could. And as true Christian Zeal had in these Days degenerated into a most hellish and most execrable Spirit of Persecution; he found it no hard Task to get him condemned to the Flames; and the Sentence was accordingly put in Execution at *Geneva*, in the Year 1553. His seven Books de *Trinitatis Erroribus* were printed at *Basil*, 1531. And his *Christianismi Reſtitutio* was printed at *Basil*, 1553. Though these Pieces made their Author fall an unfortunate Victim to a Spirit of Persecution then prevailing, yet, as a Physician, they will perpetuate his Name to all succeeding Ages; since in the fifth Book of the former of these Works, which treats of the Holy Spirit, those Passages were found, which amount almost to a Demonstration, that he was better acquainted with the Doctrine of the Circulation of the Blood, than any preceding Author.

"There are," says he, "in the human Body, Spirits of three different Kinds, the natural, the animal, and the vital; which are really not three, but two distinct Spirits. The vital is that which is communicated by Anasomoses from the Arteries to the Veins, in which it is called natural. The Blood therefore is first, whose Seat is in the Liver and Veins. The vital Spirit is second, whose Seat is in the Heart and Arteries. The animal Spirit is third, which is like a Ray of Light, and has its Seat in the Brain and Nerves."

Now to understand how the Blood is the Life, he says, "We must first understand the substantial Generation of the vital Spirit, which is compounded of, and nourished by, inspired Air, and the subtlest Part of the Blood. The vital Spirit has its Original in the Left Ventricle of the Heart, by the Assistance of the Lungs, which chiefly contribute to its Generation. It is a subtle Spirit wrought by the Force of Heat, of a florid Colour, having the Power of Fire; so that it is a sort of shining Vapour made of the purer Part of the Blood, containing within, in itself, the Substance of Water, Air, and Fire. It is made in the Lungs, by the Mixture of inspired Air with that elaborated subtle Blood, which the Right Ventricle of the Heart communicates to the Left."

VOL. I.

"Now that this Communication is not made thro' the Septum of the Heart, as is commonly believed, but the subtle Blood is very artificially agitated by a long Passage through the Lungs from the Right Ventricle of the Heart; and is prepared, made florid by the Lungs, and transfused out of the arterious Vein into the venous Artery; and at last, in the venous Artery itself, it is mixed with the inspired Air, and by Expiration purged from its Dregs. And thus at length the whole Mixture is attracted, by the Diaſtole of the Heart, into the Left Ventricle, being now a fit Substance out of which to form the vital Spirit."

"Now that this Communication and Preparation is made by the Lungs, is evident from the various Conjunction and Communication of the arterious Vein with the venous Artery in the Lungs; the remarkable Largeness of the arterious Vein does likewise confirm it, since it would never have been made of that Form and Bulk, nor would it have emitted so great a Quantity of very pure Blood out of the Heart into the Lungs, if it had been only for their Nourishment; nor would the Heart have been this way serviceable to the Lungs, since the Foetus in the Womb is otherwise nourished, by reason of the Closeness of the Membranes of the Heart, which are never opened till the Birth of the Child, as *Galen* teaches; so that the whole Mixture of Fire and Blood is made in the Lungs, where there is a Transfusion out of the arterious Vein into the venous Artery, which *Galen* took no Notice of."

Afterwards he says, "That this vital Spirit is transmitted from the Left Ventricle of the Heart into the Arteries of the whole Body; so that the more subtle Parts get upwards, where they are yet more refined, especially in the Plexus Retiformis, which lies in the Base of the Brain, where, from vital, it begins to become animal, and approaches to the proper Nature of the rational Soul."

The Circulation of the Blood is a Discovery of such Importance, that every one who gives the remotest Hints of it, has some Party to take him by the Hand, and canonize him as the first Discoverer. Thus *Hippocrates*, *Galen*, and a great many more, have had their respective Champions in this Particular, who have pronounced boldly either one way or the other, just as Whim and Caprice directed them. But as such a Turn of Mind is a Disgrace to Philosophy, and a Reproach to human Nature, whose Glory and Dignity consist in shaking off Prejudice, and adhering inviolably to Truth; where-ever it can be found, so we will not absolutely pronounce, that *Servetus* knew the Doctrine of the Blood's Circulation; but certain it is, that the first Step made to this noble and useful Discovery was the finding, that the whole Mass of Blood passes thro' the Lungs by the Pulmonary Artery and Vein. Now that *Servetus* had a pretty distinct Idea of this Matter, is sufficiently plain from the foregoing Passages; but he talked in too vague and undetermined a manner, to be esteem'd a full and uncontest'd Discoverer. The Glory of this was reserved for our own Country, which gave Birth to the divine *Harvey*, who first improv'd those, and the like noble Hints, into a rational and consistent Theory, truly useful to Mankind, and absolutely necessary to farther Improvements in rational Medicine.

REALDUS COLUMBUS.

This Anatomist was a Native of *Cremona*; he flourish'd about the Year 1544. and was intimate with *Vesalius*, whose public Lectures he had frequently an Opportunity of hearing. He is by some charg'd with want of Gratitude to *Vesalius*, from whom he is said to have stole every thing that is valuable in his own Works; but others maintain, that he had a clearer Idea of the Parts than *Vesalius*, and described them more accurately; and 'tis certain, that his *Latin* is very pure.

He was the first who wrote distinctly and accurately about the Caruncles in the *Vagina Muliebris*.

He was the first who made mention of the Duplication of the Peritonæum; and he affirmed, that the Pleura was everywhere double. He assumes to himself the Discovery of the *Tunica Innominata* of the Eye, and accuses all his Predecessors of Ignorance in that Point. But *Douglas* thinks, that the Coat of the Eye, which *Galen* describes under the Name of the *Tunica Sexta*, is the very Coat he means.

He also boasts of his having first discovered the third Bone subservient to Hearing.

He affirms of *Vesalius*, that he not only described, but publicly dissected, the Tongue, the Larynx, and the Eyes of Oxen, instead of those of Men; and that he himself was an Eye-witness of the Imposition.

As *Galen* and *Vesalius* exceeded in the Number of the Muscles of the Eye, so *Columbus* is as remarkably deficient in that Point, since he determines, that there are only five.

The Use, by him ascribed to the Lungs, deserves to be taken Notice of; for he thinks, that they were bestow'd on Animals for this Purpose, that the Blood and vital Spirit might be prepared and generated in them; for he thinks, that the Blood, being attenuated by Elaboration in the right Sinus of the Heart,

Heart, is carried through the *Vena Arteriosa* to the Lungs, where by their continual Motion it is agitated, still farther attenuated, and mixed with that Air, which is drawn in through the Nostrils and Mouth, and carried through the Branches of the *Aspera Arteria* to the Whole of the Lungs, which Air is itself prepared by this Collision; so that the Blood and Air, being thus mix'd, are received into the Branches of the *Arteria Venosa*, and at last carried through the Trunk itself to the Left Ventricle of the Heart, from which they are carried through the Aorta in all Directions, to all the Parts of the Body.

Since this Opinion is largely insisted upon by *Michael Servetus*, we have Reason to suspect, that *Columbus* borrowed it from him. This also *Galen* had advanced long before *Servetus*, where he says, that when the Thorax is contracted, the *Venous Arteries*, which are in the Lungs, being on all hands pent up, and compressed, quickly throw out the Spirit contained in them; but that they receive some Portion of the Blood from the *Vena Arteriosa*, by minute and invisible Orifices.

His Works were printed under the Title of *Realdi Columbi in almo Gymnasio Patavino Anatomici celeberrimi, de re Anatomica Libri Quindecim, Venetiis, 1559. Fol. Paris. 1572. 8vo. Lugd. Batav. 1667. 8vo.*

JOHANNES VALVERDA.

This Physician was a Native of Spain, and, in his Anatomical Studies, the Scholar of *Realdus Columbus*. He is said to have carried the Knowledge of Anatomy from Italy to Spain. He published the Tables of *Vesalius*, with their Descriptions somewhat enlarged in the Spanish Language, and added four new Figures to them; the first of which exhibits the Direction and Progress of the Fibres which compose those Muscles, that cover the Fore-part of the Body. The second represents a Woman big with Child. The third and fourth give us a Prospect of the cutaneous Veins scattered up and down the anterior, and posterior Parts of the Body. But he is an Author of too small Note to be insisted upon at greater Length. Since the greatest Character we find given him is, that he was rather to be commended for his Industry in propagating Anatomy, than for his writing well upon any Part of it.

GABRIEL FALLOPIUS.

This Anatomist was born at Modena in Italy, in the Year 1490. His Skill in Physic and Anatomy has rendered him universally admired. *Douglas* in his *Bibliographia Anatom.* has beautifully drawn his Character, when he says, that he was *in docendo maxime methodicus, in medendo felicissimus, in secundo expeditissimus*, Most judicious and methodical in his Method of Teaching, most successful in his Practice, and most expeditious in his Dissections. He died in the 73d Year of his Age, in the Year 1563. after having illustrated Anatomy, and enriched it with several things unknown to former Ages. He affirms in particular, That the *Musculi Pyramidales* were first discovered by him; and he is of Opinion, that the Bladder is compressed by them; but this was observed before him by *Galen*, and *Jacobus Sylvius*.

He boasts of his being the first who solved the perplexing Difficulty of *Oribasius*, or rather of *Galen*, concerning the Motion of the upper Eye-lid, after the *Musculus Orbicularis* is cut off; for he affirms, That in the Year 1553. he discovered the Muscle which raises the upper Eye-lids. But *Galen* himself solves this Difficulty, at a Time when he was become venerable for his Age and Experience, that is, when he digested the *Commentaries de Locis male affectis*, as will evidently appear to any one who reads them. Besides, *Avicenna* clearly describes this Muscle, *Lib. 1. Sum. 2. de Musculis, Cap. 5.* The same Muscle is likewise accurately described by *Realdus Columbus* in his Anatomical Works, Anno 1559.

Though he is esteem'd the Discoverer of that seminal Duct, which he calls the *Tuba Uteri*, whose Extremity, in which there is a large Hole, is lacerated and fringed, as it were, like the Edges of old work'd Linen Cloth; yet it is excellently described by *Herophilus*, and *Rufus Ephesus*, who lived long before him.

By the true Neck of the Womb, he means all that Part from its internal Orifice, till it begins to enlarge itself, and grow wider. But the Whole of that Passage into which the Penis enters, is by him called *Sinus & Pudendum Muliebre*.

His *Observationes Anatomicae* were printed Venet. 1561. 8vo. Paris. 1562. 8vo. *Helmaestadii*, 1588. 8vo. His *Expositio in Librum Galeni de Ossibus* was printed Venet. 1570. His *Lectiones de partibus similaribus humani Corporis*, were published Noribergæ, 1575. Fol. His *Compendium de Anatome humani Corporis* appeared Patavii, 1585. 8vo. Venet. 1571. His *Opera Omnia*, Venet. 1584. Fol. Francof. 1600. Fol.

AMBROSIUS PARÆUS. *Ambroise Paré.*

This Anatomist was a Native of France, and acquir'd a great Character rather for his uncommon Success in the Practice of Surgery, than for any Figure he made in Anatomical Learning.

The Muscles, which *Sylvius* calls *Succenturiati*, are by him styled the *Triangulares Pubis*, or the *Accessorii*. He first described the *Membrana Muscularum Communis*, or *Common Membrane of the Muscles*. His Works, under the Title of *Anatomie universelle du Corps humain*, appear'd at Paris, 1561. 8vo. and afterward in a Latin Version Paris, 1561-1582. Fol. Francof. 1593-1612. Fol.

BARTHOLOMÆUS EUSTACHIUS.

This Anatomist was a Native of Italy, and a Man of very extensive Learning. His Tables, 'tis to be presumed, have made his Character, as an Anatomist, sufficiently known where Learning is countenanced; or even heard of. He enriched Anatomy with several Discoveries; "for he first discovered the Glands which lie upon the Kidneys."

He finds Fault with *Vesalius* for describing, dissecting and delineating the Kidney of a Dog instead of that of a Man, without so much as taking Notice of the Difference. He maintained, that the Duct of the Renal Veins is oblique, and not transverse, as it is delineated by *Vesalius*. He exhibited, in a most beautiful Figure, the *Canaliculi Urinarii*, which he compares to very small Hairs; but which were before described by *Nicolaus Massa*. In his *Examination of the Bones*, he says, the true Structure of the Vifory Nerve was first discovered by himself; and adds, that when it is immersed in Water, it is distended and expanded into a large Membrane; like a very thin Linen Cloth.

Concerning the third Bone of the internal Ear, called *Stapes*, he has these Words: "I am conscious to myself, that without either Instruction or Information, from any one, I knew that Bone long before they wrote, and that I shewed it to many in Rome, and caused it to be engraved on Copper."

He was the first who gave an accurate Description of the *Thoracic Duct*, or the Passage by which the Chyle is conveyed to the Heart, which, he says, in Horses, resembles a white Vein, and has a semi-circular Mouth, opening into the internal Jugular Vein.

He was the first who observed the Valve at the Orifice of the *Vena Coronalis* in the Heart.

He boasts of having first discovered, and exactly described, that Valve, which is by some called the *Valvula Nobilis*, in the *Vena Cava*, near the right Auricle of the Heart, tho' *Jacobus Sylvius* seems to have observed it before him. In his *Treatise de Renibus*, he makes mention of the Glands of the Larynx. His *Opuscula Anatomica* were printed Venet. 1563. 4to. His *Libellus de Dentibus*, Venet. 1563. 4to. His *Epistola Nuncupatoria*, Romæ 1562. His *Opuscula cum Annotationibus*, Venet. 1574. 4to. Lugd. Batav. 1707. 8vo. and his *Tabula Anatomica* were published by *Jo. Maria Lancisi*, Romæ, 1714. Fol. and afterwards *Amsteladam*. 1722. Fol. then Romæ, 1728. Fol.

His Notes upon *Erotian* were published Venet. 1566.

JOHANNES HALL.

This Author was a Surgeon in London, and amongst the first who wrote any thing upon Anatomy in the English Language. Having never seen his Works, we know of nothing for which he is so remarkable as the gaudy and pompous Title of his Book, which runs thus: *A very faithful and necessary brief Work of Anatomy, or Dissection of the Body of Man, compendiously shewing the Natures, Forms, and Offices of every Member, from the Head to the Feet, with a commodious Order of Notes, leading and guiding the young Chirurgeon's Hand from all Offence and Error, in right way of perfect and cunning Operation, compiled in three Treatises, more useful and profitable than any heretofore in the English Tongue published.* It was printed at London, 1565. 4to.

VOLCHERUS COITER.

This Author was born at Groningen in the Year 1534; and, in Process of Time, acquired a very great Character, both as a Physician, Surgeon, and Anatomist. In his *Introduction to Anatomy*, Cap. 6. he gives this Advice to such as are desirous of making quick and regular Advances in their Anatomical Studies: "If, says he, any one is fond to learn the Anatomical Art, let him first read *Galen's Books de Usu Partium*, and *de Anatomia Administrationibus*; and then *Vesalius's Fabrica Corporis humani*. Let him, in the third place, read *Fallopius*; and then *Vesalii Examen*; and, last of all, *Eustachius*; and by this means he will be sure to acquire a thorough and perfect Knowledge of this Art." Anatomy is considerably indebted to this Author for his Labour and Industry; for he clearly specifies the first Origin of the Bones, accounts for their Growth, and points out the Difference between those of Infants and Adults; for he used to prepare Skeletons of Children, compare their Bones with those of Adults, and demonstrate the Difference between them to his Scholars in Bologna; where, in his own House, he exhibited an abortive Fœtus as long as a Finger, and furnished with all the Parts of a human Body. He also makes mention of another, which he saw at Bologna, in the House of Dr. *Arantius*.

In his *Tractatus de Auditus Instrumento*, he has these Words: "What *Fallopian* called the Tympanum, he chiefly took from the Ears of Brutes, and such Animals as chew the Cud; for these have this Passage formed like a certain Species of Seashell, or a *Turkish Drum*; whereas in Men this Passage is widely different from the Shape of a Drum." For this Reason he thinks, that this Passage, or the second Cavity, receives its Denomination of Tympanum rather from its Use than its Form. He maintains, that there are two of these Cavities; for, says he, immediately behind the Myringa, by which he meant the Tympanum, in the upper and fore Parts, appears a Cavity, which is at first narrow, but afterwards dilating itself, is stretch'd backwards towards the upper Parts, and this Part is spongy and fungous, and seems to have a Communication with the internal Space of the Processus Mamillaris.

According to him two of the *Officula Auditus*, that is, the two largest, are full of small Holes, which are fill'd with a medullary Substance; but the third contains none, on account of its exceeding Smallness.

He says, that there are two Muscles of the internal Ear assigned by some, but he does not describe them.

To the Muscles belonging to the Face, he adds some others, which, by later Authors, are called the *Musculi Corrugatores*, but, from their principal Office, should rather be styled the *Musculi Superciliorum Depressores*, which he first discovered, and accurately described, but gave them no Name: He adds, "You will also observe, under the internal Skin of the Lips, and that of the Root of the Tongue, many fleshy Glands, under which are found Fibres, rising upwards from their Sides in an oblique Direction; and these to me seem to draw the under Lip inwards." His Piece intitled, *de Cartilaginibus Tabula*, was printed *Bononia*, 1566. Fol. His *Externarum atq; internarum principalium humani Corporis Tabula*, &c. *Norimbergæ*, 1573. Fol. *Lovanii*, 1653. Fol. His *Lectiones Gabrielis Fallopi de Partibus Similibus humani Corporis ex diversis Exemplaribus, summa cum diligentia collectæ*, &c. were printed at *Norimberg*, 1575. Fol.

JULIUS CÆSAR ARANTIUS.

This Author was born at *Bologna*, and was the Scholar of *Vesalius*, as also of his Uncle *Bartholomæus Magis*, who taught him the Elements of Anatomy in the Year 1548. His Piece intitled *De humano Fœtu Opusculum*, was printed *Venet.* 1571. *Basil.* 1579. 8vo. *Venet.* 1587. 4to. To this Edition he join'd a Preface, and a Book of Anatomical Observations, printed *Venet.* 1595. In the first Chapter of the last Edition of this Book, he describes the true and genuine Substance of the *Uterus*, asserting that it is fungous, and bears a Resemblance to a Sponge; that it is not single, but divisible into many Laminæ, like certain *Fungi*, which grow under Trees; and that it is perforated with Holes, like a Sponge or a Pumice-stone. In the third Chapter he not only accurately describes the Vessels of the Uterus; but also maintains, that its Arteries are continued to the Veins; which he also takes to be the Case with all the Arteries and Veins in the human Body; which is the same as if, with later Authors, he had maintain'd, That the Veins were no more than Arteries returning to the Heart.

The spermatic and hypogastric Arteries, which he calls the descending and ascending ones, not only unite, and are continued together; but the Vessels of the Right Part of the Uterus are intermix'd with those of the Left.

And, in *Chap.* 4. he treats largely and accurately of the Coalition of the Vessels in the Heart of a Fœtus. "A few Days, says he, after their Birth, there is a Coalition of this Foramen; tho' even in older Subjects, some remaining Marks of that Agglutination are always retained."

He also makes mention of another Coalition in the Liver, that of the *Vena Portæ* with the *Vena Cava*, which is now universally called the *Ductus Venosus*.

That white and rising Part of the Basis of the Ventricle of the Brain, which is stretch'd forwards, on both Sides, in a longitudinal Direction to the Forehead, he calls the *Pedes Hippocampi*.

He says, that the Muscles of the Eye arise from the *Os Sphenoides*, hard by the Foramen, thro' which the Optic Nerve passes; but that one of the oblique Muscles, or that call'd the *Musculus Brevis*, arises from a certain Suture, or Cleft, which divides the Bones of the *Maxilla Superior* from the *Ossa Mali*.

He asserts, that the *Musculus Palpebræ Superioris*, destin'd for opening the Eye, and rising also from the *Os Sphenoides*, was known to him in the Year 1548.

He first observed the interior Chink of the Larynx, accurately described it, and appositely enough compared it to the Clefts in musical Wind-Instruments.

Tho' he does not openly acknowledge the Circulation of the Blood, yet he largely specifies all the Arguments that are calculated for destroying the Hypothesis of the Antients, concerning a Transudation thro' the Septum or Partition, which divides the Ventricle of the Heart.

He first observed, that the Duct of the Artery of the Spleen was oblique, and twisted in form of a Snake.

He was the first who asserted, that the middle Substance of the Urethra, or of the Canal common to the Urine and Sperm, was of the same Structure with the Penis itself, and capable both of being distended, and becoming flaccid.

He first took Notice of an orbicular Muscle surrounding, on all Sides, the Sinus Muliebris; but this Discovery was owing to *Jacobus Carpus*, who had before described the whole Neck of the Uterus as a muscular Substance.

According to him the *Musculi Recti* of the Abdomen arise with a fleshy Origin from the *Pubes*, when their Coverings, he means their *Musculi Pyramidales*, are wanting.

He maintains, that the Portion of the *Musculus Biceps*, which, according to *Vesalius*, arises from the Process of the Acromion, and is inserted into the Humerus, is the eighth Muscle of the Humerus, which was afterwards by *Riolanus* call'd *Coraco-brachialis*. But it is, without Reason, by some call'd the *Nonus Humeri Placentini*, since it is in reality the Discovery of *Arantius*.

He likewise discovered the *Indicator*, or the *Indicis extensor proprius*, which had remain'd unobserved before him.

He maintain'd, that the second Muscle of the Fingers, by which he means what is now call'd the *Flexor perforans*, was the Instrument of bending all the *Internodes*, and not of the third Joint only, as his Predecessors had maintain'd.

He assumes to himself the Discovery of the *Musculus Femur Circumagens*, which he calls the twelfth.

He likewise observes, that a Portion of the *Musculus Femoris primus*, that is, of the *Gluteus Maximus*, becomes a membranous Tendon, which, joining with another Tendon arising from the sixth Muscle of the Tibia, or the *Fascialis*, is strongly and laterally inserted into the Appendix Tibiæ.

By means of this Communion, or Conjunction, he accounts for the Pains of the Hips reaching to the very Knee.

In his *Observat. Anatom.* *Chap.* 36. he has these Words concerning the Substance of the Testicles: "Perfect Seed is carried, as it were, from numberless small Roots of a Plant; variously dispersed thro' the Substance of the Testicles, which Roots appear wrapp'd up and curl'd like the Tendrils of Vines, and resemble white curl'd Hair."

CONSTANTIUS VAROLIUS.

This Author was a Native of *Bologna*, an accurate Philosopher, an expert Surgeon, and a skilful Anatomist.

He is said to be the first who discover'd the Valve of the Colon, and elegantly described it in the following Words: "Where the *Ilium* is joined to the Colon, there rises in its inner Part a certain Membrane, being the last Boundary of the *Ilium*, which reaches so far, and which I, its first Discoverer, call the *Operculum Ilii*." And a little after he makes mention of the "Appendix of the Colon, as being an oblong Sack, imperforated at one of its Extremities, which is call'd the *Intestinum Cæcum*."

He first divided the Brain into three Parts, by adding the Beginning of the Spinal Marrow, whilst yet contain'd within the Skull, and giving Birth, as it were, to the Nerves, whose Origin was formerly thought to be the Brain.

The Optic Nerve, according to him, arises from the posterior Part of the Spinal Marrow, and not from the Base of the Brain in its fore Part, as *Galen* and others maintained.

The transverse Process of the Brain is call'd the *Pons Varolii*, from *Varolius*, its first Discoverer.

He first discovered the Glands in the *Plexus Choroideus*.

His *Anatomia, sive de Resolutione Corporis humani, Libri Quatuor*, &c. was printed *Patau* 1573. 8vo. *Francos.* 1591. 8vo.

JULIUS JASSOLINUS.

This Anatomist was the Scholar of *Philip Ingrassias*, and afterwards succeeded him in the University of *Naples*, in the Year 1570. Dr. *Douglas* calls him, *Seculi Epidaurius sui*. But *Riolanus*, who was no bad Judge of an Anatomist's Worth, talks of him in this diminutive Strain: "As the Presence of some Men lessens their Fame, so the reading Books that have been earnestly desired and sought after, sometimes makes their Authors appear mean and contemptible."

He has something pretty remarkable concerning the Generation of the Bile; for he maintains, that the bilious Excrement is evacuated from the Liver, in two different Portions; the one is unmix'd, thin, and unadulterated, and is carry'd into the *Vesicula* itself, by the small Vessels between the Roots of the *Vena Portæ* and the *Vena Cava*, which the Gall-bladder afterwards discharges into the Beginning of the Intestine. Another Portion of it is mixed, thick, and feculent, which is carry'd directly from the Liver into the Intestine. To this he has subjoin'd a new Figure of the Gall-bladder and its Vessels, His *Questiones Anatomicae, and Osteologia Parva*, were printed *Neapoli*, 1573. *Oct.* *Hænevia*, 1654. *Quarto*. His Piece

De Poris Chelidocis, & Vesica Fellea, was printed Neapoli, 1577. Octavo.

JOANNES BAPTISTA CARCANUS LEONIS.

This Anatomist was a Native of Milan, and the Scholar of *Pallopius*. He maintain'd, that there was no Membrane in the *Canalis Arteriosus*, which shuts up its Orifice, as *Vesalius* imagined.

The Foramen near the Orifice of the *Vena Coronalis*, thro' which the Blood flows from the *Vena Cava* to the *Arteria Venalis*, appears to be of an oval Figure. Hence we may conclude, that it first acquired the Name of *Foramen Ovale* from this Description.

He asserts that the *Vena sine Pari* has no Membranes or Valves on its Orifice, which contradicts what *Anatus Lusitanus* relates, who in his first Century of Cures affirms, that he saw these Membranes exhibited at *Ferrara*, by *Johannes Baptista Conanus*.

He finds Fault with *Columbus* for asserting, that the Penis has neither Veins nor Nerves; for he not only specifies the Veins of its principal Substance, but also others which creep along its Surface, and which he calls cutaneous; all which taken together, a certain Modern of great Note call'd the *Vena ipsius Penis*, or, the Vein of the Penis itself.

He asserts, that the *Musculus Orbicularis* of the Eye-lids cannot be separated into two, as *Vesalius* thought. His two Books of Anatomy were printed *Ticini*, 1574. Oct.

FELIX PLATERUS.

This Author was born at *Basil*, in *Switzerland*, in the Year 1536. He had from his Infancy a Desire to view the Entrails of Beasts when they were slain, and even then pronounced the Butcher happy, for his being able at first View to handle them over and over, without committing a Mistake. His *Libri Tres de Corporis humani Structura & Usu*, &c. were printed *Basil*, 1583. Fol. 1603. Fol. His *Quest. Physiologica*, *Lugd. Bat.* 1650. His Piece *De Mulierum Partibus Generationi dicatis*, &c. *Argentinae*.

SALOMON ALBERTUS.

This Author was Professor of Physic at *Wurtemberg*, and published a Book, intituled *Historia plerarumq; Corporis humani Partium, in Usum Tyronum, Wittebergæ*, 1583. Oct. 1602. Oct. 1630. Oct. The Discovery of the Valve of the Colon, commonly called the *Valvula Bauhini*, is justly ascribed to him; for he affirms, that he first discover'd it in a Beaver, and then in a Man.

His three Orations *de Disciplina Anatomica* were printed *Nirernbergæ*, 1585. Octavo; and his *Observationes Anatomicae*, *Wittebergæ*, 1620. Oct.

ARCHANGELUS PICCOLHOMINUS.

This Author was a Native of *Ferrara*, and a Citizen of *Rome*: He was born in the Year 1526. but in *Riolanus's* Opinion, he was rather a Philosopher, than an Anatomist, since his Anatomical Prelections are interspersed with Physiological Disquisitions, and fine-spun Controversies, quite foreign to Anatomy. But that he labour'd with Success in this Branch of Learning, is sufficiently evident from the Improvements and Discoveries he has made in Anatomy; for

He was the first who divided the Substance of the Brain into *cineritious* and *medullary*; for he calls that concretionary or whitish livid Body, which first appears, the Brain itself; but he calls that solid white Body which is wrapt up in it, the *Medulla*, or Marrow, which he distinguishes into three Kinds, the *Medulla globosa*, the *Medulla oblongata caudicis instar*, and the *Medulla spinalis*.

He maintains, that all the Nerves have their Origins from the *Medulla oblongata*.

He was the first who called the *Processus Mamillares*, *Nervi odoratorii*, or, the Nerves by which the Sensation of Smelling is produced.

He first discovered that wonderful Contrivance of Nature at the Beginning of the *Intestinum caecum*, that is, three Valves like little Doors opening downwards: And asserted, that they were design'd to prevent the Return of the *Fœces*.

He first delineated the Anastomosis of the *Vena Porta* and the *Vena Cava* within the Liver, after it had been described by *Jacobus Carpus*.

He ascribed *Prostatae* to Women, as *Galen* had done before him.

He was also the first who described the particular Membrane of the Fat, which *Riolanus* afterwards called the *Membrana Adiposa*.

He asserts, that the *Peritonæum* is every-where double, and consists of two Coats.

He first took notice of, and described, that white Line of the Abdomen, which is now called the *Linea alba*.

In his Opinion there was only one continued Duct which reach'd from the Mouth to the Anus.

He affirms that the internal Coat of the Intestines is three times as long as the external Coat; and that it is corrugated, and form'd into Wrinkles, that the Chyle, by that means, remaining longer in them, might be the more commodiously extracted by the mesenteric Veins.

He describes the membranous Canals, or the Tubes with a fleshy Covering, thro' which the Urine is strained, better than *Carpus* or *Massa*.

The Reason he assigns, why the left spermatic Vein does not arise from the emulgent, is precisely the same which is embraced by the Moderns.

He calls the *Hymen*, *Claustum Virginitatis*.

He assigns Names to all the Muscles, from the Uses and End, for which Nature design'd them; thus he named the *Musculi Ocularii*, or *Visorii*; *Masticatorii*; *Locutorii*; *Respiratorii*; *Amplexatorii*; *Scapularii*; *Humerarii*; *Cubitarii*; *Apprehensorii*, or *Manuum Moveres*; and *Ambulatorii*, or *Progressorii*; the *Femorales*, and *Tibiales*, &c.

He call'd the frontal Muscles *Musculi Pathematici*, or *Musculi Animi affectuum significativi*. His *Anatomica Prælectiones* were printed *Romæ*, 1586. Folio; and his *Commentarii in Librum Galeni de Humoribus*, *Paris*. 1556. Oct.

CASPARUS BAUHINUS.

This Author was born at *Basil*, in the Year 1560; and was universally esteem'd to be a skilful Anatomist, and a curious Botanist: But *Riolanus* talks of him as ignorant, injudicious, and presumptuous. He says, that, in the Year 1579. he observed the Valve in the Beginning of the Ilium, or Colon, before he read any Author who made mention of it: But 'tis certain, that *Varolius*, and a great many others, describ'd it very accurately many Years before.

He took notice of the natural Narrowness of the Intestinum Colon in the Right Side; and for this Reason Colic Pains not only arise most frequently, but rack most violently, in that Part; for that narrow Passage is easily obstructed, by the Excrements, which are long retained there, and indurated. His Piece, intituled *De Partibus humani Corporis externis Liber*, was printed *Basil*. 1588. His *Anatomes Liber secundus*, *ibid.* 1591. Oct. His *Anatomica Corporis Virilis & Muliebris Historia*, *Lugd. Bat.* 1597. Oct. 1609. Oct. His *De Corporis humani Fabrica*, *Lib. 4.* &c. *Basil*. 1600. Oct. His *Theatrum Anatomicum*, *Francos.* 1605. Oct. *Francos.* 1621. Quarto. His *Institutiones Anatomicae*, &c. *Basil*. 1604. 1609. Oct. 1640. Quarto. *Francos.* 1616. Oct. *Oppenheimii*, 1614. Octavo. 1629. Oct. His *Epistola Anatomica Curiosa*, *Lipsia & Franc.* 1673. Quarto.

JOHANNES POSTHIUS.

This Anatomist was born in the Year 1537, in *Germerheim*, a Town of the Lower Palatinate upon the *Rhine*, and died in the 60th Year of his Age, in the Year 1597. He seems to be very dextrous at dissecting the Muscles, which is sufficiently proved by some Discoveries he has made.

He maintains, that there are four Muscles which draw the Lips inwards to the Teeth; two in the inferior, and two in the internal Part.

He ascribes six Muscles to the Penis; and affirms, that there is only one Muscle between the Cartilages of the Ribs, and not two, as in the intercostal Spaces.

He says, that the fourth Muscle of the *Maxilla inferior* does not arise from the Styloid, but from the Mamillary Process. He was also the first who asserted, that the tendinous Part of this Muscle adhered to the *Os hyoides*. He also asserts, that the *Processus Mamillares* are not the Organs of Smell. He advises to dissect the Muscles, as much as possible, in such a manner as to preserve their Origins and Insertions entire; because by this means their Uses may be most commodiously discovered. His *Observationes Anatomicae* were printed *Francos.* 1590. 1593. Octavo. His *Mantissa Anatomica* was printed *Hafnia*, 1661. Oct.

VIDUS VIDIVS.

This Author was born at *Florence*, but was Professor of Physic and Surgery at *Paris*, and Physician to *Francis I.* He died in 1567.

He was remarkable for being extremely well vers'd in the Writings of *Hippocrates*.

His *Ars Medicinalis* was printed *Venet.* 1611. 3 Vol. Fol.

The third Volume contains seven Books, on the Subject of Anatomy, illustrated with twenty-eight Copper Plates.

ANDREAS CÆSALPINUS.

This Author was born at *Arezzo* in *Italy*, and was a strong Champion for the Peripatetic Doctrine, in Opposition to *Galen*, who was at that Time reverenc'd as an Oracle. Hence it was, that the Writings of *Cæsalpinus*, tho' very valuable in themselves, were neglected; and those Passages which he casually wrote, concerning the Circulation of the Blood, either not adverted to, or not understood, by any, till *Harvey*, the

Glory

Glory of his Country, published his incomparable Book upon that Subject.

Cæsalpinus affirms, with *Aristotle*, that the Heart is not only the Source and Origin of the Arteries and Veins, but also of the Nerves.

In Quest. 4. where he proves, that in Respiration no external Air can have Access to the Heart, he has these Words: "For the Membranes are so fitted and adapted to the Mouths of the Vessels, that when the Heart is dilated, they are opened; but when it is contracted, they are shut." Here he also clearly and fully explains the Contraction and Dilatation of the Heart.

"Some of the Vessels," continues he, "which terminate in the Heart, send their Contents into it, such as the *Vena Cava* into the Right Ventricle, and the Venous Artery into the Left. Some of them, on the other hand, draw their Contents from it, as the Arteria Aorta from the Left Ventricle, and the Arterious Vein from the Right; but they all have Membranes so fitted and adapted to them, that the Mouths of the intromitting Vessels will not admit of a Return, and the eliminating Vessels will not admit of an Intromission. It happens, that when the Heart is contracting, the Arteries are dilated; and when it is dilating itself, they are contracted; for when the Heart is dilating, it shuts the Orifices of the eliminating Vessels, so that nothing can at that Time flow from the Heart into the Arteries; and when it is contracting, its Contents must flow into the Vessels, because the Membranes are then opened.

He maintains, that the Pulsation of the Heart and Arteries proceeds from an Effervescence of Humours in the Heart; and he treats largely of the Pulse.

Soon after, he has these Words: "The Lungs, therefore, drawing the hot Blood from the Right Ventricle of the Heart by a Vein resembling an Artery, and by *Anastomosis* returning it to the Venous Artery, which goes to the Left Ventricle of the Heart, the fresh Air is in the mean time transmitted thro' the Canals of the *Aspera Arteria*." *Real-dus Columbus* had advanced the same before him.

"The several Phenomena, appearing upon the Dissection of a Subject, correspond excellently with this Circulation of the Blood, from the Right Ventricle of the Heart, thro' the Lungs, to the Left Ventricle."

And a little after he with a great deal of Learning proves, That the Antients had no manner of Reason for giving the Names of *Arteria Venosa*, and *Vena Arteriosa*, to the Vessels which bear these Names, since, in his Opinion, one of them was an Artery, and the other a Vein.

In his fifth Question, where he shews, that the Heat of the Heart is the Principle of Motion in Respiration, he has these Words: "The same hot Blood, which, by dilating the Heart, causes the Pulse, is also, by dilating the Lungs, the Cause of Respiration." The Lungs then being enlarged, the external Air must necessarily rush into the *Aspera Arteria*, which Inspiration is, for that very Reason, call'd Refrigeration; and a Diminution of Bulk happens just as in boiling Liquors, when cold ones are pour'd into them; but when the Lungs collapse, the Air must necessarily be returned, which is call'd Expiration.

In Question the sixth, he endeavours to prove, that no Part, in which there is not Blood, can be capable of Sensation. But tho' in his Opinion there can be no Sensation without a Nerve, yet it is not the Nerve that feels, but the Flesh, or Part in which the Blood is contained.

"The Contrivance of Nature," says he, "in animal Motion, resembles that of Organs, which, by means of the Air communicated to the Pipes, and by touching sometimes one, and sometimes another Key, produce the various Combinations of Sounds intended by the Organist."

In Question the seventeenth of his second Book, he says, that Suffocation in a Quinsey is rather produced by the Repletion of the Jugular Veins, than the shutting up the Mouth of the Larynx; for when the Veins of the Neck are so obstructed, that the Blood and Spirits cannot ascend, they must necessarily regurgitate to the Heart and Lungs; and the Lungs being fill'd, and becoming replete by this means, cannot contract and dilate themselves.

In Page 234. he has these Words: "The Veins become turgid beyond the Ligature, and not betwixt it and the Heart; but it ought to have been otherwise, if the Motion of the Blood and Spirits had been from the Viscera to the several Parts of the Body; for the Passage being obstructed, the progressive Motion of the Blood is stop'd, so that the Veins should have become turgid betwixt the Ligature and the Heart." Let us see whether this Difficulty is solved by what *Aristotle* has said, *Lib. de Somno, Cap. 3.* where he has these Words: "For that which is evaporated must necessarily be impell'd to some Part, and then transform'd and chang'd in the same manner with that Arm of the Sea called *Eurippus*; for that which is warm in every Animal, has a Ten-

VOL. I.

dency to fly upwards: But when much of it is lodg'd at one and the same time in the upper Parts, it then returns, and is carried downwards." Thus far *Aristotle*.

"For the understanding of which Passage we must know, that the Passages of the Heart are so contrived by Nature, that there is an Entry from the Vena Cava to the Right Ventricle of the Heart, from which there is a Passage into the Lungs; and that from the Lungs there is another Passage into the Left Ventricle of the Heart, from which at last there is a Passage into the Arteria Aorta, certain Membranes being fitted to the Mouths of the Vessels to hinder the Return of the Fluids; for thus there is a perpetual Motion from the Vena Cava, thro' the Heart and Lungs, into the Arteria Aorta.

"When we are awake, the Motion of the natural Heat is towards the Surface of the Body, which is the immediate Instrument of Sensation; and since, during Sleep, it is towards the Heart, we may suppose, that, in a waking State, many Spirits, and much Blood, are convey'd into the Arteries, and from thence carried into the Nerves; but that in Sleep this same Warmth returns to the Heart thro' the Veins, and not thro' the Arteries; for there is a natural Passage to the Heart thro' the *Vena Cava*, but not thro' the Artery. A Confirmation of this may be had from the Pulses of the Arteries, which, in waking People, are high, vehement, quick, frequent, and in some Degree vibratory. But in Sleep they are low, languid, slow, and loitering; for, during Sleep, very little of the natural Heat goes into the Arteries, but it rushes into them with greater Violence when we awake; but 'tis quite otherwise with the Veins, which, during Sleep, become turgid, but lessen and become smaller when we are awake, as will appear by taking a View of those in the Hand, in these two different States.

"For the native Heat, during Sleep, passes from the Arteries into the Veins, by a Communication of Orifices, called *Anastomosis*, and from thence to the Heart. But as the Flux of the Blood towards the upper Parts, and its Reflux to the lower, after the manner of *Eurippus*, is manifest both during a State of Sleeping, and Watching; so the Motion of it in any Part of the Body is very sensible, when a Ligature is apply'd, or the Veins are obstructed any other way. For when the Passage is intercepted, those Rivulets swell at the very Part where they were used to flow easily; perhaps the Blood, on such an Occasion, returns to its Source, lest its Motion being intercepted, it should be quite destroy'd."

Tho' *Cæsalpinus* writes, as one would think, very explicitly upon this Matter, yet we will not take upon us to determine positively, that he knew this Affair distinctly. We rather think, with Mr. *Wotton*, "That this Notion had only been occasionally and slightly treated of by *Columbus* and *Cæsalpinus*, who themselves, in all Probability, did not know the Consequences of what they asserted; and therefore it was never applied to other Purposes, either to shew the Uses of the other Viscera, or to explain the Nature of Diseases: Neither, for any thing that appears at this Day, had they made such Numbers of Experiments, as were necessary to explain their Doctrine, and to clear it from Opposition. All this Doctor *Harvey* undertook to do, and with indefatigable Pains traced the visible Veins and Arteries throughout the Body; in their whole Progress from and to the Heart; so as to demonstrate even to the most Incredulous, not only that the Blood circulates thro' the Lungs and Heart, but the very Manner how, and the Time in which, that great Work is performed."

His *Questionum peripateticorum libri Quatuor, Diæmonum Investigatio peripatetica, Quæstionum Medicarum Libri Duo, & de Medicamentorum Facultatibus*, were printed Venetiis 1593: 4to.

This Author dy'd at Rome in 1603.

HIERONYMUS FABRICIUS AB AQUAPENDENTE;

So called from a Town in *Tuscany*, where he was born. He was Pupil to *Gabriel Fallopius*, then Professor of Anatomy at *Padua*, whom he succeeded in that Province, in the Year 1565: and continued in it upwards of fifty Years. He dy'd in 1619. at *Padua*.

In 1574. he first observ'd the Valves of the Veins; of which, it is said, he was inform'd by Father *Paul*; but he was not acquainted with their true Structure, nor their Uses.

He discovered a small Muscle in the internal Ear, which he appropriates to the Malleus.

He affirms, that the Cuticle consists of two Laminæ.

He was also the first who look'd upon the carnosus Coat of the Bladder, as a Muscle concern'd in the Expulsion of the Urine.

Besides these Particulars, he has many others which deserve Attention: And, upon the Whole, he was an accurate Anatomist, and admirable Surgeon.

His Works are, *De Visione, Voce, & Auditu*, Venet. 1600. Fol. *Tractatus de Oculo Visus Organo*, Patavii, 1603. Fol. Francof. 1605. ——— 1613. Fol. *De Venarum ostiis*, Patav. 1603. Fol. *De Locutione & ejus Instrumentis*, ibid. 1603. Fol. *De Musculi Artificio, & Ossium Articulationibus*, Vicentiae, 1614. 4to. *De Respiratione & ejus Instrumentis*, Patavii, 1615. 4to. *De Motu locali Animalium*, Patav. 1618. 4to. *De Gula, Ventriculo, Intestinis Tractatus*, Patavii, 1618. 4to. *Opera Anatomica*, Francof. 1623. Patav. 1625. *Opera omnia Physiologica & Anatomica*, Lipsiae, 1687. Fol. *Opera Anatomica cum Praefatione Albini Lugduni*, Batav. 1738. Fol.

JULIUS CASSERIUS

Was born at *Placentia* in *Italy*, in 1545. He was first Servant, and afterwards Pupil, to *Fabricius ab Aquapendente*; and by dint of Parts and Industry made very great Progress in Anatomy, inasmuch that, in the Opinion of Dr. Douglas, he was a better Dissector than his Master, tho' not so good a Philosopher. He dy'd in 1605. in the sixtieth Year of his Age.

His Works relate principally to the Organs of Voice, and of the Senses, and are illustrated with excellent Figures. Their Titles and Editions are as follows: *Historia Anatomica de Vocis Auditusque Organis*, Ferrariae, 1600. Venetiis, 1607. Fol. *Pentasthesion*, Venet. 1609. Francof. 1609. 1610. 1622. Fol. *Tabula Anatomica*, with what was wanting, supply'd by *Daniel Bucerius*, Venet. 1627. Francofurt. 1632. 4to. Amstelod. 1645. *Tabulae de forma Foetu*, Amstelod. 1645.

JOHANNES PHILIPPUS INGRASSIAS,

A *Sicilian* by Birth, and Professor at *Naples*, flourish'd about the Year 1546.

He claims the Discovery of the Stapes, a small Bone of the internal Ear; and is the first who describes the true Structure of the Os Cribrosum.

His only Anatomical Work is his *Commentaria in Galeni Librum de Ossibus*, printed *Panor.* 1603. Fol. Venet. 1604. Fol.

ANDREAS LARENTIUS

Was Professor of Physic, and Chancellor of the University of *Montpelier*, and Physician to *Henry* the Fourth of *France*. He dy'd in 1619. His Anatomical Works are more remarkable for Elegance of Style, than Correctness, with respect to the Subject; for he is said to have made a great many Mistakes, and to have laid Claim to many important Discoveries, which were however known to preceding Authors. His Errors are said by *Riolanus* to be owing to his trusting to the Reports of others, without examining the Parts himself. His Anatomical Works and Figures are, notwithstanding, in very good Repute, and are esteemed very useful.

His Works are *Hist. Anatom. humani Corporis*, &c. printed *Parif.* 1600. Fol. Francof. 1600. Fol. — 1602. 8vo. 1616. 8vo. — 1627. 8vo. *Opera omnia Anatomica & Medica*, Francof. 1627. Fol. in French, à *Paris*, 1646. Fol. *Opera Anatomica*, &c. *Hanoviae*, 1601. 8vo.

LUDOVICUS SEPTALIUS

Was born at *Milan* in 1550. and dy'd at the same Place in 1630. He describes the Structure of the *Cartilago Ensisformis*, in his Book *de Morbis ex Mucronata Cartilagine evenientibus*, *Mediolani*, 1632. 8vo.

He also publish'd a Book *de Nævis*, printed *Mediolani*, 1606. *Patavii*, 1628. 8vo. *Argent.* 1629. 8vo. *Patavii*, 1651.

PETRUS PAAW.

This Anatomist was born at *Amsterdam*, in 1564. As he had the Advantage of attending the Lectures of *Bontius*, *Heurnius*, and *Rembert Dodonæus* at *Leyden*, of *Duretus*, and *Joh. Faber*, at *Paris*; and of seeing the Dissections of *Fabricius ab Aquapendente* at *Padua*, by this, and his own Industry, he acquired great Knowledge and Reputation in his Profession, inasmuch that in 1589. he was made Professor of Physic at *Leyden*.

His Works are, *Primitiae Anatomicae de humani Corporis Ossibus*, *Lugd. Batav.* 1615. 4to. *Amstelod.* 1633. 4to. *Notæ & Commentarii in Epitomen Andree Vesalii*, *Amstelod.* 1616. ibid. 1633. 4to. *Succenturiatus Anatomicus*, &c. *Lugd. Batav.* 1616. *De Vagula Intestini Epistola Duæ* are extant in the first Century of *Fabricius Hildanus*, printed *Oppenheim.* 1619. His *Anatomicae Observationes Selectiores*, published by *Thomas Bartholine*, are in the third and fourth Centuries of his *Hist. Anatom. & Med. rar.*

BARTHOLOMÆUS CABROLIUS

Was of *Aquitain*. He was Professor of Anatomy at *Montpelier*, about 1570.

His Anatomical Works are, *Alphabetum Anatomicum*, printed *Genevæ*, 1604. 4to. and in French, 1624. 4to. and the Colle-

gium *Anatomicum Clariss. trium Viror. Jassolini, Severini, Cæbrellii*, Francof. 1668. 4to.

GEORGIUS HORSTIUS

Was born in 1575. and in 1606. was made Professor at *Wirttemberg*. He dy'd in 1636. at *Ulm*.

His Anatomical Works are, *Scepsis de Naturali Conservatione & Cruentatione Cadaverum*, *Wittebergæ*, 1607. 8vo. *Libri Duo de Natura humana*, *Wittebergæ*, 1607. 8vo. Francof. 1612. 4to. *Ulmæ*, 1628. 4to. *Norimbergæ*, 1652. 4to. His *Anatome Corporis humani*, *Gressæ*, 1617. Fol. *Exercit. de Natura motus Animalis*, *Gissæ*, 1617.

CASPAR HOFFMAN

Was born at *Saxe Gotha*, in 1572. and practised Physic at *Norimberg* and *Altorf*, about the Year 1600. He died in 1648.

He wrote the following Anatomical Treatises: *De Usu Lienis Secundum Aristotelem Liber singularis*; *De Usu Cerebri secundum Aristotelem Diatriba*, *Lipsiæ*, 1619. 8vo. *Commentarii in Galen. de Usu Partium*, *Lib. 17.* Francof. 1625. Fol. *De Thorace ejusque Partibus Commentarius*, Francof. 1627. Fol. *De Generatione Hominis*, Francof. 1629. Fol. *Notæ perpetuæ in Galen: de Ossibus Librum*, ibid. 1630. *Institutiones Medicæ*, *Lugd.* 1645. *De Partibus Similibus Lib. singularis*, *Francofurt*, 1667. 4to. *Pro Veritate*, *Tract. 3.* *Lutetiæ*, 1647.

JOHANNES RIOLANUS

Was born at *Paris*, in the Year 1577. where he was afterwards Royal Professor of Anatomy and Botany, and first Physician to *Mary of Medicis*, Mother to *Lewis* the XIIIth. He was an exceeding dexterous Anatomist, and elegant Writer; he enriched Anatomy with many useful Discoveries, and appears well versed in the Writings of the Antients.

Amongst other Discoveries, he first took Notice of the *Appendiculæ Pingues* of the Colon, gave Names to the *Hepatic* and *Cystic Ducts* of the Liver; and observed, that the *Ductus Communis* was not furnished with a Valve, but instead of that, with a kind of Rugosity, which in some Degree supplies the Place of one.

With respect to the Hymen, he thinks it is a circular Membrane, placed across the Vagina, with a small Foramen in the Middle; and that by the Laceration of this, the *Carunculae Myrtiformes* are form'd.

He allows of the *Anastomoses* of the *Epigastric* and *Mammary Arteries* in Women, but not in Men.

He has also some Observations, which are new, concerning the Canal of the Cervix Uteri, the Os Hyoides, Tongue, and a Ligament, which is extended from the *Styloide Apophysis*, to the Angle of the lower Jaw.

His Works are *Schola Anatomica*, &c. *Parif.* 1607. 8vo. 1609. *Genev.* 1624. 8vo. *Anatome Corporis humani*, &c. *Parif.* 1610. Fol. *Osteologia*, &c. *Parif.* 1614. 8vo. *Anthropographia*, *Parif.* 1618. 8vo. ibid. 1626. 4to. His *Opera Anatomica*, *Lutetiæ Parif.* 1649. Fol. *Opuscula Anatomica*, *Parif.* 1652. 12mo. *Enchiridion Anatomicum*, &c. *Lugdun. Batav.* 1649. *Parif.* 1658. 8vo. *Jenæ & Lipsiæ*, 1674. 8vo. *Lugdun. Batav.* 1675. 8vo. Francof. 1677. 8vo. and in French, à *Lyon.* 1682. 8vo.

ANDREAS LIBAVIUS.

This Author was Professor of Poetry and History at *Jenæ*, in 1588. and in 1605 Director of the University of *Coburg*. He died in 1616.

His Character is founded on his Chymical Works; but he was the first who described the Method of transfusing the Blood from one Animal to another. See the Article CHYMA.

ÆMILIUS PARISANUS.

This Author treats on many Anatomical Subjects; but, as it is said, with a great deal of Ignorance and Infolence. *Riolanus* speaking of this Author, has the following remarkable Passage: *Cacata hæc Charta annalium Volusianorum fato dignissima, quæ Parisani Fatuitatem declarat, deferatur in Vicum vendentem Thus, & Odores, & Piper, & quicquid Chartis amicitur ineptis.* His Works are, *Nobilium Exercitationum Lib. duodecim*, printed *Venet.* 1623. Fol. *Par & Sanius Judicium de Seminibus à toto Proventu*, &c. *Venet.* 1633. *Altera Paris Nobilium Exercitationum*, *Venet.* 1635. Fol. *Nobilium Exercitationis Pars tertia*, *Venet.* 1638. Fol.

MELCHIOR SERIZIUS.

This Author was born at *Straßburg*, in 1578. and is remarkable for having studied at twenty-seven Universities. He was Professor at *Straßburg*.

His Works are interspersed with many Anatomical Dissertations; they are, *Exercitationes Medicæ*, &c. *Argentorat.* 1624. 1631. 1636. 4to. 1674. 4to. *Dissertationes tres de Respiratione*, *Argentorat.* 1642. 4to. *Disput. 4. de Dentibus*, ibid. 1645. 4to. *Disputat. de Concoctione*, ibid. 1642. 4to. *Disputat. de Facultatibus*,

cultatibus Naturalibus, ibid. 1644. 4to. Disputat. de Sudore, ibid. 1657. 4to. Disputat. de Fame & Siti, ibid. 1655. 4to. Disputat. de Pilis duæ, ibid. 1651. 4to. Prodromi Examinis Vulnerum singularum humani Corporis Partium partes quatuor, Argentorat. 1632. 4to.

ADRIANUS SPIGELIUS.

This Physician was born at *Brussels*, in 1578. He was a celebrated Anatomist, Knight of *St. Mark*, and first Professor of Anatomy and Surgery at *Padua*. His Works are, *De formato Fætu Liber singularis, Patav. 1626. Fol. Francof. 1631. 4to. De humani Corporis Forma Lib. decem, &c. Venet. 1627. 1654. Fol. Francof. 1632. 4to. De incerto Tempore Partus Epistola, 1664. Opera omnia quæ extant, Amstelodam. 1645. Fol.*

ALEXANDER MASSARIAS.

This Physician was born at *Vicenza*, and in 1587 was Professor of Physic at *Padua*; he died in 1598.

He is remarkable for the extravagant Compliment which he paid to the Memory of *Galen*, which was, that *he had rather err with Galen, than be in the right with the Moderns.*

His *Traçtatus de Urinis & Pulsibus*, was published *Francof. 1608. Opera Medica, Lugdun. 1634.*

MATTHIAS LUDOVICUS GLANDORP.

This Author was a Pupil to *Spigelius*, and a celebrated Surgeon of *Bremen*. His Works contain many Anatomical Observations, some of which are illustrated with Figures. His Works are, *Speculum Chirurgorum, Bremæ, 1619. 12mo. Traçtatus de Polypo Narium, Bremæ, 1628. 4to. Gazophylacium Polyplurium Fonticulorum & Setonum reseratum, &c. Bremæ, 1632-1633. 4to.*

PETRUS LAURENBERGIUS

Was Professor of Physic and Philosophy at *Rostoch*. He was; in the Opinion of *Riolanus*, but an indifferent Anatomist. His Works are, *Isagoges Anatomicae Græcæ Interpretatio, Lugd. Batav. 1618. 4to. Procestria Anatomica, Hamburgi, 1619. 4to. Anatomia Corporis humani, Rostochii, 1636. 4to. Francof. 1665. 12mo.*

FABRICIUS BARTHOLETUS.

This Author was born at *Bologna*, in 1588. and was Professor at *Pisa*. He died in 1630.

He wrote an Anatomical Piece, intituled, *Anatomica humani Microcosmi Descriptio, Bononiæ, 1619. Fol.*

JOHANNES REMELINUS

Was of *Ulm*, in *Swabia*. His Work is only remarkable for the Figures; which are contrived in such a manner, that upon lifting up that Part of the Figure, which represents the external Parts; those which are situated underneath are discovered; and upon removing these, others, which lie deeper, appear.

Stephanus Michelspachier engraved these Plates. They were published under the Title of, *A Survey of the Microcosm, or The Anatomies of the Bodies of Men and Women, &c. London, 1702. Fol.* In Latin it appear'd before, in 1613-1614-1615-1619. and in Dutch; 1645.

ROBERT FLUDD.

This Author was of *Salop*. He, in his Youth, followed the Profession of Arms; but was afterwards made Doctor of Physic at *Oxford*, and Fellow of the College of Physicians. He died in 1637.

His Work is intituled, *De Anatomia Triplici; Francof. 1623. Fol.*

RICHARD BANISTER,

An English Surgeon, wrote an Anatomical Description of the Eye, which is extant in the first Part of his Work, intituled, *A worthy Treatise of the Eyes, containing the Knowledge and Cure of 113 Diseases incident unto them and the Eye-lids, printed London, 1622.*

CASPAR ASELLIUS.

This Anatomist was born at *Cremona*, and was Professor of Anatomy at *Pavia*. He is celebrated for being the first, amongst the Moderns, who took Notice of the Lacteal Vessels in the Mesentery, which he describes as conveying the Chyle to a large Gland, situated in the Centre of the Intestines; but this Account, he confesses, is taken from the Appearances in Brute Subjects. He modestly declines the Honour of this Discovery, because he says these Lacteals were known to *Hippocrates, Erasistratus*, and *Galen*. This Discovery was made in 1622.

His Works are, *De Lactibus, seu Lacteis Venis, quarto Vaso- rum Meseraicorum genere novo invento, Dissertatio, cum Figuris elegantissimis, Mediolan. 1627. Basil. 1628. Lugd. Batav. 1640. 4to. 1641. 8vo.* It is also extant with the Works of *Spigelius*, reviv'd by *Vander Linden*, and in *Veslingius*, illustrated by *Blasius*.

WILLIAM HARVEY.

This celebrated Physician was born at *Folkstone* in *Kent*, in the Year 1577. He studied five Years at *Padua*, where he took a Doctor's Degree; afterwards took the same Degree at *Cambridge*; and having been Physician to King *James* and King *Charles* the First, and President of the College of Physicians, he died in 1657, in the Eightieth Year of his Age.

His Discovery of the Circulation of the Blood was of the most Importance to Physic of any that was ever made, and acquir'd him an immortal Name. But as it has been frivolously disputed, whether the Honour of it belongs to him, I shall transcribe a Passage from *Wotton's* Reflections on antient and modern Learning, which sets this Affair in a true Light.

This Discovery, first made perfectly intelligible by Dr. *Harvey*, is of so very great Importance to shew the Communication of all the Humours of the Body with each other, that as soon as Men were perfectly satisfied, that it was not to be contested, which they were in a few Years, a great many put in for the Prize, unwilling that Dr. *Harvey* should go away with all the Glory. *Vander Linden*, who publish'd a most exact Edition of *Hippocrates* in *Holland*, about thirty Years ago, has taken a great deal of Pains to prove, that *Hippocrates* knew the Circulation of the Blood, and that Dr. *Harvey* only reviv'd it. The Substance of what has been said in this Matter, is this: That *Hippocrates* speaks, in one Place, of the usual and constant Motion of the Blood: That, in another Place, he calls the Veins and Arteries the Fountains of Human Nature, the Rivers that water the whole Body, and convey Life; and which, if they be dried up, the Man dies: That, in a third Place, he says, That the Blood-vessels, which are dispersed over the whole Body, give Spirit, Moisture, and Motion, and all spring from one; which one (Blood-vessel) has no Beginning, nor no End; for where there is a Circle, there is no Beginning.

These are the clearest Passages that are produced, to prove that *Hippocrates* knew the Circulation of the Blood; and it is plain from them, that he did believe it as an Hypothesis; that is, in plain English; that he did suppose the Blood to be carried round the Body by a constant accustomed Motion: But that he did not know what this constant accustomed Motion was, and that he had not found that Course, which, in our Age, Dr. *Harvey* first clearly demonstrated, will appear evident from the following Considerations. (1.) He says nothing of the Circulation of the Blood in his Discourse of the Heart, where he anatomizes it as well as he could, and speaks of the Ventricles and the Valves, which are the immediate Instruments by which the Work is done. (2.) He believes, that the Auricles of the Heart are like Bellows, which receive the Air to cool the Heart: Now there are other Uses of them certainly discovered, since they assist the Heart in the Receiving of the Blood from the Vena Cava, and the Vena Pulmonaris. This no Man, that knows how the Blood circulates, can be unacquainted with; and accordingly would have been mention'd by *Hippocrates*, had he understood it. (3.) *Hippocrates* speaks of Veins, as receiving Blood from the Heart, and going from it; which also was the constant way of speaking of *Galen*, and all the Antients. Now no Man, that can express himself properly, will ever say, that any Liquors are carried away from any Cistern, as from a Fountain or Source, through those Canals which, to his Knowledge, convey Liquors to that Cistern. (4.) *Hippocrates* says, the Blood is carried into the Lungs from the Heart, for the Nourishment of the Lungs, without assigning any other Reason. These seem to be positive Arguments, that *Hippocrates* knew nothing of this Matter; and, accordingly, all his Commentators, antient and modern, before Dr. *Harvey*, never interpreted the former Passages of the Circulation of the Blood: Neither would *Vander Linden*, in all Probability, if Dr. *Harvey* had not help'd him to the Notion; which he was then resolv'd to find in *Hippocrates*, whom he supposed to be not the Father only, but the Finisher also, of the whole Medical Art. It is pretended to by none of the Antients, or rather Admirers of them, after *Hippocrates*. As for *Galen*, any Man that reads what he says of the Heart and Lungs, in the sixth Book of his *De Usu Partium*, must own, that he does not discourse as if he were acquainted with modern Discoveries; and therefore it is not so much as pretended, that he knew this recurrent Motion of the Blood: Which also farther shews, that if *Hippocrates* did know it, he explain'd himself so obscurely, that *Galen* could not understand him; who, in all Probability, understood *Hippocrates's* Text as well as any of his Commentators, who have written since the Greek Tongue, and much more since the Ionic Dialect, has ceased to be a living Language.

Since the Antients have no Right to so noble a Discovery, it may be worth while to inquire; to whom of the Moderns the Glory of it is due; for this is also exceedingly contested. The first Step that was made towards it, was, the finding that the whole Mass of the Blood passes through the Lungs, by the Pulmonary Artery and Vein.

The first that I could ever find, who had a distinct Idea of this Matter, was *Michael Servetus*; a Spanish Physician, who

was burnt for Arianism at *Geneva*, near 140 Years ago. Well had it been for the Church of *Christ*, if he had wholly confin'd himself to his own Profession! His Sagacity in this Particular, before so much in the Dark, gives us great Reason to believe, that the World might then have had just Cause to have blessed his Memory. In a Book of his, intituled, *Christianismi Restitutio*, printed in the Year 1553. he clearly asserts, that the Blood passes through the Lungs, from the Right to the Left Ventricle of the Heart, and not through the Partition which divides the two Ventricles, as was at that time commonly believed.

Realdus Columbus, of *Cremona*, was the next that said any thing of it, in his *Anatomy*, printed at *Venice*, 1559. in *Folio*, and at *Paris*, in 1572. in *Octavo*, and afterwards elsewhere. There he asserts the same Circulation through the Lungs, that *Servetus* had done before; but says, that no Man had ever taken Notice of it before him, or had written any thing about it: Which shews, that he did not copy from *Servetus*; unless one should say, that he stole the Notion, without mentioning *Servetus's* Name; which is injurious, since, in these Matters, the same thing may be, and very often is, observed by several Persons, who never acquainted each other with their Discoveries. But *Columbus* is much more particular; for he says, That the Veins lodge the whole Mass of the Blood in the *Vena Cava*, which carries it into the Heart, and so it is thrown into the Left Ventricle; and by the *Aorta* again, when enliven'd by the Air, diffused thro' the whole Body.

Some Years after appear'd *Andreas Cæsalpinus*, who printed his *Peripatetical Questions* at *Venice*, in *Quarto*, in 1571. and afterwards, with his *Medical Questions*, at the same Place, in 1593. He is rather more particular than *Columbus*, especially in examining how Arteries and Veins join at their Extremities; which he supposes to be by opening their Mouths into each other: And he uses the Word *Circulation* in his *Peripatetical Questions*, which had never been used in that Sense before. He also takes Notice, that the Blood swells below the Ligature in Veins, and urges that in Confirmation of his Opinion. Some Hints of this Matter are likewise to be found in *Constantius Varolius*, who printed his *Anatomy* in the Year 1591.

At last *Dr. William Harvey* printed a Discourse on purpose, upon this Subject, at *Frankfort*, in 1628.

This gave him a just Title to the Honour of so noble a Discovery, since what his Predecessors had said before him was not enough understood, to form just Notions from their Words. One may also observe how gradually this Discovery, as all abstruse Truths of human Disquisition, was explained to the World. *Hippocrates* first talked of the usual Motion of the Blood. *Plato* said, That the Heart was the Original of the Veins, and of the Blood, that was carried about every Member of the Body. *Aristotle* also, somewhere, speaks of a recurrent Motion of the Blood. Still all this was only Opinion and Belief: It was rational, and became Men of their Genius; but not having as yet been made evident by Experiments, it might as easily be denied as affirm'd. *Servetus* first saw, that the Blood passes thro' the Lungs; *Columbus* went farther, and shew'd the Uses of the Valves, or Trap-doors of the Heart, which let the Blood in and out of their respective Vessels, but not the self-same Road. Thus the Way was just open when *Dr. Harvey* came, who built upon the first Foundations: To make his Work yet the easier, the Valves of the Veins, which were discover'd by *Father Paul the Venetian*, had not long before been explain'd by *Fabricius ab Aquapendente*; whence the Circulation was yet more clearly demonstrated.

There was one thing still wanting to complete this Theory, and that was, the Knowledge how the Veins received that Blood which the Arteries discharged: First, it was believed that the Mouths of each sort of Vessels join'd into one another: That Opinion was soon laid aside, because it was found, that the Capillary Vessels were so extremely small, that it was impossible, with the naked Eye, to trace them. This put them upon imagining, that the Blood oozes out of the Arteries, and is absorb'd by the Veins, whose small Orifices receive it, as it lies in the Fibres of the Muscles, or in the Parenchyma of the Bowels; which Opinion has been generally received by most Anatomists since *Dr. Harvey's* Time: But *Leeuwenhoek* has lately found in several sorts of Fishes, which were more manageable by his Glasses than other Animals, that Arteries and Veins are really continued Siphons, variously wound round each other towards their Extremities, in numberless Mazes, over all the Body: And others have found what he says to be very true, in a Water-newt; so that this Discovery has passed uncontested. And since it has been constantly found, that Nature follows like Methods in all sorts of Animals, where she uses the same sorts of Instruments, it will always be believed, that the Blood circulates in Men, after the same manner as it does in Eels, Perches, Pikes, Carps, Bats, and some other Creatures, in which *Leeuwenhoek* tried it. Tho' the Ways how it may be visible to the Eye, in human Bodies, have not, that I know of, been yet discovered.

But *Thomas Bartholine* and *Consentinus* have raised up a modern Rival to *Harvey*, for the Honour of the Discovery of the

Circulation, which is the celebrated *Father Paul*. What they relate amounts only to this; that in a Manuscript of *Father Paul's*, which was left in the Hands of *Father Fulgentius* at *Venice*, the Particulars of the true Circulation of the Blood, as publish'd by *Harvey*, are contain'd; and hence they conclude, that he communicated it to *Fabricius ab Aquapendente*, who told it to *Harvey* whilst he was at *Padua*.

But the Truth of the Affair appears to be; that after *Harvey's* Return to *England*, he made a Prefent of his Book, just then publish'd, to the *Venetian* Embassador; who, immediately after going home, lent it to *Father Paul*, whose Curiosity led him to make some Extracts from it, which are contain'd in the Manuscript above-mention'd.

What made this Story the more likely to be true; was *Father Paul's* Sagacity in Anatomical Researches, who first observed the Contraction and Dilatation of the Pupils of the Eye; and is said to have communicated to *Fabricius ab Aquapendente* his Knowledge of the Valves in the Veins.

Besides this Discovery of the Circulation, *Harvey* made several with respect to the Generation of Animals.

His Works are, *Exercitatio Anatomica de Motu Cordis & Sanguinis in Animalibus*, *Frankf.* 1628. 4to. *Lugd. Batav.* 1639. 4to. *ibid.* 1647. *Cum Refutationibus Emiliij Parisiani*, 1647. *Patavii*, 1643. It is likewise in a Book, intituled, *Recentiorum Disceptationes de Motu Cordis, &c.* printed *Lugd. Batav.* 1647. 4to. Then it appeared in *English*, printed at *Rotterdam*, 1671. His *Exercitationes duæ de Circulatione Sanguinis*, *Rotterdam*, 1649. *Epistola ad Joh. Dan. Horstium de Inventis Asellii & Pequeti*, are in the Decad. of *Medical Epistles* of *Joh. Dan. Horstius*.

Exercitationes de Generatione Animalium, *London.* 1651. 4to. *Amstel.* 1651. 1652. 12mo. *Hagæ Comitum*, 1680. 12mo. In *English* at *London*, 1653.

CASPAR BARTHOLINUS.

This Author was a *Dane*, born in 1585. After visiting most of the most famous Universities, and attending the Lectures of the most celebrated Professors, he was made Royal Professor at *Copenhagen*; then turn'd his Studies to Divinity, and died in 1630. in the Forty-fifth Year of his Age. He was Cotemporary with *Harvey*.

His Anatomical Works are in much Esteem, which are his *Anatomica Institutiones*, printed *Albiæ*, 1661. *Argentorati*, 1626. *Rostoch.* 1626. *Goslaræ*, 1632. *Oxoniæ*, 1632. These Institutions were enlarged by *Bartholine* the Son, and publish'd in different Years at different Places. They were publish'd in the German Tongue, *Hafniæ*, 1648. His *Controversiæ Anatomicae*, *Goslaræ*, 1631. His *Enchiridion Physicum*, *Argentiniæ*, 1652.

To *Caspar Bartholine* I shall subjoin his Son and Grandson, tho' not properly belonging to this Place.

THOMAS BARTHOLINUS.

This Physician was the Son of *Caspar Bartholine*, and born at *Copenhagen* in 1616. He was Professor at the Place of his Birth, and enrich'd Anatomy with many useful Discoveries. He claims the Glory of having first observed the Lymphatic Vessels; but the Pretensions of *Olaus Rudbeckius*; and *Dr. Jolliffe*, an *English* Physician, to the same Discovery, render his Title to it doubtful. *Rudbeckius* publish'd his Observations much about the same time as those of *Bartholine* appear'd; and *Dr. Jolliffe* shew'd the same to several of his Friends, but without publishing any thing concerning them. The Discoveries being undoubted, and all three working upon the same Materials, there seems no Reason to deny any of them the Glory of their Inventions. The thing which they found was, that there are innumerable small clear Vessels in many Parts of the Body, chiefly in the lower Belly, which convey a colourless Juice either into the common Receptacle of the Chyle, or else into the Veins, there to mix with the Blood.

He also pretends a Title to the Discovery of the *Thoracic Duct*; but this is also disputed with him by *Van Horne* and *Pequet*.

His Works are *Anatomia ex Caspari Bartholini parentis Institutionibus, &c.* *Lugd. Batav.* 1641. *ibid.* 1645. *ibid.* 1651. *Hagæ Comitum*, 1655. *ibid.* 1660. *ibid.* 1663. *Rotered.* 1669. *ibid.* 1673. *Anatomica Aneurismatis dissecti Historia*, *Panormi*, 1644. *De Lacteis Thoracicis in Homine Brutisq; nuperrime observatis Historia Anatomica*, *Hafniæ*, 1652. *Londoni*, 1652. *Parisiis*, 1653. *Genevæ*, 1654. *Lugd. Batav. & Ultra Trajecti*, 1654. It is also in the *Messis Aurea* of *Siboldus Hempsterhuis*, printed *Heidelbergæ*, 1659. and with his own *Opuscula*, *Hafniæ*, 1670. *Vasa Lymphatica, nuper Hafniæ in Animalibus inventa, & in Homine*, *Hafniæ*, 1653, 1654. *Parisiis*. They are also extant with *Siboldus Hempsterhuis*, *Messis Aurea*, *Heidelbergæ*, 1659. and also with his own *Opuscula*, printed *Hafniæ & Amstelodami*, 1670. *Historia nova Vasorum Lymphaticorum*, publish'd with *Le Clerc* and *Maugelus's Bibliotheca Anatomica*, printed *Genev.* 1685. *Dubia Anatomica*, *Hafniæ*, 1653. *Parisiis*, 1653. *Defensio Vasorum Lactearum, &c.* *Hafniæ*, 1655. and with

with his *Opuscula Anatomica*, 1670. *Historiarum Anatomicarum Centuria prima & secunda*, Hafniae, 1654. *Historiarum Anatomicarum Centuria tertia & quarta*, ibid. 1657. *Historiarum Anatomicarum Cent. quinta & sexta*, Hafniae, 1661. *Vindiciae Anatomicae*, Hafniae, 1648. *Opuscula nova Anatomica*, Hafniae & Amstelod. 1670. *Observationes Anatomicae Petri Pavi*, printed in his third and fourth Centuries of his own Observations, Hafniae, 1657. *Collegium Anatomicum*, Hafniae, 1651. *Specilegium primum ex Vasis Lymphaticis*, Hafniae, 1655. 1658. *Reflectionum*, 1660. Amstelodami, 1661. Also with his *Opuscula*, printed Hafniae, 1670. *Specilegium secundum ex Vasis Lymphaticis*, Amstelod. 1660. *Specilegia bina ex Vasis Lymphaticis*, Amstelodami, 1661. And with his own *Opuscula nova Anatomica*, Hafniae, 1678. *Dissertatio Anatomica de Hepate defuncto*, Hafniae, 1661. And with his *Opuscula Anatomica nova*, Hafniae, 1670. *Responsio de Experimentis Anatomicis Bilsianis*, &c. Hafniae, 1661. Amstelodami, 1661. And with his *Opuscula nova Anatomica*, Hafniae, 1670. *De Hepatis exautorati Causa desperata*, Hafniae, 1666. And with his *Opuscula Anatomica nova*, Hafniae, 1670. *De Cerebri substantia pingui*, &c. Hafniae, 1669. *De Anatome Practica ex Cadaveribus morbofis adornanda Consilium*, &c. Hafniae, 1674. *De Pulmonum Substantia & motu Diatribe*, Hafniae, 1663. Lugd. Batavor. 1672.----- Vander Linden, p. 1003.

He left two Sons, *Caspar* and *Thomas*; the former of whom published many of his Father's Works. He also wrote upon the Ovaries of Women, Generation, and the Structure of the Diaphragm; and is said to have first discovered the inferior and lesser Salivary Ducts. He farther speaks of a new Method of preparing the Viscera for Anatomical Uses.

His Anatomical Works are, *De Ovarii Mulierum*, &c. Romae, 1677. Amstelodami, 1678. Norimbergae, 1679. *Epistola de Nervorum Usu in Musculorum Motu*, Parisiis, 1676. *Diaphragmatis Structura nova*, Parisiis, 1676. *Administratio-nem Anatomicarum Specimen*, publish'd with *Michaelis Lyseri Cultrum Anatomicum*, Francofurti, 1679. *Exercitationes Miscellaneae*, 1675. There are likewise several of his Anatomical Pieces printed in the *Acta Hafniensia*.

From the Time of the great *Harvey*, there have been such a Multitude of Anatomical Writers, that a particular Detail of them would of itself require a Volume. I shall therefore only give an alphabetical Catalogue of the principal, and take some Notice of their Discoveries, when of any Importance. I must, however, remark, that it would have been fortunate for Anatomy, and Students in this Science, if Authors could have contented themselves with publishing their own Discoveries, and animadverting upon the Errors of others: But, instead of doing this, many have thought, that a Discovery, sometimes trifling enough, or a Professor's Chair, have intitled them to write an entire System; thus making it necessary to search large Volumes for Discoveries, which a few Pages were sufficient to contain.

ALBINUS,

A Professor at *Leyden*, has published some Anatomical Pieces, which are in much Esteem; and the World is in Expectation of more from the same Hand. His Works which have come to my Knowledge, are as follows:

Historia Musculorum Hominis, Lugdun. Batav. 1734. 4to.
Icones Offium Foetus humani; accedit Osteogeniae brevis Historia, Lugdun. Batav. 1737. 4to.
Tabulae Anatomicae, Lugdun. Batav. 1741. Fol.
The last is not yet completed.

BELLINI (LAURENTIUS).

His Anatomical Works are,

De Structura Renum.

Gustus Organum novissime detectum.

Of both which there have been several Editions. I have seen one printed Lugduni Bat. 1711.

BERGERUS (JOHANNES GODOFREDUS).

He was of *Hall* in *Saxony*, but Professor of Physic at *Wirttemberg*.

His principal Anatomical Piece is an Epistle concerning the Division of the Aorta, principally with respect to its ascending Branches.

BESLERUS (MICHAEL RUPERTUS).

He was of *Nuremberg*, born 1607. died 1661. according to *Goellicke*. His Anatomical Works are,

Admiranda Fabrica humanae Mulieris partium Generationi potissimum inservientium, & Foetus, fidelis, quinque Tabulis, ad magnitudinem naturalem & genuinam, typis aeneis impressis, hactenus nunquam visa, Delineatio. Noribergae, apud *Jeremiam Dumlery*, 1640. in Fol.

Observatio Anatomico-medica singularis cujusdam, Calendar. Januar. 1644. tres filios naturalis magnitudinis viventes, enixa. Puerpera vero retentis secundinis extremum quasi balitum spirabat, intra aliquot horarum spatium, dextra divinitus adminiculante, summa cum adstantium admiratione & stupore, feliciter evasit. Noribergae, 1644. in 4to.

BIDLOO (GOTTOFREDUS).

He was Professor, at *Leyden*, of Surgery and Anatomy. He publish'd a hundred and five magnificent Figures of different Parts of the Body, Amstelodam. 1685. in a very large Folio, some of which are said not to be according to the Life. Cowper corrected these.

Opera omnia Anatomico-Chirurgica edita & inedita, Lugdun. Batav. 1715.

His *Exercitationum Anatomico-Chirurgicarum Decas* was printed Lugdun. Bat. 1704.

BLANCARDUS (STEPHANUS)

Publish'd some Anatomical Pieces, which are said to be very indifferent Compilations.

BLASIUS (GERHARDUS)

Publish'd several Anatomical Treatises, as, *Commentarius in Syntagma Anatomicum Johannis Veslingii, cum Figuris*, Amstelodam. 1659. 4to.

This was reprinted at the same Place, 1666. 4to. This Edition is said to be the best.

De Renibus monstrosis, published with *Bellini Exercitatio Anatomica de Struct. Renum*, 1665. 12mo.

Anatome contracta, Amstelodam. 1666. 12mo.

Anatome Medullae Spinalis, & Nervorum inde provenientium, Amstelod. apud *Casparum Commelinum*, 1666. in 12mo.

Observata Anatomica in Homine, Simia, Equo, Vitulo, Testudine, Echino, Glire, Serpente, Ardea, variisque Animalibus aliis. Accedunt extraordinaria in Homine reperta, Praxin Medicam aequae ac Anatomen illustrantia, Lugd. Batav. & Amstelod. apud *Gaasbeeck*, 1674. in 8vo.

Zootomia seu Anatomies variorum Animalium pars prima, Amstelod. apud *Abrahamum Wolffgang*, 1676. in 8vo.

Anatome Animalium Terrestrium variorum, Volatilium, Aquatilium, Serpentum, Insectorum, Ovorumq; Structuram naturalem, ex Veterum, Recentiorum, propriisq; observationibus proponens, Figuris variis illustrata, Amstelod. apud *Viduum Johannis a Someren*, 1681. in 4to.

BOHNIIUS; (JOHANNES)

Professor of Anatomy at *Leipsic*. Several Anatomical Observations are dispersed in his Works, the principal of which are relative to the Biliary Ducts, and Bile.

BONETUS (THEOPHILUS)

Collected with immense Labour, and publish'd, a prodigious Number of Dissections, which had been made upon Bodies which died of Distempers, or Casualties, thereby excellently explaining the immediate Causes of Diseases and Death. This Work is, perhaps, the most valuable Piece which the Moderns have produced, and the best adapted to render a Physician perfectly acquainted with the Indispositions of the human Body.

No Physician should be a Day without consulting this Author.

His large Work, intituled, *Sepulchretum sive Anatomia Practica*, was first published in two Volumes, Geneva, 1679. Fol.

Mangetus published another Edition, with considerable Additions, in three Volumes, Lugd. 1700.

There is also another Piece on the same Subject, intituled, *Prodromus Anatomiae practicae, sive de abditis Morborum Causis, ex Cadaverum Dissectione revelatis, Libri primi Pars prima, de Doloribus capitis, ex illius apertione manifestis*, Geneva, apud *Franciscum Miege*, 1675. in 8vo.

BONTIUS (JACOBUS)

Publish'd some Anatomical Observations, which are extant, amongst other Treatises, in his *Medicina Indorum*, Lugd. Batav. 1642. 12mo. Amstelodam. 1658. 12mo.

They are also amongst his *Opuscula varia*, Amstelodam. 1658. Fol.

These are also printed with *Prosper Alpinus's Medicina Aegyptiorum*, Parisiis, 1646. 4to. and Lugd. Bat. 1719. 4to.

BORELLUS (ALPHONSUS)

Gave a Mechanical Account of the Motion of Animals, drawn from the Structure of the Parts. As he had the Advantages of Dr. *Lower's* Discoveries, with respect to the Order of the muscular Fibres of the Heart, he was enabled to give a Solution of all the Appearances of the Motion of the Heart, and of the Blood in the Arteries, upon Mathematical and Mechanical Principles. His Anatomical Works are,

De Renum Usu Judicium, publish'd with *Bellini de Structura Renum*, Argentorati, 1664. 8vo.

De Motu Animalium, publish'd in the *Bibliotheca Anatomica* of *Manget* and *Le Clerc*.

BRIGGS (WILLIAM)

Wrote an accurate Description of the Eye, with the Method of dissecting it, intituled, *Ophthalmographia*, Cambridge, 1675. 8vo. This is also extant in *Mangetus's Bibliotheca Anatomica*.

From the Structure of the Eye he form'd a Theory of Vision, which is extant in the *Acta Eruditorum*, 1683.

He discover'd, that in the *Tunica Retiformis*, which is contiguous to the vitreous Humour, the Filaments of the Optic Nerve there expanded lie in a most exact and regular Order, all parallel one to another; which, when they are united afterwards in the Nerve, are not shuffled confusedly together, but still preserve the same Order till they come to the Brain. The crystalline Humour had already been discover'd to be of a double convex Figure, made of two unequal Segments of Spheres, and not perfectly spherical, as the Antients thought: So that this farther Discovery made by Dr. Briggs, shews evidently, why all the Parts of the Image are so distinctly carried to the Brain, since every Ray strikes upon a separate Filament of the Optic Nerve; and all those Strings so struck are moved equally at the same time.

He also describes the Ducts which convey Moisture to the Eyes, from the Glands in the Corners thereof, for the Convenience of their Motion in the Orbit.

BROWN, (JOHN)

A Surgeon of Saint Thomas's Hospital, wrote an Epistle concerning the glandulous Substance of the Liver.

BRUNNERUS (JOHANNES CONRADUS)

Wrote about the Pancreas, Intestinal Glands, and the Lymph. His Work is intituled, *Experimenta nova circa Pancreas*, Amstelodami, 1683. 8vo.

CASSEBOHM (JOAN. FREDERICUS)

Wrote an Anatomical Work, under the following Title: *Tractatus quatuor Anatomici de Aure humana, tribus Figurarum Tabulis illustrati, Auctore Joan. Frid. Cassebohm, Halee Magd.* 1734. in 4to.

CHARLTON (WALTER)

Publisch'd some Anatomical Works:

Exercitationes Physico-Anatomicæ, sive Oeconomia Animalis, novis in Medicina Hypothesibus superstructa, & Mechanicè explicata, Londini, apud R. Danielis, & J. Redmannum, 1659. in 12mo. Amstelodami, apud Joh. Ravensteyn, 1659. in 12mo. Lugduni Batavorum, apud Petrum de Graaf, 1678. in 12mo. Hagæ Comitis, apud Arnoldum Leers, 1681. in 12mo.

Exercitationes Pathologicæ, in quibus Morborum penè omnium Natura, Generatio, & Causæ ex novis Anatomicorum inventis sedulo inquiruntur, Londini, apud Thomam Newcomb, 1661. in 4to.

Onomasticon Zoinon plerorumque Animalium Differentias & Nomina propria pluribus Linguis exponens. Cui accedunt Mantissa Anatomica, & quedam de variis Fossilium Generibus. Londini, apud Jacobum Allestry, 1668. in 4to. Ibidem apud eundem, 1671. in 4to. Oxonii, 1673. in Fol. min.

CHESELDEN (WILLIAM)

Publisch'd the ANATOMY OF THE HUMAN BODY, of which there have been five Editions, the last of which was printed at London, 1740. This Work is interspersed with many curious Chirurgical Observations; and is illustrated with forty accurate Copper-plates.

He also lately publish'd an Osteology, with magnificent Figures. In this there is an accurate Account of the Diseases of the Bones.

LE CLERC, (DANIEL)

Together with Mangetus, publish'd the *Bibliotheca Anatomica*, which is a Collection of Anatomical Authors. See MANGETUS.

COWPER (WILLIAM)

Publisch'd Bidloo's Anatomical Figures, with many Additions and Improvements.

This has lately been reprinted in Holland, under the Direction of Albinus.

He wrote also excellently on the Muscles. His Works are interspersed with many curious Chirurgical Observations.

This Author is said to be the first who gave a Figure of the Thoracic Duct, as it is found in human Subjects; whereas preceding Anatomists delineated it from Brutes.

He also discover'd certain Glands in the Urethra, which have been since called *Glandule Cowperi*; but Cheselden disputes their Existence.

DEUSINGIUS (ANTONIUS)

Was Author of a great many Books; an Account of which may be seen in *Vander Linden*. Some of these were Anatomical; but I don't know that he made any particular Discoveries.

DIEMERBROECK (ISBRANDUS de)

Was Professor of Anatomy at Utrecht. Goelicke blames him for not publishing his Discoveries separately, instead of writing a

whole Body of Anatomy; a Fault common to him, with a Multitude of other Writers. He also accuses him of making tedious Digressions, sometimes not much to the Purpose; and he farther says, his Discoveries are not always to be depended upon, some of them being rather the Offspring of Imagination, than the Result of Experience. His Figures are not remarkably exact, for which he blames his Engraver in his Preface.

His Works are, *De Peste Libri quatuor*, Arenaci, 1646. Amstelodami, 1665. *Disputationum Practicarum Pars prima & secunda de Morbis Capitis & Thoracis, Trajecti ad Rhenum*, 1664. *Anatome Corporis humani, &c. Ultrajecti*, 1672. Geneva, 1679. Lugduni, 1679. These two last-mention'd Editions are vastly more correct than the others, and adorned with far correcter Plates.

DIONIS.

He was Demonstrator of Anatomy at the Royal Garden at Paris, where he had great Opportunities of dissecting Bodies. He publish'd a Book on the Subject of Anatomy, which is in pretty good Esteem, and of which there have been many Editions.

Dionis has had an Honour done him, which very few European Authors have attain'd to, which is to have his Anatomy translated into the Tartar Language, now used at the Court of China. This was done by Father Parenni, a Jesuit Missionary, at the Command of Cam-Hi, Emperor of China, who died in 1722. But this was a Compliment paid Dionis by his Countryman, the Translator, and not by the Emperor; for Parenni's Instructions were to translate the best European System of Anatomy.

DOUGLAS (JAMES).

This Gentleman was very eminent in the Practice of Midwifry, and an accurate Anatomist. His Memory is too fresh to make any farther Account of him necessary. His principal Anatomical Works are,

Bibliographia Anatomica Specimen, which was first printed at London, and afterwards, with Additions, at Leyden, by Albinus, 1734. Octavo.

Myographia comparata Specimen, London, 1707. In this Book, the Author remarks the Differences betwixt the Muscles in Men and in Dogs.

This was translated into Latin, and printed at Leyden, 1729.

A Description of the Peritonæum, London, 1730. Dr. Freind, in the first Volume of his History of Physic, speaking of the Operation for a Hernia, says, that to form a right Notion of the Distention to which the Peritonæum is subject, one ought to see the curious Preparations of that diligent and accurate Anatomist, Dr. Douglas, who is the first that has given us any true Idea of the Peritonæum; a Part which is much concerned, and whose Structure should be so much consider'd, not only in this Operation, but in the High Way for cutting for the Stone. He too is the first, who has plainly shewn, that the Elongation of the external Lamella of the Peritonæum does not form the vaginal Coat of the Testicles, as Authors say, but a Coat peculiar to the seminal Vessels, which he very properly calls *Tunica Vasorum Spermaticorum propria*. And he afterwards observed, in reading Paulus, that this Coat was known to, and described by him, by the Name of *ἐλκυστήρ*, from the many Contortions there are in those Vessels which it covers.

DRAKE, (JAMES)

An English Physician. His Work is intituled *Anthropologia nova, or, A New System of Anatomy*, of which I have seen two Editions. A great deal of the first Edition is left out in that of 1717. He had some very singular Notions with respect to the Bile, and the Catamenia.

DRELINCOURT, (CHARLES)

A Frenchman, was a celebrated Professor of Anatomy at Leyden, and wrote very well on many Anatomical Subjects. His Works, principally relating to Anatomy, are,

De Partu Oestimestri vivaci Diatriba, L. Bat. 1653. 12mo.

Preludium Anatomicum, 1672. 1680.

Both these are amongst his *Opuscula*, L. Bat. 1680. 12mo.

Idem, Hagæ, 1727.

De humani Fetus Membranis Hypomnemata, Lugd. Bat. 1685. 12mo.

Experimenta Anatomica ex Vivorum Sectionibus petita, Lugd. Bat. 1681. 1682. 12mo.

This Treatise is in Manget's *Bibliotheca Anatomica*; as also some Pieces of the same Author, intituled *De Conceptu*; *De Semine Virili*; *item, De Semine Muliebri*, Ovis, Utero, Tubis Uteri; *cum Corollariis de humano Fœtu*.

He was Author of many other Medicinal Pieces.

DUPRE.

Goelicke mentions this Author, and informs us, that he published a Description of five Pair of Muscles, which are concerned in moving the Head in different Directions, and which are inserted into the first and second Vertebra of the Neck.

He,

He, according to the same Author, described two Ligaments, which connect the Head either to the first or second Vertebra of the Neck.

ENT (GEORGE)

Was an *English* Physician, and President of the College of Physicians. He wrote an Apology for the Circulation of the Blood, in Answer to *Emilius Parisanus*: This was printed at London, 1641. 8vo.

He also published Animadversions on *Malachias Thurston's* Treatise of the Uses of Respiration, London, 1678, 8vo.

This Treatise is in the *Bibliotheca Anatomica* of *le Clerc* and *Mangel*.

EUSTACHIUS.

His *Opuscula Anatomica* was printed Delphis, 1726. 8vo.

FRANCUS, (GEORGIUS FREDERICUS DE FRANKENEAU)

A Dane, wrote a Treatise on the Nails. *Goelicke*.

GARENGEOT (JAQUES CROISSANT DE)

Wrote an Anatomical Piece under the following Title, which was printed at Paris, 1728. 12mo.

Miotomie humaine, & canine, ou la Maniere de dissequer les Muscles de l'Homme, & des Chiens; suivie d'une Miologie ou Histoire abrégée des Muscles.

GIBSON (THOMAS)

Wrote a Compendium of Anatomy, which is said to have nothing in it new; but to consist entirely of Collections from others. He was an *English* Physician, and Fellow of the College.

GLISSON (FRANCIS)

Was an *English* Physician, Professor of Physic at Cambridge, and Fellow of the College of Physicians. His principal Discovery was the Duct which conveys the Bile from the Liver to the Gall-bladder. His Works are,

Anatomia Hepatis, cui præmittuntur quædam ad rem Anatomicam universè spectantia, Londini, apud Oëtav. Pullen. 1654. in 8vo. *Amstelodami*, apud Johan. Ravensteyn, 1659. in 12mo. *Ibid.* apud Joh. Janssonium à Wasberge & Elizeum Weyerstraten, 1665. in 12mo.

At the End of this there is a Treatise on the Lymph.

Tractatus de Rachitide, seu Morbo Puerili, Rickets dicto, Londini, apud Sadlerum, 1650. in 8vo. *Ibid.* 1660. in 12mo. *Lugduni Batavorum*, 1671. in 8vo. *Hagæ Comitum*, apud Arnoldum Lees, 1682. in 12mo.

Tractatus de Natura Substantiæ Energeticæ, seu de Vita Naturæ, ejusque tribus primis Facultatibus: I. Perceptivâ. II. Appetitivâ; & III. Motivâ, Naturalibus, &c. Londini, apud H. Brome & N. Hooke, 1672. in 4to.

Tractatus de Ventriculo & Intestinis; cui præmittitur alius, de partibus continentibus in genere; & in specie, de iis Abdominis. *Ibid.* apud eundem 1677. in 4to. *Amstelodami*, apud Jacobum Junorem, 1676. in 12mo.

The *Anatomia Hepatis*, and *Tractatus de Ventriculo*, are in *le Clerc's* and *Mangel's Bibliotheca Anatomica*.

GOELICKE (ANDREAS OTTOMARUS)

Wrote an History of Anatomy, under the Title of *Historia Anatomica nova æque ac antiqua*, Hagæ Magdeburgicæ, 1713. 8vo.

GRAAF (REGNERUS DE)

A Physician of Delft in Holland. He published the following Anatomical Pieces.

Disputatio Medica, de Natura & Usu Succî Pancreatici, Lugd. Batav. ex Officina Hackiana, 1664. in 12mo. *Tractatus Anatomico-Medicus, de Succî Pancreatici Natura & Usu. Accessit Epistola, de Partibus Genitalibus Mulierum.* *Lugduni Batavorum*, 1671. in 8vo.

This Treatise is in the *Bibliotheca Anatomica*.

De Virorum Organis Generationi inservientibus: de Clysteribus: de Usu Siphonis in Anatomia. *Lugd. Batav. & Roterdami, ex Officina Hackiana*, 1668. in 8vo. *Ibidem*, 1670. in 8vo. *Ibid.* 1672. in 8vo.

This is also in the *Bibliotheca Anatomica*.

Epistola de nonnullis circa Partes Genitales Inventis novis, *Lugd. Bat.* 1668. in 12mo.

De Mulierum Organis Generationi inservientibus, Tractatus novus, demonstrans, tam Homines & Animalia cætera omnia, quæ Vivipara dicuntur, haud minus, quam Ovipara, ab Ovo originem ducere. *Ibidem ex Officina eadem*, 1672. in 8vo.

This is also in the *Bibliotheca Anatomica*.

Defensio Partium Genitalium. *Lugd. Bat.* 1673. in 8vo.

This is also in the *Bibliotheca Anatomica*.

Opera omnia, Lugduni Batavorum ex Officina Hackiana, 1677. in 8vo.

Two Dissertations also of this Author are extant in the *German Ephemerides*; one on the Indications of the carotid Arteries; the other on a monstrous Uterus.

Many new Things concerning the respective Subjects he treats of, are contained in the Works of this Author; but he is charged with borrowing them from *Van Horne*, whose Pupil he was. 'Tis, however, remarkable, that his invention of a Syringe gave Birth to all the Discoveries in Anatomy which have, since his Time, been made by means of Injections.

GRASECCIUS, (GEORGIUS)

Of *Strasbourg*, publish'd an Anatomical Work under the following Title:

Μεγεθυνοποιον θηρεον. In quo Fabrica humani Corporis Musculum representantis, affabre demonstratur, una cum Icone Musculi Homini dissecti seorsum expressa. *Argentorati, apud Johan. Caralem*, 1605. in 8vo.

GREW (NEHEMIAH)

Wrote a comparative Anatomy of the Stomach and Intestines, which is, I think, published at the End of his *Catalogue of Rarities, &c.*

He also wrote many Treatises on the Anatomy of Vegetables.

HALLER (ALBERTUS)

Wrote a Treatise, intitled, *De Musculis Diaphragmatis Dissertatio Anatomica*, Bernæ, 1733. 4to.

HAVERS, (CLOPTON)

An *English* Physician. He wrote admirably well on the Bones, and made some considerable Discoveries with respect to the Periosteum, and the Marrow. He discovered, in every Joint, particular Glands, out of which issues a mucilaginous Substance, whose Nature he examined by numerous Experiments, which, with the Marrow supplied by the Bones, always serves to oil the Wheels, that to our Joints and Muscles might answer those Ends of Motion, for which Nature designed them. This was a very useful Discovery, since it has made abundance of Things, that were obscure in that Part of Anatomy, plain, and easy to be understood: And, among other things, it shews the Use of that excellent Oil which is contained in our Bones, and there separated, by proper Strainers, from the Mass of the Blood; especially, since, by a nice Examination of the true inward Texture of all the Bones and Cartilages of the Body, he shew'd how this Oil is communicated to the Mucilage, and so united, as to perform their Office.

Novæ quædam Observationes de Ossibus, *Lugd. Batav.* 1734. 8vo.

HEISTER, (LAURENTIUS)

A celebrated Professor at *Helmstädt*, published a very valuable Piece of Anatomy, intitled, *Compendium Anatomicum, Veterum, Recentiorumque Observationes brevissimè complectens.* *Altorfii*, 1717. 4to.

Altorfii & Norinbergæ, 1719. 1727. and 1732.

An *English* Translation of this Book was published at London, 1721.

HEMSTERHUYTS (SYBOLDUS)

Published some Anatomical Collections under the following Title:

Messis aurea, seu Collectanea Anatomica, continentia trium Præstantissimorum Anatomicorum Opuscula: 1. Joh. Pecqueti Experimenta nova Anatomica. 2. Thomæ Bartholini de Latæti Thoracis Historiam Anatomicam, cum ejusdem, de iisdem Dubiis: & Vasorum Lymphaticorum Historiam novam. 3. Olai Rudbeck, Duct. Hepaticos aquosos: Vasa Glandularum Serosa: Observationes: Epistolæ Variorum: Ejusdem de Vasis Lymphaticis Tabulas 13. æri incisæ, Lugduni Batavorum, 1654. in 12mo. *Heidelbergæ, Typis Adriani Wyngaerden*, 1659. in 8vo.

HIGHMORE (NATHANAEL)

Published an Anatomical Work under the Title of, *Corporis humani Disquisitio Anatomica, &c.* *Hagæ Comitum*, 1651. Fol.

The large Cavity of the upper Jaw is called from him, *Antrum Highmorianum*; but he is not the first Describer of it; for *Casseri* takes Notice of it under the Name of *Antrum Genæ*.

HOBOKEN, (NICOLAUS)

A French Author, publish'd, according to *Goelicke*, a Treatise on the Method of dissecting, in French. His other Anatomical Works are, *Anatomia Secundinæ humanæ, quindecim Figuris ad vivum propriâ Auctoris manu delineatis illustrata, Cum annexo Spicilegio Epistolarum, rem potissimum generatorem referentium. Trajecti ad Rhenum, apud Johan. Ribbium*, 1669. in 8vo. *Ibidem*, 1672. in 8vo.

Cognitio Physiologica Medica, accuratissima & clarissima Methodo tradita. Ultrajecti apud Henric. Verstergh, 1670. in 4to. *Ibidem apud Johannem Van de Water*, 1685. in 4to.

Anatom.

A N A

Anatomica Secundinae humanae repetita, aucta, roborata, & quadraginta quatuor Figuris, propria Auctoris manu delineatis; insuper illustrata: quae praeter novissimè observatam Naturam ac Constitutionem universae Secundinae illius, ac partium singularum usum quoque & utilitatem docet. Praemittuntur Literae D. Henrici Euffonii cum Auctoris Responsionibus. Ibid. apud Joh. Ribbium, 1675. in 8vo.

Anatomia Secundinae Vitulinae; triginta octo Figuris, propria Auctoris manu delineatis, illustrata: Ultrajecti, apud Johan. Ribbium, 1675. in 8vo.

HOFFMAN, (JOHANNES MAURITIUS)

Professor of Physic in the University of Altorff, published an Anatomical Work under the Title of,

Dissertationes Anatomico-Physiologicae: ad Viri Clarissimi, Johannis Van Horne, in Universitate Lugduno Batav. Profess. quondam Meritissimi, Microcosmum, Annotatae, Observationibus & Experimentis Anatomicis recentioribus variis illustratae. Altorffii, apud Henricum Meyerum, 1680. in 4to.

HORNE (JOHANNES VAN)

Was Professor of Anatomy at Leyden. His Anatomical Pieces bear a very good Character. He has the Reputation of having discovered the Thoracic Duct, and is said to be the first who was acquainted with the true Structure of the Testicles. He also gave the Name of Ovaria to what was before called the Testes of Females. De Graaf is said to be much obliged to him for the Discoveries he has published with respect to the Parts of Generation. His Works are,

Novus Ductus Chyliferus, nunc primum delineatus, descriptus, & Eruditorum Examine expositus, Lugduni Batav. apud Franc. Hackium, 1652. in 4to.

Μικροκομος, seu brevis Manuductio ad Historiam Corporis humani: in Gratiam Discipulorum edita, Lugduni Batavorum, apud Jac. Chovet, 1660. in 12mo. Ibidem, apud eundem, 1662. in 12mo. Ibidem, apud eundem, 1663. in 12mo. Lipsiae apud Johannem Fritschium, 1675. in 12mo.

Leonhardi Botalli Opera omnia, Lugduni Batav. apud Daniel. & Abrah. à Gaasbeeck, 1660. in 8vo.

Prodromus Observationum suarum circa Partes Genitales in utroque sexu, Lugd. Batav. 1668. in 12mo.

Observationes Anatomico-Medicae, Amstelodami, apud Abrah. Wolffgang, 1674. in 12mo.

HORSTIUS, (JOHANNES DANIEL)

Professor at Marburg, was Author of the following Anatomical Pieces:

Decas Observationum & Epistolarum Anatomicarum, quibus singularia scitu digna, Laclearum nempe Thoracicarum & Vasorum Lymphaticarum natura, Embryonisque per os nutritio, atque alia rariora exponuntur. Francof. apud Wilhelmum Serlinum & Georg. Fickwirthum, 1656. in 4to.

Anatome Corporis humani, Tabulis comprehensa. Marburgi, apud Chemlinum, 1639. in 4to.

HOFIUS (JACOBUS)

Advances, that the Humours of the Eye are perpetually wasting, and as perpetually replenished by the Vessels which terminate in the Eye. That the aqueous Humour may waste, and be restored, is certain; but it is not evident, that the other Humours of the Eye are in the same State; though indeed it should seem necessary for the maintaining their perpetual Transparency and Lustre. I have only seen one Edition of his Book, which is intituled, *Tractatus de circulari Humorum Motu in Oculis, Lugduni Batavorum, 1740. 8vo. cum Figuris.*

KEILL (JAMES)

Was a Native of Scotland; he read Lectures in Anatomy at Oxford, and afterwards practised Physic with great Reputation at Northampton, where he died of a Cancer in his Mouth, much regretted.

His *Anatomy of the human Body abridged* is deservedly in great Esteem, of which there have been a great many Editions printed at London. He wrote also some other Treatises relating to Physic.

KERKRINGIUS (JOHANNES THEODORUS)

Wrote the following Anatomical Pieces:

Specilegium Anatomicum, continens Observationum Anatomicarum rariorum Centuriam unam: necnon Osteogeniam Foetuum, in quo, quid cuique officulo singulis accedat mensibus, quidque decedat, & in eo per varia immutetur tempora, accuratissime oculis subjicitur. Amstelodami, apud Andr. Frisium, 1670. in 4to. Ibid. 1673. in 4to.

Antropogeniae Ichnographia, sive Conformatio Foetus ab Ovo usque ad Ossificationis principia, in Supplementum Osteogeniae Foetuum, cum Figuris. Ibidem, apud Andr. Frisium, 1670. in 4to.

This is in the *Bibliotheca Anatomica.*

A N A

His *Osteogenia Foetuum* is also in the *Bibliotheca Anatomica.*

KULMUS (JO. ADAMAS)

Published an Anatomical Work, intituled, *Tabulae Anatomicae, in quibus Corporis humani, omniumque ejus Partium Structura & Usus brevissime explicantur, &c. Amstelod. 1732. and in French, ibid. 1734. 8vo.*

LANCISI (J. MARIA)

Wrote a Treatise *De Motu Cordis & Aneurismatibus*, which was printed at Rome, and afterwards at Leyden, 1740.

Lancisii Opera omnia, Genev. 1718.

He also published Eustachius's Tables.

LEALIS (LEAL)

In an Epistle to *Dominicus de Marchettis*, has several Discoveries relating to the Spermatic Arteries and Veins, and to the Structure of the Vesiculae Seminales.

LEEUWENHOEK (ANTONY VAN)

Has obliged the World with a great many Discoveries relative to Anatomy, particularly by means of his Microscopes. It is not possible to give the Particulars of them, unless I was to transcribe his Works. Many detached Pieces of this Author's were published at different times; but his entire Works were printed *Lugd. Batav. 1722.*

This Author has made evident the Anastomoses of the Arteries with the Veins, and discovered a prodigious Number of Animalcula in the Sperm of Male Animals; but the System of Generation, hence deduced, has the Appearance of being utterly false, as is shewn under the proper Article.

LISTER, (MARTIN)

In an Epistle to *Henry Oldenburgh*, has some Particularities relating to the Intestinum Cœcum.

LOWER (RICHARD)

Wrote an excellent Treatise on the Heart, wherein he advances several things which are new, with respect to the spiral Order of the Fibres which compose this Part. There are several Editions of this Work: Those I have seen are,

Amstelodami, 1669. Londini, 1670.

Manget and Le Clerc have also printed it in their *Bibliotheca Anatomica.*

LYSERUS, (MICHAEL)

Of *Leipsic*, was a Pupil, and Favourite of *Thomas Bartholine*, and by his Friendship and Instructions became a very dexterous Anatomist.

The only Anatomical Work he published, is intituled, *Cultus Anatomicus*, which contains excellent Instructions for dissecting Bodies with Dexterity: Of this there have been many Editions, as

Hafniae, 1653. 8vo. 1665. 8vo.

Frankfurti, 1679. 8vo.

Lugduni Batav. 1731.

In this last Edition are contained, his *Observationes Medicae*; the *Observationes Medico-Chirurgicae Henrici a Moench*; and the *Observationes Anatomico-Chirurgicae Martini Bogdani.*

MALPIGHIIUS (MARCELLUS)

This Author flourished in the last Century, and was deservedly celebrated for his great Skill, and singular Sagacity, in Anatomical Researches. His Industry was not confined to the more perfect Animals, but was extended to Insects, and even to Vegetables, to the great Improvement of natural Knowledge, and to his own Honour. He was a Member of the Royal Society.

Amongst other Discoveries, he found by his Microscopes, that the Cortical Part of the Brain consists of an innumerable Company of very small Glandules, which are all supplied with Blood by Capillary Arteries; and that the Animal Spirit, which is separated from the Mass of the Blood in these Glandules, is carried from them into the Medulla Oblongata, through little Pipes, whereof one belongs to every Gland, whose other End is inserted into the Medulla Oblongata; and that these numberless Pipes, which, in the Brain of some Fishes, look like the Teeth of a small Ivory Comb, are properly that which all Anatomists after *Piccolhominus* have called the *Corpus Callosum*, or *The medullar Part of the Brain.*

Before his Time, the Texture of the Tongue was but guess'd at, which occasioned great Disputes concerning the Nature of its Substance, some thinking it to be glandulous, some muscular, and some of a peculiar Nature, not to be matched in any other Part of the Body. This therefore *Malpighius* examined with his Glasses, and discovered, that it was cloathed with a double Membrane; that in the inner Membrane there are abundance of small Papillae, which have Extremities of Nerves inserted

inserted into them, by which the Tongue discerns Tastes, and that under this Membrane it is of a muscular Nature, consisting of numberless Heaps of Fibres, which run all manner of ways, over one another, like a Mat.

The Lungs, as most of the other Viscera, were believed to be of a parenchymous Substance, till *Malpighi* found by his Glasses, that they consist of innumerable small Bladders, that open into each other, as far as the outermost, which are covered by the outer Membrane, that incloses the whole Body of the Lungs; and that the small Branches of the Wind-pipe are all inserted into these Bladders; about every one of which, the Veins and Arteries are entwined, in an inconceivable Number of Nets and Mazes, that the inspir'd Air may press upon, or mix with, the Mass of Blood, in such small Parcels as the Antients had no Notion of.

Till *Malpighi* discovered the Texture of the Liver by his Glasses, its Nature was very obscure. But he has found out, that the Substance of the Liver is framed of innumerable Lobules, which are very often of a cubical Figure, and consist of several little Glands, like the Stones of Raisins; so that they look like Bunches of Grapes, and are each of them clothed with a distinct Membrane; that the whole Bulk of the Liver consists of these Grape-stone-like Glands, and of divers Sorts of Vessels; that the small Branches of the Cava, Porta, and Porus Biliaris, run through all, even the least of these Lobules, in an equal Number; and that the Branches of the Porta are as Arteries that convey the Blood to, and the Branches of the Cava are the Veins which carry the Blood from, all these little Grape-stone-like Glands. From whence it is plain, that the Liver is a glandulous Body with its proper excretory Vessels, which convey away the Gall, that lay before in the Mass of Blood.

He also discovered, that the Substance of the Spleen deducting the numerous Blood-vessels and Nerves, as also the Fibres which arise from its second Membrane, and which support the other Parts, is made up of innumerable little Cells, like Honeycombs, in which there are vast Numbers of small Glandules, which resemble Bunches of Grapes; and that these hang upon the Fibres, and are fed by Twigs of Arteries and Nerves, and send forth the Blood there purged, into the Ramus Splenicus, which carries it into the Liver; to what Purpose, is not yet certainly discovered.

The Mechanism of the Reins was wholly unknown till *Malpighi* found it out. He by his Glasses discovered, that the Kidneys are not one uniform Substance, but consist of several small Globules, which are all like so many several Kidneys, bound about with one common Membrane; and that every Globule has small Twigs from the emulgent Arteries, that carry Flood to it; Glands, in which the Urine is strained from it; Veins, by which the purified Blood is carried off to the emulgent Veins, thence to go into the Cava; a Pipe, to convey the Urine into the great Basin in the Middle of the Kidney; and a Nipple, towards which several of those small Pipes tend, and through which the Urine issues out of them into the Basin. This clear Account of the Structure of the Reins has effectually confuted several Notions, that Men had entertained, of some secondary Uses of those Parts; since hereby it appears, that every Part of the Kidneys is immediately and wholly subservient to that single Work of freeing the Blood from its superfluous Serum, and Salt.

He also made some Observations concerning the lymphatic Vessels and the Glands, which are new.

His Works are, his *Observationes Anatomicae de Pulmonibus*, printed along with *Bartholini de Pulmonum Substantia & Motu Diatribæ*, *Hafniae*, 1663. *Lugd. Bat.* 1672. *Dissertatio Epistolica de Bombyce*, *Londini*, 1669. *De Viscerum, nominatim Pulmonum, Hepatis, &c. Structura*, *Amstelod.* 1669. *Jenæ*, 1677. They are also in *Le Clerc* and *Mangetus's Bibliotheca Anatomica* printed *Genevæ*, 1685. *Epistolæ Anatomicae*, *ib.* 1669. and in *Le Clerc* and *Mangetus's Biblioth. Anatomica*, printed *Genevæ*, 1685. *Anatome Plantarum*, *Lond.* 1675. *Anatomes Plantarum Pars altera*, *ibid.* 1679. *Dissertatio Epistolica de Formatione Pulli in Ovo*, *Lond.* 1666. It is also in the *Biblioth. Anatomica* of *Le Clerc* and *Mangetus*, printed *Genevæ*, 1685. in which are likewise contained his *Dissertationes De Cornuum Vegetatione: De Utero, & Viviparorum Ovis, & de Pulmonibus Epistolæ: His Dissertatio de Polypo Cordis. Epistolæ quædam circa illam de Ovo Dissertationem, &c. Appendix repetitis auctasque de Ovo incubato Observationes continens.*

MANGETUS (JOHANNES JACOBUS)

Was a Physician at *Geneva*, and, together with *Daniel le Clerc*, publish'd the *Bibliotheca Anatomica*, *Genev.* 1685.

This was also reprinted at *Geneva*, 1717.

In this Collection the following Treatises are contained:

Francisci Glissonii Tractatus de Partibus continentibus in genere, et in specie Abdominis.

Marcelli Malpighii de Externo Fœtus Organo Exercitatio Epistolica.

VOL. I.

Marcelli Malpighii de Cornuum Vegetatione Dissertatio Epistolica.

Francisci Glissonii Continuatio Tractatus de Partibus Continentibus in Genere, & in Specie de iis Abdominis.

Marcelli Malpighii Exercitatio de Omento, Pinguedine, & Adiposis Duëstibus.

Francisci Glissonii Tractatus de Ventriculo & Intestinis.

Thomæ Willis Primarum Viarum Descriptio.

Johannis Conradi Exercitatio Anatomica Medica prima de Glandulis Intestinorum.

Johannis Conradi Anatome Ventriculi Gallinacei.

Johannis Conradi Exercitatio secunda de Glandulis Intestinorum.

Ejusdem Certamen Epistolare de Glandulis Intestinorum cum Joh. de Muraltio.

Excerpta ex Joh. Nicol. Pechlini de Exercitatione & purgantium Medicamentorum Operationibus.

Excerpta ex Johan. Jac. Wepfero de Glandulis Ventriculi.

Chylificationis Historia ex Variis.

Thomas Whartonius de Mesenterio e Tractatu de Glandulis.

Regneri de Graaf Tractatus Anatomico-Medicus, de Succu pancreatici Natura & Usu.

Johan. Conradi Brunneri Experimenta Nova circa Pancreas.

Francisci Glissonii Anatomia Hepatis.

Marcelli Malpighii Exercitatio de Hepate.

Marcelli Malpighii Exercitatio de Liene.

Glandularum Renalium, seu Renum Succenturiatorum, Historia ex Variis.

Laurentii Bellini Exercitatio Anatomica de Structura & Usu Renum.

Marcelli Malpighii Exercitatio de Renibus.

Regneri de Graaf de utriusque Sexus Organis Generationi inservientibus Tractatus duo.

Nicolai Stenonis Observationes Anatomicae spectantes Ova viviparorum.

Johannis Swammerdam Miraculum Naturæ, sive Uteri Mulieris Fabrica.

Regneri de Graaf Partium genitalium Defensio.

Caspari Bartholini Thomæ Filii Hafniæ Professoris Anatomies de Ovariis Mulierum, & Generationis Historia, Epistolæ duæ.

Marcelli Malpighii de Utero, & Viviparorum Ovis, Dissertatio.

Gualtheri Needham Disquisitio Anatomica, de formato Fœtu.

Marcelli Malpighii Dissertatio Epistolica de Formatione Pulli in Ovo.

Epistolæ quædam, circa hanc de ovo Dissertationem, aliqua ex Occasione, sub nata Argumenta ultro citroque scripta.

Marcelli Malpighii Appendix, repetitis auctasque de Ovo incubato Observationes continens.

Gulielmi Harvei Exercitationes de Generatione Animalium.

Theodori Aldes, seu potius Matthæi Sladii Amstelædamensis, Dissertatio Epistolica contra Gulielmum Harveum, tribus Observationibus Anatomicis in Vitulis & Vaccino Utero factis, auctior reddita.

Theodori Aldes Observationes in Ovis institutæ, An. 1668. in Variis Incubationis Diebus.

Frederici Ruyschii observatiuncula de Ovo in Utero humano reperto.

Theodori Aldes Sciagraphia Nutritionis Pulli in Ovo Fœtus vaccini in Utero, ut et Fœtus humani in Utero suo, & de Urina.

Caroli Drelingcurtii de Conceptu Conceptus.

Carolus Drelingcurtius de Semine Virili, item de Semine Mulieris, Ovis, Utero, Tubis Uteri, cum Corollariis de Fœtu humano.

In the second Tome are contained the following Treatises:

Caspari Bartholini Thomæ Filii Diaphragmatis Structura Nova.

De Mammis, & Lactis Secretione.

Gulielmi Harvei Exercitatio Anatomica de Motu Cordis & Sanguinis.

Exercitationes Anatomicae duæ de Circulatione Sanguinis ad J. Riolanum, J. Filium.

Richardi Lower Tractatus de Corde, item de Motu & Colore Sanguinis, & Chyli in eum Transitu.

Nicolai Stenonis Observationes circa Motum Cordis, ejusque Auricularum, & Venæ Cavæ, excerptæ a variorum Animalium Sectionibus, hinc inde factis.

Marcelli Malpighii de Polypo Cordis Dissertatio.

Marcelli Malpighii de Pulmonibus Epistolæ duæ.

Thomæ Willis de Respirationis Organis & Usu Dissertatio.

Johannis Swammerdami Tractatus Physico-Anatomico-Medicus de Respiratione, Ususque Pulmonum.

Malachiæ Thruston de Respirationis Usu primario Diatriba.

Georgii Entii Antidiatriba, sive Animadversiones in Malachiæ Thruston Diatribam de Respirationis Usu primario, cum Responsionibus & Instantiis.

Johannis Mayow Tractatus de Respiratione.

Ejusdem Tractatus de Respiratione Fœtus in Utero & Ovo.

Thomæ Willis Cerebri Anatome.

Marcelli Malpighii Exercitatio Epistolica de Cerebro.
Caroli Fracassati Dissertatio Epistolica responsoria de Cerebro.
Marcelli Malpighii de Cerebri Cortice Dissertatio.
Nicolai Stenonis de Cerebri Anatome Dissertatio.
Nicolai Stenonis de Vitulo Hydrocephalo Epistola.
Joannis Jac. Wepseri de Puella sine Cerebro Nata Historia.
Theodori Rerckringii de Orbibus aliquot & Puero Cerebro carentibus; &c.

Gulielmi Briggs Ophthalmographia.
Joannis Baptist Verle Anatomia Artificialis Oculi.
Guntheri Christ. Schelhammeri de Auditu Tractatus.
Josephi du Verney de Auditus Organo Tractatus.
Marcelli Malpighii Exercitatio Epistolica de Lingua.
Laurentii Bellini Gustus Organum novissime deprehensum.
Theodori Rerckringii Anthropogenia Ichnographia.
Theodori Rerckringii Osteogenia Foetuum.
Nicolai Stenonis de Musculis Observationum Specimen.
Nicolai Stenonis Elementorum Myologiae Specimen.
Thomae Willis Exercitatio Medico-physica de Motu Musculari.
Joannis Mayow Tractatus de Motu Musculari, & Spiritibus animalibus; obiter de Motu Cerebri, necnon de Usu Lienis & Pancreatis.

Caroli Sponii Myologia heroico Carmine expressa.
Caroli Sponii Musculorum Microcosmi Origo & Insertio.
Thomae Willis Nervorum Descriptio & Usus.
Thomae Willis Arteriarum Descriptio Anatomica.
Caspari Asellii Ticinensis Historia Vasorum Chyli.
J. Pecqueti Diepensis Experimenta Nova Anatomica circa Lactearum Progressum.
Thomae Bartholini Archiatri Regii, & Hafnienfis Academiae Professoris Honorarii, de Lacteis thoracicis Historia Anatomica.
Thomae Bartholini de Lacteis thoracicis Dubia Anatomica.
Caroli Drelingcurtii Experimenta Anatomica ex Vivorum Sectionibus petita.
Thomae Bartholini Vasorum Lymphaticorum Historia Nova.
Olai Rudbechi Succi Nova Exercitatio Anatomica, exhibens Ductus hepaticos, aquosos, & Vasa Glandularum serosa.
Frederici Ruysch Dilucidatio Valvularum in Vasis Lymphaticis & Lacteis.

Guntheri Christ. Schelhammeri de Lymphæ Ortu, & Lymphaticorum Causis, Dissertatio Epistolica.
Thomae Whartoni Adenographia.
Nicolai Stenonis Observationes Anatomicae de Glandulis Oris, & Novis inde prodeuntibus Salivæ Vasis.

Nicolai Stenonis de Glandulis Oculorum, novisque earundem Vasis.

Ejusdem Appendix de Narium Vasis.
Nicolai Stenonis de Glandulis Tractatus.
Gulielmi Cole de Secretione Animali Cogitata.
Johannis Alphonsi Borelli de Motu Animalium Opus posthumum.
Michaelis Lyseri Culter Anatomicus.

Simonis Pauli Dani Modus dealbandi Offa pro sceletopæia.
Ejusdem Observationes in Coctura Ossium, præsertim Sterni.
Caspari Bartholini Thomæ Filii Administrationum Anatomicarum Specimen.

Josephi Zambeccari Experimenta circa Diversa e Variis Animalibus viventibus exsecta Viscera.

MARCHETTIS (DOMINICUS DE)

Succeeded *Veslingius* as Professor of Anatomy at *Padua*. At the same Place lived *Petrus de Marchettis*, who applied himself to Surgery.

The Works of both are in good Esteem. That of *Dominicus de Marchettis* is *Anatomia, cui Responsiones ad Riolanum Anatomicum Parisiensem in ipsius Animadversionibus contra Veslingium additæ sunt*, Patavii, 1652. *ibid.* 1654. *Harderwici*, 1656. together with *Petri de Marchettis Nova Observatio, & Curatio Chirurgica*.

MAYOW, (JOHN)

A Physician of *Oxford*, Fellow of *All Souls College*, and Doctor of Laws, wrote the following Anatomical Treatises:
Tractatus Quinque Medico-physici, printed *Oxonii*, 1669. *ibid.* 1674. *Hagæ Comitum*, 1681. These Treatises, except the first and the last, are in the *Biblioth. Anatom. of Mangetus* and *Le Clerc*, printed *Genev.* 1685. *Tractatus duo seorsum editi, quorum prior agit de Respiratione, alter de Rachitide*, *Oxonii*, 1669. *Lugd. Batav.* 1671.

MEIBOMIUS (HENRICUS)

Discovered some Vessels of the Eye-lids, which had not been taken Notice of before. These he gives an Account of in an Epistle, intitled, *De Vasis Palpebrarum Novis Epistola Vir. Clar. Joëlem Langelet, Helmstadii*, 1666. *De Medicorum Historia Scribenda Epistola ad V. Cl. Georg. Hieronym. Velfchium, Helmstadii*, 1669.

MOLINETTUS, (ANTONIUS)

A Physician and Anatomist of *Padua*, was Author of the following Treatises:

Dissertationes Anatomicae & Pathologicae de Sensibus, & eorum Organis, Patavii, 1669. *Dissertationes Anatomico-pathologicae, &c. Venetiis*, 1675.

MONRO, (ALEXANDER)

A celebrated Professor of Anatomy, at *Edinburgh*, Author of an Osteology, which is in much Esteem. I don't know, that he has published any thing else, except some Pieces in the *Medical Essays*. The second Edition of this Osteology was printed *Edinburgh*, 1732.

MORGAGNI (JOHANNES BAPTISTA)

Was born at *Forli* in the Ecclesiastical State, and was Professor of Anatomy at *Bologna*. He made considerable Discoveries in Anatomy, relating to the Muscles of the *Os Hyoides*, *Uvula*, and *Pharynx*; to the Tongue, and *Epiglottis*; to the *Arytenoide Glands*; to the *Sebaceous Glands*; to the *Bladder*, *Uterus*, *Vagina*, and *Breasts*.

His Works are,
Adversaria Anatomica, which were collected and printed at *Leyden*, 1723. 4to.

Epistolæ Anatomicae duæ, Lugdun. Bat. 1728. 4to.

MURALTO (JOHANNES DE)

Was of *Zurich*, where he was Professor of Physic. He wrote various Essays on the Anatomy of Fish, Insects, and other medicinal Subjects, which are extant in the *German Ephemerides*.

Besides these, he publish'd a Book, intituled, *Vade Mecum Anatomicum, sive Clavis Medicinæ*, printed *Tiguri* 1677.

NEEDHAM, (WALTER)

An English Physician of the last Century, gave a good Account of the Membranes which involve the Foetus; in his Book *De Formatu Foetus*, *Londini*, 1667. 8vo. *Amstelodami*, 1668. 12mo.

NICHOLLS (DR. FRANCIS).

I don't know, that this Gentleman has published any thing in Anatomy, except his *Compendium Anatomico-Oeconomicum*, and some Essays in the *Philosophical Transactions*. But his uncommon Application to this Science, and his singular Sagacity in Anatomical Researches, make it hoped, that he will some time oblige the World with an Account of his Discoveries. The Editors of the *Edinburgh Medical Essays* somewhere observe, that *Albinus* had injected the Vessels of the Coat of the Crystalline Humour of the Eye, and seem to think it a new Discovery: On this Occasion I cannot forbear taking Notice, that I have seen *Dr. Nicholls* inject these Vessels sixteen Years ago.

NUCK, (ANTONY)

A Dutch Physician, first practised his Profession at the *Hague*, and afterwards was Professor of Anatomy at *Leyden*. He was a most experienced and indefatigable Anatomist, having dissected with his own Hands, in the Space of eight Years, upwards of sixty human Subjects.

The way how the watry Humour of the Eye, when by Accident lost, may be, and is constantly supplied, was first found out and described by *Nuck*, who discovered a particular Canal arising from the internal Carotid Artery, which, creeping along the Sclerotic Coat of the Eye, perforates the Cornea near the Pupil, and then branching itself curiously about the Iris, enters into, and supplies the aqueous Humour.

He also discovered some Salival Glands, not mentioned by *Wharton*, *Steno*, *Bartholine*, or *Rivinus*.

He says, that the Breasts are Heaps of Glands, supplied with Blood by innumerable Ramifications of the Axillary and Thoracic Arteries; some of which, passing through the Breast-bone, unite with the Vessels of the opposite Side. These Arteries, which are inconceivably small, part with the Milk in those small Glands into small Pipes, four or five of which, meeting together, make one small Trunk. Of these small Trunks, the large Pipes, which terminate in the Nipple, are made up; tho' before they arrive thither, they streighten into so small a Compass, that a stiff Hair will just pass through. The Nipple, which is a fibrous Body, has seven or eight, or more Holes, through which every Pipe emits its Milk upon Suction; and left, any one of them being stopp'd, the Milk should stagnate, they all have cross Passages into each other, at the Bottom of the Nipple, where it joins to the Breast.

He says, that the Lympheducts arise immediately from the Arteries, and that many of them pass through the Conglobate Glands, that are dispersed in the Abdomen and Thorax, in their Way to the Receptacle of the Chyle, or those Veins which receive them.

His Works, which I have seen, are, *Adenographia, Sialographia, & Operationes & Experimenta Chirurgica*, in three small Vols. printed *Lugd.* 1722.

A N A

PALEYN, (JOHN)

A Surgeon of Ghent, wrote a Book intituled, *Anatomie Chirurgicale, ou Description exacte des Parties du Corps humain*, printed à Paris, 1734. 8vo. 2 Vols. and another, intituled, *Description Anatomique des Parties de la Femme, qui servent à la Generation, avec une Traité des Monstres*, à Leide, 1780. His *Nouvelle Osteologie*, &c. Paris, 1731. 12mo.

PASCHIONI, (ANTONIUS)

An Italian Physician, wrote a Treatise about the Dura Mater, which he dedicates to *Lancisi*; in this he describes some Conglobate Glands about the longitudinal Sinus, which had been overlooked by *Nuck* and *Malpighi*.

PASCOLUS, (ALEXANDER)

A Physician of *Perusa*, in Italy, wrote a Book, intituled, *Corporis humani brevis Historia*, which is printed in Italian at Venice, 1727. 8vo. 3 Vols. and at Rome, I think, in Latin, 1728. 8vo. 3 Vols.

PAULI (SIMON)

Was born at *Rostock* in 1603. In 1632. he was made Professor of Physic at the Place of his Birth. In 1639. he was constituted Professor of Anatomy, Surgery, and Botany, at *Copenhagen*: And in 1656. Physician to the King of Denmark.

He is Author of a great many Treatises; but his Anatomical Works are, *Methodus dealbandi Offa pro Sceletopectia*. *Observationes in Coctura Ossium, præsertim Sterni*. Both which are in the *Bibliotheca Anatomica*.

PEQUET, (JOHANNES)

Of *Diepe*, an Author of the last Century, rendered his Name famous by his Discovery of the Receptacle of the Chyle; which, however, it is said, *Bartholomæus Eustachius* was acquainted with before him. But the World is obliged to *Pequet* for shewing, beyond all Contradiction, that the Lacteal Vessels convey the Chyle to this Receptacle; and for proving, that it is thence carried, by particular Vessels, through the Thorax, almost as high as the Left Shoulder, and there thrown into the Left Subclavian Vein, and so directly carried to the Heart. His Works are, *Experimenta nova Anatomica*, printed *Hardervici*, 1651. *Parisis*, 1654. To this Edition there is added, *Dissertatio de Thoracis Lacteis*, &c. &c. *Amstelodami*, 1661. They are also extant with the *Messis Aurea Siboldi Hemsterhuis*, *Lugd. Batav.* *Heilbergæ*, 1659. also in the *Bibliotheca Anatom.* of *Le Clerc* and *Mangetus*, *Genev.* 1685. and with most Editions of the *Anatomia Reformata Thomæ Bartholini*.

PETIT (JEAN LOUIS)

Is Author of a Book, intituled, *Traité des Maladies des Os*, of which there have been many Editions; the last was printed *Paris*, 1741.

PEYER, (JOHANNES CONRADUS)

A Native of *Schaffhausen*, in Switzerland. He is famous for having first given an accurate Account of the Intestinal Glands, which, in a State of Health, separate a Fluid for the Lubrication of the Intestines, and which in Diarrhoeas, or upon taking a Purge, supply the extraordinary Discharge, which happens upon these Occasions. His Works are, *Exercitatio Anatomico-medica de Glandulis Intestinalibus*, *Schaffhusæ*, 1677. *Amstelodam.* 1682. This is in the *Biblioth. Anatom.* of *Mangetus* *Le Clerc*. *Pæonis & Pythagoræ Exercitationes Anatomica*, *Basil.* 1682. *Methodus Historiarum Anatomico-medicarum*, &c. 1679. *Parerga Anatomica & Medica*, *Amstelodami*, 1682. *Experimenta Nova circa Pancreas*, extant with the *Biblioth. Anatomica* of *Le Clerc* and *Mangetus*.

PLEMPIUS, (VOPISCUS FORTUNATUS)

Of *Amsterdam*, was famous for giving a good Description of the Eye, in a Treatise, intituled, *Ophthalmographia, sive Tractatus de Oculi Fabrica, Actione, Usu*, &c. *Amstelodam.* 1632. *Lovanii*, 1648.

RIDLEY (HENRY)

Was Fellow of the College of Physicians; and, at the latter End of the last Century, published a Treatise on the Brain, in which he makes some Observations, which had escaped the Notice of *Willis* and *Vieussens*. His Book is intituled, *The Anatomy of the Brain, containing its Mechanism and Physiology, together with some new Discoveries, and Corrections of modern Authors, upon that Subject; to which is annexed, a particular Account of Animal Functions, and Muscular Motion, illustrated with Sculptures*, London, printed, 1695.

ROLFINCKINS (GUERNERUS)

Was born at *Hamburg*, in 1590. and was Professor of Anatomy at *Jena*, in 1629. He wrote the following Books upon Anatomical Subjects: *Dissertationes Anatomica*, printed *Noribergæ*, 1656. *Dissertatio de Hepate*, *Jenæ*, 1653. *Dissertatio de Cordis*, *ibid.* 1654.

A N A

RUDBECKIUS, (OLAU)

Of *Upsal*, in Sweden, had a great Dispute with *Thomas Bartholine*, about the Discovery of the Lymphatic Ducts, to which both laid Claim. It is certain, that *Dr. Jolliffe*, in England, remarked these Vessels much about the Time, or something before, these Antagonists observed them; and I see no Reason why all three may not equally pretend to the Glory of the Discovery, since, 'tis probable, neither of them took the Hint from either of the other. His Works are, *Exercitatio nova Anatomica*, &c. printed *Arossæ*, 1653. *Lugd. Batav.* 1654. It is also printed with the *Messis Aurea* of *Siboldus Hemsterhuis*, *Heilbergæ*, 1659. and with the *Biblioth. Anatomica* of *Le Clerc* and *Mangetus*, *Genevæ*, 1685. *Insidiæ Structæ Olai Rudbeckii Sueci*, &c. *Lugd. Batav.* 1654. *Pro Ductibus hepaticis contra Bartholinum*, *Lugd. Batav.* 1654. *Epistola ad Thomam Bartholinum de Vasis Serosis*, *Upsaliæ*, 1657.

RUYSCH (FREDERIC)

Was born at the *Hague*, on the 23d of March 1638. He was the Son of *Henry Ruysch*, Secretary to the States General, and to *Anne Van Berghem*. The Family from which he was descended, was originally of *Amsterdam*, where from the Year 1365. his Ancestors had, without Interruption, bore the most honourable Offices of the State, till the Year 1576. when a War happening betwixt Spain and the States, occasioned a Revolution in the Fortunes of the Family.

But Mr. *Ruysch* is far less considerable on account of his Extraction, than his distinguished Merit as a Member of Society, a Physician, and an Anatomist.

This Gentleman, from his Infancy, devoted himself to Physic, and began his first Researches with the *Materia Medica*. The Virtues of Plants, the Structures of Animals, the Qualities of Mineral Bodies, Chymical Operations, and Anatomical Dissections, were the Objects that first struck his Fancy, and called for his improving Hand. He was none of those superficial Inquirers, who either thro' Prejudice, or Indolence, rest satisfied on this Side of Truth; for he had stripp'd his Mind of all those unreasonable Attachments, which are inconsistent with the Temper of a Philosopher; and acquir'd such an indefatigable Turn, that his hardest Labours in Pursuit of Truth became his highest Pleasures, and his only Recreations. And even when he married in 1661. it was in a great measure with a View to render his Circumstances easy, that he might pursue Truth to the greater Advantage.

About this Time, the famous *Bilsius*, being appointed Professor of Anatomy at *Louvain*, made his Appearance at *Leyden*. This Physician bore it with a high Hand; undervalued those who were justly esteemed the Ornaments of their Profession, and, with all the haughty and supercilious Airs of a Spaniard, extoll'd his own Discoveries above theirs, especially with regard to the Motion of the Bile, the Lymph, the Chyle, and Fat. But as Insolence seldom fails to be chastised by real Merit; so *Deleboe*, *Sylvius*, and *Van Horne*, then Professors at *Leyden*, had a mind to check the exorbitant Vanity of this Stranger. For this Purpose they courted the Assistance of young *Ruysch*, who had been more conversant in minute and delicate Dissections, than they themselves. Mr. *Ruysch* came from the *Hague*, where he lived, to *Leyden*, by Night, presented them with Materials proper for encountering and confounding *Bilsius*, and returned home directly, to make new Preparations for the same Purpose.

After having thus fought in Secret against *Bilsius*, the two Combatants came at last to an open Engagement; for *Sylvius* and *Van Horne*, to whom he had lent so reasonable an Aid, had no mind to assume the Results of his Industry as their own Discoveries. Mr. *Ruysch*, in the Course of the Debate, had asserted, that the Resistance he felt upon blowing into the Lymphatic Vessels, gave him Reason to believe, that these Vessels were furnished with Valves, which, he confess'd, he had not seen, but said, he was not singular in his Judgment as to that Particular. *Bilsius* not only denied the Fact with uncommon Assurance, but even testified a strong Contempt for those who pronounced the thing possible. *Ruysch*, who was blest'd at once with a clear Head, and an accurate Hand, actually found those Valves, to the Number of above two thousand, and gave incontestable Proofs of the Reality of that, which he had before advanced as a Conjecture only. This Accident gave unspeakable Satisfaction to Men of Sense, who always rejoice to see Merit triumph over Arrogance and Ignorance. *Bilsius*, who regarded Reputation more than Truth, promised to yield the Point as soon as he himself should see these Valves: But when the Evidence of his own Senses reduced him to a Necessity of acknowledging their Existence, he added Arrogance to his Ignorance, and confidently asserted, That he knew these Valves, tho' for Reasons of his own, he did not chuse to discover his Knowledge in that Particular. *Ruysch*, in a small Volume, published in 1665. which, by the way, was the first Work of his that saw the Light, has given us a particular Account of this Contest; in which *Bilsius*, insensible of the Advan-

Advantages of Modesty, renders himself famous, or rather infamous, for the opposite Vice.

Mr. *Ruyfch* was in the Year 1664. created Doctor of Physic in the University of *Leyden*, and had very soon after a very fine, but at the same time, a very deplorable Opportunity put into his Hand, of convincing the World with how great Justice that Dignity was conferr'd upon him; for the Plague began to rage all over *Holland*, and Mr. *Ruyfch* had the Care of those that were infected at the *Hague*, committed to him. This Office, whatever Share of Glory it might procure him, was nevertheless far from being desirable in itself: But it is no uncommon thing for Merit and Learning to subject their Possessors to Inconveniencies, from which the Ignorant and Illiterate are entirely free.

But his principal Business, and the Employment which engross'd most of his Time, consisted in carrying Anatomy to that noble Height of Perfection, at which it had never before arrived. Anatomists had long contented themselves with such Instruments as were judged necessary for separating those solid Parts, the particular Structures, or mutual Relations, of which they wanted to discover. *Regnier de Graaf*, an entire Friend, and an intimate Acquaintance of Mr. *Ruyfch*'s, was the first, who, in order to discover the Motion of the Blood in the Vessels, and the several Roads it took during Life, invented a new Species of Syringe, by means of which, he filled the Vessels with some high-coloured Substance, which sufficiently discovered the Road taken by itself, and consequently that taken by the Blood in a living Animal. This Invention was at first approved of; but the Practice was soon after discountenanced, because the Matter gradually made its Escape, and left the Preparation good for nothing.

John Swammerdam endeavour'd to supply this Defect in *de Graaf*'s Invention, and happily concluded, that there was a Necessity for using some warm Substance, which becoming gradually cool, in Proportion as it flow'd into the Vessels, might at last, when arrived at their Extremities, lose the Nature of a Fluid, and by that means become capable of being retain'd in the Vessels. This, no doubt, required a very nice and discerning Judgment, both with regard to the particular Quality of the injected Matter, its due Degree of Heat, and the just Momentum, or Proportion of Force, with which it was to be impell'd. By this means *Swammerdam* first render'd the Capillary Arteries and Veins of the Face visible; but he did not long persist either in the Use or Improvement of his new Invention; for an Excess of Piety soon after spoil'd his Anatomical Turn, and made him look upon such Practices as impious. The devout *Swammerdam* was, no doubt, afraid of rivalling the Almighty in the Perfection of his Works; but his Fears in this Particular were ill-founded. But as the most exalted Degrees of Devotion rarely extinguish all the Motions of Vanity in the Heart, so *Swammerdam* was tempted to communicate his Invention to his Friend Mr. *Ruyfch*; who was not only fond of it, but afterwards practis'd it without any Fear of offending God.

Upon his first Trial he found the Experiment to hold, and, in all Probability, produced a more perfect Preparation than *Swammerdam* himself had done: The Vessels were so curiously injected, that the remotest Parts of their Ramifications, which were as slender as the Threads of a Spider's Web, became visible; and, which is still more surprising, sometimes were not so, without the Assistance of a Microscope. What then must the Nature of that Substance be, which is, at once, so fine as to enter the imperceptible Cavities of these Canals, and at the same time is possess'd of such a Quality as to indurate itself there?

Small Ramifications were discover'd, which were neither observable in the Living, nor to be seen in dissecting the Bodies of those that were newly dead.

The entire Carcasses of Children were injected; for the Operation was thought very difficult, if not entirely impossible, in Adults. Nevertheless, in the Year 1666. by the Order of the States General, he undertook to inject the Body of the *English* Admiral *Berkeley*, who was killed on the 11th of *June*, in the Engagement betwixt the *Dutch* and *English* Fleets: This Body, tho' very much spoil'd, before *Ruyfch* put his artful Hand to it, was yet sent over to *England* as curiously prepar'd as if it had been the fresh-Carcass of an Infant; and the States General bestow'd a Recompence which was at once proportion'd to their Grandeur, and the Artist's Merit.

Every Part of the injected Matter preserved its Consistence, its Softness, its Flexibility, and even gradually acquir'd fresh Degrees of Beauty with Time.

Carcasses, with all their Viscera, were so far from having a nauseous Smell, that they even acquired an agreeable one, and that too in Cases where they smell'd very strong before the Operation.

Every Part was preserved from Corruption by Mr. *Ruyfch*'s Secret. A long Life afforded him the Pleasure of seeing, that his Preparations had, till then, been Proof against the Shocks of Time, and even put it out of his Power to ascertain the Length of their future Duration. All his injected Carcasses glow with

the striking Lustre and Bloom of Youth; they appear like so many living Persons fast asleep; and their pliant Limbs pronounce them ready to walk: In short, the Mummies of Mr. *Ruyfch* were so many Prolongations of Life; whereas those of the antient *Egyptians* were only so many deplorable Continuations of Death.

When Mr. *Ruyfch* began to produce such surprising Preparations, abundance of incredulous People pronounced the Facts impossible; but he gently oppos'd their Obstinacy with these Words, *Come and see*. His Museum was not only always open, but richly stor'd, if I may be allow'd the Expression, with living Monuments of his Art, who were ready to pronounce in his Favour, and give the Lye to his Opposers. A certain Professor of Physic very seriously advis'd him to renounce these Novelties, and tread in the safe and beaten Paths of his Predecessors; but as Mr. *Ruyfch* despis'd the foolish Admonition, the Doctor redoubled his Letters, and at last told him, that his Conduct in that Particular was inconsistent with the Dignity of a Professor; to all which *Ruyfch* replied, in a noble and truly Laconic Strain, *COME AND SEE*.

Mr. *Ruyfch* conceals the Name of the Professor, who was so friendly, or rather so foolish, as to give him this Advice; but he has acted otherwise with regard to Messrs. *Raw* and *Bidloo*, who were both famous for their Skill in Anatomy, and had openly declared themselves against him; especially *Bidloo*, who confidently boasted, that he knew the Secret of preparing and preserving Carcasses better than Mr. *Ruyfch* himself. Upon this Mr. *Ruyfch* asked him, Why, since it was so, he had not discover'd such and such Parts? And why he had mangled his Anatomical Tables, by committing notorious Blunders? which he specifies and points out to him. Thus far the Conduct of Mr. *Ruyfch* was unexceptionable, and hitherto he appears with all the Advantages that a good Cause, and Candour in Dispute, can give him: But soon after he loses the Temper of the Philosopher, and the Gentleman; for, upon *Bidloo*'s calling him a *subtile Butcher*, he falls into personal Reflections, and says, that he rather chose to be *Lanio subtilis, quam Leno famosus*, "a *subtile Butcher*, than an infamous Pimp." The Play of Words, and the imagin'd Antithesis, betwixt *Lanio* and *Leno*, may possibly have induced him to transgress so far against the Laws of Decorum, and true Politeness: But what had he to do with the Morals of his Antagonist, when the Extent of his Knowledge was the Subject in Dispute? True it is, that *Bidloo*'s Conduct was so provoking as not to admit of an Apology, when he call'd him *miserrimus Anatomicorum*, "the most miserable of Anatomists." But the Extravagance of one Man ought never to unhinge the Mind, or authorize the Rashness of another.

But tho' Fallshood may sometimes have resolute Champions, yet Truth never fails to come off victorious in the End. The Beauties of Mr. *Ruyfch*'s Art were seen, and the Advantages of it felt. The Subjects necessary for Dissection, which the reigning Superstition of the Times render'd very few, soon spoil'd in the Hands of other Anatomists; but Mr. *Ruyfch* had the incomparable Secret of rendering them of eternal Use. Dissections were now no more accompanied with those Ideas of Horror and Aversion, which before had proved fatal to Anatomy: Hitherto Anatomical Demonstrations could only be made in the Winter Season, but now the most scorching Heats were equally proper for that Purpose, provided the Days were equally clear.

Now, considering the Advantages of this Secret, and the strong Curiosity that naturally reign'd in Mr. *Ruyfch*'s Breast, we need not be surpris'd, if he discover'd things that had escap'd the Notice of all that went before him, such as the Bronchial Artery, which supplies the Lungs with Nourishment, before unknown to the most minute and accurate Anatomists; the Periosteum of the *Officula Auditus*, which were formerly look'd upon as bare; the Ligaments belonging to the Articulations of these *Officula*. He likewise found, that the Cortical Substance of the Brain was not glandular, as was commonly thought, but consisted of Vessels infinitely ramified; and that several other Parts, which were falsely look'd upon as glandular Bodies, were no more than so many Congeries of simple Vessels, which only differ'd in their respective Lengths, their Diameters, the Curves they describ'd in their Courses, and the Distance of their Extremities from the Heart, Circumstances on which the various Secretions or Filtrations depend. *Frederic Schreiber*, who writes his Life, when talking of the Extent and Importance of his Discoveries, seems animated with a kind of Enthusiasm, and expostulates the Matter in this warm Strain: *Who before him observ'd the Vessels running thro' the Tunica Aranea, the Patella, and the Acetabulum Coxæ? Who discovered the Vessels diffused in that Membrane which surrounds the Marrow of the Vertebrae? Or who found out the Vessels in the Meditullium of the Bones, and in those Tendons and Ligaments which are destitute of Blood?*

Ruyfch, besides his Practice of Physic, and Professorship of Anatomy, was, by the Burgo-masters of *Amsterdam*, appointed Inspector of all those who were either kill'd or wounded in personal Quarrels. He was likewise, for the general Good of the State, created *Master of the Midwives*, who, generally speaking,

ing; were very ignorant of their Business; they were too hasty, for Instance, in forcibly extracting the *Placenta*, when it came not away; and were often rash enough to tear it, which frequently caused unavoidable Death: But Mr. *Ruyfch* taught them, tho' with some Difficulty, to wait with Patience for its coming away, or at least only gently to assist its Expulsion; because an orbicular Muscle, which he had discover'd in the Bottom of the Uterus, naturally thrust it outwards, and was even sufficient to expel it intirely.

At last *Ruyfch* was created Professor of Botany, in the Exercise of which Office he gave the same Scope to his natural Genius, which he had formerly done in Anatomy. The extensive Commerce of the *Hollanders* supplied him with many exotic Plants, which he dissected and preserved with incomparable Art: He dexterously separated their Vessels from their Parenchyma, and by that means plainly shew'd wherein their Life consisted. Thus Animals and Plants were equally embalmed; and equally sure of Duration, by the skilful Touches of Mr. *Ruyfch's* Hand.

His Museum, or Repository of Curiosities, contain'd such a rich and magnificent Variety, that one would have rather taken it for the Collection of a King than the Property of a private Man: But not satisfied with the Store and Variety it afforded, he would beautify the Scene; and join an additional Lustre to the curious Prospect. He mingled Groves of Plants; and Designs of Shell-work, with Skeletons, and dismember'd Limbs; and, that nothing might be wanting, he animated, if I may so speak, the Whole with apposite Inscriptions, taken from the best *Latin* Poets. This Museum was the Admiration of Foreigners: Generals of Armies, Embassadors, Electors, and even Princes and Kings, were fond to visit it. When *Peter the First*, of *Muscovy*, came into *Holland*, in the Year 1695: he was so struck with the View of Mr. *Ruyfch's* Collection, that he tenderly kiss'd a little Infant, which sparkled with all the Graces of real Life, and seem'd to smile upon him. On his second coming over, in 1714. he purchased the Collection, and sent it to *Petersburg*; but the Industry and long Experience of Mr. *Ruyfch* soon supplied him with another.

In the Year 1727. he was chosen Honorary Associate of the University of *Petersburg*. He was also a Member of the *Leopoldine* Academy in *Germany*, and of the Royal Society in *England*.

He died of a Fever in the 92d Year of his Age in 1731: and had this peculiar Advantage over most other learned Men, that he lived to see all that Opposition, which Malice and Envy made to his Merit, hush'd and laid to sleep.

Mr. *Ruyfch* has publish'd a great many Pieces at different Times, which were at last reduced into a very confused and unaccountable Order, and printed, as the Title-page of the first Volume imports; *Amstelodami, apud Janssonio-Waesbergios, 1737.*

There is a Peculiarity in one Work of Mr. *Ruyfch's*, which deserves to be taken Notice of, which is, that some Passages of his *Adversaria*, which he publish'd in *Latin* and *Dutch*, are left untranslated into the *Dutch*. What influenced this Author in this Case, every one must judge for himself, from the Nature of the Passages untranslated.

We hope the vast Variety both of entertaining and instructing Incidents that occur in the Life of Mr. *Ruyfch*, will sufficiently apologize for its Length, and account for our spending more Time upon him than some of the rest.

SANTORINI, (J. DOMINICUS)

As I remember, a *Venetian*, publish'd many curious Anatomical Discoveries in his *Observationes Anatomicae*, of which there have been one or more *Italian* Editions; but the last was printed at *Leyden*, 1739-40.

His *Opuscula Medica* were printed at *Rotterdam*, 1719.

SCHELHAMMERUS, (GUNTHERUS CHRISTOPHERUS)

A Physician, who, in the latter Part of the last Century, was Professor of Physic at *Jena* for four Years; and afterwards removed into *Denmark*, where he spent the Remainder of his Days. He wrote a Book intitled, *In Physiologiam Introductio*, printed *Helmstedtii*, 1681. 4to. and another intitled, *De Auditu Liber Unus*, *Lugd. Bat.* 1684. 8vo.

This last, and his *Epistolica Dissertatio de Lymphæ Ortu, & Lymphaticorum Vasorum Causis*, are extant in the *Bibliotheca Anatomica*. He also publish'd an Edition of *Conringius's* Introduction to Physic, with Notes.

He makes various Observations relative to the Tongue, Larynx, Salivary Glands, Diaphragm, Mesentery, Colon, Intestinum Cæcum, Receptaculum Chyli, Kidneys, Fingers, Nails, and to the Lymph, and Lymphatic Ducts, all which are worthy of Consideration.

Some detach'd Pieces of this Author are extant in the *German Ephemerides*, as the *Anatomy of a Mole*, and a Treatise *De Calculo Cerebri*.

SCHILLINGIUS (HENRICUS SIGISMUNDUS)

Was Author of the following Anatomical Works:

Discursus Physiologico-Anatomicus de Microcosmi Miseria, & Perfectionis Excellentia, *Wittebergæ*, 1658. in 4to.
Tractatus Osteologicus, sive Osteologia Microcosmica, *Dresdæ*, 1669. in 4to.

SCHNEIDERUS, (CONRADUS VICTOR)

A Professor of Physic at *Wirttemberg*, in the Middle of the last Century, wrote a great many Anatomical Pieces; but his principal Subjects are the *Membrana Pituitaria*, and the Bones of the Head, upon which he has some excellent Remarks.

His Works are,

Dissertationes Anatomicae de Partibus, quas vocant, Principalioribus, Capite, Corde, Hepate, cum Observationibus ad Anatomiam, necnon ad Artem Medendi pertinentibus, *Wittebergæ*, apud *Johann. Rotinerum*, 1643. in 8vo.

Liber de Osse cribriformi, & Sensu ac Organo Odoratus, & Morbis ad utrumque spectantibus, de Coryza, Hemorrhagia Nasium, Polypo, Sternutatione, Amissione Odoratus, *Wittebergæ*, apud *Tobiam Mevium & Elerdum Schumacherum*, 1655. in 12mo.

Disputationes Osteologicae aliquot, *Wittebergæ*, apud *Michael. Wendium*, 1649. in 8vo.

Disputatio Medica de Ossibus Sincipitis, *Wittebergæ*, apud *Johann. Robnerum*, 1653. in 8vo.

De Osse Occipitis, ejusdemque Vitiis ac Vulneribus. *Ibidem*, apud *Johann. Hacke*, anno & formâ eisd.

Disputatio Medica, de Ossibus Temporum. *Ibid.* apud *Johann. Robnerum*, 1653. in 8vo.

Oratio de Aequitate ac Justitiâ Naturæ, *ibid.* 1646. in 4to.

Oratio de Bellis Naturæ, *ibid.* in Fol.

Dissertatio Anatomico-Chirurgica, de Natura Ossis Frontis, & ejus Vulneribus ac Vitiis, *ibid.* 1650. in 8vo.

Liber primus de Catarrhibus. Quo agitur de speciebus Catarrhorum, & de Osse cuneiformi, per quod Catarrhi decurrere finguntur, *Wittebergæ*, apud *Hæ. Tobiam Mevium, & Elerdi Schumacheri*, 1660. in 4to.

Liber de Catarrhibus secundus, quo Galenici Catarrhorum meatus perspicui falsi revincuntur, *ibid.* apud *Eisdem*, anno & formâ eisdem.

Liber de Catarrhibus tertius, quo Novi Catarrhorum meatus demonstrantur, *ibid.* apud *Eisdem*, 1661. in 4to.

Liber de Catarrhibus quartus, quo generalis Catarrhorum Curationis ad novitia Dogmata & Inventiâ paratur, *ibid.* apud *Eundem*, anno & formâ eisdem.

Liber Quintus & Ultimus de Catarrhorum Dieta, & de speciebus Catarrhorum, &c. *Wittebergæ*, 1662. in 4to.

Liber de Catarrhibus specialissimus, &c. *Wittebergæ*, 1674. in 4to.

Liber de Morbis Capitis seu Cephalicis illis, ut vocant, soporosis, &c. *Wittebergæ*, 1669. in 4to.

Liber de Nova Gravissimorum trium Morborum Curatione, &c. *Francfurti*, 1672. in 4to.

Liber de Spasmodum Naturâ & Subjecto, &c. *Wittebergæ*, 1678. in 4to.

SEVERINUS (MARCUS AURELIUS)

Was Pupil to *Julius Jassolinus*, in the Beginning of the last Century; and afterwards Professor of Anatomy and Surgery at *Naples*. He is more famous for his *Chirurgical* than his Anatomical Works, and perhaps excell'd in Surgery by the Help of Anatomy, without which it would be very difficult to make any considerable Figure in that Profession. His Anatomical Works are,

Zootomia Democritea, &c. *Noribergæ*, 1646. in 4to.

Historia Anatomica, Observatioq; Medica, viscerati Corporis, *Neapoli*, 1629. in 4to.

De Aqua Pericardii Cordis Adipe, Paris Cholidochis, Hancviæ, 1654. in 4to.

His *Quæstiones Anatomicae quatuor*. 1. *De Aqua Pericardii*. 2. *De Cordis Adipe*. 3. *De Paris Cholidochis*. 4. *Osteologia, pro Galeno, adversus Argutatos. Epidochæ in totidem alias Julii Jassolini*; are extant in an Anatomical Piece of *Volckamer's*, *Hanovizæ*, 1654. in 4to. *Francfurti*, 1668. in 12mo.

SEVERUS, (NICOLAUS)

About the Middle of the last Century, wrote the following Anatomical Pieces:

Responsio ad Vindicias Hepatis Redivivi contra Deusingium, *Lugd. Batavorum*, 1662. in 12mo.

Observationes Anatomicae de Glandulis Oculorum, novisque eorum Vasis, *Hafniæ*, 1664. in 4to.

Observationes Anatomicae de Glandulis Oris, *Lugd. Batavorum*, 1662. in 4to. and 12mo.

STENO, (NICOLAUS)

A Dane; flourish'd about the Middle of the last Century. He enrich'd Anatomy with many valuable Discoveries: Amongst other

other Things, he observed the Ducts which convey Moisture to the Eye for the Convenience of its Motion in the Orbit, and in 1662 describ'd a salivary Duct not taken Notice of before, which comes from the Glands which lie near the Ears. He also observed, that the Fibres of the muscular Coat of the Pharynx are spiral in 2 double Order, one ascending, and the other descending, which run contrary Courses, and mutually cross each other in every Winding. Besides these, he made several Observations concerning the Lympheducts.

His Anatomical Works are,

De Musculis & Glandulis Observationum Specimen, &c. Hafniae, 1667. in 4to. Amstelodami, 1664. in 12mo. Lugduni Batavorum, 1683. in 12mo. This is in the *Bibliotheca Anatomica*.

Dissertatio de Cerebri Anatome. This is translated from the French Edition of 1669. by Guido Fanoisus, Lugd. Bat. 1671. in 12mo. This is also in the *Bibliotheca Anatomica*.

Observationes Anatomicae, quibus varia Oris, Oculorum & Narium Vasa describuntur, novisque Salivae, Lacrymarum & Muci Fontes deteguntur; et novum Bilsii de Lymphæ Motu & Usu Commentum examinatur & rejicitur. Lugd. Bat. 1662. in 12mo. Ibid. 1680. in 12mo.

This is also in the *Bibliotheca Anatomica*.

Elementorum Myologiae Specimen, seu Musculi Descriptio Geometrica. Cui accedunt Canis Carchariae dissectum Caput, & dissectus Piscis ex Canum genere. Amstelodami, 1669. in 8vo.

This is also in the *Bibliotheca Anatomica*.

STÖCKHAMERUS, (FRANCISCUS)

In the latter End of the last Century, published the following Anatomical Pieces:

Microscopographia, sive Partium humani Corporis omnium, earumque Actionum & Usuum brevis quidem, accurata tamen & atoma Descriptio, novis hujus seculi Inventis exornata. Viennae Austriae, 1682. in 12mo.

STRAUSSIUS (LAURENTIUS)

Flourish'd in the latter Part of the last Century. He published many Pieces, amongst which, those that are Anatomical, are,

Conatus Anatomicus, aliquot Disputationibus exhibitus. Francof. 1665. in 4to.

Microscopographia Metrica, sive humani Corporis Historia Elegiaco Carmine exhibita, & ad Sanguinis Circulationem, & pleraque nova Anatomicorum Inventia accommodata. Giesse, 1679. in 8vo.

SWAMMERDAM (JOHANNES).

He was a celebrated Anatomist of Amsterdam, in the latter Part of the last Century, having been a favourite Pupil of Van Horne, under whom he made a considerable Progress in the Art of dissecting and preparing Bodies.

De Graaf was Pupil to Van Horne at the same Time with Swammerdam, and is charged by Swammerdam with Plagiarism, in stealing the Discoveries of their common Instructor, and claiming them as his own. His Works are in very good Esteem, and are,

Miraculum Naturæ, sive Uteri Muliebris Fabrica. Notis in D. Joh. Van Horne Prodromum illustrata, & Tabulis à Clariss. Expertissimisque Viris cum ipso Archetypo collatis, adumbrata. Adjecta est Nova Methodus, Cavitates Corporis ita præparandi, ut suam semper genuinam faciem servant. Lugd. Bat. 1672. in 4to. Ibidem, 1679. in 4to. This is in the *Bibliotheca Anatomica*.

Tractatus Physico-Anatomico-Medicus, de Respiratione Ususque Pulmonum. Lugd. Bat. 1667. in 8vo. Ibid. 1679. in 8vo. and L. Bat. 1738. This is also in the *Bibliotheca Anatomica*.

SYLVIUS (FRANCONIUS DE LA BOE).

He is more known as a practical Author, than as an Anatomist. He was born at Hanover, in 1614; practis'd at Amsterdam; afterwards was a Professor at Leyden, where he dy'd in 1678.

What gives him a Title to a Place here, is his System of the Bile, which, 'tis said, he borrow'd from Nemesius; and the Discovery which he claims of the Os Orbiculare of the internal Ear, whose Situation, however, he mistook; for he thought it was placed on the Side of the Head of the Stapes, whereas it is placed betwixt that and the Incus.

TAUVRY, (DANIEL)

A French Physician, who published a Treatise of Anatomy, but of no great Character, being remarkable for extravagant Hypotheses, and ill-concerted Theory. This he published under the Title of *Anatomie Renfonnée*, about 1687, being then but eighteen Years old. In 1700 he published his *Traité de la Generation, et de la Nouriture du Fœtus*. He dy'd in 1701, in the 31st Year of his Age.

TELINGIUS (MATTHIAS)

Wrote several Anatomical Pieces; but is not remarkable for any new Discoveries. He liv'd in the latter Part of the last Century. His Anatomical Works are,

De Tuba Uteri, deque Fœtu nuper in Gallia, extra Uteri cavitatem, in Tuba concepto, Exercitatio Anatomica. Rintbellii, 1670. in 12mo.

De Placenta Uteri Disquisitio Anatomica, novis in Medicina Hypothesibus illustrata. Rintbellii, 1672. in 12mo.

De Admiranda Renum Structura, eorumque Usu nobili in Sanguificatione, Seminis Præparatione, ac Humoris serosi Sanguine Segregatione, consistente, Exercitatio Anatomica, ex Principiis de Circulari Sanguinis Motu illustrata. Francof. 1672. in 12mo.

Anatomia Lienis, ad Circulationem Sanguinis, aliaque Recentiorum inventa, accommodata. Rintbellii, 1673. in 12mo. Ibid. 1676. in 12mo.

Παράρτησις, seu Digressio Physico-Anatomica Curiosa de Vase brevi Lienis, ejusque Usu nobili ac egregio in Corporis humani Oeconomia. Minda, 1676. in 12mo.

TYSON (EDWARD).

This Gentleman was Physician to Bethlehem Hospital, Fellow of the College of Physicians, and Lecturer of Anatomy at Surgeons Hall.

He was a very accurate Anatomist, as appears by several Dissertations, of which he was Author, interspers'd in the *Philosophical Transactions*, and the *Acta Eruditorum*, relating to the human Anatomy, that of Beasts and Insects.

His *Phocæna*, or the Anatomy of a Porpus, dissected at Gresham College, with a preliminary Discourse concerning Anatomy, and a Natural History of Animals, was printed London, 1681.

VALSALVA (ANTONIUS MARIA)

This Physician was born at Imola, a City of Italy, and was Professor of Anatomy at Bologna. His Treatise on the Ear is esteem'd an excellent Performance, and contains many Discoveries relating to that Organ. He also describes, and gives new Figures of, the Muscles of the Uvula and Pharynx.

VERHEYEN (PHILIP).

He was born in 1648. He intended originally to turn his Studies towards Divinity; but having lost one of his Legs by a Mortification, he apply'd himself entirely to Physic, and was Professor of Anatomy and Surgery at Louvain, where he acquir'd great Reputation, and died of a Fever in 1711, much regretted by the learned World. His Anatomy bears an excellent Character, and has gone through several Editions, the third of which is that printed Brux. 1726. 2 Vols. 4to.

VERLE (JOHANNES BAPTISTA)

Wrote a Treatise intituled *Anatomia Artificialis Oculi humani*. This was printed at Amsterdam, 1680. 12mo. and is extant in the *Miscellanea Curiosa*, and in the *Bibliotheca Anatomica*.

VERNEY (GUICHARD JOSEPH DU).

This celebrated Anatomist was born at Feurs en Forez, August the 5th, 1648. His Father, Jaques du Verney, was a Physician at that Place. He study'd Physic five Years at Avignon, and came to Paris 1667, where he was soon after employ'd in dissecting the Brain, before Assemblies of learned Men, who us'd to meet at the Abbé Bourdelet's, and at Mr. Denys's, a learned Physician at Paris. He acquitted himself so well on these Occasions, that in 1676 he was received into the Royal Academy of Sciences as a Member; and afterwards read Lectures to the Dauphin in Anatomy. In 1679 he was constituted Professor of Anatomy at the Royal Garden.

In 1683 he published his *Traité de l'Organe de l'Oïe*, which the following Year was translated into Latin, and printed at Nuremberg. He dy'd the 10th of September 1730. The above-mentioned Treatise on the Ear is in great Esteem, and is the only Work he published.

VESLINGIUS (JOHANNES).

He was Professor of Anatomy and Botany at Padua, in the Beginning of the last Century. His *Syntagma Anatomicum* bears a good Character; of which there have been many Editions adorn'd with Figures; but that of Amsterdam, 1666, with Notes, and an Appendix by Gerârd Blasius, is in most Esteem.

VIEUSSENS (RAYMOND).

He was of Montpellier, and was famous for understanding, with great Accuracy, the Anatomy of the Brain, spinal Marrow, and Nerves, in which he sometimes differs from Willis. In his *Neurologia* he gives a very good Description, and magnificent Figures, of these Parts. His *Neurographia* was painted Lugd. 1684.

VIGIERIUS (JOHANNES):

He was a celebrated Surgeon, and liv'd about the Middle of the last Century. His *Enchiridium Anatomicarum* is printed with his *Opera Medico-Chirurgica*, Hagæ Comitum, 1659. Quarto.

VIRSUGUS (JOHANNES GEORGIUS):

He was a Bavarian, and a considerable Anatomist. He published no Work, but render'd himself famous by the Discovery of the Duct of the Pancreas, which discharges the Fluid; separated in that glandulous Substance; at the same Place where the Ductus communis Cholochochus opens into the Duodenum. This he discover'd in 1642. He was, not long after, shot by an Italian, in his own Study; who, it was thought; had been hired to murder him. His Name is sometimes spelt *Wirtungus*.

VOLKAMERUS (JOHANNES GEORGIUS):

He was a Physician of *Norimberg*, about the Middle of the last Century.

There are a great many detach'd Pieces of this Author in the *German Ephemerides*; besides which he publish'd

Collegium Anatomicum concinnatum ex clarissimis Triumviris: ex Julii Jäsolini, Locris; Quæstionibus Anatomicis. 1. De Cordis Adipe. 2. De Aqua Pericardii. 3. De Poris Choleodochis; & Vesica Fellea. 4. Osteologia parva: Marci Aurelii Severini, Thurii, totidem Epidochis: & Bartholomæo Cabrollo, Aquitano. Hanoviae, 1654, in 4to. Francof. 1668. in 4to.

Epistola de Stomacho, scripta ad Doct. Johan. Georgium Sartorium, Altdorphi Noricor. 1682. 4to.

WEPFER (JOHANNES JACOBUS):

He was a Physician of *Schaffhausen* in the latter Part of the last Century, and oblig'd the World with many curious Anatomical Pieces; particularly some relating to the Anatomy of People who dy'd Apoplectic. His Anatomical Works are,

Observationes Anatomicæ, ex Cadaveribus eorum, quos sustulit Apoplexia, cum Exercitatione de ejus Loco affecto. Schaff. 1658: in 8vo. Ibid. 1675. in 8vo. Amst. 1681. in 8vo.

Historiarum & Observationum Apoplecticarum & simillium, potissimum Anatomæ subjectorum Auctarium: cum Scholiis. Ibidem, anno & formâ eisdem.

Historia Anatomica de Puellâ sine Cerebro natâ. Schaffh. 1665. in 8vo. This is in the Bibliotheca Anatomica.

De Dubiis Anatomicis Epistola. This is publish'd, together with a Treatise of *Jacobus Henricus Paullus*, intitled, *Anatomia Bilsiana Anatomæ, Noribergæ, 1664. in 4to. Argent. 1665, in 8vo.*

WESENFELD (CONRADUS):

I don't know, that this Physician ever published any thing in Anatomy; but *Johannes Petrus Albrecht*, in the *German Ephemerides*, relates, That *Wesensfeld* thought he observ'd; in a Criminal he dissected, some Ducts which pass from the *Intestinum Cæcum* to the Bladder of Urine: But I don't find, that these have been observ'd by any one since.

WHARTON (THOMAS):

He was an *English* Physician, and in 1656 published a Treatise on the Glands, intitled, *Adenographia*; in which there are many curious Particulars not known before. In particular he discover'd a Duct, which, arising from the conglomerate Glands, which are situated in the inner Side of the lower Jaw, conveys *Saliva*, which it discharges near the Middle of the Chin into the Mouth.

WILLIS (THOMAS):

He was a Physician, educated at *Oxford*, where he was Professor of Natural Philosophy. He was born in 1620; and dy'd 1677. He was more eminent for his Practice in *London*, than valuable for his Theory, which in many Instances happens to be none of the best. He was, however, an excellent Anatomist, particularly in what relates to the Brain, Nerves, Stomach, and Intestines.

Piccolhominus had observ'd before him, that the Brain, properly so called, and Cerebellum, consist of two distinct Substances, an outer Ash-colour'd Substance, thro' which the Blood-vessels, which lie under the *Pia Mater* in innumerable Folds and Windings, are disseminated; and an inner, everywhere united to it, of a nervous Nature, that joins this Bark (as it is usually called) to the *Medulla Oblongata*, which is the Original of all the Pairs of Nerves that issue from the Brain, and of the spinal Marrow, and lies under the Brain and Cerebellum. After him, *Dr. Willis* was so very exact, that he traced this medullary Substance, thro' all its Insertions, into the Cortical Substance, and the *Medulla Oblongata*, and examined the Rises of all the Nerves, and went along with them into every Part of the Body, with wonderful Curiosity. Hereby not only the Brain was demonstrably proved to be the Fountain of Sense and Motion, but also, by the Courses of the Nerves, the Man-

ner how every Part of the Body conspires with any others to procure any one particular Motion, was clearly shewn; and thereby it was made plain, even to Sense, that where-ever many Parts joined at once to cause the same Motion, that Motion is caused by Nerves that go into every one of those Parts, which are all struck together. And tho' *Vieussens* and *du Verney* have in many things corrected *Dr. Willis's* Anatomy of the Nerves; yet they have strengthen'd his general Hypothesis, even at the Time when they discover'd his Mistakes.

He separated the Coats of the Stomach; and examined the several Fibres of the middle Coat, with more Exactness than formerly; he also has been very nice in tracing the Blood-vessels and Nerves that run amongst the Coats; has evidently shewn; that its Inside is covered with a glandulous Coat, whose Glands separate that Mucilage, which both preserves the Fibres from being injur'd by the Aliments which the Stomach receives; and concurs with the Spittle to further the Digestion there performed; and has given a particular Account of all those several Rows of Fibres, which compose the muscular Coat.

WINSLOW, (JAMES BENIGNUS)

Professor of Physic, Anatomy, and Surgery in the University of *Paris*; Member of the Royal Academy of Sciences, and of the Royal Society at *Berlin*.

In 1723 he published an excellent Work intitled *Exposition Anatomique de la Structure du Corps humain, &c.*

This was translated by *Dr. George Douglas* into *English*, and published *London, 1734.*

It is esteem'd the best System of the solid Parts of the Body which has yet appeared, and is remarkable for Conciseness and Perspicuity and for the exact Order of the Work. The Author is, however, charged with introducing new Terms into Anatomy without any Necessity, which can only tend to embroil the Science, and perplex Students. The famous *Steno* was great Uncle to *Winslow*.

ANATON. See ANATRON.

ANATRESIS; ἀνάρεσις; from ἀνά and τρέω, to perforate. It signifies literally Perforation; but by *Galen* is used to signify Trapaning.

ANATRIIBE, ἀνατριβή; and

ANATRIPSIS; ἀνατριψις; from ἀνά, and τριβω, to rub. Friction.

ANATRIS, or, ANTARIS, Mercury.

ANATRON, or, NATRON, is a Salt taken from the River *Nile* in *Egypt*, by Crystallization, or by Evaporation. It was very probably the Nitre of the Antients, and is rarely found in *Europe*. It is a little acrid and alkaline to the Taste.

It ought to be chosen in a Lump, white, looking as if crystalliz'd, ponderous, having the Taste of common Salt, but of a bad Smell, easily moistening in the Air. The Washerwomen made use of it formerly, instead of the Salt of *Kali*, to whiten their Linen; from whence it is improperly called by the Name of that Salt. The Butchers also make use of it in the room of Sea Salt, to season their Fleish-meats.

This Salt is very aperitive, if taken inwardly; externally taken, it deterges, dries, and resisterh a Gangrene. It is an Ingredient in the Composition of the Stone of *Crollius*.

There is also an artificial Anatron called *Anatron Factitium*; it is compos'd of ten Parts of Saltpetre, four Parts of quick Lime, three Parts of common Salt, two Parts of Roch Alum, and two Parts of Vitriol: All these are dissolved in Wine, and the Dissolution boiled; then strain it, and evaporate it to the Consistence of Salt. It is used as Borax to purify Metals, and put them in Fusion. *Lemery des Drogues.*

There is a very great Difference between the Nitre, or Natrum, of the Antients, and our Saltpetre; which we do not know whether the Antients were acquainted with or not: And, in like manner, their Nitre is almost unknown to us.

By Nitre the Antients understood an acrid, alkaline Salt, found in *Egypt*; and other Places, which, as it made an Effervescence with Acids, was used as a lixivial Salt for cleansing Cloaths, and for making Glafs. *Solomon* mentions the Effervescence of Nitre with Vinegar, *Prov. xxv. 20.* where he compares a Man that sings Songs with an heavy or afflicted Heart, to a Mixture of Vinegar and Nitre; which Antipathy, or Contrariety, cannot be understood of the common Nitre, or Saltpetre, which raises no Effervescence with Vinegar. The Antients frequently used their Nitre, or Aphronitrum, in Baths, and the Women in their Washes; whence *Jeremiah* says, Chap. ii. Ver. 22. *Though thou wastest thee with Nitre, and takest thee much Soap, yet thine Iniquity is marked before me, saith the Lord God.* This cannot be said of Saltpetre, but of the Lixivium of that alkaline Salt; which was brought from *Egypt* by the Name of *Nitrum*, or *Aphronitrum*.

This Nitre easily relented in the Air, fermented with Vinegar, and had an absterfive Quality; and even at this Time, in the Fields of Lesser Asia, near *Smyrna* and *Ephesus*, the Earth rises in small Hillocks, placed very near each other, like Molehills,

Molehills, during the Spring and Autumn, of which the Inhabitants prepare a Ley for washing Cloaths; as also of the Salt they get from that Earth, by dissolving it in Water, they make Soap; as is related by the great *Tournefort*. This ancient Nitre was likewise used to make Glafs, being mixed with Sand, as they afterwards did with the Salt of the Plant Kali, or Glasswort, as may be gathered from what *Tacitus* says, *Hist. 1. 5.* That the Sands of *Palestine* and *Syria*, near *Egypt*, were made into Glafs with Nitre.

It is evident, therefore, that the Nitre of the Antients was quite different from ours. At this Time it is very little used, and very rare in *Europe*, tho' it was very much in Use amongst the Antients, both for making of Medicines, and for other Purposes of Life. The common Custom of Bathing alone consumed a vast Quantity of it. It served likewise for Dying, for seasoning Viçuals, and for glazing earthen Vessels. Very little of it is brought us; and it is very hard to determine the Aphronitrum, or the *African* or *Egyptian* Nitre, or *Spuma Nitri*, which I believe to be the Baurach of the *Arabians*, and the *Grecian* Nitre. Nitre was a native Salt, of a red or white Colour, and bitter Taste. It did not fly in the Fire like common Salt, nor flash like Saltpetre, but melted, and rose in Bubbles, like Alum and Borax. It made an Effervescence with Acids; and hence I look upon it to have been of the same Nature with the Salt of Tartar, or Pot-ash. See *NATRON*. *Geoffroy*.

ANATRON sometimes signifies the Gall of Glafs, which is nothing else but the Spume cast up by the Matter of which Glafs is made.

It is also taken for the Terra Saracenica, of which there are three Kinds, which are the Black, the Red, and the Azure.

Sometimes it means a white and stony Excrescence, which grows on Rocks, in Form of a white Moss, and is called by some *Sal Nitrum*. It is also called, *Anachron*, *Anatrum*, and *Anaton*. *Castellus* from *Ruland*. *Johnson*, *Schrod*. *Hoffm*.

ANATROPE, *Ἀνατροπή*, from *ἀνατρέω*, to subvert. A Subversion, literally, or Relaxation of the Stomach, attended with Loss of Appetite, Vomiting, and Nausea. *Galen*. The Verb *ἀνατρέω*, in *Hippocrates*, *Lib. de Art*, signifies to subvert, ruin, and destroy.

ANATRUM, the same as *Anatron*.

ANATUM, Egg-shells. *Johnson*.

ANAUDOS, *Ἀναυδός*, the Word is explained by *Galen* on *Hippocrates*, to signify one that has lost the Use of Speech, and *Aphonos*, *Ἀφρονός*, to mean one who can utter no Voice. In the former, the Organs of Speech, or articulate Voice, are injur'd or clogg'd; the other, who has utterly lost his Voice, has the Instruments thereof, as the Larynx, with the Muscles and Nerves thereto belonging, disabled from performing their Function. The Word is derived from a Negat. and *αὐδῆ*, Speech; as *Aphonos*, *Ἀφρονός*, comes from a Negat. and *φωνή*, Voice.

ANAVINGA. *Baccifera Indica*, *Fructu rotundo cuspidato*, *Cerasi Magnitudine*, *polyphyreno*. *Anavinga* *H. M. P. 4. T. 49. p. 101.*

A Tree of a middle Size, that grows in *Malabar* in the *East-Indies*, especially about *Cochin*. It is an Evergreen, and its Fruit, or Berries, are ripe in *August*.

The Juice of the Berries drank excites Sweat, cures malignant Distempers, and keeps the Belly soluble. The Decoction of the Leaves in Water makes a fit Bath for such are affected with Pains in the Joints. *Raii Hist. Plant.*

ANAXYRIS, *Ἀναξυρίς*, a Name for a kind of *Lapathum*, called otherwise *Oxalis*, and *Lapathum agreste*. *Oribas. Med. Coll. Lib. 11.*

ANAXYRIDES, *Ἀναξυρίδες*, in *Hippocr. de Aere*, &c. signifies a sort of Breeches, or Drawers, worn by the *Scythians*, from *ἀνατρέω*, to draw upwards, changing *o* into *z*.

ANBLATUM, *Cordi*, *sive Aphyllon*, *J. B. Orobanche Radice dentata, major*, *C. B. Dentaria major Matthioli*, *Ger. Orob. Radice dentata, sive Dentaria major Matthioli*, *Park. The GREATER TOOTHWORT.*

It flowers about the latter End of *April*, and Beginning of *May*. It has been observed in a shady Lane, not far from *Dorking*, in *Surry*; at *Bredgate*, near *Sittingborn*; about *Chislehurst* and *Maidstone*, in *Kent*; near *Dalston*, in *Westmorland*; and *Heptonstall*, in *Yorkshire*. *Syn. Ship. Brit. 288.* I find no Virtues ascribed to it. *Martyn's Tournefort.*

ANCHA, a Word used by *Avicenna*, and sometime by *Foerster*, and signifies the same as *Coxa*. *Castellus.*

ANCHILOPS.

The Anchilops is a Tumour situate at the great Angle of the Eye, for the most part, under the Conjunction of the Eye-lids; it degenerates into an Abscess, and is twofold, the one, attended with Pain, the other almost without any Pain.

The Anchilops with Pain is often accompanied with a violent Fever, which continues till the Matter is formed and discharged.

The Anchilops with little Pain is, for the most part, free from a Fever; the Swelling of the great Angle is light, and the Colour of the Skin but little changed.

This Tumour is produced by various Causes: 1. By the Lymph, which passes from the Eye through the Lachrymal Points, into the Nose. For, if this Humour, which ought to enter these small Channels, be vitiated, or the Parts, through which it should pass, be obstructed, it will certainly cause, by its Stagnation, an Abscess in the great Angle. This Lymph may be vitiated in a twofold manner: 1. When, through its Acrimony, it corrodes the inward Parts of the Lachrymal Bag, and so causes an oufing of purulent Matter, which enters the Lachrymal Duct, and stops it. The Lachrymal Lymph, being thus intercepted in its Passage, fills the Bag, swells it, and raises the upper Part of it, as appears from an Eminence, or Rising, under the Union of the Eye-lids: If this Eminence be pressed, the Matter regorges through the Lachrymal Points.

2. When the Lachrymal Lymph grows too thick or viscid, as it cannot pass through the Nasal Duct, it stagnates in the Lachrymal Bag, and there produces a Rising like to the before-mentioned Eminence, with this Difference, that, when the Tumour is press'd, the Humour flows through the Nose; this does not happen, when the Tumour is produced by the first Cause. Sometimes there is no Defect in the Lymph, but the Membranes, which form the Lachrymal Duct, are inflamed. As this Duct is obstructed through the Distention of its spongy Tissue, the Serosity must stagnate in the Lachrymal Bag, and by stagnating becomes acid, and excoriates the Inside of the Bag, from whence the forementioned Accidents arrive.

This Repletion of the Lachrymal Bag, from the Stagnation of its Lymph, is called by some a *Dropsy*, whether, when the Bag is squeezed by the Finger, the Lymph passes through the Nose, or flows towards the Eye. But this new Name for this Disease is altogether improper; for all Dropsies suppose an Accumulation of a watry Humour in some Cavity, out of which it has no Egress. But, in the present Case, the Matter contained in the Lachrymal Bag may be squeezed out; nay, the very Lymph passes through most Peoples Noses, when they are asleep; so that, in the Morning, the Bag is empty, tho' three Hours after the Patient has got up, the Bag fills again, which obliges him to empty it. This Observation seems to shew, that, whilst the Patient is in an erect Posture, the Lachrymal Bag forms a sort of Fold, or Plait, which stops its inferior Passage.

When the Lachrymal Bag is filled in the above-mentioned manner, and the contained Humour is too thick to pass off, either through the Lachrymal Points, or through the Nasal Duct, it causes an Inflammation, which turns to an Abscess, and forms the present Disease. What has been premised, sufficiently delineates the Signs of an Anchilops, when it is formed; but it is hard to know it, in the Beginning; notwithstanding, when the Tears cease to flow through their usual Passages, or when they flow with more Difficulty, a filmy Humour may be perceived at the great Angle, attended with a light Inflammation, with Pain, Itching, and a Flux of Tears. These Symptoms accompany most Defluxions.

When the great Angle of the Eye is pressed, if a whitish Humour flows through the Lachrymal Points, or the Eminence in the Lachrymal Bag appears, there is Reason to fear the Humour, contained in that Cystis, will become acid, and an Abscess ensue.

Abscesses of the great Angle, for the most part, degenerate into a Fistula Lachrymalis, and sometimes into a Cancer, when their productive Humour is malignant.

Care must be had to examine strictly, whether the Abscess opens into the Lachrymal Bag, or whether it be only superficial between the Skin and the Orbicular Muscle. In the latter Case, there is no Fear of its changing to a Fistula, if the Matter is not lodged between the Bag and the Muscle. When, by the precedent Signs, we perceive the Lymph is obstructed in the Lachrymal Bag, we must immediately apply Remedies to prevent the Increase of the Distemper; for which Reason the Patient must be let Blood. Let him take every Morning a Broth made of Veal, Chervil, Bugloss, Borrage, and Succory; he must likewise be purged from time to time. He must use the House Baths, and other Remedies proper to rectify the bad Crasis of the Lymph. In this Case, Injections through the Lachrymal Points are chiefly useful; but you must take care, if the Bag be considerably dilated, to press it a little with your Finger, whilst you syringe; otherwise the Injection, instead of doing any Good, will be very pernicious; for, without this Precaution, the injected Liquor will cause a greater Dilatation of the Bag: After you have used the Syringe five or six Days, if the Injection through the Lachrymal Points does not pass into the Throat, or flow through the Nose, it is of no Service; which confirms my Opinion, that it is proper only in simple Obstructions of the Lachrymal Bag, but not in a Fistula Lachrymalis.

A Bandage, that shall compress the Lachrymal Bag in its Elevation, will be more efficacious than the Syringe; for it continually forces the Humour towards its lower Orifice. Let the Outside of the Eminence be rubbed three times a Day with *Hungary Water*.

Let the Inside of the Eye be washed with hot Wine, in which you may mix some Drops of the *Friers Balsam*. (See *BAL-SAMUM*

SAMUM COMMENDATORIS). Every Night, let a Compress, dipp'd in this Wine, be laid to the great Angle. Some People are cured by this Method, when the Obstruction of the Lachrymal Bag is small, and the Os Unguis is not affected.

The Abbot de Grace has sometimes cured with his Plaister, Fistulas and Abscesses of the great Angle; he laid on a Plaister, that covered the whole Eye; for the Space of a Month, still wiping the Eye Night and Morning, and applying every Day a fresh Plaister. In any of the preceding Cases, when an Inflammation of the Lachrymal Bag supervenes, tho' it should be caused by a Flux of Humours on that Part, the Patient must be let Blood, and you must apply Remedies that will prevent the Increase of the said Afflux. The Pulp of a roasted Apple, mixed with the White of an Egg, or Pulp of Cassia, and a roasted Apple, of each an equal Quantity, mixed together, are very good. If the Os Unguis be not infected, to cure the Ulcer, make use of the Plaister of the Abbot de Grace; at the same time you must take care to purge the Patient, as the Disease shall require. When you perceive the Matter in the Lachrymal Bag is changed to Pus, you must not wait the spontaneous Discharge of it; for, by a long Continuance, it may generate a Caries in the circumjacent Bones; for which Reason you must open it with a Lancet, still observing the Direction of the Fibres of the Orbicular Muscle; dress the Wound with the Plaister of the Abbot de Grace. See FISTULA LACHRYMALIS. St. Yves.

The Plaister above-mentioned is made of discusive, and some restraining, Ingredients.

ANCHOAS, a Name which the Natives of Mexico have for the Male Ginger, which differs from the Female, or common Ginger; in having rougher and thicker Leaves, with a greater and thicker Root, which has a more acrimonious Taste, with a kind of Bitterness. *Hernand.*

Its Place of Growth, and Virtues, are the same with those of the common Ginger. See ZINGIBER. *Raii Hist. Plant.*

ANCHORALIS PROCESSUS, is the same as the *Processus Coracoides*. See CORACOIDES.

ANCHUSA, a Plant thus distinguished:

ANCHUSA, Offic. Chab. 516. Park. Parad. 250. *Anchusa Monspeliensis*, J. B. 3. 583. *Raii Hist.* 496. *Anchusa puniceis floribus*, C. B. Pin. 255. Boerh. Ind. A. 189. *Anchusa minor purpurea*, Park. Theat. 517. *Anchusa, Alcibiadion*, Ger. 656. Emac. 800. *Buglossum radice rubra*, sive *Anchusa vulgarior*, floribus caeruleis. Tourn. Inst. 134. *Buglossum radice rubra*, sive *Anchusa vulgarior*, Elem. Bot. 110. *Buglossum perenne minus, puniceis floribus*. Hist. Oxon. 3. 438. ALKANET. Dale.

ANCHUSA, by some called *Calyx*, by others, *Onoclea*, has Leaves like those of the sharp-leaved Lettice, hairy, rough, black and numerous, lying round about the Root close to the Ground, prickly. The Root is of a Finger's Thickness, inclining to a Blood-colour, sends forth Shoots in the Summer, and stains the Hands; it grows in a fertile Soil.

The Root is astringent, and good for Ambuitions, and old Ulcers, being boiled in Wax and Oil. Apply'd in a Cataplasim with Barley-meal, it cures the Erysipelas; and, anointed with Vinegar upon the Part affected, cleanses the Alphas and Leprosy. Applied by way of Pessary, it extracts the dead Child. The Decoction of the same is given to those who are afflicted with the Yellow Jaundice, and Infirmities of the Kidneys or Spleen; and if there be a Fever, it is mixed with Hydromel. The Leaves, drank in Wine, bind the Belly. The Dealers in Ointments also use the Root to incrassate their Compositions. *Dioscorides, Lib. 4. Cap. 23.*

Another *Anchusa*, which some call *Alcibiadium*, or *Onochiles*, differs from the first in having smaller Leaves, though rough like them, and slender Stalks, which bear a purplish Flower. The Roots are red, of a good Length, and, about the time of Wheat-harvest, full of a Blood-like Juice; it grows in a sandy Soil.

Both the Root and the Leaves are good against the Bites of venomous Beasts, and especially of Vipers, whether they be eaten, drank, (in Infusion) or worn as an Amulet, even so far, that if a Person, after chewing them, shall spit in the Mouth of a venomous Creature, he will kill it. *Idem ib. Cap. 24.*

There is a third Species of *Anchusa*, like the former, bearing a lesser Seed of a red Colour, which if a Person chew, and afterwards spit in the Mouth of a Serpent, it will die. The Root, taken to the Quantity of an Ounce and half, with Hyssop and Nasturtium, expels the broad Worm. *Id. Cap. 25.*

The Root cleaves like the Papyrus; it stains the Hands of a bloody Hue, and prepares Wool to receive costly Colours. It will not dissolve in Water, but in Oil, which is a Proof of its being genuine. A Dram of it in Wine is prescribed for Pains in the Kidneys; or if there be a Fever, in a Decoction of the *Balanus*. The Leaves, bruised with Honey and Meal, are applied to Luxations; and, drank to the Weight of two Drams in Mulsim, stop a Looseness. A Decoction of the Root in Water is said to kill Fleas.

There is another Plant like this, and therefore called the *Pseudanchusa*, and by some *Enchusa*, or *Doris*, and many other

Names, being more downy, and not so fat, but of a thinner and weaker Leaf. The Root yields no Oil, but a red Juice, by which it is distinguished from *Anchusa*. The Leaves are applied to Hurts received by Blows. It expels the Poison of Serpents, and is drank also to drive out Thorns from the Flesh. The Magi order the Leaves to be pluck'd with the Left-hand, and that you specify the Person for whom you take them, and then tie them about the Body as an Amulet, against a Tertian.

There is yet another Herb, whose proper Name is *Onochiles*; but some call it *Anchusa*, others *Anebion*, some *Onochelis*, others *Rhexias*, many name it *Enchusa*. It has a purple Flower, rough Leaves and Branches, a Root, in time of Harvest, of a Blood-colour, at other times black; but it is most efficacious in Harvest. The Leaves, bruised, smell like Cucumber. Three Ounces are a Dose for the Falling down of the Uterus. Those who carry it, they say, will not be hurt by Serpents.

Another Herb, like to this, but less, has a red Flower, and the same Virtues. *Pliny, Lib. 22. Cap. 20, 21.*

Anchusa and *Cinnabar* were used by the Antients, to give an agreeable Colour to their Ointments; and where there was *Anchusa* used, they put no Salt to prevent the Oil in those Compositions from growing rancid. *Idem, Lib. 13. Cap. 1.*

The Root of *Anchusa* was also serviceable in colouring Wood and Wax. *Idem, Lib. 21. Cap. 16.*

The Root of *Alkanet* is thick and woody, white within, and covered with a red Bark, which gives a red Dye or Tincture to any thing it is infused in: The Leaves are long, rough and hairy, in Shape like the common *Viper's Bugloss*; the Stalk grows about two Foot high, having many long narrow and hairy Leaves, disposed in alternate Order. On the Top of the Stalks grow the Flowers, thick set together in Bunches, of a purple Colour, smaller than *Bugloss*; each Flower consisting of a single Cap, divided at the Top into five sharp Segments, standing in a long hairy five-leaved Calyx, in which, after the Flowers are fallen, grow four longish Seeds.

It grows with us only in Gardens, and flowers in June. The Roots only are used.

Parkinson highly commends the Infusion of the Bark in *Petroleum*, as excellent in fresh Cuts, and green Wounds; at present it is very little used. *Miller's Bot. Off.*

The common *Alkanet*, *Anchusa*, Offic. is brought from *Languedoc* and *Provence*, being the Root of the *Buglossum Radice rubra*, sive *Anchusa vulgarior*. The Root is astringent, and proper in Hemorrhages of all Kinds. Apothecaries employ it to colour their Ointments, particularly the *Uguentum Rosatum*; but, for this Purpose, it must be boil'd in Oil; for it does not readily communicate its Tincture to Water. The Antients used it as a Cosmétique, as is mentioned by *Galen*. *Geoffroy.*

It contains a great deal of Oil, and a little Salt.

It stops Fluxes of the Belly, being made into a Decoction.

They bring from the *Levant* sometimes a kind of *Alkanet*, called *Alkanet of Constantinople*.

It is a kind of Root, near as thick, or as large, as a Man's Arm, but of a particular Figure; for it appears a Collection of great Leaves, twisted like a Roll of Tobacco, of different Colours, but generally of an obscure Red, and of a very fine Violet. There appears at the Top of this Root a kind of white or bluish Hoariness. They find in the Middle a Heart, which resembles a thin Bark, roll'd up like Cinnamon, of a fine Red without, and White within: In Appearance, the Root looks as if it was artificial. But whatever it be, it yields a finer Tincture than ours. *Lemery des Drogues.*

ANCHUSA LUTEA, Offic. Ger. 656. Emac. 800. J. B. 3. 583. *Raii Hist.* 1. 497. *Anchusa lutea major*, Park. Theat. 515. C. B. Pin. 255. *Anchusa lutea rarior & elegantior*, Chab. 516. *Symphytum Echii folio ampliore, radice rubra*, Elem. Bot. 114. *Symphytum Echii folio ampliore, radice rubra, flore luteo*, Tourn. Inst. 138. YELLOW ALKANET.

There are three Species of *Anchusa* described by *Dioscorides*; but what Plants they are, is not agreed among Authors, one naming this, another that. *Casalspinus* and *Thalium* call the common *Viper's Bugloss* by this Name. *Turrier*, *Dodonaeus*, and *Cordus*, refer two of the Species to *Bugloss*, for what Reason, I am a Loss, since the characteristic Mark, which is the Root's staining the Hands with a Blood-colour, belongs to neither of them.

The more modern Botanists acquaint us with several Species of this Plant: Those two, which I have here given, I am of Opinion, with *C. Baubine*, are the second and third Species of *Dioscorides*, whose first seems to be only a larger Sort of the second. Dale.

ANCHYLE, the same as ANCYLE, which see.

ANCHYLOPS, the same as *Anchilops*.

ANCHYLOSIS, the same as ANCHYLE, ANCYLE, or ANCYLOSIS, which see.

ANCHYNOSES, a Name for the *Phoenix*, or *Ray-grass*, in *Oribasius, Med. Coll. Lib. 12.*

ANCHYROIDES. See CORACOIDES.

ANCI, in Greek, Γαλιδζωνες, *Weasel-elbow'd*, from γαλιδ, a *Weasel*, and ἄγκων, an *Elbow*. So *Hippocrates* calls those, who,

who, from slipping of the Head of the Os Humeri into the Ala, have an Arm shorter and smaller than it ought to be, and the Cubit, or Elbow, of a Weasel, whence they are called by some *Mustelanei*, which fully expresses the Greek Word; or barely *Anci*.

The Disorder that gives Occasion to the Name, happens either in the Womb, where the Os Humeri suffers a Luxation from too much Moisture, or in tender Years, by means of an Abscess deeply seated about the Head of the Os Humeri. *Fæsius*.

ANCINAR, Borax. *Rulandus*.

ANCISTRON, Ἀγκίστριον, a Hook.

ANCON, Ἀγκών, the gibbous Eminence, or Flexure of the Cubit, the Middle of that Eminence, on which we lean, being the greatest of the two Apophyses of the Ulna, and the same with the Olecranon. *Castellus, Winslow*.

ANCONÆUS MUSCULUS. It arises by a round and short Tendon from the Back-part of the external Condyle of the Os Humeri; this soon grows fleshy, and is so intangled with Part of the Brachizus Externus, that there can be no separating them without Violence.

It is inserted fleshy and thin into the Lateral Part of the Ulna, a few Inches below the Olecranon.

Its Use is to assist in extending the Cubitus. *Douglas*.

ANCORA, Calx. *Ruland. Johnf.*

ANCORALIS, the same as ANCHORALIS.

ANCOSA, Lacca. *Ruland. Johnf.*

ANCTER, Ἀγκίτης, the Greek Term for a Fibula, or But-ton, in Surgery, by which the Lips of Wounds are joined and held together, *Celsus, Lib. 5. Cap. 26.* which Operation is called *Ancteriaismus*, Ἀγκίτησμός, according to *Galen*. See FIBULA, and SUTURA.

ANCUBITUS, an old Term, by which was meant that Affection of the Eyes, in which they seem'd to contain Sand, or small Pebbles. It was also called *Petrification* by *Johannes Anglicus. Castellus*.

ANCUNULENTÆ. Women are so called in the Time of their Menstruation, as contracting *Inquinamentum* [Pollution]. *Festus*. From the Greek Κόινω, comes the Latin *Cœnum*, from whence are derived *Cunire* and *Inquinare*.

Ancunulenta is compounded of *An* for Ἀντι, and *Cunio* quasi *Kovido*, *Inquino*, to pollute.

ANCUS. "A Name for such as have an Arm bent crooked, so that they cannot extend it." *Festus*. From Ἀγκών, an Elbow, according to *Servius*. "Ancus, mancus, καλλός, λαφός." *Vet. Glossarium*. *Varro* takes it for a Sabine Word, but it is certainly derived from the Greek Ἀγκή, which signifies the Bending of the Arm. The Greeks also use Γαλιανκόν, [Galiancon] for Ancus. See ANCI. *Baxter's Glossarium*.

ANCYLE, and ANCYLOSIS, from Ἀγκύλος, crooked. A Distortion, a Fixation (ἀλόχη) of the Joints, caused by a Settlement of the Humours, or a Distention of the Nerves. *P. Eginet. Lib. 4. Cap. 55. Actuarius, Meth. Med. Lib. 4. Cap. 16.*

In this Case, Remedies of a mollifying and relaxing Nature are required; in general, such as are appropriated to Scirrhotities, or rather, to Resolutions of the Parts. Particular Medicines are, a Perfusion of Water and Oil, in which have been boiled Lindseed, Fœnugreek, Marsh-mallow, Bay, and Root of Wild Cucumber, and *Sycæonian Oil*. After Perfusion, proper Applications may be made of some of the more simple *Acopa*, for Instance, that prepared of the black Poplar, and another of Fir, or the *Bromion*, *Aristophaneum*, *Azanitæ*, *Lyssponium*, or *Varium*. Proper Plaisters are that of *Amythaon*, the *Anicetum*, and the following, which is excellent:

Take of Bdelium, Fat of a Calf, Gum Ammoniac, *Illyrian* Orris, each sixteen Drams; of Opopanax, Galbanum, Rosemary-seeds, Stryax, Frankincense, each eight Drams; Grains of Pepper, one hundred and sixty; Wax, half a Pound; Resin of Turpentine, half a Pound; Dregs of Oil of Orris, a sufficient Quantity; Wine, a sufficient Quantity; beat them up together.

This also makes a good *Acopa*, moistened with *Unguentum Irinum*, *Cyprinum*, or *Laurinum*. Of a middle Nature, betwixt *Acopa* and Plaisters, is the compound *Pharmacopœia Pernâ*.

Your *Acopa* must be used by long and gentle Affriction, together with Endeavours to bend and stretch the affected Joint. *Paulus Egineta, ibid.*

The Malagma of *Euthycleus* for the Joints, for all Sorts of Pain, and particularly in the Bladder, and for Contractions of the Joints, after they have been newly cicatrized, (which the Greeks call ἀγκύλας) consists of

Soot of Frankincense, Rozin, half a quarter of a Pint; Galbanum without the Branches, an Ounce and an half; Gum Ammoniac, Bdelium, of each one Dram two Grains and an half; of Wax, one Dram thirty-three Grains.

Another Malagma is thus prepared:

Take of Orris, Gum Ammoniac, Galbanum, Nitre, of each one Ounce six Drams thirty-five Grains; Liquid Rozin, six Drams fifteen Grains; of Wax, two Ounces two Scruples. *Celsus, Lib. 5. Cap. 18.*

I don't well understand what *Celsus* means by *Fuligo Thuris*, unless the Soot arising from Frankincense, when burnt in Temples as Incense.

When a Joint, or Articulation of the Bones, grows stiff, and the peccant Matter there settles and hardens, which Disorder the Greeks call *Ancylosis*, if it proceeds from an Effusion and Concretion of the Juices of some broken Bone, the Cure, in such a Case, will be very difficult. But if this Stiffness be the Consequence of too long a Rest, or the Inspissation of the Humour which lubricates the Joint, it may not be altogether unreasonable to ply the Part affected with emollient Fomentations, and Bathings often repeated, especially the natural Baths; to be often rubbing it thoroughly with Oils, Fats of Animals, or mollifying Ointments, and with your Hands to move and inflect it this way and that way, till its former Flexibility be perfectly restored. *Heister*.

The following Case is related by Mr. *Malouet* in the Memoirs of the Academy of Sciences for 1728.

A young Man, three-and-twenty Years of Age, had, for more than a Year past, his Leg quite bent backwards, without being able, in all that time, to extend it in the least. He felt great Pains in his Knees, which were more acute at some Seasons than at others, but sometimes were so violent, that when he was in Bed, he could not bear the Weight of the Bed-clothes on his Knee, insomuch that, during four Months, he was obliged to support them with a Hoop, to prevent their touching him. Though these Pains were much less troublesome at certain Seasons, they were always felt, if any Pressure was made on the affected Part, and rendered him incapable of using a wooden Leg, which, through the Compression which his Knee must have suffered by resting on it, would not have failed to render his Pains more acute.

He was no less incapable of walking by the Help of two Crutches; for whenever he attempted it, the Weight of his Leg made him endure insupportable Misery in his Ham. He had tried to free himself from this Inconvenience, and from the Necessity of keeping his Bed, by the Help of a Swathe; but as this Expedient did not secure that Part sufficiently immoveable, it did not ease him in the least of his Sufferings.

The Surgeons in the Country, who passed for Men of Skill, being persuaded that it was an *Ancylosis*, in which the Leg and Thigh were ossify'd together, had for a long time used several Sorts of Remedies in vain, till at last, after several Consultations held upon the Affair, they concluded, that no other Method was to be taken but Amputation of the Thigh.

Some Persons of Consideration, who commiserated the Patient's Case, prevailed with him to let himself be brought to Paris, in Hopes that he might there find such Relief as would save him from coming to that Extremity.

Being arrived there in the Month of September last, he consulted the most experienced Surgeons in those Sorts of Maladies. They were of Opinion, there was no other Remedy for him but cutting off his Thigh.

He was so disheartened at the sad Condition to which he was reduced, and sometimes felt such exquisite Pains, that at last he made his Choice, and determined to undergo the Operation. As the Success was doubtful, and he must run a Hazard of his Life, the Surgeons, by a wise Precaution, had given Notice to the Vicar of the Parish, that he might administer to him the Sacraments; and because I had an Opportunity to visit the Patient, they made me acquainted with the Resolution they had taken to perform the Operation, as a thing liable to no Objections, with an Intent only, that I should prepare him for it by Purgations, and other Medicines, as I thought proper.

Thinking myself obliged to examine into the Disorder which gave Occasion for the Amputation of this Thigh, I had the affected Part uncovered, and found, that of the two inferior Condyles of the Os Femoris, that on the Inside was a little thicker than it ought to be, as well as the Inside of the superior Extremity of the Tibia. This Thickness was not painful, not even when it was pressed; and the Pain which the Patient felt at his Knee, was directly at the Place of the Ligament which fastens the Patella to the Tibia. I observed no Tumour in the Flesh; on the contrary, the Leg was considerably wasted.

Tho' the Excess in Bigness, which I had observed in that Knee, did not appear to me of Bulk sufficient to be the Cause why the Patient could not in the least extend his Leg, yet if we may judge from what usually happens, it might proceed from some disorderly Situation of the Heads of the Bones, in Consequence of which they might have been solder'd together by a Liquor, diffusing itself at the Joint, and by its Inspissation conglutinating them in such a manner as of two Pieces to make but one; a Disorder but too common, and the Cause why none

none of the soulder'd Bones thus united can any longer stir with its proper Motion, nor consequently play in their Articulations. But as I had made no such Observation on the Knee of this Patient, whatever Efforts he made to stretch out his Leg, I was willing to be assured, whether any such Cause operated in the present Case.

For this End I endeavour'd to extend the bended Leg, by making an Effort to pull it out strait with my Right-hand, while I kept down his Thigh with my Left. I observed, that the Leg bended, tho' indeed it was not without Difficulty on my Part, and Pain to the Patient. Wherefore I made no greater Efforts to extend it more, as well because I was persuaded, by the Resistance which I found, that I should hardly accomplish my Design, as because I was unwilling to increase his Pains, and render them insupportable. However, since the Leg return'd to its former State of Flexion, as soon as it was left at Liberty, and I believed it was of Importance to be assured, whether the Leg had this Motion in common with the Thigh, I repeated at several times my Efforts to extend it, and always with the same Success.

I was then persuaded, that the Bones were not soulder'd together; for in that Case not only the Limb has no more Play in its Articulation by its proper Organs, but it is also impossible to procure it by any outward Assistance, either in extending it when it is bent, or bending it when it is extended, unless the Bones should unfold, or break, neither of which, I was sure, had happen'd by the Efforts I had made.

I was obliged then to search somewhere else for the Cause which held the Leg in this Posture of Inflection, and quite disabled the Patient from extending it.

I examin'd the Tendons of the Musculi Flexores, and found they were extremely tense, and drawn back towards their Origin. I was satisfy'd there needed no more to hold the Leg in this inflected Situation, and thought I had discover'd the Cause. But in order to be better assured, if it were possible, I question'd the Patient about the Manner in which this Disorder happen'd to him, in Hopes to procure some Light from thence.

He told me, that in the Month of August 1726. he had a Fever, which lasted forty-five Days, the first fifteen or sixteen of which he had lain under a Delirium; that during all that Time, he struggled, and would have come out of his Bed, so that they were forced to tie him in it; that he had found means to untie himself, and to throw himself out of Bed upon the Floor; that he had been blooded seven times, four times in the Arm, and thrice in the Foot; that he knew all this to be true, because his Companions had related it to him, when he was come to himself; that then he perceived his Right Leg was quite bent, since which Time he could by no means stretch it out, whereas before it had always been as the other; that he had never felt any Pain in his Knee, nor felt any thing extraordinary, till this Time.

This Account did the Patient give me of the Condition he was in when this Disorder of his Knee seiz'd him; and I believed, that I had Reason to conclude, that the Illness, of which he gave the Particulars, was a continued Fever, attended with a Delirium; and as such a Symptom is accompany'd with convulsive Motions, of which it is usually the Cause, I judg'd from this Relation, that the Tension which I observed in the Flexores Musculi of the Leg, might well be the Consequence of a Convulsion of those Muscles, at the Time when the Patient was under the Delirium; in Consequence of which they might continue thus shrunk back by means of some Matter, which was capable, by swelling them, of keeping them in this contracted Condition, and was of a Nature not fitted to dissolve, either of itself, or by the Remedies hitherto used.

Whether this Reasoning be just or not, which I propose only as a Conjecture concerning the Origin of a Disease, of which I never saw the Beginning, I was persuaded by the Patient's own Account, and by what I observed of his present Condition, that the Reason why his Leg was thus inflected, and incapable of being extended, was because the Flexor Muscles were shrunk back and shortened.

Far from considering the Disorder as incurable, on the contrary, I believed it was very easy to be cured. Wherefore I oppos'd the Amputation of the Thigh, and set myself to think of some Remedies, by which I might cure the Patient, and at the same time preserve his Limbs intire.

In pursuance of the Notion which I had form'd of the Disorder, I propos'd to myself the mollifying and relaxing of the Fibres of the Muscles, which by their Contraction held the Leg bent, that I might give them that Suppleness which they wanted, in order to extend and stretch themselves out at full Length. I propos'd to myself also the Dissolution and Dissipation of the Matter which might be lodged in their Interstices, and, by keeping them swelled, hinder'd their Lengthening or Extension.

I thought I should endeavour to answer these two Indications at once, and that I might succeed, by putting the Patient in an aromatic Bath of hot Water, which seem'd to me the most proper Means for penetrating to the very Muscles, which

were shrunk backwards, and to produce the Effects which I had in View, as well on account of its Heat and Fluidity, as of the volatile Parts with which it would be impregnated.

After some general Remedies, which I gave the Patient, I order'd a Bath of this Kind. He went into it twice a Day, and stay'd there an Hour, or an Hour and an half, each time (Observe it was a whole Bath, which, acting equally upon the whole Mass of Blood, was much more efficacious than a Semicupium). At the fourth Bathing the Patient's Leg began to extend itself, and continued so to do in such a manner, that the eighth Time, when he got out, he set his Foot to the Ground, and was in a Condition to walk with two Crutches.

From that time the Pain of his Knee went off, and he never felt it since. After bathing seven Days, that is, fourteen times, I order'd him Rest, and even during that Rest his Leg extended itself more and more, and at last equally with the other, so that he had no Need of Crutches, but was oblig'd to use a Stick in walking, because he had still a Pain in his Ham; when he stretch'd it out. When he walk'd, he felt a Pain in the upper Part of his Foot, which I imputed to the Inaction in which he had been for a long time, by which some of the Parts had acquired a Dryness, or a Stiffness, which put them out of a Condition of readily complying with the different Motions necessary for walking.

To remove these Symptoms, I order'd Embrocations under the Ham, and upon the Foot, with Oils of Earth-worms, and St. John's-wort, mixed in equal Parts. By the Use of these Remedies for ten or twelve Days, the Motion of his Foot became less painful, and that of his Leg more free.

Mean while, as there still remained some little Stiffness in the Tendons of the Musculi Flexores of the Leg, I judg'd it proper for the Patient to repeat his Bathing; after purging him again. At the End of four Days finding him fatigued, I made him intermit it; and in short, after a Rest of fifteen Days, I made him repeat it for six Days, twice every Day. He bore it very well, and was perfectly cured; so that from that Time he has felt no Pain in his Knee nor Foot, except sometimes after he has walk'd a great deal. He stretches and bends his Right Leg as easily as his Left, he walks and runs without Cane or Stick; in short, since he has been cured, he has employ'd himself in clearing a Garden, tho' he is able to live without it, and spent his Time in carrying Earth and Stones, and doing other Works of that Nature, without feeling any Inconvenience.

However, tho' his Right Leg has recovered much of its Flesh, it has not yet attain'd to the Bigness of the Left, and his Knee always appears a little bigger than the other. This proves, that it was not this Excess in Bigness that held his Leg thus bent, and hinder'd its Extension.

The Leanness of this Leg might be imputed to the Alteration that its Flexion, which lasted above a Year, produced in the Tubular Vessels appropriated for the Conveyance of nutritive Juices to that Part. Those Tubes, instead of strait, as they commonly are, becoming very much bent, and by that means incapable of receiving, and consequently of supplying the Leg with a sufficient Quantity of those Juices, which occasion'd its Leanness, grew narrow and streighten'd; wherefore, though at present they have their first Direction, the Leg has not been able to recover its former good Plight; because they have not as yet resumed their natural Diameter.

With respect to the Bigness which remains on the Inside of the Thigh, I don't think, that we ought to regard it as an Exostosis of a bad Kind, that is, which was produced by a Depravation of the nutritive Juices, which had altered the Substance of the Bones; because they appear to be in their natural State, and the Bigness there observed is without Pain, Softness, Redness, or Swelling of the Skin, and does not incommode the Movement of the Articulation, which is a Symptom, that, for the most part, attends Exostoses of a bad Kind.

This Bigness then ought to be imputed only to a greater Quantity of nutritious Juices with which that Part was supply'd, whether owing to some natural Disposition, as we see in those Persons who have naturally one Part bigger than another; or to some Blow or Fall; or, lastly, to the bending Posture in which that Leg continued for so long a time, which State of Flexion, having been capable of making way for the Leanness of the fleshy Parts, might also be the Occasion of this Excess in Bigness of the bony Parts. These two Effects, tho' contrary, may proceed from the same Cause; of which we see an Example in the Rickets, where the Heads of the Bones increase considerably, while the fleshy Parts fall to Decay. But that we might give a Reason adapted to the Subject, let us suppose, that the Blood not having been capable of flowing in so large a Quantity as usual, in the Arteries which supply the Leg, because of their extreme Curvature, as I said just now, was oblig'd to stop at the Knee, in Consequence of which the Extremities of the Os Femoris and the Tibia having received a greater Abundance of Lymph, the same afforded a greater Quantity of nutritious Juice to those Parts of them which were most dispos'd to receive it.

It may be said, perhaps, that tho' there be no Room to doubt, that the Contraction of the Musculi Flexores of the Patient's Right Leg was the real Cause that held it thus bent, it is still uncertain whether that Contraction was the Consequence of a Convulsion of those Muscles, or of a Resolution of the Extensores of the same Part; that this last Disorder might equally make way for the Musculi Flexores of that Leg to bend it, and to keep it in that State of Flexion, as long as it subsisted; and that in this Case it might also have been cured by the Remedy which was used; and upon these Accounts, the Disease which I attribute to one Cause, might perhaps be imputed to another quite opposite.

I answer, that 'tis true a Member may as well be bent in Consequence of a Resolution of the Muscles which serve to extend it, as by a Convulsion of those which are appointed to bend it; that whether their own Force increases, or that of their Antagonists diminishes, they equally exert themselves beyond their just Bounds, and must by Consequence keep the Part bent, or inflected: But besides that we seldom or ever see a Delirium consequent upon a continual Fever attended with a Resolution, instead of which a Convulsion is the ordinary Symptom; I have observed this Difference betwixt a Member bent in Consequence of a Resolution of its Musculi Extensores, and a Member bent by a Convulsion of its Musculi Flexores; that in the first Case, a Force equal to that of the Musculi Extensores might perfectly extend the bended Part; that but a small Resistance is to be perceived from the Musculi Flexores, and that the Patient cannot in the least suffer from that Extension; but that, instead thereof, in the second Case, the greatest Force cannot altogether extend the bended Part, and that there is an invincible Resistance to be perceived on the Part of the Musculi Extensores, inasmuch that a Man would run the Risk of breaking or tearing them asunder, if he should endeavour with all his Force to extend them to their full Length; and in such a Case, the least Extension would put the Patient to great Pain.

Thus it happened exactly in the present Case: With all the Efforts which I made to stretch out the bended Leg, I came very short of extending it to the utmost, finding too much Resistance. 'Tis true, the Pains which the Patient felt on this Occasion, prevented me from using greater Force; and I have been told, that a Surgeon of an Hospital in that Country, having try'd to extend this Leg to its full Length by Strength, had employ'd two or three Men for that Purpose, and was not able to accomplish his Design, the Man having fallen into a Swoon, which lasted half a Quarter of an Hour.

These are the Reasons why I judged, that the Contraction of the Musculi Flexores of the Patient's Leg was not the Consequence of a Resolution of the Musculi Extensores.

The Result of this Observation is, that we ought not always to look upon those Symptoms as the Causes of a Disease, which, though they are often so, might yet, for all that, be sometimes the Consequences of it; and that in Distempers, even those belonging to Surgery, we are not always to rely on those Signs which are the most usual, and which appear the most natural, if possibly they may deceive us. Of this Nature was the Bigness of this Patient's Knee, the Pain which he felt, the Absence or Failure of a Tumour in the soft and fleshy Parts, the Impossibility he lay under of extending his Leg in the least. All this seem'd to indicate, and commonly shews, a Fault in the Bones, which gives Rise to all these Symptoms; but which were, for all that, the Effects of another Cause.

The Passion which some Surgeons in the Country have for Operations, makes them take all Opportunities of cutting off a Limb: Such may learn from the preceding Case, that it is never to be done rashly. Reason and Humanity should also inform them, that there is more Reputation and Satisfaction to be acquired by saving one, than amputating a thousand.

When an Ankylosis is perfectly form'd, that is, when the Bones are ossify'd together, it appears by the Nature of the Distemper, that the Case is incurable. But when the Stiffness is only caused by Humours inspissated in the Articulation, the Methods specify'd in the preceding History, and the two following Cases from *Le Dran*, seem to promise fair for a Cure, if duly persisted in.

Hot Pumping is a Remedy very little used; whether it be for want of knowing its Advantages, or from the Difficulty of performing it properly, which has often rendered it unsuccessful. It is very beneficial, however, in many Cases, and especially in Ankylosis, before they arrive to a perfect Hardness. A Series of Time is required before it can produce any considerable Effect, and it must be often repeated, when it begins to operate, having frequently proved unsuccessful, for want of being long enough continued.

In the Month of January 1725, a Man aged twenty-one Years felt an acute Pain in his Left Groin, which subsisted in the same Place during the Space of a Fortnight, and then removed its Situation. It varied often, affecting the Thigh one time, and the Rotula another, and then returned to its first Point again. After he was bled and purged, they bathed the

Part with Lavender-water for above three Weeks. The Patient finding no Relief, but on the contrary, that his Leg and Thigh were emaciated, he declined the Use of it, and put himself under the Hands of several Empirics for near three Months, who robbed him of his Money, without doing any Service. These Gentlemen (according to themselves) have infallible Noftrums; but if they are so, it consists in draining the Patients Purses; who place a Confidence in them. The last Remedy he used was dry Baths, such as are performed with Spirit of Wine; which being attended with the same Success as the former, he applied himself to me.

When I first saw him, he could not move his Thigh without violent Pains, nor suffer the least Violence to be used in moving it; the superior Part, to the Spine of the Ilium, was so prodigiously swelled, as to be twice its ordinary Magnitude. It was exceedingly distended, and as hard as a Stone; the Pain was very deep, but not augmented when the Tumour was handled.

What increased the Bulk of the Thigh to that Extent in its superior Part, was, probably, a large Quantity of Lympha inspissated and filtrated in the Interstices of the Muscles; perhaps also the Capsula, embracing the Articulation, was filled with Sinovia, as well as the Cavity Cotyloides. The Projection of the Trochanter Major externally afforded some Reason to believe, that the Thigh was luxated (This Sort of Luxation is often seen from an internal Cause, whereby the Head of the Femur is gradually thrust out of its Cavity). The internal Part of the Thigh was emaciated to such a Degree, that the Bone seemed to be covered only by the Skin, and might be embraced with one Hand. The Leg was emaciated also.

Seeing the Inutility of all the Remedies hitherto employ'd, I advis'd the Patient to go to *Bourbon* to try the Hot Pump, which he had not yet attempted. He told me the Impossibility there was of undertaking that Journey, both because his Circumstances could not afford it, neither would the Excess of his Pains suffer him to be moved. This gave me a Thought of erecting a Pump at my own House, which might, in some measure, answer the Use of the Hot Mineral Waters, and supply the want of them.

The Place being prepared with all necessary Conveniences, I put the Patient into *La Charité*, from whence I could remove him every Day to my House. I order'd him to be twice bled and purged, and the 12th of August began to pump upon him for the Space of an Hour; and when it was finished, he went to bed, where the whole Part affected was covered with Bladders, half filled with hot Water, to a supportable Degree. These Bladders were often renewed in the Space of two Hours, and when they were removed, the Part was suffered to perspire another Hour, covered only with warm Linen. Then the Patient was brought back to *La Charité*, where the Bladders were again renewed in the Evening.

When he had been pumped a few times, he began to lean upon his Leg with less Pain, but always by the Assistance of Crutches, and without any Motion in the Articulation.

The Part affected sweated considerably at each Pumping, and appeared much softer after it. The Patient had not used this Method above a dozen times, but the Swelling on the superior Part of the Thigh began visibly to diminish. Then I order'd the Motion of the Articulation to be gently forced, notwithstanding the Pain, tho' by Degrees, and a little at a time; moreover, I purged him twice. These Precautions, united with the Pumping, dissolved the Sinovia, so that the Patient could move his Thigh a little without any Assistance. In proportion as the Tumour diminished, the Leg and Thigh grew more fleshy; in short, within the Space of four Months, during which he was pumped between forty and fifty times, suffering him now-and-then to repose a Day or two, the Distemper so far yielded, that the Patient was able to walk very fast by the Help of a Cane only, feeling no more Pain, and having this Leg and Thigh answerable to the other.

In the Year 1728, a Gentleman, belonging to the King, had an inspissated Sinovia upon his Right Foot, which not only possessed the Articulation, but spread over the whole Foot, so that the Ankylosis was almost formed.

As he was ready to depart for *Bourbon*, to drink the Waters, by the Advice of Mr. *de la Peyronnie*, they mentioned the Pump I had erected at my own House; and having view'd it, the Patient was prepossess'd in favour of the Effect it might produce, and deferr'd his Journey for several Days to experience it.

Twelve Pumpings, with the same Precautions observed in the preceding Case, so far cured him, that he laid the Thoughts of his Journey aside, and has felt nothing since.

REMARKS.

We ought not to be surpris'd at the sudden Effect of Pumping, properly managed; three things act at the same time upon the stagnated and inspissated Fluids.

First, The falling of a Column of Water, of an Inch Diameter, from seven or eight Feet high, abrades and comminutes the inspissated Juices, by its Force and Compression.

Secondly,

Secondly, The Nature of the Water may contribute to produce this Effect, if the active Particles contained in it can be immitted into the Texture of the Part affected: And is there any thing that can sooner make it penetrate, than the precipitate Fall of a Column of Water upon it?

Thirdly, The Heat of the Water, which insinuates itself into the Part affected, and warms it to the very Bottom, afflits and accelerates the progressive Motion of all the Fluids; perhaps even the intestine Motion of such as have not entirely lost it, and communicates a Motion to those that are stagnated.

From hence it follows, that one Part of the stagnated Fluid transpires externally, whilst another takes the Course of the Circulation; and thus the Part is gradually disengaged. It is true, indeed, that every Patient does not receive the same Relief; but if the Distemper begins to give way after a few Pumpings, the Number is not to be regarded. Several Persons who have reap'd no Benefit from the Pumps at *Bourbon*, and other Places, have return'd unrelieved, for want of using it often enough, independent of other Obstacles opposing the Cure. So far *Le Dran*.

I must not dismiss this Article without observing, that though *Ancyle*, or *Ancylolosis*, are usually taken for a Union of the Bones at the Joint in general; yet *Ancyle*, or *Ancylolosis*, properly imports a Stiffness of the Joint, when the Part is fix'd in a bended Position; whereas when it is frait, the Disorder is call'd *Orthocolon*, *ὀρθόκωλον*.

ANCYLIDOTON, *ἀγκυλιδότον*. The Word is used by *Hippocrates*, and signifies, according to *Galen's* Interpretation, *ἀγκύλην ἔχοντα*. Things that have a Handle.

ANCYLOBLEPHARON, from *ἀγκύλη*, bent, and *βλέφαρον*, an Eye-lid. A Disease of the Eye, which closes up the Eye-lids.

Sometimes there is a Coalition of the Eye-lids, so that the Eye cannot be opened; and, what is an usual Accessory to the Disease, a Cohesion of the Eye-lids with the White of the Eye, which is owing to Carelessness in the Cure of an Ulcer affecting either of the Parts; for, as the Sore heals, what might and ought to be separated, will, if neglected, be glued together. The *Greeks* call both Affections *ἀγκυλοβλέφαρον*.

When there is only a Cohesion of the Eye-lids, they may be easily separated, tho' sometimes to no Purpose, for they will unite afresh; however, we ought to try, because it often succeeds. Introduce therefore the Specillum, with the blunt Side towards the Eye, and with it separate the Eye-lids; after which lay some small Pledgets between them, till the exulcerated Place be heal'd.

But when there is an Adhesion of the Eye-lid to the very White of the Eye, *Heraclides the Tarentine* advises cutting at the inferior Part of the Adhesion, the sharp Edge of the Knife being turn'd upwards; but with great Tenderness, that we may avoid cutting off any thing from the Eye or Eye-lid; but, if necessary, let it be rather from the Eye-lid. After this, the Eye must be anointed with Medicines proper to cure Asperities, and the Eye-lid must be turn'd up every Day, not only that the Medicine may have Access to the Ulcer, but also that it may not again adhere; and the Patient himself must be charg'd to raise it often with his two Fingers. I don't remember, that ever any one, by this Method, recover'd; and *Meges*, in his Writings, owns, that he had try'd many things, but never once succeeded; because the Eye-lid always stuck to the Eye afresh. *Celsus*, *Lib. 7. Cap. 7.*

The upper Eye-lid sometimes grows to the lower, sometimes to the *Tunica Adnata*, and sometimes to the *Cornea*. This Disease is an Impediment to the Function of the Eye.

In this Case the Coalition must be dissolved, either by passing a Probe under the whole Eye-lid, or by first distending it with a Hook, and then using the *Pterygotomus*; taking care not to wound the *Cornea*, lest it should occasion a Falling out of the Sight.

After the Section, and Infusions into the Eye, the Eye-lids are kept asunder by the Interposition of Lint, lest they should grow together again; then we apply Wool moisten'd with an Egg [*αἰβερχης*]; and, after the third Day, carry on the Cure with attenuating and cicatrizing Collyriums. *P. Eginet. Lib. 6. Cap. 15.*

When there is a Coalition of the Eye-lids, either with one another, or with the Eye itself, whatever be the Cause, it is call'd an *Ancyloblepharon*; and is easily distinguish'd from that Distemper of the Eyes, when, by the Intervention of some glutinous Matter, as it often happens in the Small-pox, and an Ophthalmia, they cohere or are glued together for a Time only, without a true Coalition.

Sometimes the Eye-lids unite so closely, that the Eye can by no means be open'd (see *Tab. 36. Fig. 23. A. A.*); and sometimes one, sometimes both Eyes labour under this Disorder; sometimes again the Eye-lids cohere with the Eye, either by the White of the Eye, or the *Cornea Tunica*, in a closer or looser manner, according to the Number of Fibres between which there is a Coalition. Affections of this Kind usually hap-

pen whenever the Eyes, or Eye-lids, have been injur'd by the Small-pox, or some violent Inflammation, or an Amblyopia; especially with Gun-powder; or, in short, by any other Exulceration whatsoever. 'Tis also no unusual thing for Infants to be born with this Defect, or for adult Persons to contract the same, as when, by means of a preternatural Excrecence of Flesh in either Canthus, the Eye-lids grow together, of which I have seen an Example.

Tho' this be, for the most part, a dubious and dangerous Disease; yet it is never more so, than when there is a Cohesion of the Eye-lids with the *Cornea*; for, in this Case, the Patient is seldom or never cur'd without the total Loss, or great Diminution of Sight. But the Eye and Eye-lids are separated with the greatest Difficulty, when the Disease is caused by an Amblyopia; wherefore it is much the best way to be diligent in making Injections of moistening and mollifying Medicines into the Eyes, to preserve them always moist and moveable, and to prevent the inflamed Parts from being glued together. But when there happens a Coalition of the Eye-lids from the Small-pox, they usually also grow to the Eye, and especially to the *Cornea*, from which they cannot easily be separated without very great Damage to the Eye; for, however circumspectly and nicely they are divided, there will always remain some Spots and Cicatrices in the *Cornea Tunica*, which are a great Impediment to Vision, and are seldom or never removed.

From the Premises we may infer, that the principal Part of the Cure consists in separating, by the Help of a ready and expert Hand, the conglutinated Parts. For this Purpose let the Patient be placed in Bed, or in a Chair, in such a Position as may be most convenient for taking a full View of the Eye, and for the commodious Access of the Surgeon. This done, the Surgeon is, first of all, to examine whether the Eye-lids be quite closed up, or whether there be any small Interstice to be met with any-where between them; which, if there be any, is commonly found in the great Canthus, or Corner of the Eye nearest to the Nose. If there be a perfect Coalition of the Eye-lids, a small Perforation is to be made in either Canthus, as shall be most convenient; in performing which, the Hand is to be conducted with the greatest Care and Nicety, for fear of hurting the Eye, and especially the *Cornea*. Into this Perforation is to be introduced one Arm of a fine Pair of Scissars, or a crooked small Knife, arm'd with a Button at Top, by the nice and even Management of which the Eye-lids are to be separated from each other. If the Eye-lids are not perfectly united, there is no Necessity of making a new Perforation; but the Instruments before-mention'd are immediately to be introduced, and the Eye-lids disunited in manner aforesaid. But if the Surgeon should not happen to be furnish'd with this Instrument, or Knife arm'd with a Button, to prevent, however, the Eye from being touch'd or injur'd by the Scissars, or sharp Lancet, it will be proper first to introduce a fine Probe with a Groove (see *Tab. 36. Fig. 24.*); and then, by another fine Instrument, as a Pair of Scissars, or Lancet used for Incision of Bleeding, with all imaginable Care to disjoin the Eye-lids from one another.

This done, we are to inspect very narrowly, and examine with the Probe, whether the Eye-lids adhere to the Eye: If this be the Case, we are to proceed with severing them, by cutting with the greatest Caution; or, if they stick to the Pupil by only a few Fibres, the Separation is to be effected by a Knife arm'd with a Button, or a Lancet blunt at the Point. If there be a perfect Coalition of the Eye-lids with the Eye, or at least with a great Part of it, this Operation by Section is usually not only troublesome, but extremely dangerous; for the Eye-lids can hardly be loosen'd from the *Cornea*, without damaging both It and the Sight, as before observed: But if the Coalition is only between the Eye-lids and the White of the Eye; their Division is much easier to be accomplish'd, without Danger of Blindness; for a Hurt done to the White of the Eye is of so small Moment, that I dare maintain, that if an Abscission from one or other of the Parts be unavoidable, it is better to cut off something from that white Tunic, than from the inner Membrane of the Eye-lids; because by injuring this Membrane, the Ducts of the Lachrymal Glands are at the same time very liable to be destroy'd, which would be of very bad Consequence. Hence appears the Necessity of a skilful and well-exercis'd, as well as steady, Hand in this Operation, that the Eye may receive no Damage.

But in order to prevent the separated Eye-lids from a fresh Cohesion, which usually happens, if not prevented by Art, there is no better way than to interpose between them a very thin Slip of the finest Leather, a Bit of Linen, or Gold-beater's Leaf, or Wax, or a thin Plate of Lead, in the Form of a Half-moon, or of an artificial Eye, and anointed with Oil of Almonds, or some such Oil; or else put some Lint between them. And whatever is thus interposed, must there remain for some Days, or till the Danger of a new Coalition is over; or if any thing happens to fall off, or is voluntarily taken off for some particular Reason, it must immediately be replaced. If any Person, as is sometimes the Case, cannot bear to have any thing of this Nature interposed, then, in order to prevent, as much as possible,

ble, a new Coalition, a Collyrium, compounded of Plantain-water, Tutty, and Sugar of Lead, is to be often infill'd into the Eye; or a Powder prepar'd of Sugar, Pearls, and Crabs-eyes, from time to time sprinkled on the Place. The Patients also are to be charg'd gently to rub and stroke their Eye-lids, and to lift them up with their Hands. In short, the Surgeon himself must, now-and-then, introduce a blunt Probe between the Eye and its Lids, for the more easy Prevention of a new Agglutination.

When by means of the Small-pox, or an Inflammation of the Eyes, as it often happens, the Eye-lids stick together during Sleep, thro' the Intervention of some viscid Humours, or glutinous Matter, so that the Eye cannot be opened, nor the Patient have the Use of Sight; in this Case, the Eyes are never to be open'd by Force, but the Humours are rather to be mollify'd by Injection or Instillation, or frequent washing the Parts with warm Milk; by the Use of which the Patients are usually enabled, in a short time, to open their Eyes, and to see again. *Heister.*

ANCYLOGLOSSUM, a Contraction of the Ligaments of the Tongue, hindering Speech. From *αγκυλω*, crooked, and *γλῶσσα*, the Tongue.

Some are Ancyloglossi [Crooked-tongued] from the Birth, others from a Disease. The former are such as have the lower Membrane, which support the Tongue, form'd imperfect, or of too hard a Substance, by Nature; the latter are those who are affected with an Incurvation of the Tongue, occasion'd by a preceding Ulcer, and a hard Cicatrix left under the Tongue; these speak with Difficulty, on which account they are call'd by the Greeks *μυριαδαί*. The Ancyloglossi by Nature are late before they come to their Speech; but after they have begun to speak, they utter their Words without Impediment, and fast enough, yet hesitate in pronouncing Words which are difficult of Pronunciation in other respects, as are those which have R, L, or K, repeated once or oftener. Ancyloglossi ought to be cured only by manual Operation, under the Hands of a Surgeon.

To perform this in a convenient Manner, the Patient must seat himself, and raise his Tongue to the Palate; then, if the Cause of the Incurvation lies in the Membranes themselves, the Surgeon takes hold of them with his Hook, extends them, and cuts them off, taking care that he does not, at the same time, cut the subjacent Veins. But if a Cicatrix be the Cause of the Curvature, it is in like manner taken up with the Hook, extended, and whatever is hard, and not of a Piece with the natural Flesh, is cut off. After the Operation the Mouth is to be wash'd with cold Water, or Posca, and then the Wound is to be sprinkled with Powder of Frankincense, and Lint must be apply'd to the Place. On the Days following the Sore is to be wash'd with Hydromel, and anointed with Egyptian Ointment, and Lint is to be laid thereon, in order to keep the Sides of the Wound separate, that the same may not be form'd again. *Aetius, Tetr. 2. Sermon. 4. Cap. 36. Paulus Aegineta, Lib. 6. Cap. 39.*

That Operation by which the Membrane under the Tongue, commonly call'd the Frenulum, by Physicians, is divided or cut, is styl'd *untying the Tongue*. This Operation is most generally perform'd upon Infants, and that with two different Intentions: First, in very tender Infants, when the fore Part of their Tongues, from the Moment of their Birth, is so closely join'd to the subjacent Parts, by means of this Membrane, that they cannot move their Tongues sufficiently, or thrust them so far out of their Mouths as to be able to suck. This Operation is also perform'd on Children somewhat farther advanced, when, by this Membrane's being too streight or short, they cannot pronounce articulately at an Age when it might be expected of them. For both these Reasons, this Operation is absolutely necessary; but it must be remember'd, that it is not to be perform'd promiscuously, and at random, upon all new-born Children, as most Midwives, Women, and even some Men, idly imagine. We have Reason rather to assert, that it is scarce necessary in one of a thousand Infants; for Experience has shew'd both myself and a great many more skilful Physicians, that this Case occurs far less frequently than Hare-lips; for when a Child can thrust its Tongue without its Lips, there is nothing amiss about the Frenulum; and it will learn, in Process of Time, both to suck and speak, unless there be some other Defect in the Organs necessary for these Purposes. On the other hand, if the Infant can scarce move its Tongue, and cannot thrust it beyond its Teeth; or if, in some other respect, this Membrane should fetter the Tongue, then a skilful Incision becomes very proper: But because this Operation is not to be rashly perform'd, lest, as has frequently been the Case, the most terrible Evils, and sometimes Death itself, should ensue, it will not be amiss to direct to the safest and most accurate Method of performing it.

The Point of the Tongue, then, ought to be a little elevated with the Left Hand, using either a Linnen Cloth, that it may not slip thro' the Fingers, (see *Tab. 42. Fig. 1.*) or even with a small Fork made for that Purpose (see *Tab. 42. Fig. 2. 3. and Tab. 22. O. and P.*); then as much of the Frenulum, as is necessary for Speech and Sucking, is to be cut with blunt-

pointed Scissars, (see *Tab. 22. C.*) or an Incision-knife; betwixt the *Vena Ranina* and the lower Salivary Ducts: But this is to be done with a great deal of Caution, lest either the Salivary Ducts, the *Vena Ranina*, or the Nerves of the Tongue, should happen to be cut at the same time; for when these are injur'd, very terrible Consequences ensue. Thus *Dionis*, in his Surgery, makes mention of an Infant, who by an excessive Hæmorrhage, in consequence of the *Vena Ranina* being cut, died very soon after the Operation. But if a Vein should be unluckily cut, which may very readily happen in a Frenulum that is too thick and short, a Compress, soak'd in Vinegar, is to be held a little while under the Tongue, till the Blood stops; but if, at the first Incision, the Tongue is not sufficiently untied, a few Days, or even a few Weeks after, as Circumstances shall require, the remaining Part of the Frenulum is very cautiously to be cut with Scissars, or an Incision-knife: Then, after the Operation is over, the Finger dipp'd in Honey of Roses, or Syrup of Violets, is very frequently to be rubb'd up and down under the Tongue, and the Wound is to be anointed with it, lest the cut Frenulum should again unite.

From what has been said it appears, that Disorders of this Nature are not only less frequent, but of more difficult and hazardous Cure, than is generally thought. Upon this Account, those Midwives are miserably mistaken, who, concluding with the ignorant Multitude, that no Infant is born without this Defect, thrust their whole Fingers into the Infant's Mouth, and with their Nails destroy the Frenulum; for it must necessarily happen, that such a rash and fool-hardy Laceration, by their Nails, must bring an Inflammation of that Membrane, Convulsions, and often the Death of the little Patient: For this Reason, Midwives and foolish Women are not only to be caution'd against such Practices, but *Hildanus* is to be carefully consulted; for he (in *Cent. 3. Obs. 28.*) hath very accurately laid down not only the Nature and Cure of the Disorder itself, but also the several bad Consequences that possibly may, and generally do, ensue from performing this Operation at an unreasonable Time, or in an uncautious Manner. But when the cutting this Frenulum is absolutely necessary, it may be done much more safely, and with much less Pain to the Patient, by the Scissars refer'd to, than by the long Nails of a simple old Woman. *Heister.*

There is no Operation belonging to a Surgeon, which is commonly esteem'd of so slight Moment as cutting the Ligament under the Tongue, the Care of which is commonly committed to Midwives, who use to break it off with their Fingers. Now this I cannot but disapprove, because they very often lacerate and break the adjacent Parts, so as to occasion a Pain and Inflammation, which hinder the Child from Sucking; whence he grows froward, lean, and weak. We ought therefore to act with Prudence in this Operation, and not think too slightly of it, tho' it seems to be the least in which we are concern'd: In the first Place, we ought to examine, whether the Ancyloglossus really wants the Operation; for Children are often incapable of uttering an articulate Voice, from some other Cause than the Ligament under the Tongue, being not really Tonguetied; and in such Subjects a Section would be dangerous, as will appear from the following Example:

A Peasant of my Neighbourhood, in the Village of *Corfellis*, named *Petit Yeux*, in May 1608. brought his Son, two Years old, to my House, to have his Tongue untied; for the Parents were thoroughly persuaded, that if the Ligament was cut, the Tongue would perform its Office, and the Child would speak in a short time. But when the Mouth was open'd, and the Tongue, which was very thick, was raised, no nervous Ligament appear'd; therefore I sent back the Parent with the Child, without doing any thing. A Month after came about a Circumforaneous Empiric, or Mountebank, who had the Child brought to him: He persuaded his Parents, that his Tongue was ty'd by a very hard nervous Ligament; and had the Impudence to affirm, that for a Sum of ready Money he could easily bring the Child to speak in a short time. He receives the Money, the Child is placed in a Woman's Lap, and the Impostor goes to work; in which, as I was told by some who stood by, he separated the Tongue both before and on both Sides to a great Depth from its Basis. The Consequence was, that the Boy, who before could go upright, on that very Moment sending forth a most loud and bitter Cry, was seiz'd with a Convulsion, so that his Knees were drawn up towards his Groin, and his Arms towards his Breast. On July 18. next, I visited this Child, and found that he could not speak a Word, and that his Legs and Arms were still contracted, and, when extended by Force, still fell back into their former Posture; his Tongue was thick, and his Head, and all Parts of his Body, of a phlegmatic Constitution.

I had a Brother, by the Mother's Side, who was very sickly when a Child, and, amongst other Disorders, could not speak a Word till he was three Years old. As I lived with a Surgeon, and exercised the Operation of cutting this Ligament almost every Day, I had once a Fancy, when I visited my Father's House, to inspect my Brother's Tongue. I found it tied and bridled

bridled with a gross thick Ligament in such a manner, that he could hardly put it out to his Fore-teeth: I cut it as well as I could, and for some Days after anointed the Place three or four times a Day with Honey of Roses. Two Months after the Abscession I found the Ligament in some measure renew'd; so that I was oblig'd to use the same Means as before; which, by the Divine Blessing, happily succeeded; for the Boy began to speak in a short time, and has ever since continued to speak as well and articulately as any Man.

This Operation is void of all Danger, if it be rightly perform'd. We are principally to take care, that we do not cut too deep: My way is to raise the Tongue, and cut the Ligament commonly in two, and sometimes in three Places; by which means it is more difficult for it to grow together again, than if the Incision had been only made in one Place. I cut only what is nervous, scarce touching the Flesh; and if it be not cut enough the first Time; or if it grows together again, the same Operation may be renew'd. When the Ligament is cut, I order the Nurse to raise the Tongue very often, and gently, with her Finger anointed with Honey of Roses, or common Honey, which is the way to prevent an Agglutination. *Hildanus, Cent. 3. Obs. 28.*

ANCYLOMELE, Ἀγκυλομήλη, from ἀγκύλῳ, crooked, and μέλη, a Probe. A Surgeon's crooked Probe; or, a Probe with a Hook.

ANCYLOSIS. The same as **ANCYLE**, which see.

ANCYLOTOMUS, **ANCYLOTOMUM**, Ἀγκυλοτόμος, Ἀγκυλοτόμῳ, from ἀγκύλῳ, crooked, and τέμνω, to cut. A crooked Knife to cut the Ligament of the Tongue: It is also used, as by *P. Egineta*, to signify any crooked Knife in general.

ANCYRA, Ἀγκύρα, an Anchor, a Hook. See **UNCUS**.

ANCYROIDES PROCESSUS, a Process from the upper Part of the Neck of the Scapula, or Shoulder-blade, resembling an Anchor, whence it takes its Name. It is also called *Coracoides*, and *Sigmoides*, from representing, in some measure, a Crow's Bill, and the Letter Sigma. *Rufus Ephesius*.

ANCYROMELE, the same as **ANCYLOMELE**. *Galen* explains it ἄγκυρῃ, a Surgeon's Hook.

ANDA, *G. Pison*. is a Tree of *Brasil*, the Wood of which is spongy and light; the Leaf longish, fibrous, and pointed; the Flower large and yellow, and the Fruit a grey Nut, which incloses, under a double Rind, two Kernels, of the Taste of Chestnuts.

The Fruit is said to be Purgative, and a little Emetic: Two or three of the Kernels are a Dose. They extract Oil by Expression from these Kernels, with which they anoint their Limbs.

The Rinds of the Fruit are esteemed proper to stop a Looseness. Thrown into Ponds, they kill the Fish. *Lemery de Drogues*.

ANDARAC, red Orpiment. *Rul. Johnf.*

ANDAS, a Solution of Salt, or Salt resolved. *Paracelsus*.

ANDENA, Steel imported from the Eastern Countries, which melts in the Fire, and takes any Form. *Rul. Johnf.*

ANDIRA, or, **ANGELYN**, *G. Pison*. a Tree in *Brasil*, the Wood of which is hard, and proper for Building: Its Bark is of an ash Colour: Its Leaves resemble those of the Laurel, but are less: It produces blackish Buds, from whence proceed many Tufts of Flowers, which are fragrant, and of a fine purplish and blue Colour: Its Fruit is of the Shape and Size of an Egg, green at first, but grows blacker by Degrees; has, as it were, a Seam running down one of its Sides, and is of a very bitter Taste. It is cover'd with a hard Rind, inclosing a Grain, or yellowish Kernel, of a bitterish, and somewhat astrigent Taste.

They pulverize this Nut, and give it for the Worms; but the Quantity must not be above one Scruple; for more than this, they say, turns to Poison.

The Bark, Wood, and Fruit of this Tree are as bitter as Aloes, in which it differs from another **ANDIRA**, which resembles it in every thing, except the Taste, which is insipid. The wild Beasts eat of this Fruit, and it fattens them. *Lemery de Drogues*.

ANDIRA, is also an Animal call'd *Andira guacu*; a kind of Bat in *Brasil*, the largest of which are as big as our Pigeons: They call them Horned Bats, because of a sort of Excrecence or pliant Body above their Beak: Their Wings are longer than half a Foot; they are of an ash Colour, have large Ears, and white Teeth; each Foot hath five Toes armed with sharp Claws. They persecute all Sorts of Animals, and suck their Blood. Some of these are very dangerous; for they get into Beds in the Night, and so subtly open the Veins in the Feet of those who are in Bed, that they are no sooner perceived than by the Blood that flows in the Bed, which it is a difficult Matter to stop. The Inhabitants of that Country reckon the Tongue and Heart of that Animal amongst Poisons. *Lemery de Drogues*.

ANDRACHNE. Among the homonymous Words of the *Materia Medica*, which are very numerous, is Ἀνδράχνη, An-

drachne, which signifies a Tree like the Strawberry-tree, and also the Herb *Portulaca*, Purslain. In vain does *Pliny* distinguish here between the Herb and the Tree, by changing one Letter; as if the Tree were call'd Ἀνδράχνη, *Andrachne* [*Pliny, Edit. Santandreaus, 1582, distinguishes the Tree by leaving out a Letter, that is, the first n, calling it Adrachne*]; for this *Attic* Name belongs as well to the Herb as the Tree, the *Attics* usually saying *Andrachne*, instead of *Andrachne*, which is the common Word; just as they say λίτρον, *Litron*, for what others call νίτρον. No less mistaken is *Galen*, when he labours at making a nominal Distinction of Ἀνδράχνη, and Ἀνδράχνη, *Aphronitron*, and *Aphrolitron*.

Andrachne, is the Herb in Latin call'd *Portulaca*, or *Porcaca*, quasi a *Porcis*, "as taking its Name from Swine; and hence "the later *Greeks* have call'd it χοιροβότανον, *Hogwort*." We [the *French*] commonly call it *Pourpier*, when we should say *Poupiéd*, quasi *Pulli Pes*, Fowl's Foot; for so it was call'd by the *Latins* of the latest Ages. The spurious *Macer de Herbis*,

*Andrachne Græcis, quæ Portulaca Latinis
Dicitur, hæc vulgi Pes Pulli more vocatur.*

Many other Herbs have Names of the like Kind imposed upon them; as *Pes Alaudæ*, *Pes Corvinus*, *Pes Columbinus*; *Lark's-foot*, *Crow-foot*, *Dove's-foot*, &c. *Salmaf. de Homonymis. Hyl. Iatr. Cap. 1. See PORTULACA.*

ANDRANATOME, or, **ANDROTOME**, Ἀνδραντομή, or Ἀνδρτομή, from ἀνδρ, a Man, and τέμνω, to cut. The Dissection of a human Body, especially of a Male. *Castellus* from *Marc. Aurel. Severini Zootome Democrit.*

ANDRAPHAXIS, or, **ANDRAPHAX**, Ἀνδράφαξις, Ἀνδράφαξ, in *Hippocr. περί γυναικ.* signify the same as *Atriplex*. Ἀνδράφαξις, stinking *Arrach*. *Fæf. Oecon. Hippocr.*

ANDRAPODOCAPELOI, Ἀνδραποδοκάπηλοι, from ἀνδραποδῶν, a Slave, and κάπηλος, a Dealer; and Ἀνδρακάπηλοι. These were a certain Species of Brokers, mentioned in many Passages of *Galen*. Those People were in antient Times so call'd, who kept Boys, Girls, Slaves, Eunuchs, and other Men for Sale; not for the Purposes of Lust, as Pimps did, but on other Accounts. These People, that they might render their Commodities the more saleable, apply'd themselves carefully to beautify the Bodies of those they were to dispose of: Hence we read in *Galen*, that they us'd to wash the Faces of their Boys with strain'd Pisan, Bean-meal, and sometimes with Nitre, in order to render their Countenances more beautiful and sparkling; that they sometimes lashed the Hips of those which were emaciated, with Rods, and anointed them, that their Bodies might appear fuller and better shap'd; that they brac'd up the Ribs of their Girls with strong Roilers, that their Breasts might appear full, and that the Breadth and Fulness of their Haunches, commonly esteemed an Ornament to a Woman, might be set off to the greater Advantage; and that they sometimes pull'd off, in different Ways, the Hairs growing on their Cheeks, and other Parts of their Bodies, that they might appear more beautiful and young. The *Roman* Ediles enacted a Law, that they should affix certain Titles to their Slaves design'd for Sale, expressive of the Diseases they labour'd under, or the Vices they were addicted to; that the Faulty, in any of these respects, might be return'd to their poper *Andropodocapelos*.

ANDREAS, an antient Physician, mention'd by *Celsus* in the Preface to his fifth Book. This Gentleman, with *Zeno*, and *Apollonius*, surnamed *Mys*, left behind them whole Volumes on the Virtues of purging Medicines. Great Part of these Remedies were neglected, and brought into Disuse, by *Asclepiades*, and not without Reason, as *Celsus* says; for since almost all Cathartics are of bad Juice, and hurtful to the Stomach, this Physician turn'd all his Studies to that Part of Medicine which cures by Regimen.

ANDRÆ COLLYRIUM, the Collyrium of *Andreas*, with which the Forehead is to be anointed in an Inflammation of the Eyes, is thus prepared:

Take Gum Arabic, one Dram two Grains and a half; Cereus, Antimony, each two Drams five Grains; Litharge boil'd and wash'd, four Drams ten Grains. The Litharge must be boil'd in Rain-water, and the dry Ingredients bruised with the Juice of Myrtle. *Celsus, Lib. 6. Cap. 6.*

ANDRÆ MALAGMA, the Malagma of *ANDRÆAS*, for Pains in the Side.

Take of Wax, one Ounce three Drams twenty-seven Grains; Mistletoe, Tears of the Sycamore-tree, each one Dram two Grains and an half; Pepper round and long, Gum Ammoniac, Bdellium, Illyrian Orris, Cardamoms, Amomum, Xylbalsamum, Male Frankincense, Myrrh, dry Rosin, each one Ounce two Drams twenty-five Grains; Pellitory of Spain, Gnidian Grains, Aphronitrum, Sal Ammoniac, Cretan Birthwort, Root of wild Cucumber, Resin of liquid Turpentine, each two Ounces four Drams fifty Grains: To these must

be added as much Unguentum Iridum, as will serve to mollify and make them of a proper Consistence.

This Medicine resolves, draws out a Humour, ripens Pus, breaks the Skin, and cicatrizes. It is proper to be apply'd to small and great Abscesses, and to the Joints; and is therefore good for the Gout and Sciatica. It is good for an inward Bruise, and mollifies Hardnesses and Infections in the Region of the Stomach, extracts Bones, and, in short, is good in all Cases where Heat can be of Service. *Celsus, Lib. 5. Cap. 18.*

ANDRIA, Ἀνδρία, from ἀνὴρ, a Man. An Hermaphroditical Woman, who has the Parts of both Sexes.

ANDRIUS, Ἀνδρεῖος, manly, metaphorically apply'd to strong generous Wine. Ἀνδρεῖος οἶνος in *Hippocrates*, according to *Erotian*, either signifies generous Wine, or Wine from the Island of Andros.

ANDROGENIA, Ἀνδρογένεια, from ἀνὴρ, a Man, and γένναι, to generate. This Word in *Hippocrates*, according to *Galen's* Exposition, signifies a Succession of Males, or a Propagation of the Male Sex.

ANDROGYNI, Ἀνδρογύναι, from ἀνὴρ, a Man, and γυνή, a Woman. Effeminate Men, in Opposition to Andrii, ἀνδρεῖαι, manly. *Hippoc. neci diatr. Lib. 1.* The Word is also used to signify Hermaphrodites.

ANDROMACHUS. *Andromachus* the Elder was a Native of Crete, and lived under the Reign of Nero, as we may conclude from his Poem upon the *Theriaca*, dedicated to that Emperor. *Galen* also observes, that *Andromachus* liv'd after *Menecrates*, who liv'd under *Tiberius* and *Claudius*, and before *Crito*, who flourish'd under *Trajan*. We know nothing concerning this Physician's Sentiments, or the Method of his proceeding in the Cure of Diseases: The only Remains we have of his are a great many Descriptions of compound Medicines, which were partly of his own Invention. *Galen*, who took the Pains to transmit these Descriptions to Posterity, places *Andromachus* among those Authors who have wrote best upon Medicines; but blames him for having given the Descriptions of them, without specifying their Properties and Virtues; and without having pointed out, except very rarely, those Diseases they were calculated to subdue or remove. The most famous of all the Compositions, either invented or described by this Physician, is the *Antidote* which he distinguished by the Epithet γαλήνη, that is, *Calm*; or, rather, according to the Idiom of our Language, *Calm-procuring*; but this Medicine came afterwards to be called *Theriaca*. *Andromachus* wrote a Greek Poem in Elegiac Verse, which he dedicated to Nero, and which is extant to this very Day. In this Work he teaches the Manner of preparing his Antidote; and specifies the particular Disorder for which it is proper. He chose to give this Description in Verse, rather than in Prose, that Alterations might not be easily made in it without being discover'd. At least *Galen* is of this Opinion, and approves of the Conduct of *Andromachus* in this Particular.

Till that Time the Antidote of *Mithridates* was the only Medicine used by every body; but when that of *Andromachus* came to be known, the former was laid aside as useless, tho', to speak the Truth, the latter was no more than an Imitation of it; since the only essential Difference between them consisted almost in nothing else than the Addition of the Vipers as an Ingredient into the *Theriaca*. Notwithstanding this, the Antidote of *Andromachus* was so highly esteemed at Rome, that some Emperors would have it made up in their own Palaces; and took particular Care to have all the Ingredients brought from the Places where they were produced, on purpose. The Emperor *Antoninus* used the Bulk of a Bean of it every Morning fasting, and its Reputation was now so effectually established, that several Physicians endeavour'd, but in vain, to alter it, and compose new *Theriacas* in their own Manner: But the *Theriaca* of *Andromachus* retained its Character in spite of all the Efforts they could make; and what is still more surprising is, that tho' a great many Faults or Superfluities have long ago been observ'd in its Composition, yet, to this very Day, the most considerable Towns in Europe religiously follow the Directions of *Andromachus*, in their Method of preparing it.

This Direction comprehends above sixty Ingredients, most Part of which are Aromatics, except some common Simples, Gums, and inspissated Juices, the most considerable of which is Opium. But the Vipers are the Ingredients from which this Medicine receiv'd the Name *Theriaca*; for the Word θηρίον, among the Greeks, imported all Kinds of fierce Animals, but more particularly such as were esteemed venomous. Before the Vipers were used as an Ingredient in the *Theriaca*, they were thus prepared: After their Heads and Tails were cut off, they were skinn'd, their Entrails taken out, and their Flesh separated from their Bones: Then the Flesh was wash'd, boil'd in Water with Dill and Salt, and kneaded with Crumbs of Bread into such a Consistence, as that the Whole might be form'd into Troches, or little Cakes.

If the Antidote of *Andromachus* was possess'd of the wonderful Qualities ascribed to it by its Inventor, we should scarcely have Occasion for any other Remedy; for he prescribes it against Poisons and Venoms of all Kinds, and pronounces it a Remedy for Pains and Weakness of the Stomach; for Asthmæ, and Difficulty of Breathing; for beginning Consumptions, Emphysemæ, Colics, Jaundice, Dropsies, Weakness of Sight, Convulsions, Ulcers of the Bladder, Venereal Impotence, Pains of the Kidneys, and even of the Plague itself.

Andromachus the Son, who reduced the Father's Verse to Prose, asserts, in so many Words, that the *Antidote* called *Theriaca* was excellent in all Indispositions of Body, proceeding from internal Causes, and especially for Disorders of the Stomach, for Poisons, and for intermitting Fevers.

Both Father and Son talk'd of their Antidote in this romantic Strain. But before we go farther, we must make a particular Inquiry into the Time when; and the Manner how, these Compositions came to be used; and what it was that People meant by an *Antidote*. *Hippocrates*; and the most ancient Physicians, seem to have founded the principal Maxims of their Practice upon the Observation of the several Motions of Nature in particular Distempers; and almost the Whole of their Method of Cure consisted in Diet, that is, in giving proper Rules relating to the Regimen of the Patients. *Herophilus* and his Followers were the first who made any considerable Use of Medicines, or who began to repose a greater Confidence in their Efficacy, than the Physicians who went before them: *Hippocrates*, it must be owned, made use of them sometimes, but very rarely, and even those he prescribed were of the most simple Kind. This Practice was not imitated by the Abettors of *Herophilus*, nor even by some Physicians, who liv'd a little before his Time; witness the Complaint which *Erasistratus* his Contemporary made against those who compos'd *Royal Compositions* and *Antidotes*, which they styled the *Hands of the Gods*. In these there were Ingredients drawn from Plants, from Animals and Minerals; from the Earth, and from the Sea.

But, compound as these Antidotes were, of which *Erasistratus* complains, 'tis probable that they were not so faulty, in that respect, as those which were afterwards made; and that before the Antidote ascribed to *Mithridates*, the shortest Receipt of which contains thirty-six Ingredients, so compound Preparations had not been seen. There was also another Antidote much more simple, the Receipt of which was found in the Closet of *Mithridates*, after he was routed by *Pompey*. We don't know at what particular Time this second Receipt or Prescription was made public, but 'tis probable it was so, very soon after the first, whether it actually had *Andromachus* for its Author, or only usher'd itself into the World, under the Sanction of his Name. Be this as it will, *Celsus*, who probably liv'd about an hundred Years after *Mithridates*, has describ'd the *Mithridate*; upon the Model of which the *Theriaca*, and all the other Medicines, consisting of a great Number of Ingredients, were made.

It may be said, in Defence of these Compositions, that Experiments upon Simples being daily multiplied, Physicians imagined, that the more of these Simples of similar Qualities were crouded into a Composition, the more likely it was to answer the End intended by it. It is also possible, that, as their Knowledge, both of the Qualities of Simples, and the Natures of Diseases, was very imperfect, they might imagine, that by mixing a great many Drugs together, they could produce Effects which one could not, since the Medicine is often wiser than the Physician who prescribes it. But *Pliny*, and a great many others after him, have imagin'd, that they crouded such a Number of Simples into their Compositions, only ad *Ostentationem Artis*, rather to make People believe, that there was more of Art and Mystery in their Profession, than from a Persuasion that such a Farrago was of any real Use in the Cure of Diseases.

The same Author, reflecting upon the *Mithridate* having fifty-four Simples in its Composition, and upon the small Quantity of each Ingredient that must consequently be taken at a Dose, is so provok'd against this Abuse, that he openly declares his Surprise, that Men should be capable of so glaring and bare-fac'd a Piece of Imposture. He puts the *Theriaca* upon the same footing, and says, that the *Theriaca* was invented for the sake of Delicacy or Sensuality; that it is composed of Ingredients produced in Foreign Countries; and that there were every-where Numbers of simple Medicines capable of answering the same Purposes equally well. Here he must certainly mean the *Theriaca* of *Andromachus*; for what he says with regard to the Foreign Ingredients, cannot be apply'd to that other Sort of *Theriaca*, which he elsewhere describes, [*Lib. 20. Cap. 24.*] and which, he says, consists only of a very small Number of common Simples. Hence we may infer, that the Antidote of *Andromachus*, which was called *Galenæ* by its Author, had the Name of *Theriaca* given to it before the Days of *Crito*, as the Author of the Book *De Usu Theriacæ*, ascribed to *Galen*, insinuates. Now *Crito* liv'd under *Trajan*, whereas *Pliny* liv'd under *Nero* and *Vespasian*, and consequently

quently might have seen both the elder and younger *Plinys*, whose Cotemporary he was, tho' he mentions neither one nor the other.

As for the Name *Antidote*, which was bestowed upon the *Theriaca*, it is composed of two *Greek* Words, one of which signifies *against*, and the other *given*; because Antidotes were given against Poisons, Corruption of Humours, or other bad Dispositions of Body. This Word seems in the *Greek* Language to be both of the Masculine and Feminine, and even sometimes of the Neuter Gender; and the *Latins* have said, *hæc Antidotus*, and *hoc Antidotum*. But, in all Probability, the *Greeks* at first used this Word as an Adjective, and not as a Substantive. When they used the Words *ἰσχυρὸν*, they understood the Substantive *Δύναμις*, which signifies every Sort of Medicine, Simple as well as Compound. The *Latins* might have translated the Word *Δύναμις*, by *Potentia*; but the Idiom of their Language, and the particular Idea they had affix'd to that Word, would not admit of such a Translation. The *Latins* then, for want of a proper Word to express the *Greek* *Δύναμις*, made use of the Words *Medicamentum* and *Compositio*, *Δύναμις ἰσχυρὸν*, *Compositio contra data*, as if one should say, *Δύναμις τελεσπάρχων*, a Composition, consisting of four Simple Ingredients; *Δύναμις ἰσχυρὸν, ἀσκήσαν*, a Composition for the Liver, or the *Aspera Arteria*. The Word *Δύναμις* was not only suppress'd by the *Greeks*, when they talk'd of Antidotes, but almost upon all other Occasions: Thus, for Instance, they used *ἰσχυρὸν καδελόν*, to express a Composition of Poppy-heads, and even without the Article, they used *ἀσκήσαν*, to denote a Medicine for the *Aspera Arteria*; *καλὴν*, for a Medicine against the Colic. We may even venture to say, that the Conjunction of these two Words *Antidotus Tranquilla*, or *Theriaca*, imports, that the former is a Substantive, and the latter an Adjective; but we must observe, that the Adjective *tranquilla* is an Epithet given to this Composition, and that the Meaning is the same, as if one should say, *Compositio Antidotus, Tranquilla dicta*; so that these two last Words are equally Adjectives. The Case is the same with regard to the Names of other particular Antidotes, such as *Hiera*, or *Sacred*, *Telia*, or *Accomplish'd*, &c. I may also shew, that the Word *Antidotus* was an Adjective, from the Use *Scribonius Largus* makes of it, who calls a Plaster, applied to Bites given by mad Dogs, *Emplastrum Antidotum*. I must also observe, that the *Greeks*, in their Turn, had no Word that corresponded directly to the *Compositio* of the *Latins*; for *Σύνταξις*, 'tis true, signifies *Composition*; but then it is restrained to the Act of Composing, and did not imply the Effect or Result of that Act, or the Thing composed; which the *Latins*, and we ourselves, mean by the Word *Composition*. In *Artemidorus*, the Word *Σύνταξις* occurs, which *Cornarius* translates *Compositio*; but I am inclined to think, that it ought rather to be translated by the Word *Præscriptum*, or the Receipt of a Physician.

Having now hinted at the Name of this Medicine, the Nature and Number of its Ingredients, and the Properties ascribed to it by its Inventor, it now remains, that we should give some Account of the Method in which it was prepared, and the Consistence it had; which was common to it, with all the other Antidotes. In order then to prepare the *Theriaca*, the Spices and other Ingredients capable of being reduced into a Powder, were pounded. The Gums and Juices were dissolved in *Cretan* or *Falernian* Wine, and passed through a Sieve after they were reduced into a Pulp. Then all these were mixed *secundum Artem*, in three times the Quantity of clarified *Attic* Honey. I think it needless to enter upon a fuller Detail, or more particular Account; of this Medicine, because 'tis in our Day too well known to call for a more minute and particular Description. What has been said of the Quantity of Honey used in this Composition, is sufficient to convince us, that it must have been of a pretty good Consistence. I shall not here speak of the various Antidotes which different Physicians invented in Imitation of the *Theriaca*, and the *Mithridate*, neither shall I consider those that were in Use before only; thus much I must observe in general, that they were all nearly of the same Consistence, since they were all made up of various Powders, Gums, Juices, and Honey. *Le Clerc Hist. de la Medicine*.

To this Account of the Origine of the *Theriaca*, I shall subjoin the Method of making it, as directed by the College, with *Quincy's* Remarks.

ANDROMACHI THERIACA. The Treacle of *Andromachus*, commonly called *Venice Treacle*.

Take of the Troches of Squills, forty-eight Drams; of the Troches of Vipers, Long-pepper, Opium, and Troches of Hedychoi, each four-and-twenty Drams; of exungulated dry red Roses, of fragrant *Sclavonian* Orris, of Juice of Liquorice, of Sweet Navew-seeds, of Tops of Scordium, of Opobalsamum, Cinnamon, and the Troches of Agaric, each twelve Drams; of Myrrh, Sweet Costus, or Zedoary, Saffron, true Cassia Bark, Spikenard, Schœ-

nanth, white and black Pepper, Male Frankincense, *Cretan* Dittany, Rhapontic, *Arabian* Stechas, Horehound, *Macedonian* Parsley-seeds, Calamint, *Cyprus* Turpentine, Roots of Cinquefoil, and Ginger, each six Drams; of the Tops of *Cretic* Polymountain, of Ground-pine, *Celtic* Spikenard-roots, Amomums, Styrax, Meum-root, Tops of Germander, *Pontic* Phu-root, *Lemnian* Earth, *Indian* Leaf, calcined *Roman* Vitriol, Gentian-root, Gum Arabic, Juice of Hypocystis, Carobalfam, or in its Defect, Nutmegs or Cubebs, of Seeds of Anise, Cardamoms, Fehil, and Heartwort, of *Acacia*, or in its stead, the inspissated Juice of four Plums, of the Seeds of Treacle-mustard, Tops of St. John's-wort, Seeds of Bishops-weed, and Sagapenum, each four Drams; of the best Castor, long Birthwort-root, Bitumen Judaicum, or Amber, *Cretic* Daucus-seed, Opopanax, the Lesser Centaury, and fat Galbanum, each two Drams, of old Canary, a sufficient Quantity to dissolve the moist and dissolvable Ingredients; and of clarified Honey, triple the Weight of all the dry Species: Make it into an Electuary. *S. A.*

This is likewise made with *Syrupus de Meconio* instead of Honey.

This hath continued the same in almost all the Dispensatories it hath yet passed through, and is not only the capital Alexipharmic of our Shops, but of all *Europe*. It has a great deal more wrote about it, than could be contained in the largest Volume: We shall therefore content ourselves with as short Remarks upon this grand Medicine, as is consistent with that Acquaintance every one in the Practice of Physic ought to have with it. That we frequently call it *Venice Treacle*, is from the great Quantities made there, and thence transported to most Parts of the World. As this has passed through many Ages, and the Hands of many, in their own Opinions, able to alter it for the better, there are abundance of different Recipes extant in Dispensatory Writers; and this of our College seems to be one of the best; that in the *Augustan* Dispensatory differs little from it. *Diemerbroeck* greatly extols the Multiplicity of Ingredients in this Composition, and had odd Notions of the united Efficacies of such Ingredients arising to a much higher Degree, and exalting the Virtues of each much beyond what they were possessed of when separate. *Monf. Chorras*, a *French* Author, has wrote a whole Treatise upon the *Theriaca*, and is very particular upon each Ingredient, but says nothing worth Notice here. *Zwelfer*, in his Animadversions upon the *Augustan* Dispensatory, says most to our Purpose, in which he has followed *Quercetan*. Many Ingredients are by them justly found Fault with, as not at all agreeing with the Intention of the Whole, such as Agaric, Rhubarb, Vitriol, &c. The Troches of Squills are likewise rejected, with those of the Viper; because the manner of making them into those Forms, destroys the Virtues which they are intended to retain. If therefore such were omitted, and others proportionably increased, so that the Opium might still have the same Proportion to the Whole, the Medicine would be much the better.

In the Dispensation of this Medicine, *Zwelfer* divides the Ingredients into several Classes, according to their Similitude of Textures; some to be dissolved as the Gums, and the other powdered separately, and afterwards mixed: But such a Trouble seems altogether needless; for some of the more tough and moist Ingredients will beat well enough with such as are drier, and more brittle, and pass the Sieve together; and some even powder the Opium itself, which is as good a way as any, if it has been already cleansed of its Fœces. All the Herbs ought to be cleared of their Stalks, and to be as fresh as possible; and the Roots should be freed from every thing that is unsound or decaying. The Saffron, if its Colour be insisted upon, may be powdered separately, and put into the Wine, drawn from the Vipers. The Galbanum, Turpentine, &c. must be first strained, and mixed with the Honey; and the Species sifted in leisurely, another stirring it all the time, that it may be well mixed; and last of all, the Wine is to be put in. This is a noble Medicine, and cannot be exceeded by any Composition as an Alexipharmic, and a Cephalic; for there is scarce any particular View, which any Symptom can give in either of these Intentions, for which there are not many Ingredients herein of great Efficacy provided. It is a good Opiate, and may more safely be taken than many of the plainer Opiates, in Cases that require some Stimulus to be used at the same time, with such things as procure Indolence; because such alone are apt to occasion Stagnations, and other Inconveniences. There is one Grain of Opium in each four Scruples, and therefore it may be given from one Scruple to two Drams, as the Strength and Circumstances of the Patient require.

Many here have a Prejudice, that this Medicine, made in *England*, is not so good as what comes from *Venice*, as if the Name, which by mere Accident it has obtain'd, confined it to be made good only in that Place; and their Vipers, they

A N D

they say, are much better than any other. But there is no Foundation for this; for tho' their Country is hotter, and so may the more rarefy the viperine Juices, in which their Efficacy herein consists; yet the manner of their making them into Troches loses so much of their Volatility, that the way we have here directed to manage them, carries much more of their Virtues into the Medicine. Besides, this is but a naked Supposition, and in which there does not seem to be any Weight; for if we may judge by their poisonous Properties, the Bites of our Vipers, at the proper Time of the Year, which is the hottest, are as efficacious and deadly as theirs. But to end all Controversy on this Head, if a proportionable Quantity of the volatile Salt, drawn from these Creatures, be put into this Medicine, instead of any other Preparation, the Virtues will then be exactly the same; for the Salt which is produced from one, tho' it does not rise in such Plenty, is however of equal Virtues with that which comes from another. But if any other Country has the Advantage over us in this one Ingredient, ours has it much more, in another of as great, if not greater Moment; and that is, in the Saffron; for that which our own Country produces, is of four times more Strength and Goodness, upon every Account, than any which comes from abroad. This foolish Opinion, of the foreign Theriaca being better than what is made here, has occasioned the common People to be cheated, as they too much deserve, with the worst of Medicines for right Venice Treacle. For they, imagining that to be the proper Place of its Manufacture, and that it can come from thence genuine, at cheaper Rates than it is here sold at in our Shops, please themselves much with a Tincture, at a low Price, of a dirty Sailor, who pretends to have imported it, wrapt up with printed Directions in the Italian Tongue; whereas some of our Druggists, and unworthy Wholesale Dealers in Pharmacy, make this wretched Stuff of little else than the Sweepings of their Shops, have the very Bills printed in London, and put it off in this Disguise, upon such simple People. In Reality, no Country can make this cheaper than ourselves, and not easily so cheap, because many of the Ingredients are furnished us from both the Indies. And no one here, buying every thing to the best Advantage, can make it for so little as three Shillings a Pound out of Pocket; and therefore any one may judge what that must be, which is sold for less, as it is by these pretended Importers. They who have any Suspicion, that this is an Injustice upon their Venice Treacle Merchants, may be satisfied at almost any Printer's, who print and keep by them such Italian Directions; unless they can persuade themselves, that an Apothecary at Venice is forced to send to London to have his Bills printed.

This one Remark more the present Practice will not suffer us to omit, which is making this Medicine into an Electuary with *Syrupus de Meconio*, instead of Honey; but such who think there is equal Reason for so doing, proceed upon a great Mistake. The Diacordium is calculated for an Astringent, to which Intention Honey is opposite, because it attenuates and deterges, and therefore with great Reason was the *Syrupus de Meconio* substituted in its Room; but in an Alexipharmic Composition, as the Venice Treacle is, to reject Honey, which is of the same Intention, and very powerfully so too; and substitute what is contrary, unless by Accident, seems to be owing more to Whimsy, or the Vanity of leading an Example, than any good Reason. Opiates indeed contribute somewhat, which, we say, by Accident, forwards the Intention of an Alexipharmic; but in the Theriaca there seems to be a full Proportion of Opium already; so that by the Addition of the Diacordium, instead of procuring that easy Relaxation which favours the Operation of an Alexipharmic, there is induced such an Insensibility, that the Secretions will rather be diminished than enlarged; that is, instead of warming the Patient into a Sweat, he will be dozed into a Stagnation, and so have a Fever, which might be soon thrown off, changed into one of a putrid malignant Kind. And Instances of this Nature I have more than once met with, from the common Venice Treacle, when imprudently taken, or in an Over-dose; and therefore such Accidents are much to be feared, when this Alteration comes more to take Place. The greatest Reason which can be alledged for this Practice, is the Honey disagreeing with some particular Constitutions; but one Instance of this does not happen to a hundred of the contrary: And, if this is sufficient, it pleads for the same Alteration in most of the Official Electuaries; because there are few of them without it. *Quincy's Dispensatory*.

Quincy is undoubtedly right in his Remark with respect to the Change of Honey for Diacodium in this Composition; for if it is made without Honey, it must be a Medicine very different in every respect from the true Theriaca Andromachi; because Honey, by its Fermentation, induces a very great Change in all the Ingredients which enter the Composition of this Capital of the Shops, and unites the Virtues of all the Simples together, so as to become altogether as one, and to act with Uniformity in the Compound.

The Receipt of *Myrsifus* has the Ashes of Crawfish burnt in this Composition.

A N D

ANDROMACHI ANTIDOTUS AD CALCULOSOS: *Andromachus's* Medicine for the Stone and Gravel. It breaks the Stone by Degrees, and expels it, thoroughly cleansing the Bladder, till the Urine is at last discharged pellucid; and, what is of greatest Moment, works so perfect a Cure, that the Stones shall not grow again. It is thus prepared:

Take of Seed of Wild Carrots, Anise, Cucumber-seed husked, Seed of Smallage, Parsley, Myrrh, each a Dram and an half; Cassia, Cinnamon, Celtic Nard, each one Dram; bruise them in Water, and make them up in the Form of small Lupines, to be taken fasting every Day, for thirty Days together, in a quarter of a Pint of Water. *Actius, Tetr. 3. Serm. 3. Cap. 13.*

ANDROMACHI COMPOSITIO AD DENTES MOLARES, *Andromachus's* Composition for the Grinders or Cheek-teeth, which easeth the Pains thereof in an Hour, is made of

Pepper, Pellitory of Spain, Juice of Spurge, Galbanum, of each an equal Quantity. Make them up with Galbanum, and put the same into the Hollow of your Teeth. *Idem, Tetr. 2. Serm. 4. Cap. 33.*

HEPATICA ANDROMACHI CYPHOIDES. The Hepatic Cyphoides of *Andromachus*, good in all Diseases of the Thorax.

Take of Raisins of the Sun, twenty-five Drams, some have it a hundred; of Saffron, a Dram; of Calamus Aromaticus, two Drams; of Bbellium, Juncus Odoratus, each two Drams and an half; Cinnamon, Cassia, Spikenard, each half a Dram; Myrrh, Turpentine, each four Drams; some have it sixteen; Aspalathum, a Scruple; Honey, sixteen Drams; Wine, a sufficient Quantity. *Actuarius, Meth. Med. Lib. 5. Cap. 6. See CYPHI.*

ANDRONIS MEDICAMENTUM PRO CANCRO. *Andron's* Remedy for a Cancer in any Part of the Body.

Take of the Rind of Pomgranate, ten Drams twenty-five Grains; of Birthwort, nine Drams twenty-two Grains and a half; of Aloes, four Drams ten Grains; of Myrrh, two Drams five Grains; of Galls, eight Drams twenty Grains; of Plumous Alum, three Drams seven Grains and a half; of Flos Aëris, two Drams five Grains. Bruise them, and sift them very carefully; then pour to them as much Cretic Raisin-wine, as shall make it of the Thickness of Honey. Keep it in a glass Vessel; and when there is Occasion, take it diluted with austere Wine. This Medicine is good for Carbuncles, for the Ignis Sacer, and for the Girdle, which the Greeks call *Herpes* [*εἶρας*]. *Scribonius Largus, Cap. 13.*

ANDRONIS MEDICAMENTUM IN UVAM. *Andron's* Remedy for the Swelling of the Uvula, consists of

Plumous Alum, Squama Aëris, Vitriol, Galls, Myrrh, Misy. Bruise and mix them together, adding by Degrees, as much austere Wine as will make it of the Consistence of Honey. *Celsus, Lib. 6. Cap. 14.*

ANDRONIS PASTILLI. *Andron's* Troches.

These Troches, *Actius* tells us, are good for running Ulcers; also for Inflammations of the Uvula, and Defluxions on the Tonsils, if the Parts under the Chin be anointed therewith. They take off Films from the Eyes, and are serviceable in the Beginning of Inflammations of the Glandules about the Groins, and for Abscesses in the Intestines after they are broken, when taken in a Clyster with two thirds of a Pint of Water, if there be a Fever, or with the like Quantity of Wine, if there be none. They also deterge the Callosities of Ulcers, and are thus prepared:

Take of Balaustines, ten Drams twenty-five Grains; Galls, Birthwort, each eight Drams twenty Grains; Plumous Alum, Vitriol, each four Drams ten Grains (some take but half that Quantity); Myrrh, Aloes, Frankincense, Saffron, each one Dram two Grains and a half. Bruise them first separately, and then all together, and reduce them into Troches. *Actius, Tetr. 4. Serm. 2. Cap. 50.*

P. Egineta gives a somewhat different Preparation of these Troches, as follows:

Take of Balaustines, ten Drams twenty-five Grains; Galls, eight Drams twenty Grains; Myrrh, Round Birthwort, each four Drams ten Grains; Vitriol, Saffron; Plumous Alum,

Alum, Crocomagna, Misy, Frankincense, each two Drams five Grains; bruise them in austere Wine or Vinegar. *P. Aegineta, Lib. 7. Cap. 13.*

He reckons it among the vehement Kind of Remedies for the Herpes and Carbuncle. *Lib. 4. Cap. 20. & 25.*

ANDRONION, the same as ANDRONIS PASTILLI.

ANDROSACES, Offic. Chab. 458. *Androsace annua spuria*, Ger. 425. Emac. 531. *Androsace Matthioli altera*, J. B. 3. 368. Raii Hist. 2. 1086. *Androsace altera major Matthioli*, Park. Theat. 560. *Androsace vulgaris latifolia annua*, Elem. Bot. 101. Tourn. Inst. 123. Boerh. Ind. A. 201. Rupp. Flor. Jen. 13. *Auricula urfi affinis*, *Androsace dicta major*, Herm. Hort. Lugd. Bat. 82. *Sanicula affinis Planta*, *Androsace dicta major*, Hist. Oxon. 2. 556. *Alpine affinis*, *Androsace dicta major*, C. B. Pin. 251. SUMMER NAVEL-WORT. Dale.

Androsaces grows in the maritime Places of Syria. It is a slender Herb, with thin Stalks, bitter, leafless, bearing small Pods on the Top, which contain the Seed.

The Quantity of two Drams hereof taken in Wine powerfully provokes Urine in hydropical Persons. The Decoction of the Herb, and the Seed, work the same Effect. It also makes a useful Cataplasm for the Gout. *Diosc. Lib. 3. Cap. 140.*

Oribasius reads λευκή, white, instead of λεπτή, slender. *Pliny* also says it is white, and in the rest agrees with *Dioscorides*.

It is a Plant which pushes up many hairy Stalks half a Foot high; the Top, dividing itself into six or seven Parts, forms a sort of Umbel; its Leaves are long and large, hairy, nervous, like that of Plantain; indented all round, spreading round about the Stalk upon the Ground; the Flower is small and white, spreading at the Top, and cut into five Segments; when the Flower withers, a little orbicular Fruit is found as big as a Pea, containing many longish and reddish Seeds; its Root is short and fibrous: It grows in maritime Places, amongst Corn, and in Woods; it contains a great deal of Salt.

It is aperitive, and good for the Dropsy, for Retention of Urine, and for the Gout.

Androsace is so called, from its bringing Relief to Men: *αὐτὸς ἀνδρὸς οὐρεσιν*. *Lemery de Drogues.*

ANDROSÆMUM, Offic. *Androsæmum vulgare*, Park. Theat. 575. Merc. Bot. 1. 19. Phyt. Erit. 8. Mer. Pin. 8. Raii Hist. 2. 1020. *Androsæmum maximum frutescens*, C. B. Pin. 280. Boerh. Ind. A. 242. *Hypericum maximum (quasi frutescens) bacciferum*, Hist. Oxon. 2. 472. *Hypericum maximum Androsæmum vulgare dictum*, Raii Synop. 3. 343. *Siciliana*, aliis *Ciciliana*, vel *Androsæmum*, J. B. 3. 384. *Siciliana*, vel *Androsæmum*, tota bona quibusdam, Chab. 457. *Clymenum Italorum*, Ger. 435. Emac. 543. TUTSAN, or PARK-LEAVES.

It grows in Hedges and Thickets, flowers in July and August; the Flowers, Leaves and Seed are used, which have the same Virtues as Hypericon, or St. John's-wort. Dale.

ANDROSÆMUM is by some called *Dionysias*, by others *Afcyrus*; but there is a Difference between this Plant and *Hypericum* and *Afcyrus*. It is a shrubby Plant, with small slender Twigs, and Branches of a scarlet Colour, and Leaves three or four times as large as those of Rue; which, being bruised, yield a viscid Juice. At the Head it expands itself into a Multitude of Branches, about which grow small yellow Flowers, producing a Seed in the Calyx, like that of black Poppy, and distinguished by Marks, as if they were engraved.

The Leaves, bruised, yield a resinous Smell. The Seed, pounded, and drank to the Weight of two Drams, purges Bile. It is very useful in the Sciatica; but after Purging, the Patient is to take a Draught of Water. The Herb, used in a Cataplasm, heals Burns, and stops Hemorrhages. *Dioscorides, Lib. 3. Cap. 173.*

ANDROSÆMON, or, as others call it, *Afcyrus*; is not unlike *Hypericon*, only has greater, thicker, and redder Stalks. The Leaves are white, and shaped like those of Rue. The Tops of the Herb, bruised, yield a Blood-like Juice. It springs up among the Vines, and is commonly digged out about the Middle of Autumn, and hung up. Bruised with the Seed, and taken to the Weight of two Drams, either in the Morning or after Supper, in Hydromel, Wine, or pure Water, it is a good Purge. But the next Day, the Patient must take the Weight of a Dram of Capet-root mixed with Rosin, and four Days after, he is to do the same. After Purging, the Patient, if of a robust Constitution, ought to drink Wine; if weak, Water. *Pliny, Lib. 27. Cap. 4.*

It is called *Androsæmon*, from *ἀνδρ*, a Man, and *αἷμα*, Blood, from its making the Fingers of those who rub it, look bloody. *Oribasius, Med. Coll. Lib. 11.*

The Stalks of *Tutsan* grow to be two or three Foot high, smooth, reddish, and not much branched, having two large oval brownish green Leaves set opposite at every Joint on very short Foot-stalks, those next the Ground, being usually smallest. On the Top of the Stalks grow the

Flowers, several together, on pretty long Foot-stalks, of five small yellow roundish Leaves apiece, with Stamina in the Middle, of the same Colour, yielding a reddish Juice, upon being rubbed between the Fingers, and are succeeded by Berry-like Seed-vessels, green at first, and afterwards of a deep-shining Purple, almost black, containing small Seed in a purplish Juice. The Root is somewhat thick, of a reddish Colour, with many Fibres. It grows in Hedges and Thickets, and flowers in July.

The Leaves and Flowers are sometimes used, and are counted much of the Nature of St. John's-wort, being a good Wound-herb, used both inwardly and outwardly; and is therefore called in French, *Tout-sain*, signifying *All-heal*, and from thence by us corruptly, *Tutsan*. *Miller Bot. Off.*

It contains a great deal of Oil, and a moderate Quantity of Salt and Phlegm.

It is aperitive, vulnerary, resolute, good for the Stone, to kill Worms, to resist Malignity, and guard against Madnefs, being externally or internally apply'd. *Lemery de Drogues.*

ANDROTOME. See ANDRANATOME.

ANECPYETUS, *Ἀνεκπύετος*, unsuppurated, from *ἀ* Neg. and *ἐκπύετος*, suppurated. See *ΕCΠΥΕΜΑ*.

ANEILEMA, ANEILESIS, *Ἀνείλημα*, *Ἀνείλησις*, from *ἀνείλω*, to roll up, or involve. An Involution, particularly such as is caused by Gripes and Flatulencies in the Intestines. *Hippoc. de vet. Med.*

ANEMONE, a Plant which Botanists, from the Time of *Dioscorides*, have distinguish'd into the cultivated; and wild Sort. The first is,

Anemone hortensis, Offic. *Anemone Geranii Rupertiani folio cœruleo*: an *Dioscoridis*, C. B. Pin. 174. Tourn. Inst. 277. Hist. Oxon. 2. 426. *Anemone Geranifolia*, Ger. 304. Emac. 377. Raii Hist. 1. 625. J. B. 3. 405. *Anemone Geranii folio, radice tuberosa, flore cœruleo & albo*, Chab. 462. *Anemone tenuifolia sive Geranifolia cœrulea*, Park. Parad. 208. GARDEN-ANEMONE. Dale.

The wild Sort is call'd

Anemone sylvestris, Offic. *Anemone Matthioli*, Ger. 304. Emac. 377. *Anemone sylvestris alba major*, C. B. Pin. 176. Raii Hist. 1. 627. Rupp. Flor. Jen. 128. Tourn. Inst. 277. Elem. Bot. 239. Boerh. Ind. A. 37. Buxb. 23. Hist. Oxon. 2. 425. *Anemone sylvestris latifolia alba, sive tertia Matthioli*, Park. Parad. 202. *Anemone magna alba, plurimâ parte anni florens*, J. B. 3. 411. *Anemone magna alba, capitulo tuberoso, caule densa lanugine cœnescente*, Chab. 464. WILD ANEMONE.

Of this Plant there are two distinct Species, the garden and the wild ANEMONE; and each of these Species is subdivided into several others, but especially the former, which is carefully cultivated in Gardens, on account of the Beauty of its Flowers. Their Roots send forth Leaves, that are almost round, and resemble those of Sow-bread, Mallows, Crane's-bill, or *Sanicle*. Some of these Leaves are pretty large, and others smaller; some of them are deeply indented, and others not so much; but still each Leaf has its proper Stalk. From the Middle of these Leaves arise small Stalks, bare half way up, where they are adorned with three Leaves, disposed in Form of a Collar. Each of these Stalks bears at its Top a beautiful large round Flower, with several Leaves disposed like those of a Rose. This Flower is single or double; yellow or white, purple or carnation, blue or red, violet, or diversified with several Colours, and sometimes adorned with a Tuft. When this Flower falls, a Fruit appears in its Place, which is generally of an oblong Figure, and includes a Nut filled with several Seeds, each of which is covered with its proper Husk, which is generally soft like Cotton. Its Root is fungous or knotty, and has many Fibres sprouting out from it. The wild Anemone grows in rising Grounds, and mountainous Places. Both Species of this Plant contain a great deal of Salt and Oil.

This Plant is deterfive, aperient, inciding, vulnerary, desiccative; but generally 'tis only used externally. It is used in Errhines and Collyriums for Ulcers of the Eyes. *Lemery de Drogues.*

There are two Kinds of Anemone, the wild, and the cultivated. Of the latter, one Sort bears a scarlet Flower, another a whitish, or milk-white, and another a purple one. The Leaves are like those of Coriander, tho' but slightly jagged near the Ground. The Stalks are downy, slender, bearing Flowers like those of the Poppy, and inclosing a black or sky-coloured Head in the Middle. The Root is of the Bigness of that of the Olive, or bigger, and divided as it were by Joints. The wild Kind is larger in all respects than the other, having broader and harder Leaves, and a longer Head, a scarlet Flower, with small and slender Roots, more in Number than the former. There is one Sort of it which has black Leaves, and more of Acrimony than the rest.

Both Kinds are acrimonious; for which Reason the Juice of the Root, snuffed up the Nostrils, is good to purge the Head. The Root, chewed, draws out Phlegm. Boiled in Passum,

[γλυκύ,

[γλυκὺν, Wine made of Grapes that have hung on the Vine till wither'd by the Sun] and apply'd as a Cataplasm, it cures Inflammations of the Eyes, deterges Specks, and whatever causes Dimness of Sight, and cleanses Ulcers of Filth. The Leaves and Stalks boiled in Ptisan, and eaten, breed Plenty of Milk in the Breasts, and made into a Pessary, provoke the Menfes; apply'd in a Cataplasm, they remove the Leprosy.

Anemone is by some called *Phenion*. There are two Kinds, the wild, and what is cultivated in Gardens; both delight in a sandy Soil. Of the garden Kind there are several Sorts; for one bears a scarlet Flower, which is the most common, another a purple, and a third a milk-white Flower. The Leaves of these three Sorts are like those of Smallage. They seldom exceed half a Foot in Height, and have a Top like that of Asparagus. The Flower never opens but when the Wind blows, whence it takes its Name. The wild Kind is the larger, has broader Leaves, and a scarlet Flower. Many have mistaken this for the Argemone, others for the red Poppy; but there is a great Difference between them, for both these come later in Flower, nor have they the Juice or Flower-cups of Anemone, and are only like it in having an Asparagus-top.

The Anemones are good for the Pains of the Head, and for Inflammations; help Diseases of the Uterus, and procure Milk in the Breasts. Taken in Ptisan, or apply'd to the Part in Wool, they provoke the Menfes. The Root chewed in the Mouth draws out Phlegm, and makes the Teeth sound; and the Decoction thereof cures Inflammations in the Eyes.

The Magi ascribe much to their Virtues. They order, that as soon as you see the Plant that Year, you take it up, saying these Words, That you gather it as a Remedy for Tertian and Quartan Agues; then wrap it up in a red Cloth, and keep it in a shady Place, till there be Occasion to tie it about the Patient. The Root of that which bears a scarlet Flower, bruised, and apply'd to the Flesh of any Animal, by its putrefactive Quality, causes an Ulcer, and is therefore used as a Deterfice for Ulcers. *Pliny, Lib. 21. Cap. 23.*

All the Anemonies are acrimonious and deterfice, Drawers, and endu'd with the Faculty of opening the Mouths of the Veins. *Oribas. Med. Coll. Lib. 15.*

Emplastrum ex Anemone. The Plaister of Anemone.

Take of Colophony, seventy-four Drams; liquid Resin of the Pine-tree, Wax, each four Ounces; Oil, nine Ounces; fresh Flowers of Anemone, taking out the black that is in them, and cutting off their Bottoms, eight Ounces: Boil the Colophony with the Oil over a Fire made of the Wood of the Pine-tree; stirring it with a Spathula of the Tæda, [a Sort of Pine-tree] till it comes to a solid Mass; then add the Resin, and boil it again, till it will no longer foul; when put in the Wax, and as soon as this is melted, take the Medicine off the Fire, and pour it upon the Flowers bruised in a Mortar, and work them together with your Hand, smeared in Oil; for they are glutinous, and no Water must come near them.

It is good for green Wounds, and bruised Flesh; for old, malignant, over-grown Ulcers, which are hard to cicatrize; for Bites of venomous Creatures; for swell'd and inflamed Joints, that are painful, and not without Difficulty moveable; for Strumæ, Fistulas, a Ganglion, Stæatoma, and Furunculus; for sinuous as well as spreading Ulcers; for Abscesses in any Part, but especially the Breast. To stop an Hemorrhage at the Nose, they lay a Bolster of it upon the Stomach, or it may be apply'd to the Forehead; in short, it mollifies, discusses, contracts, dries, and is an Anodyne.

If you had rather have it prepared with Vinegar,

Let the Flowers of the Anemone be cleansed, and their Bottoms cut off as before, and then dry'd in the Sun, and afterwards kept in a glass Vessel; then take of them eight Ounces, and pour thereto three Attic Half-pints of the strongest white Vinegar, in which let them macerate a Day and a Night. After this, work it with your Hands, and by Degrees press out all the Juice: Then take of the brightest Colophony, forty-two Drams; liquid Resin of the Pine-tree, Wax, Oil, each four Ounces; Juice of the Anemone, two Attic Half-pints and a quarter of a Pint: Boil the Colophony with the Oil at a slow Fire of the Wood of the Tæda, stirring it continually with a Spathula of the same Wood, till it comes to a proper Consistence; then put in the Resin by Degrees, lest it should boil over the Vessel, and boil all again till they come to a solid Mass; when put in the Wax, which being melted, take it off the Fire, stirring it with the Spathula, till it ceases boiling; then pour in the Juice by Degrees, carefully watching that there be no Ebullition, to which it is very subject, so as to run over. While the Mixture is thus gradually made, the Medicine takes a various, purple, and pleasing Colour. All the Juice being thus poured

in, and united with the rest, remove the Whole into a Mortar, and when it is cold work the same with your Hands, till all the Juice is absorbed.

This Medicine is good for the same Purposes as the former, only is of a milder Nature, and more accommodated to the Bites of Dogs, and venomous Creatures. Being diluted with Oil of Roses, it is proper for Ulcers in the Arms and Pudenda, when they need only mild Remedies. *Actius, Tetr. 4. Serm. 3. Cap. 12.*

ANEMONOIDES,

Offic. *Anemonoides flore albo*, Boerh. Ind. A. 36. *Anemonoides flore majore*, Dill. Cat. Giff. 39. *Anemone nemorosa, flore majore*, C. B. Pin. 176. Buxb. 20. *Anemone nemorum alba*, Ger. 306. Emac. 387. Raii Hist. 1. 614. Synop. 3. 259. *Anemone nemorum*, Merc. Bot. 1. 19. Phyt. Brit. 8. Mer. Pin. 8. *Ranunculus phragmites albus vernus*, J. B. 3. 412. Chomel. 653. Tourn. Inst. 285. Elem. Bot. 241. *Ranunculus nemorosus albus simplex*, Park. Theat. 325. *Ranunculus*, Chab. 465. *Nemorosa, flore roseo albo expansa*, Rupp. Flor. Jen. 128. **WOOD ANEMONE.** Dale.

The Word is derived from *Ἀνεμών*, Anemone, and *ἔδος*, Form, that is, in the Form or Image of Anemone.

The Characters are;

The Root is perennial, and for the most part grumose and creeping; the Leaves are finely cut, three of which, for the most part, surround the Stalk; it hath a single Flower upon each Stalk, which consists of many Leaves, and are expanded in Form of an Anemone, having many Stamina or Threads in the Middle; the Seeds are collected into an oblong Head, and are, in Shape, like those of the Ranunculus, having no Down adhering to them.

Miller enumerates six Species, and Boerhaave twelve, of this Plant.

The *Anemonoides flore albo* is found wild in the Woods, in most Parts of England; some of the other Varieties Miller says he hath gathered in great Plenty, in the Wildernesses belonging to the Gardens at *Wimbleton* in Surry, which were probably at first taken from some Woods in England. In this Place they increase so fast, that the Surface of the Ground is cover'd with them in the Spring; and what is more remarkable, there the large blue and double Sorts are the most common. *Miller's Dictionary.*

It is an hot and acrimonious-Plant, that will raise Blisters on the Skin. Dale.

ANEMONOSPERMOS, from *ἄνεμος*, Wind, and *σπέρμα*, Seed, because the Wind easily bears away the Seed.

The Characters are;

It hath an hemispherical scaly Cup; the Flower is radiated like the Ragwort; but the Seeds are copiously surrounded with a pappous Down, as are those of Anemone.

Miller enumerates four, and Boerhaave six, Species of this Plant.

They were originally brought from about the *Cape-of-good-Hope*, into the curious Gardens in *Holland*, where they have been propagated, and from whence they have been distributed into the several Parts of *Europe*, where they are now growing. *Miller's Dictionary.*

ANEMOS, *ἄνεμος*, Wind. See VENTUS.

ANENCEPHALOS, *Ἀνεγκεφαλός*, brainless, from a Neg. and *ἐγκεφαλός*, the Brain. In general it signifies mad, or foolish, but in a more restrained Sense may be apply'd to such Monsters as are born without Brains, on which *Bonetus* in his *Medic. Septentr.* has made a Collection of Observations. *Castellus.*

ANEOS, *ἄνεως*, in *Hippocrates*, as expounded by *Galen*, signifies *ἄφωνος ἢ τὸν νοῦν ἐμπεπλεγμένον*, "one struck with the Loss of his Voice and Reason;" and by *Helychius*, *ἄνεως* are said to be *ἄφωνοι ἢ ἐκπληξῆς ἡσυχῆς*, "seized with a Stupor and Loss of Voice." *Ἄνεως* is put for *ἄνεος*, according to the *Attic* Dialect. *Foefius.*

ANEPICRITON, *Ἀνεπίκριτον*, something of which no Judgment can be formed, that is neither the Object of the Understanding nor Senses, from a Neg. and *ἐπικρίνω*, to judge. Thus *ἄνεπικρίστον διαφωνία*, with the Empirics, [a Sect of Physicians among the Antients] signifies a Controversy and Disagreement in Words about a thing that can never be determined or defined, because of its Acatalepsia, which was a Word much in Use among that Sect, as *Galen* says, *Lib. de Sedis, &c.* See ACATALEPSIA.

ANERECTOS, *ἀνέρηκτος*, *ἀνέρηκτος*, *ἀνέρηκτος*. From a Neg. and *ῥήγνυμι*, to break. Apply'd to Fruit or Corn, not hull'd or broken in the Mill, or with the Pestle. *Ἀνέρηκτος ἕψος*, in *Hippocrates*, *Lib. περὶ τρώων*, signifies Bread made of Wheat not cleansed from the Bran.

ANESIS, Remission. See REMISSIO.

ANESTRAMMENA, *ἀνεστράμμενα*, from *ἀναστρέφω*, to change, or subvert, in *Hippocrates*, is expounded by *Galen* to mean the same as *Anatetaragmena*, *ἀνατέταραγμα*, from *ἀνατάσσω*.

psia, to trouble, or disturb; and 'tis apply'd, he says, to Urine, to signify such as is turbid or thick, without depositing any Sediment after standing.

ANETHOXYLA, *Ἀνεθόξυλα*. So the Translator of *Myrepsus* reads the Word, instead of *ἀνεθόξυλα*, as it is in the Greek Manuscript, and understands it of the woody Root of Dill. *Myrepsus*, *Self*. 8.

ANETHUM, Offic. Ger. 878. Emac. 1033. Raii Hist. 1. 415. Mor. Umb. 36. J. B. 3. 6. Chab. 384. Dillen. Cat. Giff. 136. Rivin. Irr. Pent. *Anethum hortense*, C. B. Pin. 147. Hist. Oxon. 3. 311. Tourn. Inst. 318. Elem. Bot. 268. Boerh. Ind. A. 65. Buxb. 20. Rupp. Flor. Jen. 222. *Anethum hortense sive vulgare*, Park. Theat. 886. **DILL**. Dale.

The Decoction of the Tops and Seed of dried Anethum, being drank, promotes the breeding of Milk, and easeth the Gripes and Inflammations, stops a Looseness and Vomiting, occasion'd by Humours floating in the Stomach, provokes Urine, and asswages the Hiccups. Often used, it renders the Sight dull, and consumes the Seed. The same is also good in an Infection for hysterical Women. The Seed burnt, and sprinkled on the Part, takes off a Condyloma. *Dioscorides*, Lib. 3. Cap. 67.

Pliny adds, that the Root is used, in Water or Wine, to anoint Inflammations of the Eyes [*Epiphora*]. The Seed, vehemently heated, and smell'd to, stops the Hiccups. Taken in Water, it takes off Uneasiness from Crudities. The Ashes give Relief in a *Prolapsus Uvulae*. *Pliny*, Lib. 20. Cap. 18.

The Root, heated, and applied to the Mouth of the Uterus, provokes the Menfes. *Oribasius*, *Synop.* Lib. 1. Cap. 22.

Burnt, and the Ashes sprinkled upon humid Ulcers, especially about the Pudenda, disposes them to heal; and cicatrizes inveterate Ulcerations under the Prepuce. The green Herb, as having less Heat, and more Moisture, is a better Digestive and Hypnotic, but the dry is more discutient. *Actius*, *Tetr.* 1. *Serm.* 1.

This Herb, both in Root, Stalk, and Leaf, very much resembles common Fennel, except that it seldom grows so tall, or so much branch'd; it bears such yellow Umbels of Flowers, after which come Seeds rounder, broader, and flatter than those of Fennel. The whole Plant is of a strong Scent, less pleasant than Fennel. *Dill* grows in Gardens, and flowers and seeds in *July* and *August*. The Leaves and the Seed are used.

Official Preparations from *Dill* are only the *Oleum Anethinum*, made by Infusion, and gentle Coction of the Leaves and Tops in Oil. *Miller Bot. Off.*

I meet with nothing with respect to the Virtues of *Dill* amongst the Moderns; but what has been specified from *Dioscorides*, and the Authors above quoted.

The Preparation of the Anethinum.

Take of the Flowers of Anethum, eleven Pounds eight Ounces, and infuse them in eight Pounds and nine Ounces of Oil for a Day; then press them out with your Hands, and set the Oil by for Use. If you think fit to make a second Maceration, take fresh Flowers, and infuse them in like manner.

It has the Virtue of mollifying and relaxing the Parts about the Uterus; and is of Service in the periodical Returns of a Rigor, being of a warming Quality, by which it relieves under Lassitudes, and helps Pains in the Joints. *Dioscorides*, Lib. 1. Cap. 61.

Oribasius, who every-where transcribes *Dioscorides*, reads him as appointing equal Quantities of Oil and Flowers, that is, eleven Pounds eight Ounces of each. *Orib. Med. Col. Lib.* 11.

ANETHINUM VINUM, Dill Wine.

Take of ripe, fresh, and sifted Seed of Anethum, nine Ounces; tie them up in a Linen Bag, and put them into ten Gallons two Pints of *Mustum* [Wine unfermented]; let them macerate for three Months, and afterwards put up your Wine into proper Vessels.

It creates an Appetite, helps Sickness at the Stomach, and Difficulty of Urine, and makes a sweet Breath.

After the same manner are made Wines of Parsley, Fennel, and Smallage, which have the same Virtues as that of *Dill*. *Dioscorides*, Lib. 5. Cap. 73, 74, 75.

OLEUM ANETHINUM, Oil of Dill,

Is made of the fresh Tops of *Dill*, before the Seeds are grown solid and acrimonious; for it would be unfit for this Purpose, if the Flowers were wanting.

Take only the green tender Tops, or Shoots, to the Quantity of an Ounce, and infuse them in an *Italic* Pint of Sweet Oil. Let the Mouth of the Vessel be well closed, and the Vessel set to stand in the Sun for forty Days.

This is hotter than Oil of Chamomile, and is therefore proper for Lassitudes in the Winter, for it mollifies and moistens.

It is also serviceable in feverish Disorders arising from Phlegm, and in all Distempers caused by Cold, especially where the Tendons or Muscles are affected. *Actius*, *Tetr.* 1. *Serm.* 1.

This Oil may be made, in case of Necessity, without Infusion; that is, by boiling the dry Tops of the *Dill* in a double Vessel; and so may Oil of Chamomile, &c. be prepar'd; but then these Oils are weaker than those which are made of the green Tops, and suffer'd to stand in the Sun. *P. Egineta*, Lib. 7. Cap. 20.

The Method directed by the College for making the *Oleum Anethinum*, is thus:

Take of the Flowers and Leaves of *Dill*, bruised in a marble Mortar, with a wooden Pestle, four Ounces; Oil of Olives, one Pound: Expose them to the Mid-day Sun, in a glass Vessel well stopp'd, for a whole Week, and shake them together every Day; then let them gently simmer in a Bath-heat, and press out the Oil: Put in fresh *Dill*, which manage after the same manner, and repeat the Process a third time; then let them stand together for forty Days; at the Expiration of which set by the Oil for Use, without pressing out the *Dill*.

There is also a Chymical Oil prepar'd from the Seeds of *Dill*, in the following manner:

Take two Pounds of *Dill*-seed bruised; of Spring-water twenty Pints: Let them be distill'd in an Alembic, with its Refrigeratory; and then let the Oil be separated by a proper Funnel.

These Oils partake of the Virtues of the Plant.

ANETICUS, *ἀναιτικός*, from *ἀνίμω*, to remit. An Epithet of such Remedies as have the Virtue of remitting Pain, and are call'd Purgatives. *Castellus*.

ANEURYSMA, from *ἀνευρύω*, to dilate much. An Aneurysm.

An Aneurysm may affect any Part of the Body, but most frequently happens in the Throat, where it produces a Tumour call'd Bronchocele, which is most incident to Women in Labour, because of the violent Retention of their Breath. This Disease also affects the Head in the Parts about the Arteries, or any Part of the Body where an Artery happens to be wounded; as, for Instance, when an unskilful Operator, in attempting to open the Vein of the Cubit, at the same time cuts the subjacent Artery.

Every Aneurysm is occasion'd either by a Transudation, an Anastomosis, or a Rupture, in both which Cases there is a gradual Extravasation of the Blood and Spirits, which are collected under the Skin.

The Characters of an Aneurysm are a small or great Tumour, of the Colour of the Skin, void of Pain, soft to the Touch, and seeming to be of a loose spongy Substance, yielding to the Compression of the Fingers so as almost to vanish, but recurring as soon as the Fingers are taken off; which Character is most remarkable in Aneurysms of the Chin, and such others as are not occasion'd by a Wound: But where a Wound of the Artery has preceded, and the Skin afterwards closing up, there has follow'd a Dilatation of the Vessels, the Tumour is less soft; for the Blood, more abounding with Spirits, runs into grumous Concretions, and extends the Tumour.

As to the Therapeutic Part, those Aneurysms which happen in the Head or Throat are accounted desperate, and are not attempted by Surgeons: For as soon as the Aneurysm is cut, there follows an excessive Hæmorrhage, with such a Profusion of vital Spirits, that the Patient often dies under the Operation. But as to an Aneurysm in the Cubit, we treat it in the following manner:

First, we mark out the Artery that extends itself along the internal Part of the Arm, from the Arm-pit to the Cubit. Then, in the same internal Part of the Arm, three or four Inches below the Arm-pit, we make a simple Incision lengthways, in the Place where the Artery is most obvious to the Touch; then by degrees we lay the Artery bare, by separating it from the Skin and the other incumbent Corpuscles; we then take hold of the Artery with a blunt Hook, extend it, and secure it by two firm Ligatures. This done, we make an Incision in the Part between the Ligatures, and fill the Wound with Powder of Frankincense, and, laying Lint thereon, apply a proper Bandage: After this, we proceed, with great Security, to cut the Tumour in the Cavity or Flexure of the Cubit, being under no Apprehension of an Hæmorrhage. After Evacuation of the grumous Contents of the Tumour, we search out the Artery whence the Blood made an Eruption, and having discover'd it, take it with a Hook, tie it in two Places, and make an Incision between them, as we did in the former Part; then filling up the Wound with Powder of Frankincense, as before, we procure a Suppuration.

For an Aneurysm in the Throat, a Plaister of Cypress is a proper topical Remedy. *Actius*, *Tetr.* 7. *Serm.* 3. Cap. 10.

The Aneurysm is a Tumour, soft to the Touch, and yielding to the Fingers, and owing its Generation to Blood and Spirits. *Galen* says of it: "When the Mouth of an Artery is open'd, the Affection is call'd *aneurysma* [a Dilatation]: The same thing happens, when, the Artery being wounded, the incumbent Skin is cicatrized, but the Wound of the Artery remains, being neither conglutinated, cover'd with a Cicatrix, nor shut by Incarnation. Affections of this Kind are known by the Pulsation of the Arteries, or more especially by compressing the Artery; for then all the Tumour diff: appears, the Matter that caused it recurring into the Artery." So far *Galen*; but we distinguish these Affections in the following manner: Those which proceed from the Anastomosis of an Artery, appear of a more oblong Form, are deeply situated, and, when impress'd by the Fingers, a Noise is perceiv'd. When the Affection is caused by a Rupture, no Sound is heard, but the Tumour is rounder, and more superficial.

Aneurysms which happen in the Arm-pits, the Groins, or the Neck, or in other Places, if they are of a remarkable Bigness, are not attempted by the Surgeons, because of the Largeness of the Vessels; but those in the extreme Parts, the Joints, or the Head, are treated as follows:

If the Tumour proceeds from a Dilatation of the Artery, we make a direct Incision lengthwise; then taking hold of the Lips of the Wound with Hooks, we separate the Artery, by the Help of proper Instruments, from the Skin and Membranes, laying it bare; then passing a Needle under it, we make a Ligature with two Threads: After this we prick the intermediate Part of the Artery with the Incision-knife, evacuate its Contents, and endeavour a Suppuration till the Threads fall off.

When the Aneurysm is caused by a Rupture, we take entire Hold of it, as far as may be done, together with the Skin, with our Fingers; then pass under it a Needle with a double Thread, and, after it is pass'd, cut the Loop, by which means we have two Threads, in order to make a Ligature on each Side the Tumour. If we are apprehensive, that the Threads should slip, we may pass another Needle, exactly by the same Perforation, threaded also with a double Thread; which being cut like the former, you may have four Ligatures upon the Tumour; then opening the Tumour in the Middle, we take away the Contents by the Aperture of the Skin, leaving the Ligature; then we apply a Compress moisten'd with Wine and Oil, and prosecute the Cure with Lint. *P. Ægineta, Lib. 6. Cap. 37.*

Dr. Freind takes Occasion, from the Doctrine of *Paulus*, with respect to an Aneurysm, to make the following Observations on this Subject:

An Aneurysm by *Galen*, and we see here by *Paulus*, is described to be a Tumour, which rises from arterial Blood extravasated; and that it proceeded from a Rupture in the Coats of the Arteries, was the constant Opinion of all the *Greek* and *Arabian* Writers. *Fernelius* was the first, who asserted, that the Artery was only dilated, but not burst, in an Aneurysm: And *Vesalius* seems to be of the same Opinion; for *Adolphus Occo* gives us the Relation of a Patient he had the Care of, in Conjunction with *Achilles Grasserus*. The Case was a Tumour in the Back, and that excellent Anatomist being call'd in, soon discover'd what it was by the Pulsation, and pronounced it an Aneurysm arising from a Dilatation of the great Artery; and, at the same time, he said, that the Blood was contain'd within the Coats of it, as 'tis in those of a Vein in a Varix; that he had found in these Swellings sometimes an Humour, concreted like Ice, or Crystal, sometimes like Suet, and sometimes Blood, grumous like a Mola. Upon Dissection, the Cavity of the Aorta was found vastly distended, and much clotted Blood in it, as *Vesalius* had foretold, which gain'd him a great Reputation. That the Arteries are capable of Distention, we find often in Persons who are poison'd, and in some morbid Cases. 'Tis a remarkable Instance which *Vidus Vidius* relates, and owns it to be a rare one, of a prodigious Intumescency in all the Arteries of the Head, quite round, so as to resemble large Varices. He adds, that *Fallopian* having undertaken to open it, just as he was going to attempt the Operation, being discouraged by the Bigness of the Tumour, alter'd his Opinion, and would not proceed: But such a Distention as this, which spreads itself equally through so many Branches, would scarce, I believe, be call'd an Aneurysm, which is a Tumour of a quite different Nature, and more circumscrib'd.

Sennertus, refining upon the Notion of *Fernelius*, and not satisfied with a bare Dilatation, makes the Nature of all Aneurysms to consist in a Rupture of the Muscular, or inner Coat of the Artery, while the outer, in the mean while, remains unbroken. It seems to me very plain, that he borrows this Doctrine, tho' he mentions nothing of it, from *Hildanus*, who, in express Words, said the very same thing before him. The Case *Hildanus* describes is that of an Aneurysm, succeeding upon a Puncture; and in that Case it may possibly happen, as he conjectures, that the outer Coat may upon Compression unite, being compos'd of membranous and very glutinous Parts, as is evident from all Glue being extracted from such Skins; but the Fibres of the inner Coats, being muscular, when they are

once broken, must of course contract and shrink up, and, by starting from one another, be more difficultly brought to a Reunion: And I can scarce think it well conceivable, that any other Aneurysm can be form'd in this manner, than that only, and that not always, which comes upon a Puncture; for it does not seem probable, that, when the Cause is intrinsic, a Force which is supposed able to burst the inner Coat, should find any Resistance from the outer, which is own'd to be at least five times weaker. But, however, the Notion we have mention'd, though scarce so much as plausible, was embraced by *Willis*, *Barbette*, and others, and became the fashionable Definition of an Aneurysm for many Years. And, indeed, since the Opinion of the Blood being not extravasated was first started, it may be observed, that all the Writers of Bodies either of Physic or Anatomy, have run into this Hypothesis, without knowing much of the Subject they writ upon, or indeed of what they writ upon the Subject. To give an Example: *Forestus* contends vehemently, that all Aneurysms come from a Dilatation of the Artery; and yet, in the very Instance, which is the only one in his Works he gives us of an Aneurysm, the Tumour came from a Rupture, and the Blood was extravasated. And *Diemerbroeck*, in Complaisance to the Doctrine then in Fashion, defines an Aneurysm, in Opposition to Mr. *Regi*, who was for a Rupture in the Artery: Then he tells a Story of an Aneurysm, where there was a Rupture; but at last judiciously concludes, that 'twas no Aneurysm at all, for no other Reason but because there was a Rupture, and so consequently did not come within his Definition.

The chief Arguments which the Assertors of Dilatation urge, and which those who acknowledge a Rupture in the Artery are at a Loss to answer, are only two: How comes it to pass, if the Blood be not confin'd within the Coats of the Vessels, that there is a Pulsation in an Aneurysm? How is it, that the Blood, if extravasated, does not turn to Pus? As to Pulsation, it may, I presume, be easily conceived, how the constant Impulse of the Blood of the Arteries may communicate a Motion to that which lies contiguous to it, though extravasated. The Force of Percussion is vastly great; and we find, by Experiment, in a Bladder full of Air, the least fresh Impulse from a Syringe will move all that is contain'd in it, and distend its Sides. If the Artery is large, if it lies superficial, and near the Centre of the Tumour, and if the Aneurysm be not diffused too much lengthways, the Pulsation will be strong, tho' the Coat of the Artery be burst; and this may be proved not only from Reason, but from Matter of Fact. We have a Case in *Severinus*, where, upon a Wound in the great Artery of the Thigh, there was an Effusion of six Pounds of Blood in the Interstices of the Muscles; there was so violent a Pulsation in the Swelling, as to lift up both one's Hands, when laid upon it. When the Aneurysm lies deep among the Muscles, very often the Pulsation is not sensible. We may add to this, that it may grow more obscure, and at last be utterly extinguish'd, as the Coagulation of the Blood increases; and of this we have Instances, both in *Severinus* and Mr. *Littre*, where the Pulsation was very violent at first, and afterwards entirely vanish'd; and, therefore, we must not look upon this as a constant Concomitant in the present Case. Indeed, in most Swellings, we ought rather to argue negatively; and if we are not sure of Pus, we ought always to be suspicious of an Aneurysm; and, for want of this prudent Fear, some have mistaken, and fatally cut it for an Abscess. What has been said of Pulsation, may let us into the Solution of the second Objection; for if we can conceive how there can be a Motion communicated to the Tumour, we may naturally and easily comprehend, how the same Motion may preserve the Blood from Putrefaction, as well as if it were contain'd in the Coats of the Artery, enlarged by Distention only. A very little Degree of Impulse will serve to hinder a large Mass of any Fluid from an entire Stagnation. Accordingly, in an Ecchymosis, the extravasated Blood, we see, very often never suppurates; or, when it does, there is some Part of it found turn'd to a red Coagulum, distinct and separate from the rest, without any Mixture of Pus. The very Case we have already mention'd in *Severinus*, comes up to the Purpose; where, after the Tumour had been growing forty Days, there were taken out of it six Pounds of pure Blood, extravasated between the Interstices of the Muscles, and it had no sort of Tendency to Pus. Besides, I believe, the very Position which these Writers lay down, that all extravasated Blood turns to Pus, may be justly question'd: What Quality 'tis in the Blood, or what Particles they are which dispose it to Suppuration, is a Problem, I confess, difficult to be solved; but, sure I am, there is something in arterial Blood which often hinders it from being chang'd into Pus, though extravasated.

Thus we see, how insufficient these Arguments made use of are to overthrow the Opinion of the Antients; and we shall find, that Experience itself, from Dissections in these Cases, generally decides the Controversy in their Favour. For, to return to the very Case, where we mentioned *Vesalius* before, (which indeed is the first History of an Aneurysm dissected, that we meet with) besides a Dilatation of the Artery, there was a large

large Rupture, as *Achilles Grafferus*, one of the Physicians concern'd, gives us an Account. *Saporta*, who was contemporary with *Fernelius*, and seems to have him in his Eye, tho' he does not mention his Name, relates three Cases, with all the Particulars, where the Artery was burst. The first is singled out, and repeated at length, by *Sennertus*, who pronounces it to be no Aneurysm: Though I can't imagine why he chose this Case to object against, when, of all the three, 'twas the most distinct, and least liable to Objection; for, upon Dissection, a great deal of pure Blood was taken out, and the Artery dilated and burst; and, while the Patient was alive, the Tumour had a great Pulsation, and receded upon Pressure; and if this be not a true Aneurysm, I can't tell what Words can be found out to describe one. *Bartholine* gives us the History of several Aneurysms dissected, particularly of one at *Naples*, which he has made the Subject of a Book, writ indeed in a romantic Style, but where the Fact is clearly enough delivered. This was in the Arm, and happen'd from a Puncture; the Arm was cut off, but the Patient died: The axillary Artery was vastly dilated up to the Arm-pit; it was whole, only where the Puncture had been made; on the other Side, all the Coats were burst, and the Branches which came from it could not be traced; as it lay superficial, there was grumous Blood lying along all the Tract of the Muscles. *Van Horne*, in his Epistle, which is printed with this Treatise of *Bartholine*, has another very remarkable Case: Because the Instance may suggest to us several practical Reflections, give me Leave just, in short, to relate the Particulars. This was a Tumour in the Calf of the Leg; *Antonius Vacca* pronounced it an Aneurysm; others were of a different Opinion, and, out-voting him, prevail'd, and treated it for an Abscess: This Method made the Swelling extend itself to the very Toes, and there occasioned a Gangrene, so that they were forced to cut off the Foot above the Ankle, for fear the Mortification should spread up to the Thigh: The third Day after, they attempted to open the Tumour, and the Patient died in the Middle of the Operation. Tho' the Artery was dilated, so as to be six times bigger than natural, the Side towards the Skin was eaten thro' and burst; and between the Gemelli was a Parenchyma of grumous Blood, very solid, and near the Consistence of Flesh. Somewhat a like Case I was an Eye-witness to myself, with the Surgeons of *St. Bartholomew's Hospital*: The Person was old, and of an ill Constitution; the Aneurysm had been, by his own Account, twelve Years growing, and of late it had increased extremely: It surrounded all the Calf, almost up to the Knee; and the Pulsation was very strong, not only along the Skin, but upon the Muscles, in the thickest Part of the Calf. The Valves of the Veins (many of them) were so entirely broken, that there were Varices both above and below the Knee, of a prodigious Bigness, which nevertheless subsided upon holding up the Leg. Upon Amputation, notwithstanding the Ligatures were strong, and the Operation perform'd with great Dispatch, there was discharged from the Vessels above a Pint of Blood, the Diameters of the Arteries and Veins were so greatly enlarged. In the Aneurysm, upon Dissection, were found, besides fluid Blood, two or three Pounds of Thrombi, which lay like so many Plates upon one another: The whole Tract of the Crural Artery was greatly dilated, and the several little Branches were broken off from the Trunk, not above a Quarter of an Inch from their Rise; and from these the Blood was thrown into the Interstices of the Muscles, and the Gastrocnemii; neither was there any Communication at all from the Bottom. The Bones were so carious, that there was a great Hole in the Tibia, and four Inches at least in the Fibula entirely wanting. This Circumstance of the Bones being carious, often attends an Aneurysm: *Ruyfch* has two Cases, where all the true Ribs, and the Sternum, were almost consum'd, and the little which remain'd was all rotten: And we may easily conceive, how such a Tumour, by a constant Pressure, may affect the Periosteum, and cause an Obstruction there, and by that means gradually waste the Bone itself. We may learn another thing too from this Circumstance, that, since so solid a Substance as the Bone cannot resist the Pressure of an Aneurysm, the arterial Coats may be thought more likely to yield to its Force, and have their Fibres destroy'd by it. *Lancisi* gives us the History of an Aneurysm in the ascending Trunk of the Aorta, where the Patient, who had some time before complain'd of a Palpitation, Fainting, Pain, Streightness, and Beating in the Thorax, died suddenly: The upper Part of the Sternum was press'd a little outward on one Side. Upon Dissection, in the whole Curvature of the Aorta, was found a Substance like Lard, inclosed in a Cystis; there was a Hole into the very Pericardium, in which accordingly were found two Pounds of Blood. He is of Opinion, that all Aneurysms come from a Dilatation of the Artery; and so, very probably, at first most of them do: Yet, in the present Instance, he speaks of the Fibres being corroded, and from thence accounts for the Dilatation, as he calls it, of them, in which the true Nature of an Aneurysm (he says) consists; that is, in *English*, I think, in an unripping or tearing of the arterial Coats. A Case, exactly like this, we find in *Laurentius of Guicciardin*, where not only

the Cava and its Valves were all burst, but the Orifice of the Aorta enlarged to the Bigness of one's Arm. So it was, in a like Case, related by *Paré*, where the inner Coat of the Artery, tho' offixed, yet at the same time was burst. Certain it is, the Aorta, before its bending, is easier dilated, upon the Account of the Resistance the Blood meets with from the Curvature there; and, for this Reason, Aneurysms ofteneft happen in this Part of the Artery; and one may easily conceive, that if they can consist in Dilatation only, it can no-where else so likely take Place as here.

Mr. *Littre* in the *French Memoirs*, gives a long and particular Detail of two Aneurysms in this Place; where the Artery was thrust out so, as to form a Sack, which reached up into the Thorax and Neck, and in one Case, even along the Neck to the lower Jaw. [See these Cases below]. In both these Cases, at first the Persons complained of a Beating, which exactly answered that of the Arteries, and of an uneasy Struggling in the Thorax, 'attended' at length with a great Oppression, a Difficulty of Breathing, and an universal Languor, some time before any thing was perceived outwardly above the Clavicles; afterwards other Symptoms appeared, much like what I have observed myself in a parallel Case, such as Pain, not only in the Chest, but in the Shoulders, the Arms, and the Head; in the last, often a Pulsation likewise; very little Sleep, and that often interrupted; and Inability often to lie down in Bed, and always a greater Ease in a leaning Posture forwards; the Breathing sometimes so disturbed, as to give Apprehensions of a sudden Suffocation. In the first of these Instances, some Part of the Ribs, the Sternum and the Clavicles were found carious. A Quack, by suppurating Medicines, had made some Part of it burst, upon which followed a Gangrene, and, in three Days, Death. Each of these Aneurysms, he says, was only a Dilatation of the Artery: But, I must confess, though his Description be very minute and exact, I have still some Scruples upon me, and am not perfectly satisfied, that in this Case there was a mere Dilatation alone of the arterial Coats. For, besides that he says himself, there was not only a firm Adhesion every-where of this Aneurysmal Pouch to the Ribs, the Sternum, the Clavicles, and the Muscles, but a Corrosion of its Membranes in all those Places, where it adhered; these Membranes, which he attributes to his Pouch, might be Portions of the *Mediastinum*, and the *Pleura*, or Expansions of those belonging to the Muscles. But yet further, it may not be absurd, if, in Answer to this, we should affirm, that Humours extravasated may form a particular Membrane to themselves, which is no Part of the Vessels, from whence those Humours are discharged. What we observe every Day of an Hernia Carnosa, and Wens, consisting of a vast Number of Cystis's, each of which has its particular Membrane, and is filled often with a different sort of Substance, may give so much Countenance to this Opinion, that we may at least think it worth considering, before we determine any thing in this Point. The Account *Ruyfch* gives of an Aneurysm in the Thorax, which filled the whole Cavity of it, without any outward Swelling, seems to answer this Idea: For it consisted, he says, of innumerable thick Coats, which lay like so many Plates one over another, between which was inclosed a great deal of coagulated Blood. Thus the Blood lay like Leaves one upon another, so as to form a sort of Polypus, in the Case recited by Mr. *Littre*. This is certain, that we may find Examples of this Kind in *Severinus*, *Marchetti*, and others. Our Countryman *Wiseman* tells us, that he always found both Coats of the Artery open. In short, as Matter of Fact is the best Argument, I can't but observe, that among all the Accounts Anatomists give us of the Dissection of an Aneurysm, there is scarce an Instance upon Record, of a large one, at least, where there was not a Rupture in the Artery, according to the Doctrine of *Paulus*. What has been said will, I believe, be sufficient to shew, how ill founded is that Division, which some Moderns have made of Aneurysms, into true and spurious; whereas the whole Difference lies only in the Form of a Tumour. And if you consider what they have advanced upon this Head, you will find that, as this Distinction is generally wrong in Theory, it signifies still less in point of Practice. *Freind's Hist. of Physic.*

I have inserted the preceding Dissertation, because there are many curious Passages in it, which should not be omitted in a Treatise on an Aneurysm. But in Justice to the Reader I must remark, that Dr. *Freind* has absolutely mistaken the Passage in *Paulus*; for this last Author plainly distinguishes betwixt an Aneurysm by Dilatation, and one by the Rupture of the Artery, in describing the Operation. His Words are *Εἰ μὲν κατ' ἀνεύρεσιν ὁ ἔγχεθ' ἐγείρετο*. *Cornarius*, the Interpreter of *Paulus*, translates this, *Si ex Apertione Tumor factus est*; but how erroneously, the learned Reader will readily see. I am sensible, that, a little before, *Paulus* seems to make a Distinction betwixt an Aneurysm *δι' ἀναστόμωσιν ἀεργίας*, and one *κατὰ ρήξιν*. But as no such thing as an *Anastomosis* can be meant here, in the Sense it is generally used in by the Greek Writers; and as he seems to explain it afterwards by *ἀνεύρεσιν*, when

when he speaks of the Operation, I am inclined to think he means by *Anastomosis* a Dilatation of the Artery.

I must not omit here a Remark of some Importance to Students in Physic, with respect to the *Latin* Translations of the *Greek* medicinal Authors: It is that they are so little to be depended on, that it is very dangerous to quote a Passage on their Authority. I have frequently been misled by their Inaccuracy, when I had no Opportunity of consulting the Originals, being at a Distance from Libraries; and I will not be answerable that I have corrected all the Mistakes they have led me into.

The following Histories of Aneurysms will set their Nature and Origins in a true Point of Light, and prove evidently, that the Distinction of Aneurysms into *true* and *spurious*, is not without Foundation.

HISTORY I. By Mr. LITTLE.

A Man of fifty-six Years of Age, who had always enjoyed a good State of Health, sent for me the tenth of *July* last.

I found him by the Fire, in an Elbow-chair, to which he had been confined four Months; for he could not keep in Bed, nor walk, because he was almost choaked so soon as he lay down, and could not walk without being in Danger of fainting.

He told me, that he slept very little, that his Sleep was unsound, and interrupted, that he was grown very lean and weak, and sometimes fainted, even in his Elbow-chair, altho' he took nutritive Food, and in sufficient Quantities; that his Respiration was difficult; that he could not turn nor bend his Neck and Head, without great Pain; that for five Months he had a Tumour upon his Neck, which increased by Degrees, altho' now-and-then it diminished very sensibly; but that this Diminution did not continue long, the Tumour quickly returning to its former Bulk; that it was painful, but especially in the inferior Part, and accompany'd with a continual Pulsation, which for a Month past had been gradually decreasing.

I felt his Pulse, which I found weak; and upon examining the Tumour, found a Part of it on the Neck, and a Part of it upon the Breast. This Tumour was soft, and yielded to the Pressure of the Fingers, but recovered its former Shape, so soon as I forbore pressing it. I felt a small Pulsation in it, which exactly agreed with that of the Arteries; the Colour of the Skin that covered it was natural. All these Circumstances made me conclude, that this Tumour was a real Aneurysm, formed by the extraordinary Dilatation of some Artery.

I asked the Patient, if he had received any Blow upon the Neck or Breast, or if he had strain'd himself in Coughing, Sneezing, or Vomiting, &c. He answered, that he was conscious of having received no Blows, but that for five Days successively he had used great and almost continual Efforts to vomit, and go to stool, which he said were the fatal Effects of Pills a Quack had given him to cure him of a Rheumatism; that three Weeks after he began to feel, towards the Middle of his Breast, a Beating he had not before felt; that six Weeks after a Difficulty of Respiration succeeded this Beating; and that the Difficulty of Respiration three Months after was followed by a Swelling on the Neck; that the Beating, and Difficulty of Respiration, had always insensibly increased, till this Tumour appeared; upon which he no more felt the Beating at his Breast, but began to perceive another Beating in that Part of the Neck where the Tumour was, and that the Difficulty of Respiration did no more increase, but continue the same.

I advised the Patient to take little Food, or what was not very nourishing, or to let Blood now-and-then, if he took a good deal of Nourishment. I also advised him to put a Bandage upon the Tumour, not with a View to compress it, but only to support the Integuments, that by being rendered more capable of resisting the Impulse of the Blood, they might in some measure prevent the Increase of the Tumour.

The Patient having sent for me again fifteen Days after my first Visit, told me, that his Faintings were more violent and frequent. I found him much weaker, and the Tumour larger; there was no more Pulsation, but about three Inches of the Skin towards the Right Armpit was become livid. In the Middle of the discoloured Place there were two Holes almost imperceptible, whence now-and-then proceeded some Drops of Blood. These new Symptoms were probably occasioned by acrid Medicines, which another Quack had apply'd to the Tumour to make it resolve or suppurate, who doubtless knew not the Nature of the Distemper, or was ignorant that real Aneurysms are not cured by resolute nor suppurative Medicines.

Two Days after, a dry Gangrene in the discoloured Part of the Tumour ensued, three Days after which the Patient died. I laid open his Body, which was so lean, that scarce any thing remained but Skin and Bones. I observed nothing extraordinary in the Parts contained in the Cavity of the Abdomen, nor in that of the Cranium, except that there was but little Blood in their Vessels, as also in those of the Face and Extremities.

Before I laid open the Breast with an Incision-knife, I disengaged the Integuments which covered the Tumour, except in the gangren'd Part, where I left them; for it was impossible to disengage them from it, without cutting or tearing a Part of

the Tumour, so firm was their Adherence to one another. I afterwards separated the Tumour from the Neck, from the Clavicles, and from the exterior Parts of the Breast; but it adher'd very strongly in those Places that touch'd upon the Ribs, the Sternum, and the Clavicles, where it was corroded, and the Bones become carious; the rest of the Tumour adher'd but little. The soft Parts situated upon the Breast under the Tumour were full of a serous Humour of a yellow Colour.

I then raised the Sternum with a Part of the Ribs, and the Clavicles that are join'd thereto on both Sides, that I might examine with more Freedom the Parts contain'd in the Cavity of the Breast, and extirpate the Tumour whole.

I observed, first, That the Lungs were dry, wither'd, and collaps'd; and that the Trunk and Branches of the Blood-vessels retained their natural Shapes.

Secondly, That there was a Spoonful and an half of Serum in the Pericardium, and no Fat about the Heart.

Thirdly, That the Trunk of the Aorta, from nine Lines Breadth above the Heart to the Place where it takes the Name of Aorta descendens, had its Coats much thinner, and was very much dilated, so that almost all the Dilatation was made in the superior and anterior Parts; and the three Branches which compose the Aorta ascendens, and which commonly rise from the Middle and Upper-part of the Trunk of the Aorta, were placed in the posterior Part of this Trunk.

Fourthly, That the dilated Part of the Trunk of the Aorta extended itself as far as the Under-jaw, cover'd the Forepart, and the Sides of the Neck fell back upon all the upper and anterior Part of the Breast, from one Armpit to the other, and form'd a Cystis not unlike a Bottle, the Neck of which was within the Breast, and Bottom without. This Cystis was nine Inches and an half long from the Trunk of the Aorta to the Under-jaw; it was two Inches broad at its Origin, and three at its Egress out of the Breast. Its Diameter upon the Neck was betwixt nine and ten Inches, and thirteen upon the Breast. Upon the Whole, this Cystis was half a Foot in Depth at the Neck, and seven Inches and an half on the Breast.

Fifthly, The Thickness of the Sides of this Cystis was so different in different Parts, that it varied in all the intermediate Degrees between the fifth Part of a Line, and ten Lines. Both the thickest and the thinnest Parts were without the Breast; the thinnest lay chiefly in the gangren'd Part, and the thickest in the Part situated upon the Breast.

Within this Pouch there was about two Pints of Blood, of which one third was black, coagulated, and very strongly adhering to its inner Surface; the other third was of a reddish-brown Colour, and half coagulated; the remaining third was liquid, and had almost its natural Colour and Consistence.

Lastly, The internal Surface of the Cystis of the Trunk of the Aorta was smooth and even in some Places, and rough in others. This Smoothness of the Surface was natural, and was owing to the internal Coat of the Cystis being kept entire. The Unevenness of the same Surface was unnatural, and depended upon two Causes, the Erosion of a Part of the proper Coats of the Pouch, and the Adherence of certain Fibres, which differ'd not from these of a Polypus of the Heart, but in this, that they were larger, plainer, firmer, and more red. These Fibres composed several Laminæ, that were easily separated from one another.

Having now given some Account of this Man's Distemper enumerated, with the several Symptoms that attended it, and declar'd what I found extraordinary in his Body, I shall endeavour to assign the Cause of the Distemper itself, and account for the most material of its concomitant Symptoms.

The Pills which this Man had taken, being composed of very violent Purgatives, as one may readily suppose from the Excess of their Operation, probably gave Occasion to the extraordinary Dilatation of the Trunk of the Aorta. My Reasons for thinking so are these: First, In the Efforts the Pills produced in him to vomit and go to stool, the Diaphragm, being violently contracted, compress'd the Aorta descendens strongly, and almost intercepted the Passage of the Blood to it; then the Blood sent from the Heart to the Trunk of the Aorta, finding only the Branches of the Aorta descendens open, but incapable to receive it, must of Necessity do Violence to these Branches, in order to force itself a Passage. Now if the Sides of the Trunk were thinner in Proportion, or of a less close Texture than the Branches, the Trunk must of Consequence have been dilated; and not the Branches; and this Dilatation must have been only in the weakest Parts of the Trunk, that is, in its Middle and Left anterior Parts, as has been already observed. These two Parts being once stretch'd by the Impulse, and the extraordinary Quantity of Blood, could no longer resist it, altho' it was only impelled to them with its ordinary Momentum, and in its ordinary Quantity; consequently they must afterwards yield, and be more and more dilated.

The Efforts also occasioned by these Pills might excite a great Agitation in the animal Spirits, determine them to flow into the Heart in greater Quantity, and with greater Velocity than ordinary, and thus render its Contractions more strong and frequent;

quent; so that it must of Consequence have thrown more Blood, and that with a greater Impetus, into the Trunk of the Aorta, forc'd its Sides to dilate themselves to receive it, and thereby have laid a Foundation for the extraordinary Dilatation of this Artery.

The posterior Part of the Trunk of the Aorta scarcely suffer'd any Dilatation, because it was thicker, and of a more compact Texture: But as the Trunk was dilated towards its superior Part, the three Branches, which compose the Aorta Ascendens, must of Necessity have been situated in the posterior Part.

The Sides of the Cystis of the Aorta were very thin in some Places, and very thick in others. Two Reasons may be assign'd why the Parts were thin: 1. Because they consisted of nothing but the simple Coats of the Artery. 2. Because of the vast Dilatation which these Coats had suffer'd, by the Impulse of the Blood, and by its Coacervation in the Cavity of the Cystis. The Sides of the Cystis were thick in the Places where the polypous Fibres were fastened to its inner Surface, and the Thickness was greater or less, just as there were more or fewer of these Fibres, laid upon one another. These Fibres, and even those of the Polypus, must have been formed by the Slowness of the Blood's Motion, by the Grossness and Viscosity of its Parts, and by their Surfaces coming into a great many Points of Contact.

The Slowness of the Blood's Motion might have also occasion'd its being pent up in the Cystis, and its Coagulation there: Hence also the weak Pulsations, and the Separation of some Part of its Serum. The Motion of the Blood was slow in the Cystis, because becoming gradually larger and larger, and its Bottom being imperforate, the Blood must come out at the same Place where it went in. Now the Blood which had been driven into the Cystis by one Contraction of the Heart, was hinder'd from coming out, by that which the next Contraction sent to it.

As soon as the Tumor appeared on the Patient's Neck, he felt a Pulsation there; but felt it no more in his Breast, because the Impulse of the Blood, which was the Cause of the Pulsation, made a much greater Effort against the Bottom of the Cystis, that form'd the Tumor, than against the other Parts, and because this Bottom was then out of the Cavity of the Breast. The Pulsation by Degrees diminished in the Tumor, in proportion as the Blood coagulated in the Cystis, as more polypous Fibres were formed, and as the Contractions of the Part became weaker.

The Difficulty of Respiration increased no more after the Tumor of the Neck appeared, because the Impulse of the Blood being chiefly in a rectilinear Direction, the Cystis of the Aorta only increased in Length within the Breast. Thus, when it reach'd the Neck, it increas'd no more in the Breast, consequently the Difficulty of Respiration continued the same.

The Patient was in Danger of Suffocation when he lay down: 1. Because in this Situation, the Blood driven by the Heart into the Trunk of the Aorta, flowing more easily into the Cystis of this Artery, than in a vertical Situation, it consequently received a greater Quantity of it on this Occasion. 2. Because the Blood contained in that Part of the Cystis, situated externally upon the Breast, fell then into that Part of the Cystis within the Breast, and from thence a Part of it fell into the Trunk of the Aorta. Lastly, In the horizontal, or somewhat oblique Situation, the Blood contain'd in the Part of the Cystis, that formed the Tumor of the Neck, had a greater Weight upon the Trachea, than in the vertical Situation, and therefore compress'd it more. These three Causes must necessarily produce the Danger of Suffocation in the Man, when he lay down. Towards the last Stage of the Distemper, the Tumor now-and-then diminished, but soon after returned to its former Bigness. The Tumor diminished now-and-then, 1. By the Confinement and Coagulation of the Blood. 2. When the Heart drove little Blood into the Trunk of the Aorta, or that its Motion thither was slow and weak; because then the Blood contained in the Tumor might with Ease fall into the Trunk of the Aorta, and from thence pass into its Branches.

The Tumor might return to its former Bigness, 1. By the intestine Motion and Rarefaction of the Blood. 2. When some Clots of Blood shut up its Passage from the Tumor into the Trunk of the Aorta, in such a manner, that it allow'd fresh Blood to enter, but suffer'd none to get out. The Sides of the Cystis of the Aorta were corroded in the Places where they touched the Ribs, the Sternum, and Clavicles; and these Parts of the Bones were become carious, because the Trunk of the Body of this Man being always vertical, a Part of the Blood contained in the Cavity of the Tumor press'd with a greater Weight upon the Coats of the Pouch, and upon the Periosteum of these Bones, compress'd them strongly, and stopp'd, or at least retarded, the Return of the Blood, and of the Lymph, into their Vessels; and thereby gave occasion to the Separation of a Part of the Serum. Now this Serum being always impregnated with Salts, which it dissolved, and carry'd along with it, must have first stimulated and corroded the Coats of

the Cystis, afterwards the Periosteum, and then the Bones. The Coats of the Cystis in these Places were sooner corroded than in others, because they, being supported there by Bones, were more press'd upon, resisted more, and consequently were more directly exposed to the Action of these Salts. The soft Parts situated upon the Breast, below the Tumor, were filled with a great deal of Serum, which was extravasated by the Pressure of the Tumor on these Parts.

The Body of the Patient was vastly extenuated, tho' he used a nourishing Diet, and that in considerable Quantity, because the Circulation being render'd very slow by the bad Disposition of the Trunk of the Aorta, the Parts of the Blood could neither be sufficiently attenuated, nor propelled with Force enough into the Pores of the solid Parts, in order to furnish them with a sufficient Quantity of Nourishment.

As for his great Weakness, and the fainting Fits that often seiz'd him, they might arise from the same Causes that the Leanness did; besides this, they might have been caused by some Clots of Blood, which falling from the Cystis of the Aorta into its Trunk, might, in some measure, shut up some of its Branches. These continued till the Clots were dissolved and attenuated by a fresh Impulse of the Blood, and by the Construction of the Artery. *Mem. de l'Acad. R. 1707.*

HISTORY II. By Mr. LITTRE.

A Man of 44 Years of Age dying of an Aneurysm, I laid open his Body to examine the Particulars of this Distemper: This was a true Aneurysm, that is, an extraordinary Dilatation of the Artery, situated partly upon the Neck, and partly in the Breast, parallel to the Spina, and extending itself from the third superior Vertebra of the Back, to the fifth inferior of the Neck, and laid all along upon the Oesophagus; its middle, and superior Parts lay upon the Trachea, and its middle inferior Part upon the Body of the Lungs themselves. It was four Inches long, and above two Inches and a half broad: Where its Diameter was largest, its Thickness was unequal, being thicker in its inferior Part, than in its superior; and in its superior, than in its middle. It was round and oblong, plain and smooth, of a reddish-brown Colour, and so hard, that tho' I press'd it down very much with my Finger, it yielded but little. It adhered pretty close to the Fore-part of the Sternum, to the first Rib on each Side, and to the Skin, and behind to the Muscles which cover the Trachea Arteria; and by its whole Basis it was join'd to the superior Right Part of the Trunk of the large Artery, of which it was only an Extension and Production.

After I had examined the Situation of this Aneurysm, I separated it from every thing to which it was fixed, and laid it open. I made the following Observations:

1. That the Sides were very dense, and of an unequal Thickness, being a quarter of a Line thick in the thinnest, and about a Line in the thickest Places; so that in the last the Sides were little less thick than in the rest of the Trunk.

2. That half of the Cavity of the Aneurysm was filled up with a sort of polypous Flesh, ranged in Laminæ fixed to one another, the outermost to the internal Surface of the Tumor, so that they might have been separated without breaking, if they had been gently handled.

3. That the same Surface of this Aneurysm was smooth in the Places where the polypous Flesh was not fixed; and that it was uneven in the Places where it adher'd. It was probably the Inequality of this Surface that caused the Attachment of the polypous Flesh; and the Inequality was the Effect of the Erosion of the Membrane, occasioned by some Salts separated from the Blood in the Cavity of the Aneurysm, by reason of the Stay it was obliged to make there.

Lastly, The Sides of this Aneurysm formed internally two Bodies of Strings; the one was situated about the middle Part; it was of a reddish Colour, one Line thick, and described only three quarters of the Circumference. The other String was placed in the inferior Part: It was of a whitish Colour: It was much harder than the other, two Lines thick, and went quite round the Aneurysm. At the Place where the two Strings were, the Aneurysm was not so big as in the Places near it, which made a sort of a Strangulation there. All the Trunk of the Aorta, unless where the Aneurysm was, had kept its former tubular Form. It was grown bigger, and its Sides somewhat more dense, but the Thickness seemed natural.

This Trunk, towards its Origin or Base, was two Inches and six Lines in Circumference, six Inches ten Lines towards its Middle, and two Inches six Lines towards its Extremity. One might observe, in the Thickness of its internal Sides, small stony Laminæ, of a whitish Colour, pretty brittle, of different Bulks, and of different Thicknesses. The interior Surface, in the Places where there was none of these Laminæ, had a great many Pores, from whence, when I press'd the Artery, a sort of Lymph came out, which was clear, and a little mucilaginous. This Lymph might have imparted some Fluidity to the Blood, moisten'd the interior Surface of the Artery, made

it smooth and slippery, and secur'd it from the Action of the Salts of the Blood.

The Right Axillary preserv'd its ordinary Bigness, and its exterior Surface was every-where smooth as usual. But the interior, four Lines from its Beginning, was, for half an Inch, unequal; there the Sides were somewhat more dense, and twice as thick as in the Parts near it, and the Cavity narrower in Proportion.

The Left Subclavian was also as big as usual, and its exterior Surface equal; but the interior was unequal in its Beginning, for the Space of three Lines; its Sides, in the same Extent, were somewhat more compact, three times thicker, and there the Cavity was proportionably narrower. In the above-mentioned Places, a faint Tincture of Yellow was observed in the Sides of these two Arteries. Lastly, the left carotid Artery, and the Aorta descendens, were in their natural State.

The Heart was big; the Cavities of its Ventricles were large, but especially that of the Left; their Sides also were somewhat thinner than usual.

The Lungs were full of a thick, blackish Blood: The Trachea, in the Place where the Aneurysm lay, was thicker, more compact, and not so round as in other Places; and the Branches and the Vessels of this Part contained in their Cavity a great deal of Humour, which was viscous, tenacious, and of a yellowish Colour.

REFLECTIONS on the Circumstances above-mentioned.

First Reflection. A true Aneurysm being only, as I said, an extraordinary Dilatation of the Artery, one may affirm, that in the Trunk of the Aorta, the Man I speak of, had two true Aneurysms; one particular, the other universal. The former, which has been the Subject of my Observation, was only form'd of a Part of this Trunk; and what remain'd, form'd the other.

Second Reflection. These two Aneurysms were produced by the same Causes: The Diminution of the Cavity of the Right Axillary, and the Left Subclavian Arteries, was the occasional Cause of them, the Blood the instrumental, and the Heart the efficient.

It is easy to comprehend, 1. That the Blood, continually thrown from the Left Ventricle of the Heart into the Trunk of the Aorta, finding no more, after the Diminution of the Cavity of these Arteries, the same Facility in its Distribution, must have struck with a greater Impetus upon the Sides of this Trunk, stretch'd them by Degrees, dilated them in an extraordinary Manner, and, at last, have form'd a total Aneurysm, if all their Parts had equally yielded to this Impulse; but a partial one, accompany'd with a total, if some of them were more distended than others, either because they were thinner, or of a Texture less compact, or, perhaps, more exposed to the Impetus of the Blood. It is easy to comprehend, 2. That the Circulation of the Blood, partly interrupted in the Sides of these same Arteries, might cause the Blood to coagulate there; this Interruption might have been occasioned by the Shriveling of the Fibres which compose these Sides, and which may have been stimulated by some extravasated Salts; or by the Elasticity of their respective Membranes and Vessels being weaken'd by the Blood which is continually driven thither by the Heart.

In these Cases, the Blood, not having its free Course, or not being propell'd in its ordinary Manner, must stop, and coagulate in the Cavities of these particular Vessels, dilate them, separate their Fibres, enlarge their Pores, give occasion to a greater Quantity of nutritive Juice to be discharged, to get between the several Laminæ of the Membranes of the Sides, diffuse itself among their Fibres, separate and disjoin them, adhere firmly to them on all Hands, and consequently increase the Thickness of the Sides of these Arteries.

Third Reflection. The considerable Diminution of the Cavities of these Arteries was the Effect of the extraordinary Thickness of their Sides, especially since the Thickness was wholly form'd on the inner Side; either because the Circulation had been only intercepted on this Side, or because the external Laminæ had more oppos'd their Separation than the internal. Thus the internal Sides incroached upon the Cavity, and diminished it in Proportion.

Fourth Reflection. It may possibly be asked, Whether the extraordinary Thickness of the Sides of these Arteries was a Fault in their original Conformation; or, Whether it was afterwards contracted by any particular Accident. The latter of these Opinions, to me, appears the more probable of the two, for the following Reasons:

1. The Patient, some Days before his Death, told me, that for about eight Months past, he had felt in the Middle of his Breast an extraordinary Heat, Palpitation, and Oppression, which had daily augmented from their very first Appearance. These three Symptoms may easily be accounted for, from the Description I have now given of the Aneurysm itself.

2. The Patient also assured me, that before that Time he had never been sensible of the least Indisposition, or Disorder, in his Breast.

Moreover, the Texture of the Sides of the Arteries was irregular, and their internal Surface uneven. We have therefore no Reason to believe, that this was a Fault of forty Years standing, (for so long the Patient had liv'd) or even of any considerable Number of Years; since in Infants, and even in Adults, we can with Difficulty observe the *Callus of a Bone*, which has been broken about a Year before.

Fifth Reflection. The Membranes of the Trunk of the Aorta, which in this Case, as one would imagine, must necessarily be very thin, by reason of the great Dilatation they had suffer'd, had nevertheless preserved their natural Thickness, probably, because in proportion as these Membranes were dilated, their Pores had proportionably opened and enlarged, and more nutritive Juice had insinuated itself into the Interstices of the Fibres, adher'd to their Surfaces, and increas'd the Thickness of the Membranes.

Sixth Reflection. The particular Aneurysm must have been formed at that particular Part of the Aorta where I observ'd it, rather than any other, since all its Parts are supposed of an equal Thickness, and endow'd with an equal Power of Resistance; and that so much the rather, because that Trunk of the Artery, which is nearly of a semicircular Figure, does not begin to bend itself, till it reaches the Place where this Aneurysm was situated. Thus the Blood thrown out of the Heart must, of Consequence, have produced more considerable Effects upon this particular Part, dilated it more, and brought on an Aneurysm in it.

Seventh and last Reflection. The particular Aneurysm must have been formed rather at the superior Part of the Aorta, than in the inferior and lateral Parts; because the Blood, which was the instrumental Cause of it, is directed in its Motion, from below, upwards; and consequently its Action must have been greater on the superior, than any of the other Parts. This upper Part then must of course have been thrust upwards, insensibly dilated, and form'd into an Aneurysm, which would enlarge itself towards that particular Side.

The principal Symptoms, with which this Aneurysm was accompany'd, accounted for.

The Patient complain'd of a Weight and Pain in his Head, and of a Weakness of the principal Functions of his Mind. These three Symptoms were produced by one and the same Cause, that is, the Compression of the Jugular Veins, occasioned by the Aneurysms.

The Case stands thus: These Veins being compress'd, the Return of the Blood from the Brain to the Heart is not free and uninterrupted; so that less Blood returning, the greater Quantity must consequently remain in the Head, and the Head itself of course must seem heavy: Because in such a Case there is too much Blood in the Brain, the Coats of its Blood-vessels, its Membranes, &c. must of course be stretch'd and vellicated, and suffer a kind of Distortion and Dilaceration, in which the Pain consists.

The same Vessels, so distended with Blood, must compress the Nerves situated in their Interstices, deprive the animal Spirits of their free and easy Motions in the Brain, and consequently weaken the Functions and Operations of the Soul, which depend upon these very Motions.

The Patient felt also a Pain in his Neck, Shoulders, and Arms; because the Aneurysm, being situated upon the Jugular as well as the Subclavian Veins, by which the Blood returns to the Heart from these Parts, must compress them, render the Motion of the Blood thro' them slow and difficult, and even, in some measure, stop it in them. The Blood, thus lodg'd in the Veins, must distend and stretch them by its excessive Quantity, and stimulate and irritate them by the Salts which are secreted from the Blood, by reason of its Continuance there; and thus, by these two Means, the Pain in these Parts is excited.

He was likewise troubled with a Difficulty of Respiration and Deglutition, because the Aneurysm being situated upon the Trachea, and Oesophagus, which are, as it were, the Conduits of Respiration and Deglutition, compress'd them so, that it was with Difficulty they performed their respective Functions, especially about the Beginning of the Sternum, where the Passage being surrounded on all Sides with bony Parts, whose Resistance cannot be surmounted, these two Conduits cannot of course elude this Pressure.

The Pulse of the Patient's Right Wrist was small and weak, because, as I have observed, the Entrance of that arterial Branch, whence the particular Branch occasioning this Pulse sprung, being very small, there must, of consequence, be little Blood convey'd into it, and that too must flow very slowly in it, since the Branch itself was too large and capacious, in proportion to the Blood carry'd thro' it. Thus that Blood could neither fill the Cavity of the arterial Branch, and thereby occasion a full Pulse, nor dilate the Sides of it with Force and Impetuosity enough to produce a strong one; so that the Pulse, in his Right Wrist, must have been both small and weak.

The Pulse also of the Patient's Left Wrist was so small and weak, that it could scarcely be felt. We have already observed,

served, that the Entry of the arterial Branch, from which the Branch producing this Pulse sprung, was much less than that in the Right Arm. The Artery where this Pulse is, must consequently receive much less Blood, its Sides be less dilated, and with a proportionably smaller Degree of Force, by which means the Beating of it was almost imperceptible.

Last of all, the Patient fainted, when, being weary'd of holding his Neck and Head upright, he let them fall to one Side.

When the Head and Neck are inclin'd forwards, the Jugular Veins form a kind of Bend, and are, as it were, choaked : When the Head and Neck, on the other hand, are reclin'd backwards, these Veins are too much stretched, and the Diameters of their Cavities are diminish'd ; because their Sides must of consequence approach nearer to one another ; and when the Head and Neck are inclin'd, either to the Right, or Left Side, the Jugulars of the one Side are bended, whilst those of the other are too much stretch'd.

Now in all these Situations, the Jugular Veins are compress'd, and their Cavities diminished ; and the Return of the Blood from the Brain to the Heart is by that very Means retarded and render'd more difficult. If to these Compressions we add that made upon the same Veins by the Aneurysm, we shall find no great Difficulty in comprehending how the Veins of the Brain must be choaked up, and how these choak'd up Veins must compress the Nerves to such a Degree, that, in our present Case, a sufficient Quantity of animal Spirits could not be convey'd to the Heart, in order to carry on its Motion without Interruption. Now this Interruption of the Motion of the Heart is always followed with Faintings, which are greater or less, according as the Interruption is shorter or longer. *Mem. de l'Acad. R. 1712.*

HISTORY III.

On the 5th of June 1721, a Soldier came into the House of Invalids with an Aneurysm, almost of a Year's standing, on the anterior, right and upper Part of his Breast. The external Tumour, which was about a Finger's Breadth distant from the Sternum, seem'd to be divided into two Parts, one of which possessed the intercostal Space between the second and third Cartilages of the Sternum ; and the other that between the third and fourth. This Aneurysm rose several Lines above the Level of these Cartilages, altho' they were sensibly more arch'd, and projected farther, than those of the Left Side, which was occasioned by the quick and continual Beating of the Aneurysm. They were even visible at some Distance ; and all the adjoining Parts were so sensible of Pain, that the Patient could scarce suffer his Cloaths to touch them. He could not call to Mind any external Accident, which might be assign'd as the Cause of the Disorder ; however, he spun out his Life under all the Agonies of his Disease, till the 22d of October, when Death put an End at once to his Life and his Pain.

Mr. Morand, the younger, laid his Body open, and found the Aneurysm in the Aorta. But a Circumstance which appears somewhat miraculous, was, that the Aorta, already preternaturally enlarg'd at the Place of its Egress from the Heart, about an Inch farther, form'd itself into a large Bag, thirteen Inches in Circumference, and capable of holding a Pint of Water. Afterwards it contracted itself in order to continue its ordinary Course, send forth its four superior Branches, and form its Crofs ; and at its upper and anterior Part, it was very closely united with that Part of the Pleura which covers the Cartilages of the Sternum.

Two Polypi fill'd the Cavity of the Aneurysm. The one began at the lower Part of the Aorta, cover'd the internal Surface of that Part of it which is next the Base of the Heart, and afterwards form'd a kind of Plate, pierc'd with a Hole, parallel to the Opening of the Left Ventricle. The other Polypus covered the superior Part of the Aorta, which adher'd to the Pleura. They both had this Circumstance peculiar to them, that the red Substance, of which they were compos'd, serv'd as a kind of Ground-work for a beautiful Contexture of small, white Filaments, which, by their Ramifications, intersected one another, and represented various Figures, such as Rays darting from a common Centre, Lozenges, Nets, and the nervous Ramifications observed on the Leaves of Trees. The red Substances were undoubtedly Concretions of Blood, form'd by its Congestion in the dilated Aorta. But if it should be ask'd, what the white Filaments were ; I answer, They were probably the lymphatic and nutritive Parts of the Blood, separated from the rest, by its Stay in the Bag, and again united, as much as their Nature would admit of. If, on the other hand, it should be asked, why these lymphatic and nutritive Parts of the Blood should rather unite themselves in Filaments, than in any other given Form ; I answer, That tho' we cannot account mechanically for this Phenomenon, yet we may reasonably suppose, that they are naturally dispos'd so to do ; and that this Effect is very agreeable to their Functions, and confirmed by the Formation of new Membranes, and Cysts, which are found upon certain Occasions.

Mr. Morand observed how surprisngly skilful Nature was, in finding out Expedients for her own Relief ; and drawing, as it were, from the very Disorders into which the animal Machine is thrown, the Means of preserving herself, or, at least, of warding off her Destruction. The Polypuses, as is usual, occasion'd a great Inequality in the Patient's Pulse ; sometimes an Intermittence, and at other times too great a Frequency ; but without these Inequalities in the Pulse, the Disorder would have been still greater, since the dilated Aorta would have received a larger Quantity of Blood, than the Heart would have been able to propel ; the Polypuses, by filling the Cavity of the Aneurysm, made amends for its excessive Dilatation, and directed the Course of the Blood thro' a Canal which had all along been kept open. In the two Polypuses also, a Part of one of which was pierc'd with a Hole, this Hole was parallel to the Opening of the left Ventricle, thro' which the Blood flows from the Heart. The upper Part of the Aneurysm adher'd to the Pleura, and, by its Union with it, had so fortify'd the Membrane of the Aorta, as to prevent its breaking by the Action of the Blood, and save the Patient from an Effusion of Blood in the Cavity of his Breast, which would have proved immediate Death. *Hist. de l'Acad. R. 1721.*

HISTORY IV.

A certain Surgeon gave our Society an Account of a very surprisng and uncommon Case : A Man, as he inform'd us, who had gone a hunting, happening to turn his Head hastily, and with some Degree of Violence, to the Right Side, was not able, without a good deal of Pain, to return it to its natural Situation ; ever after which Accident he was so much indispos'd, that he could neither swallow nor breathe without a very great Difficulty. About fifteen Months after the Accident, the Patient died ; and upon searching for the Cause of his Disorder, we found the Aorta very much dilated, a large aneurysmal Cystis in the Right Subclavian, the Oesophagus and Trachea strongly compress'd by this Cystis, the Clavicles removed out of their natural Situation, and a Piece of Bone, which was wanting in the Sternum, included in the Cystis. 'Tis no easy Matter to account for the Bone's being lodg'd in this Place. *Hist. de l'Acad. 1700.*

HISTORY V. By Mr. MALOET.

On the 26th of June last, in the Afternoon, a Soldier of 45 Years of Age came into the Royal Hospital of Invalids, where I saw him the same Day ; and upon asking him for what Disorder he came there, he told me, that for six Weeks past he had been troubled with a Defluxion in his Breast, for which he had been blooded six or seven times ; that he had cough'd a great deal, and spit Blood, and that his Cough, and a Pain in his Throat, were still remaining. I look'd at his Neck to see whether there was any Rising or Elevation about it, and found on the lower and anterior Part of it a Tumour as large as a Nut, immediately above the Cavity of the Sternum, on which it rested : It was soft, round, and smooth. The Skin which cover'd it retain'd its natural Colour. It had a very perceptible, and a very regular Pulsation, and yielded to the Pressure of one's Finger ; but restor'd itself to its former Dimensions very quickly, and with a kind of Force. From all these Symptoms I easily concluded, that it was a true Aneurysm ; and suspected it to lie at the superior Part of the Aorta, which I imagin'd to be lengthen'd out independently of the Aneurysm. I asked the Patient how long he had been afflicted with that Tumour, and whether he was sensible of any Circumstance, which might have possibly laid a Foundation for it.

He told me, that he had only perceived it since the Defluxion in his Breast ; and that he could think of nothing to which he could so properly attribute it, as to the Efforts he had made in Coughing.

As his Cough remain'd as yet, I order'd him composing Medicines ; and because his Pulse was a little too frequent, I reduced him to Broths and Ptisans ; and order'd him to abstain from making any Kinds of Efforts, because of the Aneurysm.

The Patient having continued under this Regimen till the 29th of the same Month, he asked me one Morning, when I made him a Visit, if it was by my Orders that he had not Wine allow'd him : When I told him it was, he said, I cut his Throat, as it were, by discharging him the Use of it : That as he had work'd at his Business in the Quarries, he had been accustomed to it ; and therefore begg'd, that I would let him have some Allowance of it. Finding his Pulse calmer than it was on the Day in which he came to the Hospital, I made him be mark'd among the Number of the Patients who were to have Wine.

I had no sooner reached the Bed next to the Patient's, than I heard behind me a Noise, as it were, of one vomiting. Upon returning, I found the Man, with whom I had just then parted, discharging Torrents of Blood from his Mouth. I ran to his Assistance, as did likewise the Apothecary of the Hospital, who attended me during my Visit. But as he cover'd not only himself, but every one that came near him, with Blood,

the first Step we took, was with all Haste to provide a Vessel for receiving the Blood, which he discharged without any Effort, in great Quantities, which came up immediately upon the Back of one another. As I thought the Case very desperate, I desired a Sister of the Infirmary to call a Priest with all possible Haste. The Patient, having laid himself on his Bed, in the Posture which he judged most advantageous, discharged great Quantities of Blood in the Vessel, which the Apothecary held for that Purpose, and expired in a Moment, before the Priest, who was in the Hospital at the very Time the Accident happened, could have an Opportunity of discharging the Functions of his Office, with regard to his Soul; for there was scarce a Minute betwixt his Death, and the Time of his beginning to throw up the Blood, which was frothy, and of a vermilion Colour.

Tho' I expected very fatal Consequences from the above-mentioned Tumour, yet, I must own, I did not imagine the Patient's Death so near at hand; and much less did I suspect, that the Aneurysm should have been discharged by the Mouth.

But there was no Reason to doubt of its having burst, and of the Patient's having lost all his Blood by that Means, since upon his Death the Tumour of his Throat disappeared entirely. But how did it appear possible, that this Blood should have reached the Mouth, since nothing is more evident, than that the Tumour was a dilated Artery, none of which have an immediate Communication with the Mouth, nor with any of these Canals by which this prodigious Quantity of Blood could be furnished? I saw plainly, that the Blood must have forced a preternatural Road to itself; but it could not have possibly discharged itself so suddenly without two Openings, one in the Artery, where the Aneurysm was, and the other in the Trachea, which I judged the only way by which the Blood could reach the Mouth. This too appeared somewhat hard to conceive, since the Fluid contained in the Tumour did not seem capable of corroding the Sides of the Canals; and even tho' it had, it must have pierced the Sides of the Aorta, before it could produce any Effect upon those of the Arteria Trachea; in which Case, that is, after it has pierced this Artery, it must have thrown itself into the Cavity of the Breast, and by that very Circumstance become incapable of corroding the Trachea, or coming through it to the Mouth.

Upon laying the Patient's Body open, my Difficulties were removed. This I did the very Night on which he died, and, before I began the Work, I observed a kind of bloody Froth flowing from his Mouth, and the smallest Remains of the Tumour on his Neck were not to be seen. I opened the Breast, and after having disengaged the great Artery, and its three large Branches, the Right Subclavian, the Left Carotid, and the Left Subclavian, I found something peculiar and uncommon in the Aorta; for it was dilated in the upper Part of its Arch, between the Right Subclavian, and the Left Carotid, betwixt which, just at their Origin, there was, contrary to what commonly happens, a Space of six Lines. The Right Subclavian Artery was larger and longer than ordinary; for it was about an Inch in Diameter, and two Inches long, before it sent forth the Carotid. There was on its upper Part, where it springs from the Aorta, a Cystis, which had form'd the Tumour, which appeared on the lower Part of his Neck. Hence it was, that this Aneurysm was not, as I had suspected, altogether in the Aorta, which nevertheless contributed somewhat to its Formation; for it was really dilated, or lengthened out, in its upper Part, as I had suspected.

The Cavity of this Cystis was about two Inches in Diameter every way. It was placed before the anterior Part of the Arteria Trachea, between the tenth and fifth cartilaginous Segments inclusively; so that it covered six of these Segments, and in its posterior Part adhered very closely to them, as it likewise did on the Left Side, which I did not touch.

I endeavoured to disengage it from the Arteria Trachea, but it opened as soon as I touched it with the Knife, though I did it with all the Gentleness I possibly could. Finding that it was not possible to separate the whole Cystis, which I at first intended, I enlarged the Orifice which I had made in its Right lateral Part, that I might look into its Cavity. I found nothing in it, but was surprised to see the Cartilages of the Arteria Trachea discovered. I endeavoured to find out the posterior Side of the Cystis, or dilated Artery, which, in Consequence of its Situation, should have been opposite to the said Cartilages; but I found no Side there, except a little Shred, which seemed to be very weak, decay'd, and even torn. I also observed, that the Cartilages upon which the Cystis touched, were weaker, flatter before, and less projected than the rest. And lastly, I observed between the sixth and seventh of these Cartilages, on the Right anterior Part of the Trachea, a Hole almost round, of two Lines transverse, and two and an half of vertical Diameter.

This Hole was made in the ligamentous Membrane, by which the cartilaginous Segments are tied to one another; and it even bordered upon the sixth and seventh, which by that means had become a little arched at that particular Place.

Upon founding the Hole with a Probe, I found it passed into the Cavity of the Arteria Trachea, but yet in such a manner, that it was larger at its Entrance, than in any other Part. I also judged it proper to take a View of the Stomach, which when I did, I found it filled with Clots of Blood.

I was then no longer at a Loss to judge which way the Blood discharged by the Mouth had come, and why it had been thrown up so quickly, and in so large Quantities; and even why it had not been thrown up sooner, though the Hole in the Trachea seemed to be of a considerably old Date.

'Tis not, in my Opinion, to be doubted of, but the Blood passed, by means of this Hole, from the Cystis into the Trachea; thence it must needs either mount up into the Larynx, or descend into the Bronchia; but the Air included in them prevented its taking that Course, tho' it was carried thither by its own Weight; so that it was forced to the Larynx, and from thence towards the Palate, from which it was discharged by the Mouth.

Though the Hole seemed to have been made in the above-mentioned ligamentous Membrane, some time before the Patient's Death, or rather before his Hæmorrhage, yet the Blood did not pass from the Cystis into the Cavity of the Trachea, because the internal Membrane of that Canal had remained entire, block'd up the Hole on the Side of the Cavity, and prov'd, as it were, a Defence to its Entrance. But this Membrane being broken and dilacerated, the Moment before the Patient died, the Blood contained in the Aneurysm, or rather that of the Subclavian Artery, found nothing to oppose its Passage into the Trachea.

I say this last-mentioned Membrane must have been first distended, and then broke, which could not well happen otherwise, since, being pretty lax, it must have yielded, and be driven inwards by the Blood, which came from the Subclavian Artery.

This appeared from the Form of its Opening, the Lips of which projected considerably into the Cavity of the Arteria Trachea; so that by laying them back towards the Hole formed in the ligamentous Membrane, they closed up the greater Part of it.

It now remains, that we consider how this Hole may have been made, between these two Cartilages, in the Membrane by which they are tied to one another; and this is not very hard to be conceived; for the posterior Side of this Cystis, which adhered to the Arteria Trachea, having been stretched, and at last broken, by the impetuous Efforts of the Blood, which arrived continually at it; and even destroyed, since it was very slender, and on one Side, apply'd to Substances harder than itself, and on the other, exposed to the Shocks of the Blood thrown very forcibly upon it, the Blood acted immediately upon the Trachea, but was not thrown forth from the Cystis, by reason of its close Adherence to the Trachea, which served as a Side to its posterior Part. This same Blood, whether by its Serosity, or some of the saline Parts, or by the Effort with which it had been thrown into the Cystis, had gradually wasted the Interstices of the cartilaginous Segments, which concurr'd to form the Trachea, and had produced this Opening betwixt the sixth and seventh of them, because that Place might have possibly been weaker, or more exposed to the Efforts of the Blood in Consequence of its Direction.

But this Opening was not formed instantaneously, but by little and little. It was begun, and even pretty well advanced, at that time the Patient spoke to me with so much Resolution, and accused me of cutting his Throat, as it were, by debarring him the Use of Wine. He did not certainly at that time think, that he was so near the Point of having it really cut, or, at least, pierced. The Blood had already broken through the ligamentous Membrane betwixt two of the cartilaginous Segments of the Trachea, and had arrived at the internal Membrane of that Canal, which was now the only Obstacle left for it to surmount in its Passage. At this particular time, it might have been truly said, that the Life of this Soldier hung, as it were, by a Hair, since it only depended on the shorter or the longer Time, which so slender a Membrane might be supposed to hold it out against the Shocks of the Blood, supplied by the first and largest Branch of the Aorta. It was scarce possible, that such a Membrane could, for any considerable time, hold it out against a Force capable of overcoming a vastly greater Resistance: Thus it was broken in a Moment; and that was the very Moment preceding the Death of the Patient.

As the Communication betwixt the Aneurysm and the Arteria Trachea had become free and uninterrupted by the breaking of this Membrane, the Blood contained in the Aneurysm, or rather in the Subclavian Artery, passed with all its Impetuosity into that Canal, and was from it convey'd, as I have already said, through the Larynx towards the Palate, by which it was discharged thro' the Mouth, as long as the Patient had Strength enough to sit up; but being obliged to lie down, or rather falling backwards, by reason of the extreme Weakness occasioned by such a Loss of Blood, and the Blood, in the mean time, continuing to flow towards the Palate, a Part of it then fell

fell into the Pharynx, and from thence into the Oesophagus and Stomach; this it might the more easily be supposed to do, because the Posture of the Patient favoured its Direction that way, by its proper Weight, whereas it opposed its Discharge by the Mouth. Hence we may account for the Blood found in the Stomach, where it was coagulated.

The Effort of the Blood, which flow'd from the Subclavian Artery to the Aneurysm, beating continually and immediately upon the Cartilages of the Arteria Trachea, could not fail to stretch them, and render them flat and weak, as I have observed they were.

This Aneurysm seems to me to have been the Consequence of the Augmentation of the Diameter of the Right Subclavian Artery, from whatever Cause such an Augmentation might proceed; for as the Diameter of this Artery could not be augmented without its Sides being at the same time distended, and consequently rendered thinner, which they were in Reality, in proportion as they were dilated, it is plain, that these Sides, becoming thinner, must, of course, have less Force to resist the Impetuosity of the Blood, which was carried towards them, and which was so much the greater, as it came immediately from the Aorta. These Sides then were forced to yield, and stretch more in some Places than in others, that is, in those Parts most which were most exposed, or weakest; and as they lost their proper Tone, and a Power of restoring themselves, the Cystis, or Cavity of the Aneurysm, was by that means formed.

The Efforts which this Soldier used to make when working at his Trade in the Quarries, might have laid a Foundation for this Augmentation of the Diameter of the Right Subclavian Artery, and by that means rather prove the Cause of the Aneurysm, than those Efforts which he made in Coughing, during the Defluxion of his Breast, to which he attributed it; because as in the Work in which he was employed, the Muscles of the Arms must be violently contracted, and remain for a long time in that State, they could not fail to intercept the Course of the Blood in those Arteries, which supply them with it; and this must have happened more remarkably in the Right, than in the Left Arm; because the former makes stronger and more frequent Efforts than the latter. The Course of the Blood being intercepted in the Arteries of the Right Arm, it must of course have stopped in the Trunk of the Subclavian, from which these Arteries take their Origin, and which was free from all Compression. The Blood being stopped in that Trunk, and rendered incapable of circulating forwards, in proportion as it was propell'd by the Heart, and accumulated there, it must have dilated the Vessel, and occasioned an Augmentation of its Diameter.

It is very rare, that a true Aneurysm opens, and kills the Patient in so short a time, especially when it is not more considerable than this was; for one may see very large ones supported by Patients for a great Number of Years, whereas this open'd in about the Space of six Weeks.

The Circumstance, which, in my Opinion, best accounts for this, is, that the Aneurysm touched upon the Cartilages of the Arteria Trachea. I have already taken Notice of the Part these Cartilages had in destroying the posterior Side of this Cystis, and consequently in its becoming open.

It is perhaps still rarer, that one should discharge, by the Mouth, Blood, which comes immediately from the Trunk of the Subclavian Artery. As I never saw another Instance of it, and have not met with a Case of the like Nature in all the Authors I have read with that very View, I thought proper to communicate the Particulars of a Case so singular. *Mem. de l'Acad. R. 1733.*

HISTORY VI. From the Philosophical Transactions.

In the Year 1685. a Servant to my Lord Culpeper got a Fall, which caused him a heavy Pain in the Breast for a while. About a Month after this Accident, a Musket burst in his Hands, and gave so violent a Recoil against his Right Side, that it made him spit Blood immediately, and continued for six Months. A Year after, he began to feel a Continuation on that Side, and then he spit Blood again, which continued but only in the Spring and the Fall, till he died.

He bled likewise by the Nose twice a Year, for a Month every time. In 1695. or 1696. a Tumour began to appear under the Right Nipple, which, growing by little and little, came to an extravagant Bigness, and at last, after using some emollient Ointments upon it, (of its own Accord) it broke suddenly, and he soon after died. Mr. Lafage open'd the Body, and found that two of the Cartilages of the Ribs were worn off, by the continual Pulsation of the Tumour: Part of the Sternum Bone was also worn off, by the same Cause. The Dilatation of the Artery began precisely on its Trunk next to the Heart, before it divided itself into the ascending and descending Trunks; and though there is but a little Place, yet it did dilate itself so excessively, that the Bag did fill up the whole Cavity of the Thorax on the Right Side, and pressed the Lungs so much, that they were thereby much diminished; the Bag by the Outside did adhere to the Mediastinum, to the Dia-

VOL. I.

phragma, the Pleura, and to the Sternum, in which it had digg'd two great Holes, so strong was the Impulsion: The Inside of that Bag was lined, almost all over, with bony Laminæ, some larger, some lesser, like so many Shells; the Heart was mightily relaxed, insomuch that it was twice as large as it ought to be; and amongst its Fibres there were some Stones, like them which are sometimes found in the Lungs of scrophulous Bodies. *Philosoph. Trans. Abr. Vol. 3.*

HISTORY VII. From the Philosophical Transactions.

We had lately an Opportunity of examining into the Nature of an Aneurysm, by means of a Patient, who was taken into St. Bartholomew's Hospital. She was about four-and-thirty Years of Age, and of a good Constitution; but there was a Tumour, bigger than one's Fist, which began from the upper Part of the Sternum, between the Origins of the *Musculi Mastoidei*, and extended itself to the *Pomum Adami*, almost up to her Chin, and possessed all the Breadth between the two Carotid Arteries. The Account that she gave of the Occasion of it was, that her Husband, being a passionate Man, took her by the Throat one Day, as she was crying out upon some Occasion or other, and griped her so hard, as almost to throttle her. She was then with Child, and immediately perceived something of a Pain a little above her Heart; and a few Days afterwards there appeared a Tumour about the Bigness of the Top of her Finger, just above the Sternum, and so continued without Increase or Pulsation, till she was brought to Bed, when it began to be enlarged, upon her having a hard Labour, agreeable to what Practitioners have observed, that Accidents of this Nature often happen to Women in Labour. This was about four Years since, and from that time it had continued gradually increasing, until it was arrived to almost the highest Pitch of Extension; and she had all along been troubled with a Palpitation, Pain, and Straightness within the Thorax, great Interruptions in her Rest, and frequent Sinkings, together with a constant Beating along the Chest up to the Tumour; in which likewise there was a Pulsation correspondent to the regular Pulse, shaking the Tumour at every Stroke, and manifest to the Eye as well as the Touch. Notwithstanding this, she was otherwise hearty, had her *Menses* regularly, had a good Appetite, and was mostly cheerful and lively, and never more so than just before the fatal Period of her Tumour. The Apex of the Tumour, which was towards the Middle, in the prominent Part of it, was beginning to mortify, through an Over-distention, and the common outward Integuments were the first that seemed to suffer: But the Distention continuing, the Mortification increased, and was quickly communicated to the outer Coat of the Artery likewise, which therefore sloughed off as well as the other Integuments, and being at length worn away, just at the Extremity, made a sudden Aperture, about twice the Bigness of a Goose's Quill. The Blood instantly gushed forth, as from a Stream or Torrent, and the poor Patient died in less than a Minute.

Upon opening the Body, we began from the Heart, in which there was little remarkable, except that the Left Ventricle was somewhat larger, as were likewise the *Columnæ Carnea*, than they naturally should be. There was little observable likewise in the Aorta itself, till we came to the *Curvature*; upon the upper Side of which was the Basis of the Tumour, forming a cylindrical Stem of four Inches long, while in the Cavity of the Thorax; but extending itself into a circular Form of a larger Dimension, when it became external. Upon opening the under Part of the Aorta, opposite to this Basis, and carrying the Incision throughout its whole Extent in the Thorax, the Trunk retained its usual Form and Dimensions, and was not at all dilated; but in the upper Part above described, just on this Side the Orifice of the Right Subclavian Artery, (which was nearer than usual to the Orifice of the Left Carotid) there was a preternatural circular Aperture of half an Inch Diameter. Upon dividing this Aperture, and carrying on the Incision to the Apex of the Tumour, its whole internal Substance appeared. The Edges of the Aperture, at the Basis of the Tumour, were hard, and almost cartilaginous, and seemingly the Remains of thick and fleshy Fibres, which, upon a nicer Inspection, they appeared to be in Fact; viz. the broken Fibres of the Inner, or what is commonly called, the Muscular Coat of the Artery, which terminating here, the Tumour immediately increased to two Inches Diameter, and continued of that Dimension, till it came out of the Neck, between the Clavicles; but then extended itself circularly to a Diameter of above three Inches, the Covering of which was nothing else but the outer Coat of the same Artery, all along dilated from the Base, even to the Extremity of the Tumour. The Cavity was, for the most part, filled with a sort of Polypus, or Sarcoma, in which, nevertheless, there were three Sinuses, or Passages, that were kept open by the constant Influx of the Blood, and communicated near the Apex with one another, (that in the Middle being the largest) and terminating in one towards the Extremity of the Tumour, not far from where it broke. *Philosoph. Transact. abridg'd, Vol. 8.*

I shall conclude these Histories of Aneurysms with the following Remarks by Dr. Nicholls, which I find in the *Philosophical Transactions*, because they seem to set the Nature of these Tumours in a just Light.

An Aneurysm is, by all Authors, defin'd to be a soft, circumscribed Tumour, in which there is a sensible Pulsation of the Artery, to which it adheres. As it is certain, that any Tumour, of what Kind soever, lying on, or adhering to, any considerable Artery, must necessarily be mov'd by every Pulsation of such Artery; so this Pulsation (unless understood in such manner as I shall hereafter explain) can no ways be admitted as the true Diagnostic, whereby to specify the Difference between this kind of Tumour and any other. An Aneurysm is found most commonly to succeed Falls, Vomiting, Labour-strains, and such other Motions or Indispositions of the Body, as, by compressing the great Branches of an Artery, any ways stop the progressive Motion of the Blood. It is obvious, that, as the Section of the Artery, above the Compression, must, in its natural State, be sometimes very incapable of containing at once the whole Quantity of Blood, which ought only to have pass'd thro' it successively; and as the Force of the Heart may frequently exceed the Resistance it may meet with from the Coats of the Artery, so the Consequence of such a Stop to the progressive Motion of the Blood, may occasion either a Rupture of the Artery, or a Distention of the Artery without a Rupture, or a Rupture of the internal Coats of the Artery, and a Distention of its external. A Rupture of the large Branches of the *Aorta* necessarily allows so plentiful Effusions of the Blood, as to occasion immediate Death; while the Capillaries may be burst, without any other Injury but a slight *Echymosis*; and the Tumour form'd by the Effusion from them, will be diffused and superficial. A Rupture of the mean Branches (such as descend between the *Tibia* and *Fibula*, the *Radius* and *Ulna*, &c.) will be attended with a considerable Effusion of Blood; but as the Blood will find a Passage between the Interstices of the Muscles, it will never form a circumscribed Tumour. However, the Effusion being continued, *per Saltum*, thro' the ruptured Artery, will give a faint Pulsation, and consequently some Resemblance of the Aneurysm; for which Reason it is, by some Surgeons, term'd a *Bastard Aneurysm*. Whether or no an Aneurysm be a Tumour form'd by the Dilatation of the Artery, or by a Rupture of the internal Coats of the Artery, and a Distention of the external, has for some time been a Matter of great Dispute; each Party protesting (perhaps too unjustly) against the Possibility of the other's Opinion: As to the Possibility of an Artery's being dilated, it stands supported by Reason and Autopsy. We find the Uterine Arteries constantly increased in Thickness and Diameter, in proportion as the *Uterus* is distended; and many Cases of Palpitations of the Heart have been attended with great Dilatations of the *Aorta*: Instances of which I have seen both in human and brute Subjects. Such a Dilatation will necessarily follow a constant or frequent Pressure on any Part of the *Aorta*, provided such Pressure does not entirely stop the progressive Motion of the Blood thro' the *Aorta*: But, on the other hand, such a Dilatation will always retain somewhat of the Form of the Artery. The Resistance will not be every way equal, as in the extravasate Tumours; because the quaquaversal Pressure of the Blood will be controul'd by the Pressure on the Artery, and the Resistance from the Coats of the Arteries, so as necessarily to form a Cylindroid; and the Consequence of such a Dilatation cannot (if consider'd abstractedly from its Pressures) be worse (if so bad) than from a varicous Vein. Again, they who conceive an Aneurysm to be a Rupture of both Coats of the Artery, oppose their Opinion who imagine the internal Coat to be ruptured, and the external to be distended, by comparing the two Coats in Question, and urging, that, as the internal Coat is so much thicker than the external, it seems impossible the last should be sufficient to resist a Force capable of destroying the first. Were these two Coats similar, as to their Structure, we might then compute their Strength by their Thickness, and this Argument would be of much greater Force than at present it can be; because the internal Coat being composed of annular *Fasciculi*, whose Sides have but a very weak Cohesion, their Power of resisting will not be measurable by the Strength of those *Annuli*, but by the Force with which they adhere laterally. And, on the other hand, the external Coat being composed of Fibres equally interwoven, and of a quite different Composition, it may either exert a greater Resistance, or be capable of much greater Dilatations than the internal: But, that Autopsy may evince the Truth of this Difference in the Strength of these Coats, it will be found, by any one who pleases to try the Experiment, that by blowing into the Pulmonary Artery, the internal Coat will soon burst, and the external form itself into aneurysmous Tumours (which Experiment was accordingly tried before the Society, to their Satisfaction).

Upon considering all which, and having, by Order of the Society, both privately and publicly examined an Aneurysm, which I find to be round, like other extravasate Tumours, unless when controul'd by any notable Pressure, and that the Sac-

culus does not divide into Coats, as the Artery from whence it arises does, I am induced to think, that this Aneurysm is a Tumour form'd by the Blood's being forced thro' the *Ligamentous*, or what is call'd the Muscular Coat, and distending the membranous or outer one: And because the Impetus of the Blood will, as it were, perpetually press through the Aperture into the Tumour, and be again (at least in Part) return'd by the Elasticity of the external Coat; therefore such a Tumour will rather have a pulsatile Dilatation, than a Pulsation, for its true Diagnostic. *Phil. Trans. Abr. Vol. 8.*

As Aneurysms frequently happen from Accidents in Bleeding, I shall first specify the necessary Method of proceeding, in order to prevent an Aneurysm, when a casual Wound of an Artery, in Phlebotomy, makes it suspected, that one may ensue.

In letting Blood, it sometimes happens, that the Artery is cut instead of the Vein, or that the Vein and the Artery are wounded at one and the same time. This Misfortune generally happens, when the Surgeon intends to open the *Basilic Vein* in the Arm; for near this Vein there usually lies some large Artery, and generally the principal one in the Arm (though I have often observed the large Artery near the *Cephalic Vein*); the pricking of this brings on, for the most part, a terrible Effusion of Blood, an Aneurysm, or even, as *Hildanus*, some others, and I myself have observed, a Gangrene of the Arm, from the Circulation of the Blood being stopp'd in it; or, which is still more terrible, Death itself, from an immoderate Effusion of Blood. Now, that an Artery is wounded, may be pretty well known from these Signs:

The Blood bursts from the Orifice at certain Intervals, and, as it were, by Starts; and springing forth, in a more violent manner than when no such Accident happens, it describes certain Arches in its Progress. Its Colour is also more red and florid, than that which flows from a Vein open'd as it ought to be. Besides, if the Part below the Orifice is press'd with the Finger, the Blood bursts forth with the greater Impetuosity; but if any Pressure is made above the Wound, the Impetus of the flowing Blood is diminish'd. The Reverse of all this happens when a Vein is duly open'd; but if at any time this Misfortune should happen, 'tis reasonable the Surgeon should be apprised of the Danger that attends it, that he may both preserve such a Presence of Mind, and Turn of Thought, as may enable him to take proper Measures, and conceal, if possible, his Error both from the Patient and the By-standers. He must therefore diligently observe, in the first place, whether the Blood flows freely from the Orifice, or whether it insinuates itself copiously between the Muscles and the Skin; if it flows freely, a very large Quantity of Blood is to be taken from the Patient, and even till he faints away. The Patient, in the mean time, and the By-standers, are, according to the Advice of *Dionis*, to be artfully wrought up into a Persuasion, that the Person abounds too much in Blood; that 'tis too hot, and, as it were, boiling; and that, in consequence of these Circumstances, his Case calls for so large an Evacuation: For since the Blood ceases to flow when the Deliquium comes on, the Wound may be conveniently tied up, and the Abundance or Impetuosity of the Blood, by that very Means, hinder'd from bursting out afresh, producing an Aneurysm, or at least from preventing the Agglutination of the Wound. In the mean time, the Surgeon ought, if possible, to catch an Opportunity of privately conveying a Piece of Money into the first Compress, which he is to apply immediately to the Wound, for its more effectual Compression; then, after cleansing the Patient's Arm, he is to apply a second Compress, broader than the first; and even a third, broader than the second; and all of them sufficiently thick: And then, bending the Patient's Elbow, he is to apply a double Bandage, both with a View to retain the Compresses more firmly, and compress and agglutinate the Wound of the Artery more effectually. These Bandages are to be applied in the same manner as in common and ordinary Venesections. It is also highly proper to apply a narrow, thick, and long Compress upon the Tract of the *Brachial Artery*, all along from the Wound to the Arm-pit; and this Compress is to be fix'd with a Bandage applied in obtuse spiral Wreaths, that the *Brachial Artery* being thus gently compress'd, the Impetus of the Blood upon the Wound may, by that means, be considerably diminish'd: And that the By-standers may not so much as entertain the remotest Suspicion of the Error committed, they are, with a grave and serious Air, to be told, that it was absolutely impossible to stop the impetuous boiling Blood of the Patient, without the Assistance of so artful and curious a Bandage. I hope *Father Parnin*, when he translated *Dionis's Surgery* into the Tartar, or modern Chinese Language, left out this Advice above-mention'd; otherwise it would give the Chinese a horrid Idea of the Villany of the European Surgeons, which Charity obliges us to presume they are seldom guilty of. As the most political thing a Surgeon can possibly do, is to be honest, I should advise him, in the Case before us, to discover fairly the Accident, that farther Advice and Assistance may be immediately procur'd; for the Welfare of the Patient is of infinitely more Importance, than the Reputation of any Surgeon whatever. Instead of the first Compress, arm'd with a Piece

Piece of Money, a little chew'd Paper, especially if immerfed in melted Greafe, and well wrung out, may be applied to the Orifice with the fame, if not more Propriety; and fome Comprefles, becoming gradually broader, as in the other Cafe, are to be clapt upon it, and fecured with the fame Bandages, and in the fame manner.

After this is over, if the Patient has not recover'd from his Deliquium, he is to be rous'd, by applying to his Nostrils a Linen Cloth foak'd in Vinegar or Hungary Water, by pouring a little Wine into his Mouth, and by opening the Windows, that he may enjoy the Benefit of the free Air: When this troublefome Scene is clofed, Reft, together with a fpare and fender Diet, is carefully to be recommended to the Patient: He is even to be told, in plain Terms, that a moft dangerous Effufion of Blood will enfue, if either by an improper Regimen, Motion of his Arm, or any other Caufe, the Bandages fhould be unloofed or give way. For this Reason, 'tis not only expedient, but abfolutely neceffary, that the wounded Arm, moderately bent, fhould be fupported in the Day-time with a Towel, or Scarf, hung about his Neck, and by feveral Pins fix'd to his Cloaths, that his Arm may the more effectually be kept from moving; and in the Night-time it is to be laid on a foft Pillow.

Some Hours after the Application of the Bandage, the Surgeon ought frequently to vifit the Patient, take a careful Survey of the Bandages, and the wounded Arm; and obferve whether a frefh Effufion of Blood, a hard and painful Tumour, a vehement Inflammation, or a Gangrene, have already happen'd, or are likely to happen; and whether the Bandages are ftill firm and tight. If all other Appearance are favourable, tho' a large, but at the fame time a foft, Tumour arifes about the Part affected, the Bandages are to remain in that State, and not to be loofed before the fourth Day; for a Tumour of that Kind, portends no Ill, even tho' it fhould diffufe itfelf thro' the whole Arm; but when the Bandages appear too loofe, they muft be taken off with the greateft Caution, and again applied more tightly; whilft they are taking off, the Brachial Artery fhould always be comprefs'd with a Torcular, or at leaft with the Thumb of an Affiftant, about the Middle of the Arm; and the Wound itfelf fhould always be comprefs'd with the Thumb or Finger of the Surgeon, till the fame Bandages, or others, together with frefh Comprefles, are again applied: But we are to take particular Care, that the Comprefles, efpecially the undermoft, or the chew'd Paper, if adhering to the Orifice, be not pull'd away, but rather be allow'd to fall off of their own Accord: And, indeed, this Bandage is carefully to be furvey'd, and when it becomes loofe, to be made tighter, after putting a little Balfam of Peru or Capivi into the Wound, fo long as there is even the leaft apparent Danger of a frefh Effufion, and till the Wound is effectually agglutinated. But if, unluckily, a frefh Effufion come on, the Trunk of the Brachial Artery, about the Middle of the Arm, is to be ftroingly comprefs'd, either with a Torcular, or the Thumb or Fingers of an Affiftant, as we advifed above, till other and longer Bandages, together with frefh and thicker Comprefles, are prepar'd, as in the firft Dreffing; the former Applications are to be removed, the Wound is carefully to be cleanfed with warm Wine, or Spirit of Wine, and the Comprefles and Bandages are again to be applied in the manner above directed, till the Wound is agglutinated. But if a Gangrene appears, and is occafion'd by the Tightnefs of the Bandages, in that Cafe they are to be remov'd with the Cautions already given; and, after enlarging the Comprefles, they are again to be applied a little more gently, and the Arm itfelf is to be ply'd with fuch Medicines as are good againft Gangrenes: But if the Gangrene proceed from an Obftruction of the Circulation of the Blood, for want of another Artery in the Arm, which, by the way, is rarely wanting, in this Cafe there is an abfolute Neceffity for having recourfe to Amputation.

But even tho' none of thefe Misfortunes fhould happen, and tho' the Wound fhould, for fome time, remain in this hopeful Condition, the Patient is neverthelefs to be advifed to keep a Bandage on the Wound for eight, ten, or fourteen Days, and indeed the longer the better; and to keep his Arm in a State of Reft, left the Impetus of the Blood fhould again deftroy the tender Cicatrix, or raife it into an Aneurysm. The Regimen alfo, as in the Beginning of the Diforder, muft as yet be fpare and fender: Wine, and other ftrong Liquors, are entirely to be avoided, that a too violent Motion of the Blood may be prevented; which, if it fhould happen, is to be taken off by opening a Vein in fome other Part: For thus the moft dangerous Evils, that is, an exceffive Effufion of Blood, and an Aneurysm, are not only guarded againft, but the wounded Artery is more effectually agglutinated; efpecially if, when the under Comprefle, or the chew'd Paper ufed for that Purpofe, falls off, a little Balfam of Peru or Capivi, or any other balfamic Effence, be applied to the Wound. By thefe means the Patient is frequently reftor'd fo effectually, that he fufains no manner of Injury by the Error of the Surgeon.

There are the Meafures to be taken, and this the Courfe to be follow'd, by the Surgeon, when neither Patient nor By-ftanders fufpect the Error; but if any one fhould at firft fufpect the Misfortune, and fee the Surgeon's Error, in this Cafe 'tis better ingenuoufly to own his Blunder, which indeed may be committed by any one; and after laying down the Caufes of the Error, which could not have been guarded againft even by the moft fkilful and quick-fighted Surgeon, he is to encourage the Patient and By-ftanders by the Promise of a fpeedy and effectual Cure, provided his Directions are follow'd. This open Ingenuity, and frank Confeflion, of the Surgeon frequently lays a Foundation for a fpeedier and furer Cure, than if the Patient had not fufpected the Error; becaufe, being by this means apprifed of the Danger, he is the more careful to follow his Surgeon's Directions, and both do and fuffer whatever is thought neceffary to his Cure.

But when the Orifices of the Skin and Artery do not exactly correfpond to each other, but the Blood, flowing from the wounded Artery, infinuates itfelf between the Mufcles and the Skin, the Surgeon is then to proceed in a quite different Method: For, in this Cafe, 'tis by no means proper to bleed the Patient, *ad Animi Deliquium*; becaufe, being by this means apprifed of the Danger, he is the more careful to follow his Surgeon's Directions, and both do and fuffer whatever is thought neceffary to his Cure. But when the Orifices of the Skin and Artery do not exactly correfpond to each other, but the Blood, flowing from the wounded Artery, infinuates itfelf between the Mufcles and the Skin, the Surgeon is then to proceed in a quite different Method: For, in this Cafe, 'tis by no means proper to bleed the Patient, *ad Animi Deliquium*; becaufe, being by this means apprifed of the Danger, he is the more careful to follow his Surgeon's Directions, and both do and fuffer whatever is thought neceffary to his Cure. A Quantity of Blood may poffibly infinuate itfelf between the Mufcles and the Skin, as may lay a Foundation for a Sphacelus by its Corruption, or at leaft create an immediate Neceffity of performing the Operation for the Aneurysm. In this perplexing State of Things, therefore, if the Orifice of the Skin cannot, by the Affiftance of the Finger, be made to correfpond fo to the Orifice of the wounded Veffel, that the Blood may not infinuate itfelf between the Mufcles and the Skin, but flow freely out of the Body, the Orifice is immediately to be stopp'd with the Finger, or a Piece of chew'd Paper; and feveral Comprefles, becoming gradually broader, are to be applied to it; and the Comprefles are to be retain'd and fix'd by Bandages in the manner above-directed; nor is the Application of that long Comprefle, and Bandage, which we have recommended for compreffing the Trunk of the Brachial Artery, to be neglected. A large Quantity of Blood muft alfo be taken from fome other Part of the Patient's Body, if Circumftances call for it: After this the fame Steps muft be taken which we have directed above, till the Wound be effectually agglutinated. Soon after the Patient muft again be vifited; for it fometimes happens, that, after the Application of the Bandage, no Blood flows from the Wound, but fo infinuates itfelf between the Mufcles and Skin, as to diftend the Arm fometimes to a prodigious Size. *Dionis* gives us a memorable Cafe of this Nature, in which he was obliged to lay open the Skin of the whole Arm, and evacuate four Pints of Blood, which had fill'd all the intermediate Space of the Arm, between the Elbow and the Scapula. *Ruyfch* alfo gives us an Inftance much of the fame Nature, where the Blood was found coagulated almoft thro' the whole Arm. *Heifter*.

CURE of ANEURYSMS.

ANEURYSM is a Term in Ufe among the Surgeons, by which they fignify a Tumour caufed by a Dilatation, Percuffion, or Rupture of an Artery, full of Blood, and commonly attended with a Pulfation. They reckon two Kinds of Aneurysms, the *Spurious* and the *True*: The true Aneurysm is, when a Tumour, with more or lefs Pulfation, arifes from a Dilatation either of the whole Artery, or only of one Side thereof, almoft in the fame manner as the Tumours call'd *Varices* are generated in the Veins. Both thefe Sorts of Tumours may be confider'd as Hernias of the Arteries and Veins; and by fome, for that Reason, are fo call'd. On the other hand, a *spurious* Aneurysm happens from an Aperture made in an Artery, either by external Violence, as in Phlebotomy, a Wound, or a Contufion; or by an Erofion, however caufed, whence there is produced an Extravafation of Blood betwixt the Skin and the other Parts; from whole Effufion, and Detention under the Skin, the Part affected fwells, by little and little, to an exceffive Degree, and becomes of a livid or black Colour; or when a true Aneurysm happens to fwell in fo extraordinary a manner, that its containing Coats being diftended and broken, Blood either iffues from a Wound, or there is an Effufion of the fame under the Skin, which remains whole and unperforated. Hence arifes a very troublefome Tumour, which has little or no Pulfation, and lefs Elevation than in the true Aneurysm. Sometimes a Gangrene follows the Corruption of this Effufion of Blood, or Death itfelf, from the profufe Hæmorrhage. But we may alfo diftinguifh Aneurysms by the Accidents which accompany them: Thus fome are deftitute of the bad Symptoms which attend other Kinds; and there are fome, particularly fuch as are call'd *spurious*, which are accompanied with Immobility, a great Pain, and a Corruption and Sphacelation of the Part: Thefe may, not improperly, be ftyl'd *complicated*; and the former Kind, *simple*. They may alfo be diftinguifh'd into *external* and *internal*; the firft affects fome external, the other an internal Artery: And, to name no more, there feems to be a very remarkable Difference between Aneurysms, as fome of them, tho' of a good

a good Bigness, are now-and-then void of Pulsation; others are constantly attended with the same, in a greater or less Degree; for you must observe, as was said before, that the *spurious* Aneurysms, especially the larger Sort, have scarce any Pulsation; but in the true Kind, and principally those of a small Size, the Pulsation is pretty strong; and in some of these Aneurysms diminishes as the Tumour increases, but in others is not diminish'd, but rather increases with the Tumour.

The true external Aneurysm, besides the Properties just now mention'd, is commonly at first a very small Tumour, often no bigger than a Hasle-nut, with a constant Pulsation. As for internal Aneurysms, because they are invisible in the Beginning, we can say nothing of their Size. To proceed then with the other; the Place of the Tumour is, for the most part, soft to the Touch, and a fluctuating and renitent Liquid is perceiv'd in it. It very seldom deviates from the natural Colour of the Skin, and beats like other Arteries. The Tumour, when press'd with the Finger, while it is yet small, vanishes, and returns when the Finger is removed; but this Trial very seldom or never succeeds, after the Tumour is advanced to any considerable Size; for the Tumour increases by degrees, and sometimes arrives to a vast Bigness. The spurious Aneurysm swells, with a Pain, and Hardness, and a Lividness of the Skin; but the Tumour is more flat than in the other, and generally without a Pulse; when it is press'd, a Noise is perceiv'd; and oftentimes the whole Member, or at least a great Part of it, being more and more inflated, at last putrifies, and becomes sphacelated.

Aneurysms very often arise in the Arms, that is, whenever the Surgeon, in opening a Vein, especially the Basilica, pricks an Artery at the same time, or at least touches it with his Lancet. For, in such Cases, the other Coats of the Artery, or those which were newly agglutinated, being worn and press'd by the continual Pulsation of the Blood, are more and more debilitated and distended, till at last they give way for the Rise of a very terrible Tumour. Wherefore if, in the Space of some Days or Weeks after Venæsection in the Arm, there arises a Tubercle with a Pulse in it, as described in the preceding Paragraph, you may conclude, that you see the Appearance of an Aneurysm. But, besides the Surgeon's Instrument, there are a Multitude of other Causes, both internal and external, that give Birth to Aneurysms, as well in other Parts as in the Arms: For it is no unusual thing for remarkable Tumours to arise in several Parts of the Body, from Wounds, Bruises, and Suppurations of the Arteries, by external Causes. And 'tis not impossible for the Breast and Abdomen to be inwardly affected with Aneurysms, from the Weakness of the outer or inner Coats of the Arteries, however occasion'd, whether by Exulceration, for Instance, or Erosion. This is abundantly confirm'd by undoubted Observations of *Fallopian*, *Severinus*, *Ruyssch*, *Lancisi*, and myself. The Causes, indeed, especially of internal Aneurysms, are often doubtful, or wholly uncertain; however, they must be either internal or external: And 'tis probable, that Aneurysms, many times, owe their Rise to a Fall, or to Blows, or former Fractures, to violent Motions in lifting or pushing great Weights, to Leaping, hard Riding, or any other violent Concussion, by which an Artery may happen to sustain too great a Percussion, and be debilitated; or be too much press'd, and by that means distended into a Tumour: Or they may be owing to an Inflammation, Suppuration, and Erosion, occasion'd by an Ulcer of an adjacent Part, or a Part of the same Artery, whereby its other Coats are render'd too weak to sustain the Force of the Blood that rushes into them, and so are obliged to stretch and give way, and by degrees to expand into a Tumour. So it has been often seen, that from a slight Hurt of the Artery, by a Knife, a Dart, or any other sharp Instrument, especially in Phlebotomy of the Arm, as before observ'd, Aneurysms have proceeded; and even when the Artery has been but just touch'd, and only its outer Coat slightly wounded, by the Point of the Lancet, the inner Coat remaining entire: For this slight Hurt is the Occasion, that the inner Coat, at the Place where the Injury is received, becomes unable to resist and sustain the Pulse of the Heart, and the pressing Influx of the Blood, but is forced to give way; by which means the weak and injur'd Part is by degrees dilated into a very sensible Tumour, call'd an Aneurysm. Now if we apply this mechanical Theory of an Aneurysm from external to internal Aneurysms, many things may happen to injure the Coats of the internal Arteries: Thus an Artery may be weaker, and have less renitent Force, in a certain Place than elsewhere, whether the Cause of the Defect operates on the external Superficies of the Artery, or within its Tunics. So also from a Fall, a Blow, a Bruise, an Inflammation, Suppuration, Ulcer, &c. some Part of an Artery may be so debilitated, or corroded, as to become unable to sustain the Impressions of the Heart and Blood, and so an Aneurysm may be produced; especially if some external Force, as violent Motion, a Fall, Concussion, or the like, happen to concur.

How to prevent an Aneurysm, from an Accident in Bleeding, is specify'd above. I am now to give the Signs by which you may know, whether, in opening a Vein, you happen to hurt

an Artery, tho' but slightly; but as there are no certain, or, as they call them, pathognomic Marks of a slight Hurt of that Kind, we must trust to probable Conjectures. Whenever, then, we plainly perceive a Pulsation against the Point of the Lancet held to the Arm, but no Blood springs out of the Artery, we may reasonably suspect, that the outer Coat of the Artery has been touch'd, and suffer'd Injury: To avoid therefore the Danger of a supervening Aneurysm, you are to enter on the Method of Cure directed above.

But if, through the Imprudence or Negligence of the Patient, or the Surgeon himself, the thing be disregarded, or the Bandage, there advised, left off too soon, an Aneurysm is very easily form'd, and shews itself. For it is to be observ'd, that whenever a Tubercle, with a Pulsation in it, arises within the Space of a Month after a Vein has been open'd, there is an Aneurysm, which owed its Rise to a slight Hurt of the Artery in the Arm. But a true Aneurysm, while it is yet fresh and small, brings little or no Inconvenience with it, besides an uneasy Pulsation, and a slight Tumour; but afterwards, when by little and little it is increased, and grown to the Bigness of an Egg, or a Man's Fist, or his Head, of which last there are Instances, (see *Tab. 32. Fig. 6.*) it is attended with a most intense Pain, an Immobility of the Part, a Weakness, and other ill Symptoms; the Consequences of which are, that, without immediate Assistance, the Coats of the Arteries, becoming every Day thinner, are at last burst, to the great Prejudice of the miserable Patient, and oftentimes not without instant Danger of Death; for either the outward Skin is burst at the same time, and a dreadful Hæmorrhage succeeds, or it remains entire; in which Case there comes on, by little and little, a Corruption of the retain'd Blood, and a Gangrene. Tho' almost all Aneurysms are attended with Danger, and, as *Bartholine* and *Hardey* assures us, few ever saw a happy Event of an Aneurysm; yet the most troublesome and dangerous are usually such as affect either the internal and largest Arteries, or those which lie very much conceal'd, and out of Reach. Of this Kind are those Aneurysms which arise in the Aorta, in the Beginning of the Brachial, Subclavian, or the Carotid Arteries, &c. So also, for the most part, are those Aneurysms incurable which affect the Carotid Artery in the Neck, the Subclavian and Axillary near the Shoulder, and also the Crural Artery, especially near the Belly. For, during the Operation, there usually happens a dreadful, and often mortal, Hæmorrhage; or they terminate in a Gangrene and Sphacelus. Aneurysms in the external Arteries are of a less dangerous Nature, and are frequently cured; of this Sort, in particular, are such as affect the Arteries of the Cranium, those on the Outside of the Ribs, of the Foot, Hand, and lower Part of the Arm. But in an Aneurysm in the Arm, which is caused by the Prick of a Lancet, unless it be taken care of in the Beginning, in which State, by Compresses and Ligatures, it is often cured, the Operation is of doubtful Event: For, in this Case, as the Trunk of the Artery wants to be conglutinated and closed, it can hardly be avoided but the Elbow and Hand, either through a Deficiency in the larger Branch, or the Smallness of the lesser Ramifications, must begin to want sufficient Blood and Nutriment; in which Circumstance a Gangrene and Sphacelus, and oftentimes a Mortification of the Part, are nigh at hand, as I have learn'd from long Experience, confirm'd by the Observations of several Physicians; so that we are often obliged to cut off the corrupted Part, to save the Patient's Life, who yet, for all that we can do, many times perishes after the Amputation. Whenever an Aneurysm breaks spontaneously, and contrary to Expectation, there is generally so great an Effusion of Blood, that the exhausted Patient must die immediately, if not very speedily assisted by means of the Tourniquet, and other things of that Nature, under a skilful Operator. Equal, almost, is the Danger, when a Tumour of this kind is treated like an Abscess, and suffers an Incision from an ignorant Surgeon. But there is one thing, which, above all others, merits Observation, which is, that the spurious Aneurysms are far more dangerous than the true ones: For these latter, especially if they are of no extraordinary Size, may be endur'd for many Years, and even to the End of Life, without much Trouble or Hazard, especially with the Use of a proper Ligature or Bandage; whereas, on the contrary, the spurious Sort immediately betray their Tendency either to an excessive Hæmorrhage, or to a Corruption and Sphacelus. Indeed, both Kinds of Aneurysms are to be dreaded, in proportion to their Largeness, and dangerous Situation; inasmuch that the intrepid and most experienced *Hildanus* never attempted any Chirurgical Operation upon them; and *Ruyssch* expressly says of the Surgeons of *Amsterdam*, that not one of them, for above twenty Years, undertook an Operation of that kind. So, also, a spurious Aneurysm is generally more difficult to be treated with the Knife than the true Sort; because the extravasated Blood being diffused on all Sides, and concreted, creates a great deal of Trouble to the Surgeon in removing it. As for internal Aneurysms, since they frequently lie conceal'd, 'tis plain, that they are out of the Reach of the salutary Art of Surgery, because they

they are not so to be come at by the Hands; or if these internal ones should, in some measure, offer themselves to Sight, there is no opening, or making an Incision in them, without immediate Hazard of Life; for which Reasons those consummate Surgeons, *Fallopian*, *Paré*, and *Severinus*, never attempted their Cure. Upon this Consideration we also, for our Part, left we should be thought to throw away Time and Advice upon a desperate Case, shall only treat, in the therapeutic Part, of external Aneurysms, where there is some Prospect of a Cure.

That every Person may be instructed in the best Method of curing so dangerous a Disorder, we shall make it our principal Endeavour, in the first place, briefly to explain by what Methods Aneurysms, that arise in the Flexures of the Cubit, or Elbow, which happen more frequently than elsewhere, are most properly to be treated; whence it will sufficiently appear, after what manner other Aneurysms, which are less frequent, ought to be managed. Now when a true Aneurysm arises in the Flexure of the Cubit, while it is in the Beginning, and but small, or at least of no considerable Bigness, there are two Ways of Cure, one by Compress and Bandage, the other by the Knife. The former of these is executed in two different manners, that is, by Bolsters and Fillets; or by some peculiar Instruments, adapted to the Purpose. The Method of Compression for a true Aneurysm, while it is little, and for a spurious one, where is no Effusion of Blood between the Parts, is always to be try'd in the first Place; for it would be Cruelty to set about a dangerous Incision, when a milder Method of Cure would answer the End. After we have made a Repression of all the Blood from the Tumor, the Aneurysm may be contracted, and kept down, by means of Compresses of chew'd Paper, or an astringent Plaster, and afterwards with larger Compresses, and proper Bandages, which, if kept on the Place for some Weeks or Months, may be of great Service. This Method, to pass over more modern Examples, was long ago practised by *Hildanus*, *Tulpius*, and *Rogerus*. But if a Ligature of this Kind will not answer the Purpose, as *M. Bourdelot*, Physician to the King of France, experienced in his own Case, the Surgeons have invented proper Machines, by means of which the smaller Sort of Aneurysms are not only repressed and kept down, but with the Help especially of a strengthening Plaster, are usually cured. Two of these, among many, are represented *Tab. 32. Fig. 8. and 9.* tho' their Application and Use are better demonstrated by Inspection, than described in a Multitude of Words. In the mean time we hope they will be clearly enough understood from the Explication of the above-mentioned Plate, which see.

If the Aneurysm be too large to submit to Repression, either by Ligature or Instruments, or if a true Aneurysm, by the bursting of the Coat of the Artery, be degenerated into a spurious one, especially if the Blood diffused amongst the Flesh tends towards a Gangrene; if there be any Immobility of the Arm, attended with Pain; in short, if there be any Danger, that from the Bursting of the Tumor and Skin together, the redundant Hæmorrhage should kill the Patient on a sudden; in all these Cases Recourse must be had to the Knife. The Operation, however, being very painful and dangerous, is not to be undertaken rashly, but with the utmost Caution and Circumspection, and after Consultations had with Physicians, and the most experienced Surgeons, for fear that if any ill Accidents should happen, that were unforeseen, they should readily be imputed to the Ignorance or Temerity of the Operator, who, as 'twill be pretended, was under no Necessity of proceeding in that Method.

The Business of the Operation consists in two principal Points, which are, first, removing the Tumor of the Aneurysm, and afterwards the Agglutination of the Artery. In Italy, no longer ago than the last Century, the Practice was to amputate an Arm affected with an Aneurysm, and to sear the divided Arteries with an hot Iron, as appears from *Bartholin's History of an Aneurysm*. At present we endeavour to preserve the Arm, and carry on the Cure by gentler Means. That the Surgeon may be the more ready and exact in performing his Office, he ought to direct his Intentions to the three following Points: First, by means of the Tourniquet, to stop the Blood, which is a Contrivance unknown to the Antients; in the next Place, to find out and discover the Artery; and, lastly, to compress and bind it fast by the Help of some Topical Medicine or Ligature. He ought, therefore, before he enters upon the Operation, to be provided with all the necessary Instruments, and have them ready by him, dispos'd in Order, in a Dish, or on a Board or Table. The common Apparatus of Instruments, or things necessary, is as follows: A Tourniquet, for compressing the Artery of the Arm, and stopping the Blood, and this either a common one, or one of better Sort (described under the Article AMPUTATIO); then an Incision-knife, for laying bare the Artery (*Tab. 22. G.*); some small Hooks (*Tab. 29. Fig. 2, 3.*); a Sponge dipt in hot Wine, or Spirit of Wine; a Pair of Scissars, with a blunt Point (*Tab. 22. C or D.*); Lint sufficient; some small square Bolsters of different Sizes; a narrow, but thick, Bolster, a Span long; two large linen Cloths,

big enough to envelop and cover the whole Arm; and, lastly, two or three Fillets, of the Breadth of two Fingers, but three or four times as long as those used about Bleeding in the Arm. Besides those we have mentioned, if any one chuses a Method of Cure which proceeds by Astringents and Corrosives, which, however, is a very uncertain way, he must have in Readiness a Bit of blue Vitriol, or some of *Weber's Styptic Water*, or Butter of Antimony, or some other thing of the like Nature. If you think it best to make a Ligature upon the Artery, which is the surest way to prevent a fresh Hæmorrhage, and is, for that Reason, practised of late by the best Surgeons, because the Falling-off of the Eschar is often followed by a Flux of Blood, with great Danger of Death, provide yourself with a crooked Needle, threaded with a double or triple waxed Thread, or instead thereof, with a peculiar Instrument invented by myself for that Purpose (*See Tab. 29. Fig. 4.*).

Being furnished with all things requisite for the Purpose, the Patient is to be seated in a Chair, bending forwards, with his Arm extended as for Bleeding. Then four Assistants are to be disposed in Situations where they may be most useful and serviceable to the Operator. For Example: When the Right Arm is affected, I think it most convenient for the Surgeon himself to stand by the Right Side of the Patient, and to place one of the most dextrous of his Assistants at the Right Shoulder, who may lay hold of the Arm above the Tumour, together with the Tourniquet apply'd thereto, in order to strain it tighter, or relax it, according to the present Exigency, or the Surgeon's Word of Command. Another should be ordered to stand before the Patient, and strongly to hold the Arm above the Wrist, that it may not easily be drawn back while under the Operation. Let a third stand by the Left Side, holding the Dish, or Table, with the Instruments, and the rest of the Apparatus. And the fourth must stand ready, as Occasion serves, to furnish the Surgeon with whatever he shall think necessary for completing the Operation. In what Order and Position the Operator and Assistants ought to place themselves when the Disease affects the Left Arm, is very obvious from the Premises, being only a Disposition of the Persons in an Order directly contrary to the former.

The first Business of the Operation consists in a very exact Application of the Tourniquet upon the Brachial Artery, nearly between the Middle and the upper Part of the Arm (*See Tab. 24. Fig. 1. K.*); which must be gently streighten'd, till no Pulse remains either in the Aneurysm itself, or at the Wrist of the Hand; for this is the best Precaution we can take against an Effusion of Blood. But we must take care, that the Constriction be not too hard, so as to injure the Nerves, and other tender Parts. Let the Assistant on the Right Side hold the Stick placed in the Tourniquet, or if the Surgeon chuses a Tourniquet furnished with a Screw, (*see Tab. 26. and 27.*) it will remain fixed on the Part, by that means, without further Trouble.

The Tourniquet being thus rightly fixed, there are three different ways of Operation, which, we think, deserve a particular Description.

The first Operation consists principally in passing the Incision-knife, when the Tourniquet is fixed, through the whole Aneurysm, if it be a true one, from the Bottom upwards, according to the Length and Situation of the Artery. A Wound being thus made of sufficient Largeness, either with the Knife, or by Scissars, either lengthwise or across, the Surgeon, by means of his Fingers, his Probe, and a Sponge, is to cleanse and deterge it from all the corrupted Blood and Matter. The Wound being cleansed, the Tourniquet must be a little relaxed, that the Discharge of Blood may discover the superior Orifice of the Artery. If the Patient be robust, and full of Blood, the Tourniquet is not presently to be streighten'd again, but some Ounces of Blood, as far as is consistent with Safety, may be suffer'd to flow from the Wound. The Tourniquet being streighten'd with all possible Care, if any Topics are thought proper, a little Bit of blue Vitriol, wrapt in Lint or Cotton, may be apply'd to the upper Orifice of the Artery; and over this may be laid some small Bolsters, in such Order, that the least of them lying innermost, the rest increase in Size gradually to the biggest, which is outermost, with good Store of Pledgets of Lint, roughly twisted, disposed on each Side. All these things must be well kept and held together with the Fingers, but especially the Thumb, of the Left Hand, and be closely compress'd upon the wounded Artery. Instead of a Bit of Vitriol, you may apply a twisted Pledget, express'd out of *Weber's Styptic Water*, or Butter of Antimony, to the superior Orifice of the Artery, with the same or better Effect, taking care to lay over it every one of the things before-mentioned. All these must be cover'd with a square Plaster, sit on each Side, and a large square Bolster, of a considerable Thickness; and, lastly, the Whole must be encompass'd, and bound up, with a Fillet three or four times as large as those which are commonly used in Phlebotomy. Those who follow *Dionis*, perform the Bandage in such a manner, that, omitting the Vitriol, they first apply a Bit or two of chew'd Paper, or a small Bolster

Bolster moistened with some Styptic Water, over which they bind a Multitude of small Bolsters, one still larger than another, like those we have mention'd, upon the open Orifice of the Artery; and this Method may sometimes well enough answer the Purpose.

But for the better Security against an Hæmorrhage, over the first Fillet must be brought another like it, which, after some Windings, like the former, about the affected Part, is to pass over the long, thick, and narrow Bolster, upon the Inside of the Arm, in order to strain it close to the Brachial Artery, in the Line of its Direction, and keep it tight, by passing over it as it winds upwards; and that this Fillet may hold the faster, it should go once round the Breast, and have its End firmly fasten'd to the Shoulder or Arm, and then the Patient is to be left to his Repose. Having proceeded thus far, and the Tourniquet being a little relaxed, we are to examine whether any Blood has made its way through the Bandage; and if no Sign thereof appears, the Operation is well performed.

If any Blood appears, the Tourniquet is again to be freightened, and all the Bandage being loosened, either the Ligature is to be renewed in the same manner as before, and with all imaginable Care; or if there be no trusting to so uncertain a Method of Cure, the Extremity of the Artery, agreeably to the Advice of *Paulus Ægineta*, is to be skilfully ty'd, by passing under it a crooked blunt Needle, and a strong double Thread; for there is scarce any other Means left to save the Life of the Patient. But here are two things necessary to be observed, which are, that the Surgeon be very careful, in the first place, to avoid hurting the Artery; and, secondly, that he be no less wary, lest he should hurt or prick the Nerve that lies near it. For this Reason it will be most advisable to make a sufficient Incision in the upper Skin, and with a small Hook, as exactly as may be, to remove or loosen the Nerve from the Artery, if it be possible; after which, to avoid wounding either of those Parts, you are to pass the blunt End of the Needle, which they call the Head, under the Artery, till you can take hold of the Thread, that you may not hurt the Artery with the sharp End of the Needle; or you may make use of that peculiar Instrument of my own Invention (see *Tab. 29. Fig. 4.*); which, after you have passed the Thread far enough through it, and cut it, may be withdrawn; and the superior Orifice of the Artery must be ty'd up, after laying upon it some Lint, or a little thin linen Bolster, and the Thread should be left to hang the Length of about four Fingers Breadth out of the Wound, till, as the Artery heals, it loosens, and falls off. Some advise the tying also of the lower Part of the divided Artery, but other Surgeons hold it absurd, needless, and even pernicious; and indeed in some Circumstances, as when the Flexure of the Cubit is concern'd, they are much in the Right; for in this Case a much greater Wound and Cicatrix is to be made, either of which may easily endanger a Stiffness of the Cubit. But if the Aneurysm in the Arm be out of the Flexure of the Cubit, and particularly below the Cubit, and the lower Part of the Artery, after the superior is ty'd, continues to bleed, it may be ty'd without Injury, and even ought to be ty'd. For Instance, in the Cure of an Aneurysm of the cubital Artery in the Middle of the Arm, that is, betwixt the Hand and the Flexure of the Cubit, after I had ty'd the upper Extremity of the wounded Artery; and the lower, the Tourniquet being loosen'd, still continued to discharge Blood in a considerable Quantity; I ty'd it up, by passing under it a crooked Needle, with a strong Thread; and the Patient, who was near Death, perfectly recover'd his Health, without any ill Accident, by the Help of balsamic Medicines. Wherefore, if there happens a Necessity of tying the Artery near the Cubit, it must be ty'd; otherwise it must be well compress'd with Bolsters, and a convenient Ligature; for by this means, without tying, I have perfectly cured the Wound of the lower Part of the Artery, without the least Effusion of Blood. It is the Custom with some, after tying the Artery, to cut it across just under the Ligature, with a View of preventing Effusions of Blood, as the two Extremities of the divided Artery, retiring within the Flesh, are by this means closed up. But I look upon this Method as pernicious, or at best insignificant; and I myself have twice undertaken the Operation, without cutting the Artery, and yet my Patients did very well. As to the rest, the Wound must be well filled up with Lint and Rags, or with Bolsters closely compress'd together, and afterwards bound up in the most exact and skilful manner.

Some think it not amiss, in order to prevent an Inflammation, to wrap those Parts of the Arm which are near the Cubit on both Sides, in Linen dipt in Oxycras, and over that to make a spiral Bandage, and sometimes to take away Blood from the opposite Arm. This is a good Precaution with respect to Persons of a hot Temperament, and full of Blood: But for such as are already refrigerated, and debilitated, with too great a Profusion of Blood, the taking away of more, tho' recommended by the *French Surgeons* without any Exception, and the Application of Refrigerants, are destructive; for I have cured such, without taking away a Drop of Blood; and in cold

Habits of Body, instead of Oxycras, or Vinegar, have taken care to foment the Arm with hot Spirit of Wine camphorated, or impregnated with Theriaca, and so I have bound it up. When this is over, the Patient must be put to-bed, and his Arm, gently bent, should be laid on a Pillow, that it may rest on a soft Place, and by that means all vehement Sallies and Pulsations of the Blood may be prevented; for Rest in this Case is highly necessary. However, if the Arm happens to swell extremely, we must be very cautious, lest a dangerous Inflammation should be occasion'd by the Straightness of the Bandage; for if any such thing be apprehended, the Bandage is to be taken off, and renewed. But upon other Accounts we are not easily to be prevailed upon to loosen the Bandage, for fear of an Hæmorrhage; for I know, by Experience, that in these Cases the Arms can bear to swell to a very great Degree, and even till they turn livid, without any considerable Injury, provided the Tumor be not too hard and painful, and there be no Signs of a Gangrene.

But to secure the Patient from being exhausted by a sudden Effusion of Blood, which may easily happen, when Astringents and Corrosives have been used, or in case of a bad Ligature, a Person provided with a Tourniquet should be order'd to watch for some Days and Nights together, who, if an Hæmorrhage should happen, may be ready to stop the Blood by applying his Thumb, or soon restrain it by clapping on the Tourniquet; and then call a Surgeon to make a Ligature on the Artery, if there were none before, or a better and stronger one, where it had been ill made, that the Patient may not perish by the Loss of Blood; on which Account, it is, in my Opinion, safer to tie the Artery, than to leave it unty'd; a Ligature therefore should be made upon the Artery at first, with a strong Thread, as accurately as is possible. Wherefore those Surgeons are not in the Wrong, who pass a triple Thread under the Artery, and leave one of them loose, in order to be serviceable upon such an Emergency; and, that, if the other two are not sufficient, they may tie it up afresh with the third Thread.

Now the first Bandage, provided it be sufficiently firm, if there be no Effusion of Blood, great Inflammation or Tumor, or any other ill Accidents of that Kind, ought not to be loos'd till the third or fourth Day, that the Wound of the Artery may be the better conglutinated. But when it comes to be loos'd, the Surgeon ought to take all imaginable Care, in the first place, that the Artery be compress'd, either by the Assistant's Fingers, or by means of the Tourniquet; and next, that the Compresses which stick to the Place, and especially those next the Wound, be not imprudently taken off, and so occasion a new Effusion of Blood. The Wound, however, as far as is convenient, ought to be cleansed from Sordes, and to be dress'd with fresh Lint, and some digestive Ointment, till whatever adheres to it resolves of itself, and comes off in the rest of the Dressings. But it is by much the safest Way not to be too frequent in loosening the Dressings for the first fifteen Days, and then always to observe the same Precautions as I just now advised, lest some extraordinary Effusion of Blood, especially if the Artery be not ty'd, should occasion a fresh Trouble to the Operator.

But if within a few Days after the Operation there be an intense Heat, with a quick and vehement Motion of the Blood, that is, a Fever, which may endanger an Hæmorrhage and Gangrene, we are to have immediate recourse to Phlebotomy in the other Arm, which is sometimes necessary to be renew'd, especially in such as abound with Blood, and Medicines are to be prescrib'd for allaying the Heat. As to Diet, the safest way is to avoid all heating, hard, and solid Meats; and, on the contrary, to subsist on very thin Broths, and sordid Food, very much diluted and refrigerating, and such as is usually prescrib'd in dangerous Wounds and Inflammations.

As soon as the Orifice of the Artery is thus closed, which, in Aneurysms of the milder Sort, generally happens about the tenth or twelfth Day, but later in others which are of a worse Kind, we are to set about conglutinating the external Wound with dry Lint, or some vulnerary Balsam, not omitting every now and then gently to extend the Arm, and bend it back again; for without this Precaution there is Reason to fear lest the Arm, by the too great Stricture from the Cicatrix, or the too long intermitted Motion of the Joint, should become crooked and inflexible.

Another Method of curing Aneurysms is after the following manner:

The first Step which is made, is to place and adjust the Tourniquet, and put the Arm in the Situation above describ'd. Then an Incision is made in the outer Skin, without touching the Aneurysm; then the Artery, above and below the Tumor, is carefully separated from the adjoining Nerves, and by Help of a small Hook is so raised, that a crooked and blunt Needle, or my Instrument before-mentioned, with a double waxed Thread, may pass through under it. In straining this Thread there is always a little Bolster, or Bit of Linen, under the Knot, to save the Artery from being cut. The Artery being thus ty'd on both Sides, the Tumor situated between is open'd

open'd with the Incision-knife, and the Wound treated in the manner before-mention'd. This was the Method by which *Purmannus*, as he relates it himself, extirpated a most dreadful Aneurysm, (see *Tab. 32. Fig. 6.*) and healed the Wound in the Space of a Month.

The third Method of curing a true Aneurysm, is as follows:

First, the Tourniquet is fixed on; next, after pressing, if possible, the Blood out of the Tumor down towards the Hand, an Incision is made with the Knife in the outer Skin lengthwise, without touching the Aneurysm; then the Artery next above the Tumor being separated from the adjacent Parts, and especially the Nerve, is ty'd with a double or triple Thread, once or twice, as Occasion shall require, till the Influx of the Blood into the Tumour, after taking off the Tourniquet, be wholly stopped. This done, the Wound must be very skilfully bound up, and treated with all due Care, till the Thread loosens of itself, and falls off, and the Place is perfectly conglutinated. This Method of curing without inflicting any considerable Wound, or causing a remarkable Cicatrix, was introduced by *Anelius*, as he says himself, by which he once cured a very dangerous Aneurysm at *Rome*, within the Space of a Month. For as to the general Practice, which has hitherto obtained, of laying open an Aneurysm, and with the Help of the Fingers or Instruments, exhausting all the Blood there collected, seems more inconvenient, both as it requires more Time, and occasions greater Pain, and a larger Cicatrix. The Operation being finished, *Anelius* bled the Patient four times in the opposite Arm, which the *French Surgeons* in general also prescribe. This frequent Bleeding, as it is oftentimes of singular Service in tempering the Heat and Motion of the Blood in those warmer Regions, so in our Countries, because of a colder Air, and a different Habit of Body, I judge it less necessary; and generally improper, especially when the Patient is already weaken'd; and also because some Aneurysms are very well cured without it.

If a Tumor of an Artery, as I have sometimes observ'd it, should break of itself, and degenerate into a spurious Aneurysm, there is scarcely any sure way to save the Patient, but by the Operation. In this Case therefore, as I have elsewhere advised, the Tourniquet is first of all to be apply'd, for the Prevention of an Hemorrhage; after which an Incision is to be made in the Skin, deep enough to exhaust all the Blood and Matter; and the Wound, having been very carefully deterged, is to be cautiously conglutinated by Astringents or Corrosives, or, which is much the better way, by tying the Artery with a Thread, as in a true Aneurysm.

If the Brachial, or Cubital, or suppose the Tibial, Artery, should be wounded or cut by a Sword, or any other Weapon, so that no Medicines or Bandage can put a Stop to the Effusion of Blood, there is no readier or better Remedy, in my Opinion, than what has been proposed for an Aneurysm, which is, to apply the Tourniquet, and then search for the wounded Arteries, the smaller of which may be stopped with Astringents, and the larger ty'd with Threads, in the manner already described; for by such Means I myself have often saved Men, who, in all Appearance, were near expiring, after they had been almost totally exhausted of their Blood and Strength, and had been under the Hands of other Surgeons for ten and twelve Days, and been treated in vain with Styptic Remedies, and extremely hard Ligatures, by which their Arms were swell'd to an enormous Size. Whether such Methods will, at any time, succeed upon the Crural Artery, I have never read, nor as yet had an Opportunity of trying.

Aneurysms in other Parts are to be treated nearly in the same Manner, provided they are curable, which must be determin'd from a thorough Inspection and Consideration of their Place, Situation, and Magnitude. However, it will not be amiss to touch upon some Particulars, for the sake of young Practitioners, and because our modern Surgeons have offer'd little or nothing about them. The first I shall mention is an Aneurysm, which arose between the Thumb and Fore-finger, from the Prick of a Penknife, and which *Tulpius* cured by Compression. To this he apply'd an astringent Plaster, and sustain'd it upon the Part, by a thin Plate of Lead, and Bandage; and within the Space of four Months, the Blood being expelled out of the Tumor, and the Lips of the Wound drawn together, the Aneurysm totally vanished. The like Compression may be try'd upon any Aneurysm whatsoever, especially whilst recent, and of no extraordinary Size, first repressing the Blood into the Artery, whenever it can be done. Our second Instance is of an Aneurysm in the Head: A Woman struck her Son, seven Years old, a smart Blow with a Stick on the Left Side of the Head, where the Carotid Artery passes; immediately there arose a beating Tumour, as big as a Hazle-nut, blackish at first, and yielding to the Touch, which, in the Space of eight Days, grew to such Dimensions, as to take up one half of the Head, extending itself from the Sagittal Suture, along the Temples and Forehead, as far as the Eyes. Upon a Consultation of Surgeons it was agreed, that a dubious Remedy was better than none in a desperate Case; in Conse-

quence of which they open'd the Tumor with the Incision-knife, and taking away part of the Blood which was discharg'd abundantly, closed up the Wound with Astringents, and a tight Ligature, and healed the Patient in a short time. After the same manner was an Aneurysm of the Artery behind the Ear, not without a great deal of Trouble, conglutinated at last by Astringents and a Ligature. If an Aneurysm should arise about the Ankle-bone, such as *Ruyfch* describes, and which the Surgeon had imprudently open'd as an Abscess, it must either be laid open with the Knife, and the Wound, like the preceding, consolidated with Astringents, and a proper Ligature; or the Artery must be search'd out, and ty'd up with a Thread. In the same manner are we to proceed with Aneurysms in other Parts of the Body, where there is any Prospect of a Cure. On the other hand, *Harder* gives an Instance of Death consequent upon opening an Aneurysm in the Neck; and *Van Horne* has another which was follow'd by the like Event, from opening an Aneurysm in the Leg.

Those who are willing to form to themselves a clearer Idea of the Ligature of Arteries in Aneurysms, may consult *Tab. 32. Fig. 7.* where the Letter *A* represents the Part of the Artery situated above the Tumor, *B* the Part beneath, *C* the Aneurysm, *D* the superior Ligature, *E* the inferior. But here it is to be observ'd once more, that the lower Part of the Artery in the Flexure of the Cubit ought very rarely to be ty'd, except Necessity requires it, for the Reasons above given. To draw to a Conclusion: How the Circulation of the Blood in the Arm is perform'd after an Operation of this Kind, especially where there is but one Trunk of an Artery, as it often happens, about the Joint; and how it comes to pass, that, as in the Example alleg'd by *Anelius*, the reflux Blood in the lower Artery, which has no Ligature upon it, is not elevated into a Tumor; I have not hitherto been able clearly to determine. To be satisfy'd in these two Points, we ought to make a more narrow Search into, and inspect the dead Bodies of those who had undergone this Operation when alive. *Harris*, an Englishman, in his eighth Chirurgial Dissertation, absolutely condemns this Operation, and does not stick to call it a rash and horrid Butchering; but for what Reasons, is best known to himself. In my Opinion, that Surgeon, who, out of Fear, rejects the most difficult and noble Operations of his Art, betrays too much Pusillanimity, which is too often a fatal Obstacle to the Recovery of the Patient. *Heister*.

The following Cases, from the *Edinburgh Medical Essays*, will illustrate the Treatment due to an Aneurysm.

CASE I. By Mr. MACGILL.

James Forrest, a Coachman, forty Years of Age, a hail, strong Man, being thrown from the Coach-box, broke the Bones of his Right Leg into a great many small Pieces; and a Gangrene coming soon on, there was a Necessity to perform the Amputation in the Country where he then was. The third Day after this Operation he was let Blood by a young Surgeon there, who opened the Basilic Vein of the Right Arm. The Patient felt a very sharp pricking Pain, while the small Incision was made with the Lancet; and four Days after he observ'd a Tumor, about the Bigness of a small Cherry, at the Wound, which he believed to be the common one of coagulated Blood, called by Surgeons Thrombus, and therefore did not mention it to the Gentleman who performed the Amputation.

On the twelfth Day after his unfortunate Fall, he was carried to Town, and received into the Infirmary, where the Cure of his Stump went on as well as could be wish'd, without any Accident or Symptom to retard the Cure. After he had been eight Days in the Hospital, he told the Physician and Surgeon then attending, that he had some Uneasiness from a Swelling at the Bending of his Elbow. When it was examined, a Tumor appeared of an oval Form, as big as a small Hen-egg, situated behind the Basilic Vein. The Skin over this Tumor was of a natural Colour; no Pulsation could be felt, and it adhered as firmly to the Tendon of the Biceps Muscle, as Ganglions commonly do to Tendons. Two Days after, a Pulsation exactly synchronous to that of the Arteries, was distinctly seen and felt. When the Tumor was strongly pressed, it seem'd to be less, but could never be made to disappear. There was scarce any Pain at this Part, either in moving his Fore-arm, or when the Tumor was handled.

A Consultation of several Physicians, and of all the Surgeons who attended the Infirmary, being called, the Disease was unanimously determined to be a true Aneurysm; but the Patient being still weak, it was resolv'd to try the Effects of artful Compression, and to delay the Operation till the Patient had Strength enough to undergo it, unless the Tumor seem'd before that to be in Hazard of Bursting. Graduate Compresses, wet in Oxycerate, were therefore applied, with the proper Bandage, which at first had an exceeding good Effect in diminishing the Tumor, but it soon after began again to increase; and then several Machines, such as that with a Screw for the Fistula Lachrymalis, Mr. Petit's Tourniquet, &c. were used; but without any Success; on the contrary, the Tumor still increased,

increased, and the Skin began to inflame; and a small Suppuration was brought on the most prominent Part of it. By laying aside these more forcible Machines, and returning to the Use of the former Compresses and Bandage, after covering the small superficial Ulcer with white Ointment, the Inflammation went off, and the Ulcer was cured. The Tumor was now all firm and hard, scarce yielding at all to Pressure, except at that prominent Point where it was soft, and where only the Pulsation could be felt, when the Fore-arm was bended; when the Member was extended, no Pulsation could be observed any where in the Tumor.

The Patient was not yet sufficiently recruited, and therefore the Operation of the Aneurysm was still delayed; but to prevent any Danger from the sudden bursting of the Aneurysm, the Tourniquet was kept constantly applied to the Patient's Arm.

In the Beginning of *January* 1733, the Patient was judged to be strong enough to suffer the Operation, and the Tumor increased so fast, that there was great Danger of the Teguments yielding suddenly, and therefore the Operation was not to be delayed any longer. This happening to be the Month of my Attendance, I was of course to perform; but previously brought all the Surgeons of the Hospital together, to examine the State of the Tumor, and to determine the Method to be followed in operating.

The Tumor was of a very great Bulk and Height, its Base extending internally as far as the internal Condyle of the Humeral Bone, and externally it had pushed the Tendon of the Biceps Flexor Cubiti, as far as the Cephalic Vein; it ascended about three Inches along the internal Side of the Biceps, and descended as far below the Joint of the Elbow, being also considerably prominent forward.

Being uncertain whether this Tumor was formed without the Artery, or if it was the Body of the Artery dilated, we determined to do the Operation in the most cautious, tho' more tedious way, viz. by Dissection, having also all the Instruments and Dressing for an Amputation ready, in case there was no Hope of Success from the Operation of the Aneurysm.

Having applied the Tourniquet in the common way to prevent any Hæmorrhage, the Skin was pinched up about the Middle of the Tumor, and cut with a Bistoury; then a small Directory being pushed into the fat cellular Membrane, first upwards, then downwards, and to each Side, I cut upon it with a Bistoury, and thus made a crucial Incision on the whole Extent of the Tumor. After which I dissected the four Angles of the Teguments from the Tumor, with a convex edged Scalpel, stitching a cutaneous Artery, that would otherwise have been uneasy to me. The Tumor, thus laid bare, appeared covered, at its upper Part, with a thin cellular Membrane, but below it seemed to have a very strong tendinous-like Coat, which we soon discovered to be no other than the Aponeurosis of the Biceps Muscle; after separating the Adhesion, this had to the Tumor below it with my Fingers; I cut it through to the lowest Part of the Aneurysm, which now was all bare, and full in View. The Coat of it was only a very thin tender Membrane, which appeared eroded, as well as the firm Substance it contained, at that prominent soft Part, where, as I mentioned before, the Pulsation only was to be felt. In endeavouring to separate the Tumor from the adjacent Parts with my Finger, its tender Membrane was easily torn in several Places; and therefore, without insisting on such a Separation, I opened the Membrane from one End to the other, when several Ounces of a blackish grey-coloured Liquor, like to Coffee made of half-burnt Beans, ran out, and several Pieces of coagulated grumous Blood, and of polypous Concretions, fell down to the Floor. What remained was one large polypous-like Substance, that weighed six Ounces, below which some Spoonfuls of that blackish Liquor, mixed with pretty pure Blood, were taken out with a Sponge. There were no Bridges or fleshy Beams stretched transversely from one Side of the Cavity to the other, but the Humeral Artery, involved in all its Coats, came fully in View. About the Middle of the bare Part of the Artery we saw a Hole, large enough to receive the largest Surgeon's Probe, without any retorted Lips, or other Sign of the interior Membranes having been extended through the exterior, but exactly of the same Appearance, as if it had been made by an oval sharp-pointed Instrument. After by unloosing the Tourniquet a little, we made sure of what we saw, being the wounded Artery, one of the Gentlemen who assisted me, put in a strong Probe by the Orifice, and with it raised the Artery so, that I easily passed the Aneurysm Needle, with proper Thread, behind the Artery, both above and below the Orifice, without engaging the Nerve or Vein within the Thread. I made the two Ligatures in the common way, the Patient complaining much of Pain, while I tied the superior Threads; and then untwisting the Tourniquet, only some few Drops of Blood oozed out at the Aperture in the Artery, and the other common Dressings and Bandages were applied.

The polypous Lump we took out, was very hard and firm on the Side next to the Skin, except where, I said already, it was

eroded in the Middle; but turned softer, in a lamellated way, as it approached the Artery, till it degenerated gradually into mere coagulated Blood.

During half an Hour, after the Dressings were applied, the Right Hand remained cold, and scarce sensible; but gradually then recovered Sense and Heat. Next Day, that Hand was a little swelled; and on the second Day became so big, as to oblige me to take off the thick Compress, that was pressed on the Humeral Vessels by the exterior Bandage; after which, and fomenting the Hand with warm Water and Brandy, the Swelling decreased.

On the fifth Day after the Operation, the Dressings were removed, and the Wound began to suppurate in a very right way, and was cured entirely before the End of *March*, without any Accident, unless that on the 22d of *January*, Blood made its way through all the Dressings. It had come out from the Hole of the Artery, but stopped as soon as the Dressings were removed; and no Hæmorrhage ever happened afterwards. In the Time of the Cure, the Hand often became œdematous, and sometimes a gentle Erysipelas attacked the Skin of it, but soon yielded to an Embrocation with the Aqu. Minderi, or to Aqu. Calcis, with some Brandy. The Threads with which the Artery had been tied, did not come out till the Middle of *March*.

We never could feel any Pulse below the Elbow since the Operation. The Member is weak, but he can perform the Motions of the Fore-arm, Hand, and Fingers. He still complains of a Numbness, and Difficulty of Motion, in the Thumb and Fore-finger, more than in any of the rest, tho' it is now two Months since the Wound was skinned over. *Edinburgh, Med. Ess. Vol. 2.*

CASE II. By Mr. Monroe.

Andrew Rady, living in *Galloway*, had the Misfortune, in being bled in the Basilic Vein of the Right Arm, by some Gardener there, to have his Artery hurt, which was followed by an Aneurysm. Somewhat more than a Year after, he came to Town here, and was received into the Infirmary in *May* 1735. On the 22d Day of that Month, Mr. *George Cunningham*, the Surgeon then in Attendance, performed the Operation. After the Tourniquet was applied, Mr. *Cunningham* laid open the Tumor from one End to the other, with one longitudinal Incision; then taking out the polypous Substance, and a small Quantity of liquid Blood; the small Aperture of the Artery was so plainly seen, that I put a Probe into it, and raised the Trunk of the Artery, while he passed the Needle behind it, the Sides of the Wound being held asunder, in the mean time, by two blunt Hooks. The proper Membrane of the Tumor was considerably thicker and stronger, than in *James Forrest's* Aneurysm; and required Force to push the blunt Aneurysm-needle through it; but the Nerve was pressed by the Tumor a good way from the Trunk of the Artery, so that there was no Danger of taking the Nerve within the Ligature. After making the superior Ligature, the Tourniquet was untwisted, but no Blood came by the Orifice, which shewed the Anastomosing Canals to be very small. The second Ligature was however made below the Orifice for Security. The Cavity was filled with soft Lint, and the other ordinary Dressings applied. That Afternoon his Hand swelled, and became warm, which removed all our Fears of the Circulation being entirely stopped. No Pulse was to be felt on either Side of the Wrist for several Days; but before the 5th of *June*, when both the Ligatures suppurated off, the Pulse was plainly to be felt on both Sides of the Wrist, and he was soon cured, having as much Strength and Motion in that whole Member as ever.

To make this Operation more speedy and safe, I would propose, that as soon as the longitudinal Incision is made, and the Polypus with the Blood is removed, the Patient's Elbow being bended some way, the Operator should take hold of the Humeral Artery with the Thumb and Fore-finger of the Left Hand, and, gripping it towards the Back-part, should push the Needle close upon his own Nails, by which he has a sure Direction whereby he may shun the Nerve, which he can readily distinguish from the Artery by feeling, and can, in that Posture of the Arm, easily draw the Artery so far outwards as to keep free of the Nerve.

The Operation then of the Aneurysm, which appeared by the Description Surgeons gave of it, to be very nice, difficult, tedious, and precarious, may be done easily, quickly, and safely, by opening the whole Tumor at once, and then putting the Ligature about the Artery, as just now described. *Edinburgh, Med. Ess. Vol. 4.*

As it may be agreeable to the Reader to know the precise Method generally pursued in our Hospitals, I shall add Mr. *Sharp's* Account of it, as follows:

Having applied the Tourniquet near the Shoulder, and laid the Arm in a convenient Situation, make an Incision on the Inside of the Biceps Muscle, above and below the Elbow a considerable Length, which being in the Course of the Artery, will discover

discover it as soon as you have removed the coagulated Blood, which must be all pulled away with the Fingers, the Wound being dilated sufficiently for that Purpose: If the Orifice does not readily appear, let the Tourniquet be loosened, and the Effusion of Blood will direct you to it; then carefully carrying a crooked Needle with a Ligature under it, tie the Vessel just above the Orifice, and passing the Needle again, make a second Ligature below it, to prevent the Return of the Blood, and leave the intermediate Piece of the Vessel to slough away, without dividing it. To avoid wounding, or tying the Nerve in making the Ligature, the Artery may be cleared away from it first, and held up with a Hook; but, I think, if we are aware of the Situation of the Nerve, there is no great Danger of hurting it. After the Operation, the Arm must be laid easy, on a Pillow in Bed, and the Wound be treated in the common Method, keeping it in that Posture a Fortnight, or three Weeks, especially if it should swell much, and not digest kindly.

In doing this Operation, it will be proper to have the amputating Instruments ready, lest it should be impracticable to tie the Artery; and even after having tied it, the Arm must be carefully watched, that in case of a Mortification it may be taken off; which though from Experience we learn is very seldom the Consequence, should, to all Appearance, be the perpetual one: For these Aneurysms following always upon bleeding the Basilic Vein, must necessarily be Aneurysms of the Humeral Artery, an Inch, at least, above its Division, which being obstructed by the Ligature, one would think, must necessarily bring on a Mortification; but we see the contrary, tho' for some time after the Operation, we can hardly distinguish the least Degree of Pulse, and ever after they continue languid. If the Humeral Artery happens to divide above the Elbow, which is not uncommon, the Prospect of Cure is better, and the Pulse will be stronger after the Operation. *Sharp's Surgery.*

It is to be observed, that *Heister* esteems the inferior Ligature of the Artery generally superfluous, and often pernicious, as is specify'd above.

ANGELICA, a Plant thus called, of which *Dale* enumerates four Species. The first is,
ANGELICA, Offic. Chab. 400. P. Parad. 529. *Angelica sativa*, C. B. Pin. 155. J. B. 3. 140. Ger. 846. Emac. 999. Park. Theat. 939. Raii Hist. 1. 434. Synop. 3. 208. Boerh. Ind. A. 53. Rupp. Flor. Jen. 222. Phyt. Brit. 8. Mer. Pin. 8. Mor. Umb. 9. Hist. Oxon. 3. 280. *Imperatoria sativa*, Tourn. Inst. 317. Elem. Bot. 267. ANGELICA.

This is one of the greatest of the umbelliferous Plants; its Root is large, thick, and branched, running deep in the Earth, from which arises one large hollow round Stalk, a Yard and half, or two Yards high, spreading out into many Branches. The Leaves are large and winged, divided usually into three Partitions, or lesser Wings, each single Leaf being serrated, or indented about the Edges. On the Tops of the Branches grow large round Umbels, of small five-leaved white Flowers; the Umbels, as the Seed ripens, grow out into large globular Heads, bearing the Seed at the Ends, which is large and thick, striated, or furrowed pretty deep, of a whitish Colour, two Seeds being joined together, as in other umbelliferous Plants. Both Root, Stalks, and Seeds, are of a grateful aromatic Savour. It grows in Gardens, and flowers and seeds in June and July, the Root perishing after the ripening of the Seed, which is the second Year of its springing from the Seed.

Angelica is a Plant of many Virtues, being Stomachic, Cordial, Alexipharmic; of great Use in malignant pestilential Fevers, in all contagious Distempers, and the Plague itself: It causes Sweat, and drives out all noxious Humours through the Pores of the Skin. It is very useful in Disorders of the Womb, and Hysterical Affections; it provokes Urine, and the Catamenia, and expels the Secundines. The Root, Stalks, Leaves, and Seed are used.

Official Preparations of *Angelica* are a simple and compound Water, and the Stalks candied. *Miller Bot. Off.*

A Spirit of it cheers the Heart, and revives the Spirits to a Miracle. The Chymical Oil operates powerfully in all Intentions. Besides which, it cures Palsies, Apoplexies, Convulsions, Cramps, and Rheumatisms. *Pomet.*

It is said to be good for the Bite of a mad Dog, and for the Scurvy.

Paracelsus boasts, that at Milan, in the Year 1510: he did

little less than Miracles with this Plant in the Plague. And its Virtues in this terrible Disorder are confirm'd by a Multitude of Authors. It is also esteem'd an excellent Pectoral, and hence has been called *Herba Pectoraria*. The inspissated Juice of *Angelica* is said to prevent Putrefaction of the Gums, and Rottensness of the Teeth; and the Chymists agree, that the Quintessence of *Angelica* is the greatest Restorative and Cardiac in Nature. *Angelica* is farther recommended for the Leprosy.

The Stalk of *Angelica* sends forth a very agreeable Smell; the Seeds of it a different one; its Roots are more aromatic than any of these Parts, and its Parenchyma is filled with resinous Vesicles. It is very subject to be destroyed by Worms, which prey upon the Parenchyma, and leave the resinous Parts uncovered. This same Observation holds good in Masterwort, Ginger, Fennel, and in the Roots almost of all umbelliferous Plants. *Memoires de l'Acad. 1721.*

Aromatic volatile Salt of Angelica.

Take of the fresh small Roots of *Angelica*, dug up in February, two Ounces; cut them to pieces, put them into a Retort, pour upon them twelve times as much Spirit of Wine once rectified, and then add one Ounce of pounded Sal Ammoniac, and three Drams of Salt of Tartar. This being done, immediately lute on a Receiver, and distil with a gentle Heat, not exceeding 150 Degrees. By this means, there will come over into the Receiver a white alkaline, alcoholisated Salt. When this ceases to rise, increase your Fire a little, and the Spirit of Wine will come off, and appear in very oily Streaks. Proceed as long as you have any of these Spirits, and when the Salt begins to be dissolved by the watry Part that ascends last, desist from the Operation, and put the Liquor thus prepared into a Vessel, which must be stopped very close. What remains after the Distillation, throw away.

Take an Ounce more of the same Roots, cut very small, put them into a Retort, pour upon them the Liquor drawn off before, and distil till the Salt, which will come off first, begins to be dissolved. Shake the Salt and Spirit till they are thoroughly mixed together, and stop them in a Vessel as close as possible.

REMARKS.

The Alkali of the Tartar, absorbing the Acid of the Sal Ammoniac, sets its pure Alkali free, and so renders it volatile; which, being united with the pure distilled Spirits of Wine, makes with these the volatile Salt of the preceding Process; and with this again, from the natural Disposition of the Alcohol, the Spiritus Rector of the *Angelica* unites itself, which resides in its balsamic oily Parts, and is very volatile. Hence the Nature of the Alcohol, which equally unites with all these Kinds of Spirits, is here determined by the particular Spirit of *Angelica*. In the mean time, the volatile and fixed alkaline Salts, and the acid Spirit of the Sea Salt, help to open the Body of the *Angelica* during the Distillation; and thus dispose it to give out its Oils and Spirits more successfully. The Liquor thus produced, on account of its Fragrance, grateful Taste, Penetrability, Mobility, and saponaceous, anti-acid, and anti-austere Virtue, furnishes us with a Medicine, which, in the Hand of a skilful Physician, may be used with great Success; for it is of Service in all watry, pituitous, cold, acid; and austere Diseases, in Cases where the Bile does not perform its Office, and in almost every Disorder, where there is a Languor without any Inflammation and Putrefaction; particularly, when, at the same time, an irregular Mobility of the Nerves and Spirits causes troublesome hypochondriacal and hysterical Paroxysms; and in Flatuluses, that arise hence, it proves an excellent Remedy. It is a noble Cardiac, Stomachic, Calefacient, Sudorific, Diuretic, Diaphoretic, Antiparalytic, Antispasmodic, and Antiepileptic Medicine, where the Disorders are owing to the Causes above-mentioned. The Credit of this is particularly due to *Basil Valentine*, and *Franciscus Sylvius*, who first introduced this noble kind of Medicine into Physic. The Followers of *Sylvius*, however, by an unreasonable Use of it, have frequently brought it into Disgrace. *Baerhaave's Chymistry.*

The second Species is the

A. 53. Tourn. Inst. 313. Elem. Bot. 262. *Angelica sylvestris repens*, J. B. 3. 145. Chab. 400. Hist. Oxon. 3. 281. GOUT-WEED.

This grows principally in the Hedges of Gardens. It flowers in June and July. The Herb and Root are recommended for the Gout. *Dale*.

The fourth is the

ARCHANGELICA, Offic. J. B. 3. 143. Raii Hist. 1. 454. Chab. 400. *Angelica Scandiacæ*, sive *Archangelica Tabernamontani*, quæ umbellâ est flavâ, semine rotundiore. C. B. Pin. 155. Boerh. Ind. A. 53. *Archangelica seu Angelica Tabernamontani*, seu *Scandiacæ*, Herm. Prælect. *Angelica prima*, Boerh. Hist. P. 84. *Imperatoria Archangelica dista*, Tourn. Inst. 317. Elem. Bot. 267. GREAT WILD ANGELICA.

It agrees in Virtues with the former.

ANGELICUS PULVIS, Angelic Powder. Another Name for the MERCURIUS VITÆ. *Castellus*. See MERCURIUS VITÆ.

ANGELINA ZANONI ACOSTÆ. *Castanea Malabarica Angelina dista Anseli*, H. M. *An Angelina Arbor*, C. B. ?

This is a Tree of vast Bigness, sometimes above sixteen Foot thick, which grows on rocky and sandy Places in the Country of Malabar, in the East-Indies, and bears ripe Fruit in December, and continues bearing for a whole Century.

The dry'd Leaves, heated, alleviate the Pain and Stiffness of the Joints, and discuss an Intumescence of the Testes occasioned by a Contusion, or any external Violence; and also an Hydrocele, or Pneumatocèle. Being reduced to Powder, and applied outwardly with white camphorated Ointment, they cure Venereal Buboës. The same, bruised with the Root of Turmeric, and rubbed every Day on the Part, by their astringent Virtue in consolidating the Orifices of the Vessels, absolutely cure an inveterate Flux of the Hæmorrhoids. The unripe Fruit, too greedily eaten, excite a Diarrhœa, to which the Root and Bark put a Stop with the same Facility. The Oil expressed from the Fruit, boiled, taken inwardly, or applied outwardly, excites an Appetite, and helps Digestion. The same used with roasted and pounded Garlick, or fried in coagulated Milk, and applied to the Place, is an effectual Anodyne in the Pains of the Hæmorrhoids. *Raii Hist. Plant.*

ANGELOCALOS, the true Name of the twenty-fourth Antidote of *Myrepsus*, according to his Translator and Commentator *Fuchsius*, instead of the common Reading, *Alcancali*. This he infers partly from the corrupted Word, and partly from the Latin Copies of *Myrepsus*, which read *Alcancalus*, and interpret it *bonus Nuntius*, a good Messenger, the very Meaning of *Angelocalos*. See *ALCANCALI*.

ANGELUS, a Confection. *Johnson*.

ANGELYN, sive *Andira*, Pison. *Marcgrav. Arbor naci-fera Brasiliensis, Fructu Ovi Figura & Magnitudine*. Raii Hist. Plant. The same as *Andira* before.

ANGI, Buboës, or Tumors in the Groin. *Fallopis de Morb. Gall.*

ANGIGLOSSI, Stammerers. *Blancard*.

ANGINA, from ἀγγω, to strangle, a Quinsy.

OBSERVATION I.

A certain Butcher, about Noon, began to be sensible of a Pain about his Larynx and Fauces, which was accompanied with some Difficulty in eating and drinking; towards the Evening he went to an Apothecary, who gave him a Gargarism of Plantain and Lettice-water, Diamoron, and Vinegar. After he had used this Medicine, he was seized with intense Pain, and was suddenly choaked in the Night-time; but preserved his Senses to the last.

Upon opening his Body, the Substance or Parenchyma of his Lungs was found converted into Pus; and in one of his Sides there was also an Abscess filled with Pus. He had never been troubled with a Cough before, nor had a Spitting of Blood preceded his deplorable Fate; on the contrary, he had all along appeared to be blest'd with a sound and robust Body, and was so far from being meagre, that he was fat. *Dodonaus, Cap. 18. Observat.*

OBSERVATION II.

One *Abraham Perrow*, a Soldier in the French Service, and a Man of fifty Years of Age, in order to prevent the Consequences of an *Enterocely*, submitted to Castration, which Operation was successfully performed in the Beginning of September 1677. Three Weeks after, when every thing seem'd to be in a good way, when the Consolidation of the Wound was judged to be just at hand, and the Patient beginning to walk through the Town, he was seiz'd at once with a Difficulty of Deglutition and of Breathing. As he was in imminent Danger, I was called the third Day. All his Tongue, except the very Tip, was as black as a Coal. He lay with his Breast in an erect Posture; and if any thing was given him out of a Spoon, it brought on a kind of Suffocation; for which Reason, notwithstanding his great Weakness, he obstinately refused the things that were offered him. Tho' the Season was actually cold, he would allow no Part of his Body to remain covered with Cloaths, except his Feet. I forthwith ordered a Clergyman to be called, for the sake of his spiritual Interest. I perceived all the Symptoms of an Angina, tho' nothing appeared either internally, or externally, except the Blackness of his Tongue. Hence I pronounced, that there was an internal Gangrene, the Result and Offspring, as it were, of the Inflammation which I suspected to be in the Lungs. There is a remarkable Consent between the Testes and the Breast, to which Circumstance *Hippocrates* [Lib. 6. *Epidem.*] advises the Physician to give due Attention. The miserable Patient died about an Hour and an half after my Departure.

The Wound, made in this Patient's Right Groin, being carefully inspected, the Operation, which was performed by a young Man of the Name of *Colet*, had all the Appearances of its having been done by the Hand of an Artist; for no Marks of an Inflammation appeared. He proceeded from below upwards in his Operation. The interior Part of his Neck was longitudinally dissected, where the *Arteria Trachea* was found free from every kind of Phlegmon, as were likewise the adjacent Muscles. The Gland called *Thymus* was swelled, stuffed with black Blood, and pressed upon the *Trachea*. The Thorax being compressed, there pused a Sanies from an Incision that was made in it; and when it was quite laid open, we discovered most evident Marks of an uncommon Inflammation in the Lungs; for they were distended with a very black Blood, livid, bespangled with a vast Number of black Spots, and the other evident Signs of a Gangrene, especially towards the Back. Hence it appears, that the Difficulty of Deglutition and Respiration, as also the Loss of Speech, (for the Patient could only pronounce the Letters A and O) are to be ascribed, as well as to the Compression of the *Trachea* by that tumid Gland, and to its being drawn downwards by the Weight of the Matter collected in the Lungs; but we had not an Opportunity of discovering the latent Abscess from which the Sanies came, because he was buried sooner than we could have wished. His Liver, which was ill coloured, and very tumid, discovered itself thro' his Diaphragm, which it had forced upwards. I heard he had a very voracious Stomach. *Boneti Sepulch.*

OBSERVATION III.

In the Year 1618. there appeared in our own Country, an extraordinary and uncommon Distemper, which proved mortal to many People, and especially Children, by extinguishing or stopping their Breath. This was called by the *Greeks* ἀγγωνισμός, by others The Suffocating Disorder of the Fauces, or The pestilential Carbuncle; by most 'tis called *Passio Anginosa*, the Syriac Ulcer by *Aræus*, or The pestilential Tonsilla by *Aetius*. But many things plainly point out to us, that the Disorder has its Seat in some Part higher than the Tonsilla, which Part is the Brain; and this Conjecture of mine is favoured by the Dissection of many who have died of that Distemper, in whose Heads Grumes of Blood have been found diffused for a good way under the largest Sinuses of the Dura Mater [*Severinus de Abscessibus, Tract. ult.*]. We have likewise found the Nerves passing through the Foramen Occipitis, to the Muscles of the Neck, Larynx, Os Hyoides, and Fauces, very much injured in this Distemper [*Thom. Bartholinus, Comment. in dictum affectum, Exercit. 1.*]. See *EGYPTIA ULCERA*.

OBSERVATION IV.

A Man, who seemed to have been suffocated by an Angina, had nothing preternatural in his Larynx; but his Liver itself was putrified to such a Degree, that it might have been mouldered away like a Piece of Earth. The Reason was, the Abundance of Exhalations and Ichor, which flow'd from that Putrefaction, being diffused thro' the Membranes of the Larynx, so contracted it, that he died in the Space of thirty Hours, tho' there was as yet no Streightness in his Fauces; but it must be owned, that this Effect was principally owing to the excessive Load of putrid Matter contained in his Liver.

This seems to be confirm'd by a Disease incident to Horses, which we call the *Viver*, and which generally seizes them upon their drinking Water when they are over-heated by violent Exercises;

Exercises; for when they are allowed to do so, the Glands of their Necks swell, and they generally die within two Days; and, according to the Observation of *Glisson*, their Livers are found entirely dissolved into a putrified Matter. *Beneti Sepulchretum Anatomicum.*

DIAGNOSTICS and PROGNOSTICS.

That Disease which the *Latins* call *Angina*, is by the *Greeks* distinguished into several Species, each of which has its respective Name. Sometimes neither any Redness nor Swelling appear, but the Body is parch'd, the Patient breathes with Difficulty, and a general Imbecillity seizes him. This Species is called *σνάψη*. Sometimes the Tongue and Fauces swell, and become red, the Voice is intercepted, the Eyes are turned up, the Face grows pale, and the Patient is affected with Hiccups. This Species they call the *σνάψη*. Both these Species of the Distemper have these Symptoms in common, that the Patient can neither eat nor drink, and has his Respiration interrupted. The Disease is still milder, where there is only a Swelling and Redness, without any of the other Symptoms; and this Species is called *ἀσπασψή*. *Celsus, Lib. 4. Cap. 4.*

A Quinsey is a very acute Disease, as it is an Impediment to Respiration. Of this there are two Species; one is an Inflammation of the Organs of Respiration; the Cause of the other resides in the Breath, which is respir'd.

The Organs which are the Seat of the first Species, are, the Tonsils, the Epiglottis, the Fauces, the Uvula, and the superior Extremity of the Aspera Arteria; and if the Inflammation spreads much, the Tongue and Inside of the Cheeks are also affected; inasmuch that the Tongue is so enlarged, as to hang out beyond the Teeth, for want of Room in the Mouth. This is called *Cynanche*, *κυνάγχη*, either because Dogs are much subject to these Disorders, or because these Animals, even in Health, have a Habit of putting out their Tongues.

In the other Species, the Organs above-mention'd collapse, and are each more extenuated than in a natural State; and an excessive Strangulation attends it, inasmuch that the Patient seems to perceive a hidden Inflammation in the Breast. *Aræteus, πρὸς ὁξέων παθόν, Lib. 1. Cap. 7.*

The Author proceeds to prove, that the Cause of this second Species resides in the Air respir'd; but as in this he is evidently wrong, I shall omit taking more Notice of it.

In that Species of Quinsey call'd *Cynanche*, the Patients labour, under an Inflammation of the Tonsils, Fauces, and of the whole Mouth; the Tongue hangs out beyond the Teeth and Lips; a large Quantity of Saliva is discharged; and a viscid cold Phlegm flows from the Parts affected; the Face is red and swell'd; the Eyes are prominent, staring, and inflam'd; what is drank returns by the Nostrils, the Passage into the Stomach being obstructed; the Pain is excessive, but, in some measure, less perceiv'd on account of the violent Strangulation; there is a Sensation of Heat in the Thorax, and about the Heart; a perpetual Desire of fresh Air attends, tho' but little can be inspir'd, till at last the Passage thereof into the Thorax being entirely obstructed, the Patient is suffocated. In some the Disorder is readily remov'd to the Lungs, and Death is the Consequence of such a Translation: The Fever is slow, gentle, (*μαλακόν*) and not easily relieved.

If the Distemper verges towards a happy Conclusion, Abscesses are form'd here and there, either externally about the Ears, or internally in the Tonsils; and if these suppurate slowly, and without acute Pain, the Patient may recover; however, not without much Trouble and Danger: But if a larger Tumor inclines to suppurate, the Patient is suddenly strangled, just upon the Elevation of the Abscess into a Point. This is the Form of a *Cynanche*.

In a *Synanche*, the Parts above-mention'd collapse, and appear extenuated and pale; the Eyes are hollow, and sunk; the Pharynx (*φάρυγξ*, he means the Parts about the Fauces) and Uvula are drawn backward: the Tonsils retire; the Speech is lost. In this the Strangulation is much greater than in the other, because the Seat of the Disease is in the Thorax, where the Origin of Respiration resides. These Cases are very acute, and prove fatal the very Day that they seize, sometimes even before a Physician can be called; or, if he is called, he can seldom be of any Service, the Patient expiring before his Art can have any good Effect.

When the Disease takes a Turn for the better, all the Parts inflame, and the Inflammation is elevated into a Tumor externally. A large Tumor, or Erysipelas, appearing on the Breast, are good Signs. Hence a skilful Physician will invite the Disorder outwards, by Cupping-glasses upon the Thorax, or by Sinapisms apply'd to the Breast, or about the Jaws; will endeavour to draw the offending Matter outward, and thus make it perspire thro' the Pores. It sometimes, however, happens, that the Disease is by these means, for a short Time, deposited upon the external Parts; but soon after retiring, immediately suffocates the Patient.

The Causes of this Distemper are various; as Cold frequently; Heat not so often; Wounds; the Bones of Fish

sticking in the Tonsils; drinking cold Water; Intemperance in Drinking or Eating; besides the ill Qualities of the Air respir'd. *Aræteus, πρὸς ὁξέων παθόν, Lib. 1. Cap. 7.*

To this Doctrine of a Quinsey, I shall add that of *Cælius Aurelianus*, who informs us, that this Distemper is called *Lycanche*, as well as *Cynanche*, because the Patient, under this Disorder, exerts a Voice like a Dog, or Wolf. But it must be remark'd, that, as *Aræteus* distinguishes betwixt a *Cynanche*, and a *Synanche*, *Cælius Aurelianus* comprehends both Sorts under *Synanche*.

It is the distinguishing Character of these two Authors, that their Descriptions of Distempers are extremely picturesque, and in this they excel all other Authors. For this Reason, I have given both, as they may illustrate and confirm each other.

One Species of *Synanche* is attended with no manifest Tumor; in another it is visible and manifest; one affects the Inside, another the Outside of the Mouth; another both the internal and external Parts on the Right or Left, or on both Sides; some, as for Instance, *Valens* the Physician, in his third Book of Cures, have given Names to each particular Distinction. That Species, indeed, which is without manifest Tumor, they have left without a Name; but that which comes attended with a visible Tumor, if it affect both the interior Sides of the Fauces, they call a *Cynanche*; for it causes a Difficulty of Respiration, and a Prominence of the Eyes, and a Faltering of the Tongue; as it often happens to greedy Dogs, who, stimulated by a Sense of Hunger, fall fearlessly on a Piece of Meat, which, thro' their Haste, sticks in their Throat, and they can neither swallow nor bring it up again. If the Distemper only lies in one Side, they call it a *Paracynanche*. If the external Parts on both Sides be affected with a Tumour, it has the Appellation of *Hyanche*, [from *ὕς*, a Swine, and *ἄγχω*, to strangle] because the Necks of Swine are very subject to these Inflations, which the *Greeks* call *Hyai* [*ῥαι*]. If the Tumor affects both the internal and external Parts on both Sides, it is properly called, as they tell us, a *Synanche*. If it be only on one Side, a *Parasynanche*. To give Names to their specific Differences, is not material.

The antecedent Causes of this Disease are some of them occult, others evident, and common to other Disorders, but especially strained and laborious Vomiting, more particularly after corrupted Food. Ebriety also, and drinking of Snow-water, and vehement Exclamation, kept up to the same Height and Tone of Voice, which the *Greeks* call *Menotonon*, may be reckon'd among the Causes of this Disorder. It is produced also by a Catarrh, by acrimonious Food, eaten contrary to Custom, by Medicines of a hot and fiery Quality, taken inwardly, by a purging Dose of Hellebore, and in some Women by a Retention of the Menstrues. Men are more subject to it than Women; and young Men, and those of a middle Age, than Boys or old Men.

Asclepiades, in the second Book of his Commentaries on *Hippocrates's* Aphorisms, defines a *Synanche* to be a Flux of Humour, or Humectation of the Fauces, or their upper Part, usually derived from the Head. But this is an imperfect Definition; for, every Flux of Humour, which they call a Rheumatism, is the Falling down or Discharge of a copious Liquor. But in Persons afflicted with a *Synanche*, there appears, indeed, a Tumor, but no great Discharge of a Humour is perceiv'd, unless it may sometimes happen from a Pressure.

We, according to the Sentiment of *Soranus*, define a *Synanche* to be a Difficulty of Deglutition, and an acute Strangulation, proceeding from a vehement Tumor of the Fauces, or the Parts by which Deglutition is performed.

In our Definition, we join an acute or very quick Strangulation with a Difficulty of Deglutition, to distinguish this Disorder from a Tumour of the Tonsils, or Uvula. For where there is a *Synanche*, there must of Necessity be a Tumor of the before-mentioned Parts; but it does not follow, that whenever this Tumor happens, there must presently be what we call a *Synanche*: For those who are molested with a Difficulty of Deglutition in a moderate Degree, do not seem arrived to the Pitch of a *Synanche*, since the Essence of this Affection is understood to consist in the Greatness of the Tumor, which also distinguishes the Strangulation, occasioned by this Disorder, from what is caused by the Constriction of a Cord; for, in the latter Case, there is also a very acute and sudden Strangulation, but not owing to a Tumor. *Cælius Aurelianus, Acut. Morb. Lib. 3. Cap. 1.*

The Symptoms which afflict the Patient under a *Synanche*, are, at first, Pains without evident Cause, a Difficulty of moving the Neck and Throat, a considerable Discharge of Saliva, without any visible Tumor, with a dull Pain, and sensible Asperity of the Fauces; a Difficulty of swallowing the usual Fluid which gathers in the Mouth like Spit; after these, an Impediment of Respiration, as if clogg'd with some gross Humour.

As the Disease increases, the Part grows red, with a manifest Tumor; and, at last, the Fauces, Uvula, the Parts above the Tongue, and the superior Part of the Throat, are elevated

elevated by the Tumor to a remarkable Degree, which is attended with a Difficulty of swallowing: whatever is received at the Mouth; besides a Strangulation in Proportion to the Tumor, a Difficulty of Respiration, and a Nausea. If the Mouth of the Patient be open'd, a dry Tension of the Tongue, when compressed with the Finger, is perceived.

When the Distemper is increased to a vehement Degree, the Tumor spreads over the Neck and Face, the Mouth flows with Spittle, and a viscid Humour; the Eyes are prominent, bloodshot, and the Veins appear distended.

If the Patient still grows worse, the Tongue falls without the Teeth, there is a Dryness of the Fauces, a cold Numbness of the Joints, a swift and frequent Pulse, a Difficulty of lying, especially on the Back or Side, with a frequent Desire to sit, and an inarticulate confused Speech, not without Pain.

If the Disease tends to the Destruction of the Patient, as he grows worse, he becomes livid in the Face, and speechless; there is a Stertor in the Throat and Breast; whatever Liquid he takes, recurs; and there is a Failure in the Pulse, which the Greeks call ἀσπυρία. Some utter a Voice like a Dog, others froth at the Mouth. Upon these Symptoms Death necessarily ensues.

If the Disorder be without a manifest Tumor, there is a Slenderness of the Neck, with an inflexible Erection and Extension of the same; the Face and Eyes are hollow, the Forehead is distended, the Colour like Lead, Respiration is extremely difficult, but with no manifest Tumor, as I said before, or Inflammation, either in the internal or external Parts. The Patient labours under an extreme Weakness and Dulness, and dies under a very quick and acute Suffocation.

If an Erysipelas breaks out about the Neck or Breast, and continues, it is very often a good Prognostic; for it seems to signify a Translation of the Humour from the inner Parts to the Superficies. But if, in spite of all the Assistance of Medicines, the Erysipelas on a sudden disappears, it is a fatal Sign; for it shews a Translation of the Humour from the Superficies inwards. If an Erysipelas appears not while the Distemper is in its State, nor, proceeding from the inner Parts, shews itself outwardly, but is either antecedent to the Disorder, or concomitant with it, it is, on all Accounts, a bad Prognostic. Plenty of Humour, or viscid Saliva, is bad, in the State of the Disease, but good and salutary in the Decline; for, in the first Case, it signifies a very great Strangulation, but in the latter, a Relaxation. Sometimes this Disorder increases to such a Height, as to cause a Stricture in the Fauces, Throat, and Chin. Now a Stricture is an acute, quick, and violent Distemper, and very often continual, but sometimes intermittent. *Caelius Aurel. Acut. Morb. Lib. 3. Cap. 2. See STRICTURA.*

A Quinsey without any evident Tumor in the Neck or Fauces, (ἀσπυρία) but attended with violent Strangulation, and difficult Respiration, is fatal either the first Day, or the third. *Hippoc. Coac. Prænot.*

Quinseys equally troublesome with the former, as to Strangulation, and difficult Respiration, but attended with a Tumor and Redness of the Fauces, are extremely dangerous; but, however, do not threaten so immediate Destruction, if the Redness is considerable. *Hippoc. Prædict.*

If a considerable Redness appears at the same time in the Fauces, (ἐσφυγία) upon the Neck and Breast, the Case is less acute; most, who are thus affected, recover, unless the Redness suddenly disappears. *Id. Coac. Prænot.*

But if the Tumor and Redness disappear, without any external Abscess, or gentle and unpainful Expectoration of Pus; or if this does not happen upon critical Days, the Disorder is fatal. Perhaps also the Lungs suppurate. It is therefore much the safest, when the Redness and Apostemation verge towards the external Parts. *Id. ibid.*

When the Erysipelas tends from the internal to the external Parts, it is a good Symptom; on the contrary, when it tends from the external Parts inwards, it is fatal. It verges inward, when the Redness disappearing, the Breast is oppress'd, and the Difficulty of Respiration increased. *Id. ibid.*

When a Quinsey removes to the Lungs, the Patient generally perishes within seven Days; but if he escapes, a Suppuration of the Lungs ensues, unless a large Quantity of Phlegm is expectorated. *Id. ibid.*

When, by reason of the violent Suffocation, the Forces are suddenly discharged, the Case is desperate. *Id. ibid.*

In Quinseys, if the Spit is dryish, (ῥέξη, thick and viscid) without any Tumor of the Fauces, it is of bad Presage. *Id. ibid.*

In Quinseys, if the Tumor of the Tongue subsides without sufficient Reason, it is a fatal Symptom. The Pain also vanishing suddenly, and without any manifest Cause, portends Death. *Id. ibid.*

The Doctrine of the latter Part of this Prognostic cannot be too often inculcated, because it is also applicable to all internal Inflammations whatever. The sudden Disappearance of Pain, without sufficient Cause, is a Sign, that a Mortification is begun.

In Quinseys, if a well-concocted Saliva is not soon discharged, the Case is desperate. *Hippoc. Coac. Prænot.*

In a Quinsey, Pains in the Head with a Fever, without any Alleviation of the Symptoms of the Quinsey, portend ill. *Id. ibid.*

In a Quinsey, Pains in the Legs, attended with a Fever, whilst the particular Symptoms of the Quinsey remain, without Alleviation, portend ill. *Id. ibid.*

Pains in the Hypochondria, subsequent to a Quinsey, terminated without a regular Crisis, together with great Imbecillity, and a Torpor, prove fatal unexpectedly, tho' the Patient, in Appearance, is upon the Recovery. *Id. ibid.*

In Quinseys, if the tumefied Parts subside, without salutary Signs, and the Pain removes to the Breast and Belly, with Tension of the Part where it fixes, a purulent Diarrhoea ensues, otherwise there will be no Solution of the Disease. *Id. ibid.*

In Quinseys, all Pains have a fatal Tendency, which do not manifest themselves externally. Sometimes Pains are translated to the Legs, which prove very chronic, and do not cause a Suppuration, without great Difficulty. *Id. ibid.*

In a Quinsey, the Spit, which is viscid, thick, whitish, and which is brought up with Difficulty, is bad; as are all such imperfect Concoctions. In such Cases, a great Number of Stools reduces the Patient to a Paraplegia, and Death ensues. *Id. ib.*

If the Spit, which happens from a Quinsey, is dryish, (ῥέξη, thick and viscid) and is frequently discharged with a Cough, and Pain of the Side, it is a fatal Symptom. If the Patient cannot drink without Difficulty, and if what he drinks is driven back with a Cough, the Case is dangerous. *Id. ibid.*

A Quinsey is an Inflammation of the Fauces, attended with an ardent Pain, Tumor, Redness, a Difficulty of Respiration and Deglutition, and a Fever. It arises from a Stagnation of Blood, or of an acrimonious and viscid Serum in the sanguineous or lymphatic Tubes, and is not void of Danger.

In order to form a Judgment of this Distemper, we are first and principally to consider the Parts where it is seated, which are the Fauces, and especially the Pharynx and Larynx, with the adjacent Parts. In this are included many Parts, which are of very great Use, and of quick Sensation; such are, the Root of the Tongue, with the Os Hyoides, the Holes of the Nostrils, which open into the Mouth, the Beginning of the Oesophagus, the Muscles of the Pharynx, with the internal and external Muscles of the Larynx, in Number thirteen, besides the greater and lesser Glandules, the Tonsils, the Muscles that move the Jaws, the smaller sanguineous and lymphatic Vessels, with the tender Branches of the Nerves.

The Quinsey is esteemed more or less dangerous, according to the Parts affected by the Inflammation, and goes under different Names on the same Account. There is a very old Distinction of a Quinsey in general, into an inward and outward Quinsey: The first is seated in the inner nervous and muscular Membranes of the Fauces, and does not discover itself by any outward Tumor or Inflammation, either in the Neck or Face; but there is an inward burning Heat, with an acute Fever, and if the Case be worse than ordinary, not only a Difficulty of Respiration, but of Deglutition, and the Patient is in great Danger.

The external Quinsey is more conspicuous to Sight, and principally affects the external Muscles, and glandulous Parts, the Tonsils, with the Root of the Tongue, and the Uvula; it is also more easily cured.

If we consider this Disease, more particularly with respect to the Part affected, the most terrible and dangerous Quinsey is usually that which is seated in the internal Muscles of the Larynx, and does not discover itself outwardly by any Redness, or other Symptoms about the Neck or Throat; but the Patient is afflicted with a vehement internal Heat and Pain, and by reason of the Contraction of the Orifice of the Aspera Arteria, not only the Voice is suppressed, but Respiration is performed with Difficulty, and sometimes wholly stopped, often in so short a Time, if we believe Observation, as to kill the Patient within the Space of four-and-twenty Hours, or on the third Day. This the Greeks call *Cynanche*.

What they call *Synanche*, affects the internal Muscles of the Pharynx, and is, like the other, without any conspicuous external Tumor or Redness, but attended with a greater Difficulty of Deglutition than Respiration; for what the Patient endeavours to swallow, is violently discharged by the Nostrils. But when the Tumor and Redness render themselves sensible to the Sight and Touch, the Inflammation, which has its Seat in the external Muscles of the Pharynx, is, by the Antients, called *Parasynanche*, as the other, which seizes those of the Larynx, is named *Paracynanche*.

Again, a Quinsey is distinguished, by practical Physicians, into the true or perfect Quinsey, and the spurious one.

The true Quinsey arises from a Stagnation of the Blood, but the spurious one is rather owing to an inflammatory Collection of Serum, than of Blood, in the interior Parts of the Fauces and Neck. The true Quinsey is an acute Disease, and never without Shiverings and a Fever; the spurious Quinsey is attended rather

rather with a lymphatical and catarrhus, than an acute Fever. In the perfect Quinsey there is not only a burning and pungent Pain about the inward Parts of the Fauces, but the Tongue also is turgid with Blood, and of a dark red Colour; there is also a Redness of the Face, and a great Pulse of the temporal Arteries, which are attended sometimes with a Pain in the Head, and a Drowsiness and Numbness of the Senses, and sometimes Faintings. If the Disease be violent, there is a Difficulty of Respiration, with great Anxiety, Restlessness, and Coldness of the extreme Parts. This is a very dangerous Case, and requires immediate Relief. But in the spurious Quinsey, these Symptoms are some of them wholly absent, others less violent, and there is less to be feared under a right Management. Moreover, a Quinsey may be divided into a very hot and dry, and into a moist, or very mucous one. The former takes its Rise from the Blood, and is accompany'd with a very acute Fever, as was said of the true Quinsey. The other is more chronic, and comes attended with a catarrhus Fever, is familiar to cachectical and scorbutic Persons, and covers the Tongue and Fauces with a thick slimy Mucus, which causes a foetid Breath.

All these Species of Quinsey deserve to be distinguished from other Affections of the Fauces. The true and dry Quinsey must not be mistaken for that mucous Inflammation of the Mouth and Oesophagus, commonly called *Prunella Alba*. For in the latter, the whole Region of the Fauces, and the Tongue, are cover'd with a white Mucus, the Tongue contracts painful Fissures, and there is a burning Heat, which reaches even to the Diaphragm. This frequently happens in malignant Fevers, and is for the most part a bad Symptom, because it indicates an Inflammation of the Stomach and Oesophagus. Nor is every Inflammation of the Fauces a Quinsey, but that only which is attended with a Difficulty of Respiration and Deglutition. Wherefore there is a wide Difference betwixt a Quinsey, and a slight Inflammation of the Neck, and the internal Parts of the Fauces, with a Tumor and Pain of the Glandules, which frequently happens to scorbutical Persons, and those affected with the Venereal Disease, if it proves obstinate, and is accompanied with Erosion. The true and internal Quinsey must also be distinguished from those Spasms which are usually incident to hysterical and hypochondriacal Patients, which contract the Face, and cause a Difficulty of Respiration, as well as Deglutition. These Symptoms happen without a Fever, and soon remit, and leave the Patient, and easily give way to Medicines. Lastly, The Quinsey differs from those hot and painful Pustules on the Tongue, which they call *Aphthae*. For those affect only certain Parts, and are accompany'd with a Pain and Redness; nor are they so constantly attended with a Fever, as the Quinsey.

The immediate Cause, then, of a Quinsey is a Stagnation of the Blood, or sometimes an inflammatory Collection of Serum in the internal Parts of the Fauces; to produce which, many things may concur. For 'tis evident, from Observation, that it is frequently consequent upon the Suppression of a spontaneous Evacuation, as of Blood, either by the Nostrils, Uterus, Haemorrhoidal Veins, or of the Lochia, or upon the Omission of an habitual artificial Evacuation, by Scarification or Phlebotomy. In Bodies thus predisposed, the Disease is soon form'd, after a more than ordinary Commotion of the Blood, drinking freely of Spirituous Liquors, violent Exercise, or even too high straining the Voice, especially in the cold Air. I have observ'd also the Beginning of an Inflammation like that of the Quinsey, after taking a pretty strong Sudorific, follow'd by a too sudden Admission of the cool Air; or taking a Draught of cold Liquor, after coming out of an over-hot Bath; which, however, by the Help of proper Remedies, both internal and external, have in a short time been happily discuss'd. A Quinsey is no less frequently generated by oppressing the Fauces with acrimonious things, which too much irritate and overstrain the Fibres and Vessels. We know by Experience, that a fatal Inflammation of the Fauces has often surpris'd those who have lived and slept in Rooms, which have been newly plaster'd over with Lime; and I myself knew several Infants kill'd at once by the same Means. That the same inflammatory Quality belongs to Caustics, is agreed by all. Among Cathartics, White Helilebore, by a kind of specific Property, communicates its Influence to the Fauces, and causes a Strangulation. Quicksilver, and especially ill Preparations of it, are known to incommode and inflame the Fauces. The same Effect is observ'd, by Physicians, to follow the Use of the *Solanum Furosum*, and the Bite of a mad Dog. The Fumes arising from arsenical and mercurial Ores, and the Vapours of mineral Spirits, unwarily drawn in with the Breath, have a principal Tendency to promote this Disorder; for the very subtle and penetrating pointed Particles of all these Substances, deeply insinuating themselves into the Muscles which move the Cartilages of the Larynx, by there straining the nervous Membranes, and intercepting the free Passage of the Blood through the Vessels, excite an inflammatory Tumor of this kind, with a Pulsation, and a pungent Pain, which is often fatal.

That the bare Infection of sharp and pointed things in these solid Parts, is sufficient to cause this Affection, is evident from the Effects which the small prickly Bones of Fish produce by sticking in the Fauces, which are very often Inflammations of this kind. You have a remarkable Observation to this Purpose in *Hildanus, Cent. 3. Obs. 42.*

By some of the before-mention'd Ways is a Quinsey spontaneously excited: But it often succeeds some other Disease as a Symptom; which happens frequently in a Diarrhoea and Dysentery, especially if the Flux be unseasonably stopp'd; of which we have a memorable Example in *Hildanus, Cent. 3. Obs. 27.* The same Event follows the preposterous repelling of an Erysipelas, or the Application of improper Topics to the Gout. The Quinsey also frequently supervenes upon the Small-pox, and malignant and pestilential Fevers. In particular, anatomico-practical Observations upon the Distemper call'd the *Hungarian Fever*, assure us, that it commonly ended in a Inflammation of the Meninges and Fauces, which spread itself to the Stomach and Oesophagus, and carried off the Patient: But the Cause of this symptomatical Quinsey might, for the most part, be found to be a too long Constipation of the Belly, an imprudent Checking of Perspiration, or a preposterous repelling of the acrid caustic Matter, upon the inward Parts. When the Distemper is epidemical, it must be attributed to some Fault in the Air, which usually, on these Occasions, has in it some degree of Malignity. It often happens in the Spring or Autumn, after a long rainy and moist Constitution of the Air, as *Hippocrates* of old observ'd, *Sect. 3. Aph. 16. 20. 22.* and *Bartholine* confirms by his own Experience, *Cent. 1. Obs. 81.* This Disorder also usually attacks those who breathe an Air impregnated with Effluvia of the Nature of a very acrid subtle Salt, communicated to it by a Multitude of Insects there residing, especially at the Setting of the Sun. From this Cause, *Hollerus, Prax. Lib. 1. Cap. 23.* assures, that the Quinsey is very common at *Rome*, and sometimes rages like the Plague.

A Quinsey is very dangerous, not only on account of the Fever, which is often acute, but the Fear of Suffocation. The most dangerous is the true, internal, and hidden Quinsey, as we said before; and of this Sort must be understood what *Hippocrates* pronounces, *Predict. Lib. 3. Cap. 8.* "The Quinsey is a very terrible Disease, and soon proves fatal, if it shews nothing conspicuous to the Sight, either in the Neck or Fauces; for the same Day, or the second, or the third, or fourth, it strangles the Patient." The greatest Danger of Suffocation is, when the Muscle call'd the *Thyroarytenoideus*, whose Office it is to close the Larynx, is affected. The symptomatical Quinsey is also very dubious, and full of Hazard; for the Patient, by reason of the Weakness of his Body, already exhausted, and the Virulence of the Matter, seldom gets over it. It is a very bad Sign also, when the external Tumor suddenly disappears, the Symptoms not being mitigated, but rather exasperated: For, in such a Case, the morbid Matter passes over the other nervous Parts, and directs its Course either to the Brain, where it excites a Phrensy with Convulsions; or to the Lungs, where it causes a Peripneumony, which, according to *Hippocrates, Sect. 5. Aph. 10.* ends in Death. But when the suffocating Strangulation remits, and the Tumor, Pain, and Redness tend principally to the outward Parts, and vanish by degrees, it prognosticates a happy Event; if the Case be otherwise, the Disease terminates in Death, or an Abscess; if in an Abscess, and there be an Effusion of Pus into the Bronchia and Lungs, according to *Forestus, Lib. 15. Obs. 24.* the Event is very doubtful; if in Death, Frothing at the Mouth, a Tongue very much swell'd; and of a purplish black Colour, Coldness of the Extremities, an uncommon Anxiety, and Compression about the Praecordia, and a hard, convulsive, and intermitting Pulse, prognosticate its Approach.

CURE of a QUINSEY.

The Method of Cure recommended by *Hippocrates*, consists in bleeding in both Arms, and opening the Veins under the Tongue, in Lambitives capable of inciding the Humours, in hot Gargarisms, and evacuating a Part of the Humours by an increased Discharge of Saliva, and in shaving the Head. A Cerate should also, according to him, be applied to the Head and Neck, and over this Wool; and the external Parts must be fomented with soft Sponges, wrung out of warm Water. The Drink ought to be Water and Hydromel, but by no means cold; or Cremor of Pisan, when the Danger is judged, from the Crisis, to be over. *De Ratione Vietus in Acutis.*

In both Species of Quinsey, if the Strength of the Patient will permit, Blood is to be taken away, even tho' it should not abound in him. The next Step is to purge. Cupping Glasses must also be applied directly under the Chin, and about the Fauces, that the Humours, which cause the Strangulation, may be invited outwards. Moist Fomentations also must be made use of, for dry ones render Respiration more difficult: Therefore Sponges are to be applied, which are frequently to be dipp'd in warm Oil, rather than in warm Water. Warm Bags of Salt are also of great Efficacy in these Intentions. It is also advise-

able to gargle the Mouth with a Decoction of Hyssop, or Catmint, or Thyme, or Wormwood, or even of Bran, or of dried Figs, in Hydromel; after these anoint the Palate with Bull's Gall, or the Composition which derives its Name from Mulberries. Powder'd Pepper may also, with very good Effect, be sprinkled upon it.

If these have but little Effect, the last Remedy is to make deep Incisions under the Jaws, above the Neck; or in the Palate about the Uvula; or to open the Veins under the Tongue, that by these Wounds the Humours, which cause the Distemper, may be discharged.

If by these means the Patient is not eased, we may know, that the Disease will prove fatal: But if he is so far reliev'd, as to be able to eat and drink, the Transition to Health is not difficult. In some Cases, Nature will assist, provided the Disease removes from a narrower to a wider Part. Therefore, if a Tumor or Redness arise about the Præcordia, we may be satisfi'd, that the Fauces are set at Liberty.

But by whatever means Relief is procur'd, the first Aliments which are given must be liquid, and in particular Hydromel; after these, solid Foods, which are soft, and not acrid, till the Fauces recover their usual Habit.

It is commonly reported, that if any one eats a young Swallow, he will be in no Danger of a Quinsy for that Year: And it is farther affirm'd, that if the same be preserved with Salt, and burnt, upon an Attack of this Distemper, and the Ashes are powder'd, and put into Hydromel, which is given to drink, it will be of Service. This I thought worthy of inserting, tho' I have not met with it in Medicinal Writers; because it is a popular Remedy in some Reputation, and cannot possibly have any ill Effect. *Celsus, Lib. 4. Cap. 4.*

For the Cure of a Cynanche, that Species of Quinsy which is attended with a Tumor of the Fauces, *Aretæus* advises the following Method, which, he says, must be immediately pursued; because the Distemper, being extremely acute, soon proves fatal.

If the Disorder is caused by a Debauch, either in eating, or in drinking, the Intestines must be wash'd not only with one, but with two Clysters. The first must be of the common Sort, being only intended to discharge the Excrement; the second is design'd to draw a Part of the Humours from the Tonsils and Breast; therefore let it not be simple, but made of a Decoction of Centaury, Hyssop, Wormwood, Calamint, and Birth-wort, with an Addition of Honey, and a great deal of Nitre; for these draw away Phlegm. And tho' the Patient has lived temperately, the Vein in the Cubit must be open'd, and with a large Orifice, that the Blood may flow from it with Impetuosity, and in a large Quantity; for by these means it will be more likely to moderate the Heat, relieve the Strangulation, and mitigate all the Symptoms. It will not be amiss to let the Patient bleed till he is near fainting, but not till he actually faints; for some have, upon these Occasions, died in the fainting Fit: Mean time, Ligatures must be made above the Ankles and Knees, but particularly upon the Wrist near the Cubit, and upon the Cubit near the Humerus. If the Patient can swallow easily, give him as much Elaterium as is sufficient to purge him, in Hydromel and Whey; for, of all Cathartics, Elaterium is, in this Case, the best: Cneoron and Mustard [*νέτρον*] are also of Service; for both these purge the Belly.

If, by the Use of these Remedies, the Inflammation is not mitigated, bending the Tongue upwards, open the Veins on the under Side, and if a large Quantity of Blood is discharged from these, it gives greater Relief than all the rest. Let the inflam'd Parts be moisten'd with Restringtons at first, that the Inundation of Humours may be somewhat check'd; for this Purpose use Wool, greasy with the natural Sweat, and let it be impregnated with Wine, and the Oil of unripe Olives. Cataplasms also of the same Nature must be applied, as of Dates moisten'd and bruise'd with Wine, together with Rose-flowers; and that these Cataplasms may have a proper Consistence, that is, be viscid and soft, let Meal and Lin-seed, and Honey and Oil, enter their Composition.

But if it verges towards Suppuration, make use of warm Topics, as in the other Species of Quinsy: Let therefore the Meal be that of Femugreek; and let the Powder of Frankincense [*μάρρα*] and Resin be melted; and let the Tops of Poley-mountain be strew'd in: To these add hot Fomentations, by means of Sponges, press'd out of a Decoction of Laurel-berries and Hyssop. The Dung also of Doves and Dogs are powerful Promoters of Suppuration, pass'd thro' a Sieve, and applied to the Part. Proper Lotions are prepared of Hydromel, with the Decoction of Lentils, or Hyssop, or Roses, or Dates, or of all together. The Mouth must also be anointed as far as the Pharynx, either with simple Medicines, as the Juice of Mulberries, or of Pomegranates bruise'd with Water, or a Decoction of Dates; or else with Compounds, as those which take their Names from Mulberries, from Rue, the Juice of Pomegranates, or from Swallows. But if there are Ulcers in the Mouth, with Eschars, proper Lotions and Gargarisms are prepar'd of Decoctions of Hyssop in Hydromel, or of fat Figs in

Water, with an Addition of *Amylum*, moisten'd with Hydromel, or the Juice of *Ptisan*, or of *Tragus*.

But in that Species of Quinsy which is attended with an Extenuation of the Parts, and is called *Synanche*, all possible Endeavours must be used to invite the Humours, and the Heat, and the Flesh, outwards, that all the external Parts may swell: Let therefore the Embrocations be hot, and made with Rue and Dill, with an Addition of Nitre; and let the Cataplasms, above specify'd, be laid on with these. It will also be of Service to apply a Cerate, with Nitre and Mustard, in order to excite Heat; for Heat in the external Parts contributes much to the Cure of these Disorders, and to the Swelling of the Neck; and a Tumor, rising externally, preserves the Patient from a Peripneumony; but if it retires inward in a Quinsy, it is a fatal Evil.

Those who, apprehending the Suffocation in a Quinsy, make an Incision in the *Aspera Arteria*, in order to render Respiration easy, do not seem to me to have confirm'd this Practice by Experience; for the Heat, arising from the Inflammation, is increased by the Wound, and adds to the Fatigue and Danger of the Strangulation and Cough: Besides, if the Patients escape this Danger, the Lips of the Wound will not unite, because, being cartilaginous, they cannot heal. *Aretæus de Curatione Acutorum, Lib. 1. Cap. 8.*

There is, after this, something omitted in the Copies of *Aretæus* now extant; for *Aetius* quotes some things from this Author, not to be found here, as is specified below.

By Nitre, *Aretæus* means *Natron*, a Salt very different from our Nitre. See ANATRON.

Cælius Aurelianus has preserved the Practice of a great many of the ancient Physicians, which would otherwise have been lost to us; and is very free in finding Faults, for which he sometimes gives but indifferent Reasons. He was of the Methodist Sect, and as he believed the Causes of Diseases resided in the Solids, and were nothing but too tense or lax a Tone of their Fibres, he reduced most Diseases under two Heads, which were those of *Stricture* and *Solution*: Thus, for Instance, a Phrensy was, with him, a Disease of *Stricture*; but a Diarrhoea, on the contrary, was called a Disease of *Solution*.

The Patient under this Distemper must lie in a lightsome Place, moderately spacious, warm, and free from offensive Smells. Air, thus qualify'd, is of a laxative Disposition, and proper to insinuate into the tumid Parts. The Posture of Decubiture ought to be supine, the Head a little raised, in a firm and immovable Position, or one in which the Patients say they find most Ease; for all Motion is painful to Persons labouring under a Tumor. The Neck and Breast are to be cover'd and cherish'd with clean, soft, and undy'd Wool, dipp'd in warm sweet Oil, not omitting gentle Frictions of the Joints; for the Relaxation, consequent on Perspiration thus promoted, is communicated to the affected Parts.

Rest and Abstinence are to be injoin'd for the first three Days, together with a laxative Gargarism. Fomentations with warm sweet Oil are to be used, and Bladders, half-full of the same, are to be applied to the outward Parts. If the Disease be violent, Phlebotomy is to be administer'd within the three Days; for quick and sudden Bleeding is necessary for a most speedy Relaxation. If there be no urgent Necessity, Bleeding may be omitted till the third Day, or, if the Strength continue, till after it, and then used, if any emergent Occasion requires it.

The Person to whom Bleeding has been administer'd within the three Days, is afterwards to have his Head and Neck fomented with hot sweet Oil, and have some of the same instill'd into his Ears; and then to use a Gargarism. His Drink must be warm Water, or Mulsam, and not by Draughts, but Sippings, lest the tumid Parts should be irritated by a troublesome Deglutition and Percussion.

If we bleed the Patient on the third Day, he must afterwards have his Body anointed round with sweet Oil warm'd, and his Face moderately fomented with warm Water; then we may give him forbile Food, but very thin or fluid; or else some Bread dipp'd in Mulsam.

If Deglutition be difficult, so as to prevent the Sick from receiving into his Stomach what is given him for that Purpose, it will be sufficient, for supporting his Strength, to instil Mulsam, Drop by Drop, into the Fauces. We must also continue to give him Food every other Day, till the Decline of the Distemper.

It will also be convenient, for some Days after Phlebotomy, to make use of Cataplasms, which may be outwardly applied, round about the Neck, but let them be of the mild and simple Kind; such as hot Bread dipp'd in Water and Oil, or carefully mollify'd in Mulsam, or Flour of Wheat, or Barley, or Lin-seed, or Fenugreek. The fore-mention'd Simples may singly, or mix'd together, be taken out of warm Water, Oil, or Honey, or a Decoction or Infusion of the Root of Marsh-mallows, and so applied. These Cataplasms are frequently to be chang'd, lest, by long Continuance on the Part, they contract a Sourness from the corrupt Exhalations of the Body. They are

are also to be heated, that their Vapour may continue the longer; and outward Applications are to be made of Sacks of Bran boil'd in Water, or Bladders half full of hot Water and Oil. The Vaporation of Sponges, squeez'd out of warm Water, alone or mix'd with Oil, or a Decoction of the mild Laxatives, is good in this Case. Sponges are also to be applied to the Neck and Throat, and those Parts which, by their Swelling or Inflammation, hinder Deglutition, or to the Mouth and Nostrils; the Patient also is to be exhorted to suck in the Vapour with open Mouth; for Vaporations received this way descend deep, and relax the Tumor.

Gargarisms are to be used, which have a Congruity with Cataplasms, such as warm and sweet Oil, or hot Water and Oil; also Mulsum, diluted with Water, and boil'd; Milk alone, or mix'd with Honey or Water, so that there be an entire Detersion of all the curdling Parts; lest, if any should remain; they might contract a Sourness from the Heat of the Places.

We are also to make use of a Decoction of Bran and Liquorice, or of Lin-seed and Fenugreek; but never boil'd to the Thickness of a Cremor; lest by its viscous Tenacity, in Conjunction with the Viscidity of the Humours; it should occasion a Difficulty of Respiration. Besides these, the Decoctions of Marsh-mallow, Wild-mallow, Syrian Sebestens, Club-moss, fat Dates, or juicy Figs, are all recommended, as well as the Juice of Alica, or Pisan.

When the Disease begins to decline, Sybaritic, Cretic, and Raisin Wines are proper: But as for light Astringents, and what they call Inspissants, [*Stymmata*] I think them at this time inconvenient; for these are Remedies that we use in the Beginning of the Disorder, while the Symptoms are light, and the Patient only complains of a slight Pain in the Fauces and Uvula; for *Thessalus* himself orders Posca, when he is call'd to attend those who are threaten'd, but not actually seiz'd, with a Synanche.

In short, we must make use not only of Posca, but of a Decoction of gentle Astringents, such as Roses, Thebaic Dates, Lentils, Myrtle, Lentisk, and Mastich, any one of which may be boil'd in Mulsum, or some other of the fore-mention'd Juices, whenever we find, that their astringent Quality requires Correction by the Mixture of a laxative Liquor. The Juice of Rice also is of Service, and the Medicine call'd *Diacodion* dissolved in Mulsum, and oftentimes in Substance; if the Fauces are anointed with it. Of the same Virtue are Diamoron, Diaporon, Diatymrrhion, the Troches of Andron; and the Sphragis of Polyidas, Anthera with Honey, and all Medicines prepared of Quinces or Pomgranates, Roses, the Rinds of Pomgranates, Galls, the Juice of unripe Grapes, Box-thorn, and the like.

But when the Disease is form'd, we are to do as before advised; besides which, if we find the Humours, which are condensed by the Heat, become glutinous; and appear outwardly, we deterge them with a hot Sponge; but if they lie deep, the Dipyrene [an Instrument for cleansing the Throat] must be introduced, with its Head wrapp'd in fine soft Wool; for the thick and viscous Humours, if suffer'd to remain, would accelerate Suffocation. If they lie so deep as to be out of Sight, they are to be attenuated by taking Mulsum; but boil'd beforehand, which makes it of greater Efficacy; some give Pisan mix'd with a little Salt.

All Medicines endued with a sensibly biting Quality are to be avoided; for, by irritating the Tumor, they would incrassate the Humours flowing to the Part.

If the Belly does not perform its Office, Clysters are to be used of warm Water and Oil, sometimes with, and sometimes without Honey; for the Vapour which ascends from the Liquor relaxes the tumid Parts about the Neck, and an exonerated Belly causes a free Respiration, not only under a Synanche, but even in Health; whereas an undue Retention of the Fæces burdens Nature, and, by a sort of Compression, is the Cause of very acrimonious Exhalations in the Body, by which Tumors are irritated, and the Head fill'd.

After a Clyster, Cupping and Scarifying will be proper in the Time of Remission; but if there be a Continuation, and the Disease proceeds without remitting, they are best applied, as well as other *districte* Remedies, (which take away Stricture) at the Dawn of Day. Cupping Glasses then are to be applied to the Fore-part of the Neck, or to the Throat, which Places were by the *Greeks* call'd *Anthereon*; also to the hinder Part of the Neck, and those large Nerves which they call *Tenontes*, and one to each Part under the Pits of the Ears, [*sub Aurium Lacunis*] in which Places the Position of the Fauces is plainly to be observed.

But if the Disease does not abate, and the Patient is too delicate for this Method of Cure, and fearful of being touch'd with the Point of a Lancet, we are obliged to apply Leeches, which the *Greeks* call *βελωναι*, to the Places we have mention'd; and if, after they are fallen off, the Evacuation they make is not sufficient, we take care to apply Cupping Glasses to the Punctures they have inflicted, in order to draw off as much as shall be requisite; besides, we use Fomentations of Oil, with proper Cataplasms and Vaporations. After these we ply the Pa-

tient with Epithems infused in hot Oil, and vaporate with Sponges squeez'd out of the same Matter; for we disapprove the dry Vaporation by Sacks; as capable of Condensation. In an extraordinary Tumor we scarify also the Tongue, with the Fauces and Palate, by means of a slender and pretty long Bleeding-lancet [*Phlebotomus*]; for the tumid Parts are relax'd by drawing off Blood from the Places.

After Scarification we use mild Gargarisms, and if the Disease begins to decline, Unctions of the Fauces, or of the interior Parts, as with boil'd Honey, or with a Medicine prepar'd of a Decoction of the Wild-mallow, with the Seed of Fenugreek, Lin-seed, Amylum, Honey, and Oil; or with stoned Raisins bruised, with Bread; or a Decoction of Linseed; or with Honey, and Cretic Raisin-wine, in which have been boil'd the Root of the Wild-mallow; or the Flour of Alica and Lin-seed.

If the Distemper continues without Abatement, we use Scarification a second or a third time, not only of the Throat, or Parts adjacent to the Tonsils, which the *Greeks* call *Anthereon*, and the great Nerves of the Neck call'd *Tenontes*, but to the hinder Part of the Head, the Scapula, and Interscapula, which the *Greeks* call *Metaphrenon*, and to the Breast: For tho' the Parts administering to Deglutition be most eminently affected, other Places of the Body suffer by Consent.

Many there are, who, not understanding the Method of subduing the Disease, but only labouring to divert the peccant Matter, and placing the Causes in the Fluids, advise above all things to apply Cupping Glasses to the Groin, then to the Region of the Diaphragm, then upon the Breasts, with Scarification; after this they apply the same to the Throat, the Neck, and the Parts thereto belonging.

If the Disease be evidently on the Decline, we should diet the Patient upon Pulse [a Sort of Panada] and poach'd Eggs, or Hog's Brain, utterly rejecting all acrimonious, high-season'd, heating, vinous, rough or dry Food, or whatever may irritate the Parts appropriated to Deglutition; for the Disorder easily returns on a very slight Occasion. We should also apply Cerecloths, prepar'd with sweet Oil, or *Oleum Cyprinum*, or *Gleucinum*, or *Irinum*, or *Malabathrinum*, [see the Composition of these Oils under their proper Adjectives] with the Root of Marsh-mallow. Then let the Patient bathe, and afterwards drink Wine. *Cælius, Acut. Morb. Lib. 3. Cap. 3.*

Among the Antients, *Hippocrates*, in his Treatise upon the *Cnidian Sentences* (on Regimen in acute Diseases) tells us, that Patients under a Synanche are to be bled in both Arms; but this must be avoided; for a coarctated Effusion of Blood may cause a Fainting, for which Reason we are restrain'd from taking away so much as would be sufficient for relaxing the Stricture.

He also directs the Opening of the sublingual Veins, which is not only useless, but hurtful; for the Matter, flowing in great Abundance to the Passage, is there stopp'd for want of sufficient Vent, and fills the Parts; which by this means are rather loaded by the Accession, than relieved by the Recess of Matter.

Again, a Fillet is to be bound about the Neck, in order to raise the Veins, and especially when the Synanche is without any manifest Tumor. Now a Fillet, as every body knows, must increase the Difficulty of Breathing: Besides, 'tis very certain, that the Flux of Blood from the foremention'd Veins is difficult to be stopp'd; for we can apply no Restrictant to the Place without Danger, and 'tis impossible to tie the Veins. 'Tis also natural for Tumors, after opening, to incline to an Hemorrhage.

The Author afore-mention'd uses warm Gargarisms and Vaporations, but with what Ingredients, he does not tell us: He then orders the Head to be shaved, and to be incessantly vaporated with Sponges, and then cover'd with a Cere-cloth and Wool. He allows his Patients, for Drink, warm Water and Mulsum; and, in the Decline of the Distemper, feeds them with Cremor, of what Kind, he does not specify; being ignorant also, that this Decline generally happens not till after five or six Days, and Abstinence from Food during that Time would be unreasonable. Vaporation ought indeed to be used, but not to the Head more than to the Neck, and the Beginning of the Throat, which the *Greeks* call *Anthereon*. After Vaporation, the Part must be kept warm; and in the Decline of the Disease a Cere-cloth is to be applied.

Moreover, as to Drink, he does not tell us in what Quantity, nor after what Manner, nor at what Times he allows it. Again, in his second Book of *Diseases*, he says, they ought to be relieved with Clysters, and purging Medicines, which the *Greeks* call *Cathartics*, by whose Acrimony the tumid Parts are the more exasperated.

As to bleeding in the Parts situated under the Breast, we judge it hurtful and needless; hurtful, because many Bodies must be divided, for 'tis not easy to come to the Sight of the Vein; and needless, because Blood may, with Ease, be taken from the Arm to very good Purpose; besides, the continued and joint Detraction of Matter by Clysters, Purgatives, and Phlebotomy, is plainly intolerable.

Again,

Again, if there be great Danger of Suffocation, says he, the Auliscus, which we may call the Pipe of a Clyster, must be intruded into the Fauces, and the Patient must receive by this the Fumes of burnt Hyssop, Sulphur, and Bitumen. Here is certainly a Mistake; for he tries to thrust a Pipe into the Fauces, when, through the Violence of the Disease, they can't admit the thinnest Air; and he thinks the Patients ought to be fill'd with an austere Smoke, by which sound Persons are often affected with a Suffocation.

In the last Place, he approves of Phlebotomy in both Arms, and in the sublingual Veins, which we have condemn'd, and proved to be of no Service; for it cannot be done without great Molestation to the Body.

Dioscles, in the Book which he wrote upon Diseases, their Causes, and Cures, says, That sanguine Persons should be blooded in both Arms; but those who do not abound with Blood should only be scarified. Then he would have the Patients continually anointed with Bull's Gall, mixed with *Herba Pedicularis*, which they call *Staveacre*, and Nitre, and *Cnidian* Grains, and have the same used for Gargarisms. He also prescribes Pepper to be held under the Tongue, the Neck to be vaporated with Sponges, and covered with Cere-cloths, ordering the Sick to be extenuated beyond all Reason.

As for our Part, we approve of Phlebotomy, not only for the Sanguine, but for all Persons affected with this Distemper, if their Strength permit, tho' not in both Arms, as we said before; nor are we for those extremely acrimonious Ointments and Gargarisms, nor do we use any such Inunctions in Tumors of the Eyes. For *Staveacre* will bring a Synanche upon a sound Person, by causing a sudden Inflammation of the Fauces. Nor is it agreeable with Medicine to reduce the Body, or its Habit, by Extenuation, but to relax the tumid Parts by proper Remissives.

Praxagoras, in his fourth Book of Cures, treats his Patients under a Synanche, with Clysters, and extenuates them by Sweating; sometimes he uses Phlebotomy, and administers a vomiting Medicine, which they call an *Emetic*. Then he cuts off the Uvula, or sometimes scarifies it, and heals up the Wounds with Tar. We are content, that others should give their Opinion of this Method; for excessive Vomiting, by Distention and Suffocation, has often been mortal, and a tumid Uvula wants Relaxation, not Amputation, as well as other Parts of the Body, which must, of Necessity, be relaxed by soft and gentle Means.

Erasistratus, in his second Book of Anatomics, in which he treats of Diseases in particular, prescribes, in some Cases of a Synanche, Vaporation with Sponges, Cataplasms, and a Medicine, which he called a *Catapotium*, [Pill] prepared of Castor, to be taken in Wine. But he did wrong in every Particular; for Wine is an Astringent, and every one knows, that Castor is of a very acrimonious Nature, and consequently both contrary to a Tumor. *Herophilus* has said nothing of a Synanche.

Asclepiades, in his second Book of swift, or acute, Diseases, says, That Persons under a Synanche are to be treated with Bleeding, Purging, Cataplasms, Collutions of the Mouth, Gargarisms, with attenuating and opening Inunctions, such as those prepared of Hyssop, Origanum, Thyme, Melilot, Wormwood, Decoction of Figs, Nitre, *Staveacre*, Centaury, *Elaeterium*, Bull's Gall, Resin of Cedar; to which he adds, the Use of Cupping and Scarification. He denies that Blood can be drawn by Cupping, either, says he, because this Disease is attended with a Fever, or else, by the Prevalency of the efficient Cause of the Tumor, the Heat of the Cupping-glass is over-powered, and diverted the contrary way, so as to be incapacitated for Detraction. Phlebotomy he advises to be exercised in the Forehead, in the Corners of the Eyes, in the sublingual Veins, or in the Arm. If the Disease be violent, the Fauces are to be scarify'd, that is, the Tonsils, and the Parts above the Uvula; for the principal Relief may be expected from an equal and even Incision in those Parts, which he called *Homoiotomy*. Besides, he approves the Opening of the *Aspera Arteria*, agreeing with the Antients, who call it *Laryngotomy*.

In this Method of his, the Mistakes are many and various; for whatever is of an acrimonious Nature, is an Incentive to the Humours; Phlebotomy also is hurtful to the affected Parts, as we shew'd before. Besides, he is guilty of an Absurdity, in directing the Use of Clysters, in order to divert and derive the Matter from the suffering Parts, because it is contrary to the Evacuation of those Parts, by cutting their Veins, to which he gives his Approbation. He was wrong in judging, that Scarification was to be used first, and then the Veins to be cut; for we are utterly against those local ways of draining the Part, while the Disease is in its confirm'd State. Besides, it argues a Physician of little Experience, to imagine that the peccant Matter cannot be drawn out by the Attraction of a Cupping-glass, because a Fever hinders; since we commonly see those Glasses produce their Effects without Impediment in Fevers, and to extract Matter; for Flesh, Blood and Spirit, are attracted and drawn together by their Force. It is to be confi-

dered also, that we do not use Cupping-glasses whilst the Fit is increasing, when the Matter is retired into the interior Parts.

Again, Scarification of the tumid Parts is very troublesome, and also dangerous; for it causes vehement Hemorrhages, and such as cannot be stopped. For if we endeavour to restrain them, speedy Suffocation will be the Consequence; and if we let them alone, a more speedy Death appears to be the Effect of this Effusion of Blood; or if the Patient escapes an Hemorrhage, he will not avoid a Cancer, or a Gangrene, from the Increase of the Tumor: For since we very often observe, that those Parts, which are perfectly sound, and in their natural State, do yet rise into a Tumor, when scarified, tho' treated with Astringents; we may very well expect, that Parts already swelled, if they should be scarified, and have not the Assistance of Astringents, should swell to a more vehement Degree. Certainly, in so considerable a Tumor, and so exasperated as not to bear the Touch of a Finger, and where the Patient can with much Difficulty suffer the Use of Cataplasms and Gargarisms, a deep Incision, or scarifying of the interior Parts, must necessarily be hurtful and dangerous.

As to opening the *Aspera Arteria*, which they call *Laryngotomy*, for the sake of Respiration, it is a mere Fable, and has no Authority of Antiquity, but is a rash and unreasonable Invention of *Asclepiades*. But to spend no more Time in confuting this Author, nor use too few Words in shewing our Abhorrence of so desperate an Operation, we shall answer him more at large, in a Treatise we design to write on auxiliary Remedies [*Adjutoria*]. *Themison*, who approves of *Asclepiades's* Method of curing acute Diseases, which are not attended with a Fever, incurs the same Censure with him.

Serapion, in his first Book of Cures, for a Synanche, prescribes Evacuation by Clysters, and Phlebotomy, and recommends the Use of acrimonious, irritating, and aperitive Cataplasms and Ointments, which they call *Anastomatics*. He is also very rigorous in injoining Abstinence.

This Physician also lies very open to Censure; for every body knows, that Tumors are irritated by acrimonious and attenuating things; and Phlebotomy, in Conjunction with Clysters, is acknowledged to be very troublesome and embarrassing. Again, in enumerating the Names of the *Materia Medica*, he omits those which enter the Composition of Auxiliary Remedies, tho' Meat and Drink are of no less Importance than any other Auxiliary Remedy whatsoever, when under a due Regimen.

Heraclides Tarentinus, in his third Book of Cures writing of Internals, tells us, that "To those who labour under a Redundancy of Blood, we first prescribe Evacuation by Clysters, and then use Phlebotomy, sometimes in the Arm, sometimes in the Sublingual Veins. We also make use of Vaporations to the Neck and Throat, with Sponges dipp'd in warm Water, which has had Rue and Penroyal boiled in it." Then he gives his Approbation of a Cataplasma, which we call *μυκή λυσις*, prepared of Mulsam, mixed with Ground-pine, *Illyrian* Orris, or Figs. At Night, he says, we must apply a Cere-cloth prepared of *Oleum Irinum*, with Rozin and Wax, of each an equal Weight.

In Cases where he suspects a Thickness of the Juices, he orders the Fauces to be anointed with Honey and Omphacium, and prescribes for a Gargarism, Mulsam, in which have been boiled Figs, or Origanum, and Pepper mixed with it. He also uses *Elaeterium* to the Weight of seven Drains, (an immoderate Dose) and gives to many five Grains, in Hydromel or Mulsam. After these he administers a Remedy, which he calls an *Emetic*, that is, of a vomiting Quality; and is thus prepared:

Take, says he, of Origanum and *Hercules's* Alheal, each a Handful, and put them in a copper Vessel; then take of what we call *Red Sumach* [*Rhus rubrum*] two Pounds, and twenty German Onions [*Cepula Germana*, perhaps Squills] the outer Rind peeled off; and shaking them together, put them into the Vessel. Pour upon them two Pints of *Chian*, *Rhodian*, or *Cnidian* Wine, and set them to stand in the Sun twenty Days before the Rising of the Dog-star, and twenty Days after. When the Liquor is consumed, put in another two Pints, and leave it to stand in the Sun; at last, put the Whole into a Mortar, and make it into Troches, the largest of a Dram and half, others of a Dram, and the least of half a Dram, to be given one at a time, with respect to the Strength of the Patient, in Mulsam, or like an Electuary in Honey; for it promotes Evacuation of the viscous Humour by Vomiting, and loosens the Belly. Some, he says, add *Melantheria*, and half a Dram of the Juice of *Thapsia*. If the Patient be difficult to vomit, a Feather dipp'd in old Oil, and intruded into the Fauces, will promote it. Sometimes he makes use of a Medicine prepared of Omphacium, *Elaeterium*, and *Diagrydium*, with black Hellebore and Salt, if

if the Patients are difficult to vomit; or he uses Elaterium with Vinegar and Rue, or Elaterium with Mustard and Salt.

As for those who fall into a Synanche, from taking Cold, he says, we forbid them Bleeding and Clysters, but in all other Cases we use them: He also orders his Patients to be supported or dieted with nothing but Water, or Mulsium.

But all these Experiments, or Essays, seem to be nothing but ready Expedients to answer some dubious Conjectures. For an Empiric, who has nothing in View but *Observation*, which they call *rhénos*, thinks Phlebotomy proper only for the Sanguine, not considering, that all Synanchical Patients, if Strength will permit, ought to be bled, on account of the Vehemence of the Stricture. In short, when he forbids Bleeding under a Synanche, occasioned by Cold, he deserves to be laughed at, for overlooking the present Case, and inquiring into the Causes.

The Cataplasms, which he advises, are also hurtful, and so is his Vaporation, on account of the Acrimony of the Ingredients, which are of a fiery Nature. Also his vomiting Medicines, which he calls *Emetics*, cause Swellings where none were before. For the ferulaceous Plant, which they call *Thapsia*, is sufficient to burn the Parts to which it is applied, and to inflame those which are found and in their natural State. The same Judgment is to be form'd of those which are composed of Onion, Omphacium, and Red Sumach, and such-like; old Oil also has an acrimonious Quality. What he calls *Cathartics*, which we name *Purgatives*, to be administered Clysterwise, cause a great Disturbance in all Humours, and Molestation to the Stomach, and other nervous Parts. It also argues Negligence to prescribe no Time when the Patient should take his Food.

There are some Physicians also of our own Sect (*the Methodic*) who, being still addicted to the Errors of the Antients, have given their Approbation to unusual and violent Remedies; sometimes advising human Urine or Ordure, with Honey, Myrrh, and Rue; sometimes Centaury, Wormwood, Southernwood, Thyme, Birthwort, Tymbræ, which we call *Satureia*, [Savory] and Mustard; sometimes one shall prescribe the *Pythagoric* and *Isyperian* Troche, so called from their Inventor; another advises what they call the *Sphragis* of *Polyidas*, and Constrictives, with Unctions, and Cerates of the Ointments of Sampsuchus and Rosemary; all which Medicines, through their excessive Heat, with their drying and drawing Qualities, are provocative of a Tumor; whereas the Disease is vehement and precipitate of itself, and ought to be treated with gentle and simple Medicines. *Caelius Aurelianus. Lib. 3. Cap. 4.*

For the Quinsy,

Take of Laser of *Cyrene*, if it can be procured, if not, take the *Syrian* Laser, and diluting it with Water, anoint the Fauces therewith by means of a Feather, laying it on pretty thick; or use Euphorbium diluted in the same manner.

Take of Ox-gall, Salt, Vinegar, Honey, old Oil, equal Quantities; mix them well together, and therewith anoint the Fauces for a good while together, using a Feather for that Purpose: Or,

Take Fennel-flower fry'd, two Drams five Grains; Pellitory of *Spain*, one Dram two Grains and an half; Sagapenum, thirty-one Grains; powder them together, and make them into a Mass with Honey.

A very good Medicine is composed of

Ox-gall, two Drams five Grains; Elaterium, one Dram two Grains and an half; the Seed of Rosemary, one Dram two Grains and an half; powder them, and make them up with Honey. Anoint the Fauces with this diluted in warm Water, and compel the Patient to swallow as much of it as possible; for it loosens the Belly, and in so doing gives great Relief. *Scribonius Largus, Cap. 16.*

Of human Dung I have the following Experiment:

A certain Person was frequently afflicted with Phlegmons about his Throat, in such a deplorable manner, that he was in Danger of Suffocation, and to prevent it was obliged to bleed. He happened to meet with a Person, who promised him a Remedy, and desir'd, that whenever a Phlegmon arose again in any Part of his Throat, he might be sent for before Bleeding. Being called, he anointed the Part with his Medicine, and cured the Man immediately. He had the same Success upon others, who laboured under the same Disorder, till, at length, the Gentleman, who was in continual Danger of being suffocated, and was besides rich, and of a liberal Disposition, desired to purchase the Receipt. When they had agreed on the Price, the Seller says to the other, "This Medicine has its Virtue from

"Antipathy, which Antipathy consists in that the Person who is cured, should be ignorant of its Composition." He therefore prevailed with him to substitute another in his stead, on whose Fidelity he could depend, and to whom the Secret might be communicated, upon his taking an Oath to discover it to no Person while the Author lived. After the Author's Death, the Person entrusted cured not only the Purchaser, but others, with this Remedy, and freely and heartily offered to communicate the same to me, tho' I never asked him. It was the Dung of a Boy, mixed with *Attic* Honey, dry'd and pulverized. The Boy, according to the Author's Prescription, lived on Lupines, such as we usually eat with Bread that is well baked, and seasoned with a moderate Quantity of Salt and Leaven. The Boy's Drink was old Wine; but both that and the Lupines were in moderate Proportions, that he might be able to make a perfect Concoction. When the Boy had been thus dieted for one Day, he did not take his Dung the next Day, but still fed him in the same manner, and the third Day he saved his Dung. He preferred Lupines, avoiding other Food because of the Stench; but he who told me, said, that he had often, for Experiment sake, given the Flesh of Fowls and Partridges well boiled, and served in Water, or small Broth, and that the Medicine operated never the worse. *Galen. de Simplic. Medic. Facul. Lib. 10.*

A Stoppage from a Quinsy is to be looked upon as a dangerous Case, and so much the more if the Inflammation be seated inwardly, so as that no outward Sign appears, and especially if both the Tonsils and the Uvula are inflamed. In this Circumstance, immediate Recourse is to be had to Phlebotomy; but if the Patient be unfit for it, he is to be scarify'd upon the Shin-bones, and suffered to bleed plentifully, acrimonious Clysters are to be used, Abstinence is to be enjoined, and drawing Medicines are to be applied to the Neck; for if the Matter lodged in those Parts can be attracted outwardly, so as that a Tumor arises, there is good Hope of saving the Patient. The Cremor of *Ptisan*, mixed with thin Honey, is to be used for a Gargle, or a Decoction of dry'd Figs, or of Hyssop, Origanum, and Horehound, by which means the gross and glutinous Humours, fixed in those Parts, are digested. *Orribas. de Loc. Affect. curat. Lib. 4. Cap. 71.*

Archigenes says, that the Cause of a secret or inward Quinsy, in some, is to be ascribed to the Nerves which serve the Stomach: These being disordered, occasion an Inflammation in the subjacent Parts, which are the Heart and Lungs, the Principles of Respiration, from whence it is communicated to the Arteries called *Carotides*, and the Parts adjacent. The Reason why the Patients in this Case are not apoplectic, is, that the Cause of this Disease is only an Intemperies, without a Compression of the Parts. Medicines of an emetic Quality, says the same Physician, are proper in this Quinsy, such as Elaterium, and Squama *Aëris* with Honey, anointed upon the Part. "I relieve many, says he, under an inward Quinsy, with a Gargle of Mustard-seed, and soon after carry them to the Bath; by which means I have saved many, and restored them to Health by a Distribution [of the Matter] over the whole Body." *Arctæus* advises [This is not found in the Works of Arctæus, which are extant] to apply a Cupping-glass first below the Navel, and soon after to the Sides, Back, and Scapulae, still removing it from place to place, and setting it on in such a manner as to draw from the upper Parts downwards. If the Patient be much oppressed, bruise Mustard-seed in Water, and, spreading it upon an old Rag, apply it to the Breast. Let a Linctus also be prepared of Mustard-seed, Nitre, Hyssop, roasted Squills, Sulphur Vivum, of each an equal Quantity; to be well mixed with a small Spoonful of Honey, and so given. So far *Arctæus*. In Phlebotomy, the Orifice of the Vein must not be made so narrow, that the Blood being in a manner strained, the thicker Part of it, which is the Cause of the Affection, might be left behind. If any thing forbids opening of a Vein, Clysters are to be given of the Decoction of Centaury, Wormwood, Calamint, and Birthwort, mixed with Honey, and a good deal of Nitre. The Patient is also to be purged with Phlegmagogues, of which Elaterium seems most proper sometimes in a Quinsy; but it ought never to be taken but in Whey, with *Carduus Benedictus* boiled in it. Pills of Aloes and Coloquintida are also good, if the Patient can swallow them. It would be proper also to infuse three Drams of Hiera *Archigenis*, in one of the before-mentioned Decoctions, for a Clyster, when the Belly has been already cleansed by a preparatory Clyster before. After general Evacuations, Cupping-glasses are to be applied; and if there be any Tumor about the Jaws, or under the Chin, they are to be affixed on the same, and the Place is to be scarify'd, a good deal of Blood extracted, and the Incisions sprinkled and rubbed with Salt. If no Tumor appear outwardly, as in the occult Quinsy, the Cupping-glass is to be apply'd under the Tendon of the Neck, near the first Vertebra, and often removed, with a constant Attraction, by which means the Dislocation and Luxation of the Vertebrae are well prevented. After some Rest, from the Remedies above-mentioned, Cataplasms are to be used both on the same and

the next Day. But our principal Dependence for the following Days is, on Litus and Gargles; therefore if the Distemper at first be very inflammatory, we begin with mild Astringents, such as a Decoction of Roses, Lentils, and Dates, an Infusion of Rose-leaves in Hydromel, a Decoction of Sumach in Hydromel, or a Decoction of Sebestens. If there happen an Excoriation of the Parts, the Cremor of Bread is to be given warm, or the Mouth is to be washed with a Decoction of Bran, or Milk alone. "I, says *Archigenes*, am always provided " with a dry Medicine, which consists of eight Drams of common Sumach, four Drams of Rose-leaves, and two Drams " each of Costus and Saffron; these I put in Hydromel, and " use as a Gargle, with which I have very easily cured Inflammations and Ulcerations of the Tonsils, which threatened " very bad Consequences." The milder Litus are very agreeable to the inflamed Parts, such as the Cremor of common Sumach, boiled in Hydromel to a solid Consistence; but the Sumach is first to be macerated, till the Hydromel be deeply coloured, and taste strongly of the same. The Juice of a whole Pomgranate, Rind and all, bruised, and mixed with a third of its Quantity in Honey, and the affected Parts anointed with it, is a good Medicine.

If the Disease yields to none of these Remedies, but the Conflux of Humours increases, the Veins under the Tongue, or those in the Forehead, or about the great Canthi, [inner Corners of the Eye] are to be cut, the Neck is to be wrapp'd in Cloths moistened with warm Oil, which must be often renewed; or apply a Cerate, prepared with Oleum Cyprinum, or Oleum Gleucinum, or Musteum [Oil of Cyperus, and Oil prepared of Must, that is, Wine unfermented: See the Preparation of these Oils under the Words CYPRINUM and GLEUCINUM]. If the Disease continue long, you must expect an Abscess, in which Case it will be very convenient to wash the Mouth with a Decoction of Figs, which will be rendered much more effectual by an Addition of Hyssop. For Ulcerations, Saffron in Hydromel, and a Decoction of Liquorice, are proper Medicines. In the State of the Disease, there is nothing better than to wash the Mouth with the Juice of Ptisan or Alica, which frees the Patient from many Inconveniencies, and prevents an Abscess.

A Fomentation for the Quinsey, to be received at the Mouth, is as follows:

Take Origanum, Hyssop, Savory, and Fennel-seed, with a good Quantity of Vinegar and Nitre; beat them in a Pot, that is carefully stopped, with only a Hole in the Middle of the Cover, to which, and the Patient's Mouth, must be fitted a hollow Cane, through which the Vapour may be transmitted. If the Cane grow too hot for the Lips, let the Patient hold in his Mouth an empty Egg, perforated at both Extremities, for the Cane to pass into. The Fomentation will be the milder, if instead of Vinegar you put Posca or Water. Sometimes sharper and more severe Remedies are required to make the Flesh rise, and to remove the inward and deeply-seated Straightness and Compression, under which the Patient labours; for the Disease often grows so desperate, that it has been thought necessary to use things odious and abominable, such as human Dung, which, it is certain, has been prescribed for a Litus, with the desired Success; some use it fresh, others dry'd and powder'd, mixing it with Nard or Myrrh, to take off the Stench.

From acrimonious and lacerating Medicines, we are to pass to those of a milder Nature, such as *Andron's* Troches, and the like. Emetics are beneficial, especially to those who have a Sense of Weight about the Belly. *Archigenes's* Remedy, which I use for an inward Quinsey, and is admirable also in an Asthma, consists of

Four or five Grains of Elaterium, twenty-seven Grains of Spuma Nitri, and a Dram of Mustard-seed; bruise them, and make them up in Water.

Elaterium bruised with Oil or Honey, and rubbed upon the Parts as deep as it will go, excites Vomiting, and much more effectually, if it be mixed with Spuma Nitri. The same Effect has burnt Copper, bruised with Oil of Cyperus, anointed upon the Parts. Ox-gall, so used, is very good for the same Purpose, and so is Nitre drank in Oxymel, the Juice of Centaury with Honey, and Millipedes made into a Litus with Honey. Some have given a Spoonful of the bruised Seed of Nasturtium in Hydromel, and soon after the Patients have vomited up a thick and tenacious sort of Phlegm, by which they have been greatly relieved.

Take a good Quantity of the Dung of a Cock, that is of the Colour of Cerufs, dry it, and keep it, and when a Case requires, give a Spoonful of it diluted in Water or Hydromel. It cures those who are given over; but if the

Patient cannot drink it, the Parts are to be rubbed with it as deep as you can make it go: Or,

Take Centaury, Nitre, common Salt, of each eight Drams; bruise them, and lay them aside dry; when Occasion calls, mix them with Honey, and lay it on with a Feather, or as you think fit: You may confide in the Use of it; for it is an approved Medicine: Or, bruise Wormwood, and, straining the Juice, add to it some bruised Nitre, and make it into a Litus with Honey: Or, make a Litus of Elaterium, Ox-gall, and Honey.

The *Diabesafa*, in the Beginning of the Distemper, is to be taken in a moderately astringent Decoction, such as those we have prescribed: When the Disease is arrived near its Height, give it in Juice of Ptisan; in its Remission or Decline, it must be taken in Honey, Hydromel, or Mulfum; and for an inveterate, and in a manner hardened Inflammation, it is given in Oxymel.

Philagrius advises us after the aforesaid Evacuations of the whole Body, Cupping, and opening the Veins under the Tongue, to mix other things with the *Diabesafa*, partly such as will restrain the Influx of the Matter, and partly such as will discuss what is settled in the Parts: For Example;

Take of *Diabesafa*, Galls, called *Omphacitides*, White Dog's-dung, human Dung dry'd, each eight Drams; but the Dogs must be fed with nothing but Bones for two Days before.

Marcian's Emetic for inward and outward Quinseys. "Demand your Reward, says he, before you give it" [in Confidence of a Cure].

Take burnt Copper, Vitriol, each twelve Drams; Myrrh, Elaterium, Spuma Nitri, each one Dram; Ox-gall, four Drams. Make them up with Honey, and with a Feather anoint the Parts affected as far as you can reach.

Archigenes advises to take human Dung, qualify'd as before, and dry it, then burn it in an old Rag, and afterwards give it to be drank in Hydromel; it cures those that are at the Point of Suffocation.

Antonius Musa prescribes dry'd Dog's-dung, such as aforesaid, bruised and sifted, to be mixed with Honey, and anointed on the Parts so deeply, as that it may be swallowed: "For, says *Galen*, I know no better Remedy for the Quinsey, or great " Inflammations of the Tonsils, or dangerous Suffocations from " the Glandules and Tubercles of the Throat." The same is very effectual, when mixed with Oxymel and Tar, and the Parts anointed therewith.

An excellent Remedy for the Quinsey is prepared of burnt Swallows, in manner following:

Take of burnt Swallows, eight Drams; Saffron, two Drams; Spikenard, a Dram; make them up with Honey, and use it while the Distemper is strong upon the Patient. The Swallows are thus burnt: Take the young Swallows after they are feathered, and put them alive into an earthen Pot with a convenient Quantity of Salt; and, stopping the Pot close, heap burning Coals upon it, till its Contents are reduced to Powder and Ashes, which levigate, and so use it.

Another Preparation of Swallows for the Quinsey:

Take young Swallows burnt, in Number eleven; Juice of green Myrtle, a Pint and an half; Myrtle, twenty-seven Grains; Honey, a quarter of a Pint. Burn the young Swallows, and pulverize them, and then mix the other Ingredients.

A Medicine, whose Efficacy is proved by Experience.

Take of Malabathrum, Costus, Cloves, Pepper, each an Ounce; Sandarach, four Ounces; mix them with clarified Honey for a Litus: Or,

Take Snails which have no Shells, such as are found in Gardens, and burn them in a Pot to Ashes, which mix with Honey, and so use them; it gives present Relief.

In like manner the Ashes of burnt Crabs are to be used with Honey, and the Decoction of Crabs is good to wash the Mouth. I use to bruise a Crab in half a Pint of Water, and, straining off the Liquor, give it warm for a Gargle: It draws off abundance of gross Humours, by which the Patient finds immediate Relief.

Dry the Lesser Centaury, then burn it, and, with the Ashes mixed with Honey, make a Litus: Or,

Take

Take of the burnt Jaw-bone of a young Hog, an Ounce ; of Album Græcum, four Drams ; Rind of Pomgranates, Galls, each an Ounce ; Costus, four Drams ; Pepper roasted, six Scruples : Mix them with Honey.

By way of Caution, we ought to be very solicitous and careful, when the Disease seems to remit, that the Matter, which was attracted from the innermost Parts of the Body to the Fauces, does not, by an unexpected Metastasis, fall down upon the Lungs, and suddenly carry off the Patient. *Actius, Tetrab. 2. Serm. 4. Cap. 47.*

From TRALLIAN.

The most antient Physicians usually called every Kind of Inflammation about the Throat, whether inward or outward, a *Synanche* ; but their Successors have distinguish'd this Inflammation into four Kinds : Thus an internal Inflammation of the Muscles of the upper Part they named *Cynanche*, an external one *Paracynanche* ; in like manner they called an internal Inflammation of the Pharynx, or Fauces, a *Synanche* ; and an external Inflammation of the same Sort *Parasynanche*. [To these Species *P. Egineta* adds a fifth, which, tho' rarely, affects Children, and is owing to a Luxation of the Vertebrae of the Neck ; this, he says, is incurable, *Lib. 3. Cap. 27.*]

This Distinction being thus established, we are next to direct to a proper Cure for each of these Kinds. In general then we ought to know, that neither repellent nor discutient Remedies are to be used alone, but in Conjunction ; and, that with regard to Time, sometimes Repellents, at other times Discutients, are to be prescribed. In the Beginning of the Disorder, and while the Matter seems to be in a Flux, Repellents are to be chosen ; in the State of the Disease, Discutients are generally proper ; and in its Decline, stronger Discussives. They who use only a relaxing Method, either inwardly or outwardly, do a great deal of Mischief, by inducing a very acute Suffocation, or increasing the Inflammation, to the utmost Danger of the Patient. And we are not only to consider the Times, but the Nature of the Remedies. For tender and delicate Constitutions, such as Eunuchs, Boys, and Women, mild and gentle Remedies are most convenient ; but to hardy and robust Bodies, stronger and rougher Medicines are best adapted. For as strong and hardy Complexions in Health can bear Refrigerants without being sick, so, when disorder'd, they require more powerful Remedies to restore them to their natural State ; but Persons of a softer Habit experience the contrary, for they bear well enough with weak and gentle, but are hurt by strong Medicines. Wherefore we must carefully weigh with ourselves, and consider when it may be proper to increase or remit the Force of any Medicine, so as that it may be contrary to the Disease, but at the same time familiar and friendly to the Patient. We shall begin then with the most simple and weak Remedies, and proceed to the stronger, and direct when they are to be used in their pure or simple State, and when mixed.

One of the most simple Medicines in this Case is prepared of Honey, and the Juice of Mulberries, and is good in the Beginning, or for any moderate Degree, of all inflammatory Disorders of the Tonsils, Uvula, Fauces, or any of the Parts about the Throat, especially in Bodies of a soft and white Flesh. This Medicine, which we call *Diamoron*, when compounded, is good, not only in the Beginning, but in the State of the Inflammation. It is render'd a more powerful Discussive, by being mixed with Myrrh, as most indeed prepare it in the Beginning of the Distemper ; but it would be better suited to its State, which requires both Digestives and Discussives ; and if at this Time you add a little of the Antidote called *Diabesafa*, the Remedy will be much more effectual.

When the Heat of the Inflammation is asswaged, but a sort of Hardness remains, it will be proper to add a little Sulphur and Nitre ; and if there be any thing of a gross and viscous Substance deeply seated, six Drams of Nitre, and one of Sulphur, will be sufficient. But if the Patient cannot bear so penetrating a Medicine, but labours under an Imbecillity of Stomach, which he thinks is subverted by this Topic, the Nitre and Sulphur must be left out, and we must be contented with the Addition only of the *Diabesafa*, or *Penyroyal*, and *Origanum*, or *Calamint*, or *Hyssop*, or *Pepper* ; but to preserve the Fauces from being exasperated, there must be a Mixture of the Juice of Liquorice, which will render the Medicine in all respects innocent, and not the less effectual.

The Composition of the *Diamoron* for the Quinsy is as follows :

Take of the Juice of Mulberries, three Pints ; of Myrrh, Alum, Omphacium, each two Drams ; of Honey, half a Pound : Boil the Juice of the Mulberries for an Hour, and then let it cool, and thicken by Degrees ; after this add the Honey to it, and boil them again to the Consumption of Two-thirds ; and when they are cool, mix with them the dry Ingredients

The incomparable *Galen* prepared this Medicine after the following manner :

Take of Honey, a Pound ; of the Juice of Mulberries, two Pints and an half ; of Saffron, Myrrh, Omphacium, each a Dram ; of austere Wine, two Pints and an half. If Omphacium cannot be had, substitute in its room the Juice of Sumach. Let this be first boiled to a frgmentitious Consistence, and then add the Honey ; after they have boiled for some time together, remove the Vessel off the Fire ; and, putting in the dry Ingredients, boil them well together, till they are thoroughly incorporated.

The prepared Juice of the wild Mulberries is an excellent Medicine, and so is the Juice of Quinces ; and, for want of these, the Juice of wild Pears, Medlars, Damask Prunes, Services, and wild Plums. These astringent Fruits plainly require to be mixed with a good Quantity of Honey, sometimes double, sometimes triple their Weight ; and all these Medicines are friendly to the Stomach, and not at all dangerous, and may properly be taken in a moderate Degree of Inflammation. These Juices may be prepared with the same Ingredients as the Juice of the Mulberries.

The Medicine prepared of the Juice of Walnuts is somewhat more effectual, as well as what is prepared of Blackberries, Pomgranates, and Quinces, which is a Strengtheners and Stomachic.

The Medicine of Walnuts, called *Diacaryon*, is thus prepared :

Take the external Rind of Walnuts, while they are in their most flourishing State, and pound it in a Mortar ; strain the Juice through a linen Cloth, and after boiling it, mix it with a moderate Quantity of Honey, as before in the *Diamoron*, and boil it again to the Consistence of Honey. In this State, without any further Mixture, it is proper for Women and Children to take, especially in the Beginning of the Distemper ; if you add Myrrh, it may be used when the Disease is arriv'd at its Height ; and with a further Addition of Sulphur and Nitre, in the Decline of the same, and where the Aspera Arteria, and its Top, are affected with a Hardness and Constriction, as we said before.

Another excellent and very effectual Medicine, which has saved many Lives, is thus prepared :

Take of Orris, Balaustines, Pepper, Saffron, each an Ounce ; Syrian Sumach, two Ounces ; Wine, three Pints ; Must, boiled to the Consumption of a third Part, a Pint ; Honey, a Pound ; Alum, an Ounce. This Remedy may be used at any time, especially where Heating and Attenuation of some stubborn Hardness are required.

The Preparation of the *Diabesafa*, for malignant and desperate Inflammations : It is called also *Diabarmala*, from *Har-mala*, wild Rue :

Take of Anise, Seeds of Smallage, Bishop's-weed, the Flowers of common Rushes, Alum, Illyrian Orris, wild Rue, each one Ounce ; of Cassia, Crocomagma, [Dregs of the expressed Ointment of Saffron] dry'd Roses, each two Ounces ; Ivy, fresh Ashes of young Swallows burnt, each three Ounces ; Spikenard, Amomum, each four Ounces ; Saffron, an Ounce and an half ; of the Galls called Omphacitides, [the small, tuberous, solid sort of Galls, *Dioscorides, L. 1. C. 146.*] eight in Number : Pulverize them, and make them up with Honey.

Actius ascribes this Composition to *Andromachus*, and quotes him, as saying, that he used it in desperate Quinsies, and that it was also an excellent Remedy for Pains of the Stomach, and the Gripping of the Guts. His Receipt is somewhat different from *Trallian's*, and here follows :

Take Seeds of Anise, Seeds of Smallage, Flowers of the *Juncus Odoratus*, Bishop's-weed, plumous Alum, Illyrian Orris, the Seeds of wild Rue, Cinnamon, Troglodytic Myrrh, long Birthwort, Cassia, Crocomagma, dry'd Roses, of each one Ounce ; Costus, Ashes of Swallows newly burnt, each three Ounces ; Saffron, an Ounce and an half ; Spikenard, Amomum, each four Drams ; Galls called Omphacitides, eight in Number : Make them up with Honey. The Dose is the Quantity of a Bean. *Actius, Tetr. 2. Serm. 4. Cap. 47.*

This Medicine may be used alone, if the Distemper be moderate ; and its Strength may be abated, by mixing with it Amylum, or dry'd Roses, or Earth of Crete or Lemnos, or Barley-

Barley-meal, or any other thing of that Nature, according to Discretion. If a more powerful Remedy be required, its Strength may be increased by an Addition of Nitre, Elaterium, (so they call the Juice of the wild Cowcumber) and Swallow's Dung, burnt or not burnt. The Medicine may also be improved by a Mixture of the Excrements of Dogs, and much more by an Addition of human Ordure, burnt or not burnt; but the burnt is the weakest. But Regard is to be had to the Time when we make these Additions: Thus, for Instance, we mix Sal Ammoniac, when not only Repellents, but Discutients, are required; and if we add the Root of Bryony, we shall make it a far more powerfully discussive Medicine; for Remedies of this Nature are manifestly wanted, where there is no Influx of Humours, but the Inflammation is hard and scirrhus. Many have mixed Mustard-seed, prepared as they continually eat it for Sauce, with Oxymel, and so give it warm for a Gargle; and then afterwards, by anointing the Parts with Diabesasa, have discussed a scirrhus Inflammation in a surprising manner. For in every Conflux of Humours we must restrain their Course; but when they are settled on a Part, we are to use Discussives, for fear the Passage of the Breath should be obstructed, and so the Patient be strangled as with a Cord.

You may anoint the Parts to very good Purpose, if to the Diabesasa you add but three things, which have saved many without the Help of Bleeding and Purging, and they are Dogs and human Excrements, and Elaterium; but if some abominable human Excrements, the other two will suffice, for they do well with Honey; and where Inunction cannot be performed, may be blown through a Quill, with the same Effect, on the Part. That the Dung may not have a foetid Smell, the Dogs are to feed on nothing but Bones for three Days before. To correct the Factor of the human Ordure, let a Boy eat nothing but boiled Lupines, for three Days before, that his Stools may be well concocted and coherent; these Lupines are usually eaten in small Quantities, with well-baked Bread [*ελιβανίτης ἄρτος*]. The Boy's two first Stools are to be thrown away, and the third preserved; and after 'tis dry'd, to be mixed with Honey. For the Use of this we have the Authority of the very wise *Galen*, and *Philagrius*, and many others of the Antients, corroborated by our own Experience. But the Moderns reject human Excrements as an Abomination, and only make use of those of Dogs, as having nothing of a foetid Smell, and yet are effectual to the same Purpose. But if any be averse also to the Use of this, they may keep to the Lituses prepared of the Swallows, [*Diachelidonium*, the Preparation of which see from *Actius*] and what has Sumach for an Ingredient, which are admirable Remedies; the former of these may be mixed with the Preparation of the Juice of Walnuts. Observe, that the Diabesasa is not only good in Affections of the Throat, but in many others; for it cures Disorders of the Stomach and Colon, and is an excellent Stomachic and Anti-dysenteric, when mixed with Album Græcum, or Dog's Dung, which itself cures the Dysentery, if it be mixed with Milk in which heated Sea-pebbles have been quenched; and is no less effectual in Inflammations of the Fauces, Tonsils, and Uvula, if used with the Juices of austere Grapes, the Rind of Walnuts, Cornelian Cherries, Acorns of the Ilex, or Services; it is also properly mixed with *Ægyptia* and *Anthera*. In the Beginning and Increase of Inflammations Astringents are plainly indicated; but when they are come to their full State, and ought to be dissipated, Discutients are required. Dog's Dung has also many other Virtues; for it cures the Apathæ, and old Ulcers which are hard to cicatrize.

If the aforesaid Remedies are not to be had, we must make use of such as follow, which are both good and easy to be prepared:

Take the Seed of Radish, pulverized in Oxymel, for a Gargle: It has a very good Effect by generating Plenty of Humidity.

Another Gargle for the Quinsy, which I use, as did my Father *Stephen* before me, is thus prepared:

Take of *Egyptian Thorn*, a Dram; *Orris*, and *Liquorice*, each half a Dram; Bran of Bread-corn, an Handful; dry'd *Roses*, a small Quantity; *Dates*, five or seven: Boil them in Wine boil'd to a Consumption of a Third, or Water, and let the Patient take the Decoction, with a very little Honey, for a Gargle, to be renew'd every Hour.

A very good Medicine in the State of the Distemper, is the following:

Take of burnt and washed Brals, a Dram; of red Nitre, two Drams: Give them a moderate Boiling in Honey, in a copper Vessel, and so use them. Wormwood also, and Honey, give great Relief in this Case.

Another for inveterate Quinsies, that are void of Ulcerations:

Take of Euphorbium, two Drams; of Honey, a Quarter of a Pint: Boil the Honey well, and add the Euphorbium: Make them into Pills, and give two of them in the White of an Egg. They gently loosen the Belly, and prevent a Suffocation. This is a very effectual Medicine against Inflammations, proceeding from gross and viscous Humours, which are not attended with Ulcerations.

As to Bleeding in the Quinsy, it ought to be used in the first place, but not all at once; for particular Evacuations are fittest to draw off the Cause of the Disease from the affected Part; therefore Phlebotomy is to be administer'd three or four times, only taking care to stop the Blood before the Patient faints; for nothing is more improper and dangerous in a Quinsy than Fainting, which is often the Cause of a Confluence of all the Humours inwards. If there be no Relaxation after Bleeding, but the Passages of Food and Air [of the Gullet and *Aspera Arteria*] are still obstructed, we are not to scruple cutting the sublingual Veins, nor defer it till To-morrow, but do it the same Day. I myself, in a very urgent Case, have opened a Vein very early in the Morning, cut the Sublinguals at Day-break, and in the Evening administer'd a Purge of Scammony in Cremor of Ptisan, and with all these Means had much Difficulty to relax the Strangulation which the Inflammation had caused. To another, after opening the Vein of the Cubit in both Arms, I administer'd the same Day ten Grains of the newly expressed Juice of Spurge; while it was yet in its liquid State, and before Inspissation. This is the Method to be used with Persons who are of a robust Habit, in the Vigour of their Age, and vehemently affected with the Distemper, which gives no Respite, but requires immediate Help. I have also cut the Jugular Veins when I could not find the Sublinguals, and by that means very much relieved the Patient. For a Woman I have open'd the Veins at the Ankles, when I understood she wanted her monthly Purgations, which was the Occasion of the Disease. Hence she received a double Benefit, the Restoration of the Menfes to their usual Course, and Relief from the Distemper. The same is to be done for Men, if subject to the Hæmorrhoids.

Cupping is advisable in these Disorders, but it must be used after the Influx of the Matter has ceased; for while it flows to the Part, Restrictants and Repellents are more proper than Drawers. But when the Influx is over, and the Matter wants to be discussed, Cupping and Fomentations are convenient, and if needful, a Cataplasm is to be apply'd; for when the whole Body is free from Recrements of ill Humours, there is no Fear of a new Conflux to the affected Parts; and it is certain, that Cupping-glasses have the Virtue of attracting the peccant Matter, which is the sole Cause of the Danger, from the inner Parts to the Superficies.

Externally may be apply'd Wool moisten'd with Oil, or mollifying Cerates, prepared with Wax, Butter, and the Fat of a Goose.

Cataplasms are to be such as digest and discuss Inflammations, prepared, for Example, of Barley-meal, Linseed, and Dates, boiled in Water; or Saffron and Crums of Bread boiled together. But Cataplasms which only relax, or strongly repel, are to be avoided. If the Inflammation be of pretty long standing, and hard, it will be proper to add dry'd Figs, Docks, Fats, and a little Nitre; for the Matter ought to be drawn out, and Nature assisted in her Endeavours that way.

Old and scirrhus Inflammations are proper to be fomented with a warm Decoction of Chamomile or Marsh-mallows, to which if you add Bays, especially in cold and stubborn Humours, which are deeply seated, the Fomentation will be much more effectual.

As to Diet, let the Patient's only Sustenance at first be Hydromel, which of itself produces all the good Effects that can be desired; for it attenuates and purges both by Stool and Urine. It is, in a particular manner, proper to be given in a Defluxion upon the Breast or Lungs, or where those Parts are oppressed with a Streightness; and there is Reason to fear, lest an Inflammation, *Pneumony*, and in some measure another *Cynanche* should arise. Give Hydromel till the Inflammation be moderated, and Respiration more free. After the third Day, the Patient is to take Cremor of Ptisan, which is no less effectual to all good Purposes than the former; for it absterges, incides, nourishes, and has a Virtue of asswaging the Heat of an Inflammation. When the inflammatory Matter is attenuated, and the Heat moderated, the Sick is to be indulg'd with some very soft Yolks of Eggs, but not many; for the narrow Passages are soon frighten'd with copious Aliment, and are in Danger of a new Strangulation. In this Disorder we are by all means to avoid an Inflammation, which is sooner caused by a free than a sparing Diet. *Trallian, Lib. 4.*

Of those which are strangled in this Distemper, we give over all Hopes, when the Froth appears about their Mouths, relying upon the Opinion of *Hippocrates*. Others are recalled to Life by instilling Vinegar and Pepper, or the Seed of Nettles bruised in very strong Vinegar; but as they will not receive them without much Difficulty, they must be compelled. When the

the Redness about the Neck is dispell'd, they immediately look up, and are relax'd. The same Means are to be used for those who are shipwreck'd; and, in short, for all who are under Suffocation, to revive the natural Heat. *P. Aeginet. Lib. 3. Cap. 27.*

The Method of treating this Disease varies according to its different Species, and the Causes of each; to the Knowledge of which, in order to their Removal, the Physician is to direct all his Intentions. As soon therefore as it is known by manifest Signs, that there is a Congestion of the Blood in the Head, which does not only increase the Inflammation, but is also the Cause of fatal Symptoms, the Physician's first and immediate Care is to divert the Impetus of the Blood from the Part affected, which is most conveniently done by opening a Vein near it; for, in this Remedy, Physicians of all Ages, both antient and modern, have placed their principal and almost only Hope of relieving the Patient. Let *Hippocrates* speak for all, who, in his Book *de Loc. in Hom. Sect. 1.* thus directs the Cure of a Quinsy: "They who are affected with a Quinsy from Blood collected and coagulated in the Veins of the Neck, are to be bled in the Arms and Feet; and at the same time to be evacuated by Stool, in order to divert and draw off what feeds the Disease." But where, and after what manner, this is to be done, all are not agreed. There are a great many who advise opening of the Veins under the Tongue; which others reject, because if the Orifice be not made wide enough, but little Blood comes out; from a wide Orifice proceeds an Hæmorrhage, which is sometimes known to prove fatal. Among those who despise it, *Tulpius* is one of the chief, and for this Reason, because the Blood is hereby drawn to a Place narrow of itself, and a Suffocation easily induced. Others, as *Zacutus Lusitanus*, *Hist. Med. princ. Lib. 1. Hist. 76. Joh. Steph. in Hipp. de Struct. Hom.* *Trallianus*, and *Freind* in his Commentaries on the Epidemics of *Hippocrates*, are extremely zealous for opening the external Jugular Veins; especially in a desperate Disease, and where there is present Danger of Suffocation. Some commend Scarification on the Nape of the Neck, and the Chin, as *Platerus*, *Amatus Lusitanus*, *Zacutus Lusitanus*. *Riojanus* would have it done about the Larynx. *Capivaccius* and *Hollerius* are for applying Leeches behind the Ears, and on the Neck.

After Phlebotomy, according to the Advice of *Hippocrates*, the Belly is to be purg'd, by which means the Humours may be attracted to the lower Parts, and evacuated: And this is to be effected by Cathartics, not at all acrimonious, or in the Form of Powders or Pills, but of the milder Kind, and in a liquid Form: But that we may answer two Intentions at once, that is, draw off the superfluous, and at the same time attemper and sweeten the acrid and salt Humour, it will be very proper to prescribe a Decoction of two Ounces of Manna, and a Dram and half of antimoniated Nitre, in ten Ounces of Whey. If nothing can be received by the Mouth, a Clyster must be given, made of Milk, Honey, Oil of sweet Almonds, common Salt, and Nitre.

The superfluous Blood, and impure Humours, being thus evacuated, we are next to direct our Endeavours to the Resolving of the sanguineous or ferous Humour that stuffs the Vessels, by proper Remedies, both internal and external, which may at the same time allay the feverish Heat. Most conducive to this Purpose, is the frequent Use of a diaphoretic and gently anodyne Mixture of antispasmodic and perspirative Waters of the Flowers of Elder, the Lime-tree, Cowslips, Acacia, Goat's-rue, of the Herb *Carduus Benedictus*, *Scordium*, [*Water Germander*] with *Dioscordium*, diaphoretic Antimony, and *Sal Prunellæ*, Vinegar also, with Crabs-eyes, and the Syrup of the red Poppy. Very proper also are moistening and diluting Drinks, indulged in good Quantities, such as Whey, sweet and sourish, and prepar'd with the Juice of Lemon and Sugar, Ptisan of Barley cleansed, the Root of *Scorzonera*, and the Shavings of Hartshorn, with the Syrup of Lemon-juice, Water-gruel, and Milk itself, if mix'd with an equal Quantity of Water, and some Sugar, and a little Nitre.

In so dangerous a Distemper as the Quinsy, we are also to relieve the Patient, as much as possible, by Topics, applying some to the Inside of the Mouth, others externally to the Neck and Throat, that, by these means, the Pain and inflammatory Heat may be mitigated, the Acrimony of the Humours attemper'd, and the Juices, which stick fast in the narrow Passages of the Vessels, may be dissolved. The most common Topics are, Cataplasms of pargoric and discussive Ingredients, as the Flowers of Elder, Melilot, common Chamomile, Mullein, the Roots of white Lillies, Figs, Saffron, the Seeds of Anise and Fennel; the Meal of Lin-feed, boil'd in Milk; to which some add, as Specifics, Swallows Nests and *Album Gracum*. Useful also for this Purpose are lenient and emollient Plaisters, as *Dia-chylon Simplex*, or a Plaister of Melilot, mollify'd with Oil of sweet Almonds; or render'd more efficacious by a Mixture of *Sperma Ceti*, Saffron, and Camphire. I am not fond of advising Gargarisms, or syringing the Places where the great Pain, with the burning Heat and Dryness, lies. It is sufficient, now-

and-then, to wash the Mouth with some proper warm Liquor, which may be prepared of several things, as with *Rob Diamurcum*, *Diamoron*, Syrup of the sweet Juice of Pomgranates, of red Poppies, of Violets, Mucilage of Quince-seeds, Cream, *Sal Prunellæ*; any of which, as Circumstances shall require, may be mix'd with Milk, a Decoction of Liquorice, or of Figs; or with Water-gruel: Nor is there less Virtue in the fresh Oil of sweet Almonds, mix'd with *Sperma Ceti*, Saffron, and Syrup of Violets, infused in Water-gruel, and held a while in the Mouth.

CLINICAL CAUTIONS and OBSERVATIONS.

In a sanguine Quinsy, and plethoric Body, the Cure must begin with Bleeding, which in this, if in any Distemper, delivers from immediate Danger of Death; but we must be quick with our Assistance, for we have not a Moment to spare. The Patient finds most Relief by opening the Jugular Veins; but if this be impracticable, the Veins under the Tongue must be cut; taking care first to open a Vein in the Arm. When a sanguine Quinsy comes upon a burning and *Hungarian Fever*, and there is Danger of a Phrensy, but not Strength enough to bear the Loss of much Blood, the sublingual Veins are however to be open'd with all Speed: But when the Disorder owes its Rise to a caustic Acrimony, inherent in the nervous Membranes of the Fauces and Larynx, and there is no manifest Redundancy of Blood, Scarification of the hinder Part of the Neck or Chin, or Application of Leeches, are rather indicated. And in cacochymical and phlegmatical Constitutions, when, from the Plenitude of viscid Serum, a Tumour, with a Pain and a gentle Inflammation, affects the Fauces, and the external Parts of the Neck, Scarification on the Nape of the Neck, and the Scapulae, is to be prefer'd before Phlebotomy.

In the Use of Topics, due regard is to be had to the different Kinds of Inflammations in the Fauces, and proper Remedies are to be accommodated to each Kind. Thus, in every painful and hot Inflammation of the Fauces, a Julep of Roses, with Nitre and a little Camphire, swallow'd, is of excellent Service. Also Jelly of Hartshorn, with the White of an Egg, well depurated, and the Juice of China Oranges, and sweeten'd with Sugar, repeated frequently, are of wonderful Relief. If the Fauces are dry, and parch'd with Heat, the Tongue swell'd, and there is a Difficulty of Respiration, as well as Deglutition, a Linctus is to be prepar'd, with two Ounces of the White of an Egg, beaten in Water, one Ounce of Rose-water, Syrup of Pomgranates, and *Diamoron*, of each half an Ounce, and *Sal Prunellæ*, twelve Grains; with these, according to the Condition of Circumstances, twenty or thirty Drops of some anodyne Liquor may be mix'd: Outwardly the Neck, before and behind, is to be anointed with camphorated Oil, prepar'd of one Ounce of the Oil of sweet Almonds, two Drams of the Oil of white Poppy, and half a Dram of Camphire.

In the internal and occult Quinsy, attended with a violent Heat, the Mouth is, now-and-then, to be wash'd with Milk only; and its Cream, with an Addition of *Sal Prunellæ*, and Syrup of red Poppy, and Whey, is to be frequently drank. In an Inflammation of the Oesophagus, which is often accessory to a malignant Fever, when come to its State, what is commonly used is a Powder made of a Dram of Nitre, three Grains of Camphire, and an Ounce of Sugar, together with an Emulsion of sweet Almonds, to be both taken inwardly, and outwardly to be held for some time in the Mouth. And when there is any Danger of Suffocation, from receiving inwardly the acrimonious Exhalations of Metals, Minerals, Quick-lime, and Mercury, there is no room for Bleeding or Purging in such a Case; but the fittest Remedies are Moisteners and Demulcents, both internal and external, as Milk and Nitre, the Cataplasms before-mention'd, and Clysters.

The inflammatory Pain, caused by the salt acrimonious Serum, in the glandulous Flesh of the Fauces, near the Precincts of the Pharynx and Larynx, with a Redness and copious Salivation, without a Fever, is best discuss'd in the Beginning, by immediately taking a Gargarism of Spirit of *Rhenish* or *Frankonian Wine*. The present Effects of this Remedy are attested by *Walæus, Method. Med. p. 112.* "Let him who is affected with a Quinsy, says he, gargarize himself in the Beginning with Spirit of Wine, and all the Inflammation will cease in the Space of three Hours, whether he uses it by itself, or mix'd with other things." And, for this Reason, *Martianus* commends, in a true Cynanche, things which are actually hot: And I myself have known an Inflammation of the Fauces discuss'd in a short time, by gently passing down the Fauces eight or ten Drops of Spirit of Wine camphorated, in which a Grain of Nitre has been dissolved. Some recommend, for this Purpose, Essence of white Burnet, made with Spirit of Wine.

When a great Load of impure ferous Humours oppresses the Glandules of the Palate and Fauces, the milder Laxatives are to be frequently used, such as those prepar'd with Manna, Rhubarb, Tartar, and Raisins of the Sun, and Currans. There is also an excellent Gargarism for this Purpose, which has for its Basis the *Sal Pharyngeum*, described by *Zobelius* in his *Tartarologia*:

logia: It is prepared of an Ounce of Cremor of Tartar and Nitre, with half an Ounce of burnt Alum, dissolved in distill'd Vinegar; and this Solution is afterwards to be coagulated according to Art. A Dram of the Salt thus prepar'd, with two Drams of Honey, is to be dissolved in five Ounces of Plantain-water; and with this Liquor the Fauces are to be often wash'd, and the same is to be now-and-then injected with a Syringe.

In inflammatory Tumors of the Fauces and Glandules, the mollifying Plaisters above prescrib'd have justly the Preference before Cataplasms, which, on account of several Difficulties, I seldom use; but more frequently make use of a Decoction of Emollients made in Milk, and kept in a Bladder. But as to the Use of Gargarisms, observe, that they are not to be injected with a Syringe; for the too vehement Attrition of the Parts by this Method would the more exasperate the Pain and Inflammation. It is therefore the better and safer way to wash out the Mouth, now-and-then, with the Liquor appointed for a Gargarism: But if even this, by reason of Weakness, cannot be effected, the Injection is to be forced in the most gentle manner, lest there should be an Irritation to vomit; the Head also is to be bent forward, and not backward, for fear the Liquor, by slipping wrong, should pass into the *Aspera Arteria*, and endanger Suffocation; and if there be a great Quantity of Mucus inherent in the Parts, the Injection is to be renew'd. Moreover, in all these Affections of the Fauces, it is best to abstain from speaking, because the frequent and strong Agitation of the Tongue exasperates the Disease.

If the Tumors of the Fauces tend to a Suppuration, the same may most commodiously be promoted by the Application of fat dry'd Figs: And when the inflammatory Tumor of the Tonsils is full of Ichor, I find no external Remedy better than Honey of Roses, mix'd with Spirit of Vitriol, and often applied with a Pledge; it lessens the Tumor, cleanses it, prevents any further Afflux, and dissolves the Phlegm already about the Parts. In the Aphthæ of Infants, which beset the Tongue, and are attended with Pain and Heat, there is nothing better to mitigate them, than, now-and-then, to anoint the Pustules with Cream, with a little Nitre. Sometimes it will be convenient, in order to discuss the Phlegm, and restrain the Afflux of the Humours, to apply white Vitriol dissolved in Rain-water, or, what is better, Rose-water, or Elder-flower-water.

That the Inflammation of the Fauces may not return, as it often happens, we must carefully avoid such things as we said before were dispos'd to induce it. Perspiration especially must be maintain'd, and 'tis good to defend the Head, Neck, and Shoulders, from all Refrigeration, that the Humours, and acrimonious Matter, which ought to pass off thro' the Pores, and be dispersed, may not be repell'd inwardly, and take up their Settlement in the soft Substance of the Fauces. Beware also of every thing, that may put the Juices in too great an Agitation, and especially of Vociferation, and high-straining the Voice, by which the Humours are attracted to the upper Parts. If the Body be plethoric, seasonable Bleeding must be administer'd; and if spontaneous Hemorrhages observe not their stated Times, or fail in other respects, they must be regulated, and reduced to Order. Nor is less Care to be taken to keep the Belly soluble; by taking now-and-then a gentle Purge, by which Impurities may be carry'd off, and their confluent Motion upwards may be intercepted.

HISTORIES of CASES.

CASE I.

A Woman, thirty Years old, choleric, and very subject to Rheums and Catarrhs, rose out of her Bed in Autumn, thinly cloth'd, and carelessly exposed herself to the cold Air. By this means she contracted a Hoarseness, with a burning Heat and Pain of the Throat, so that she could neither swallow nor speak without Difficulty; and her Pulse, especially in the Night, was quicker than it ought to be. Her Menfes having ceased, she was first blooded in the Arm, and then had a Clyster administer'd, but received no Relief; as for Gargarisms, so great were her Pains, she could not bear them. Mean while, the Tumor of the Throat, both internal and external, extremely increas'd, and to such a Degree as to want but little of strangling the Patient; but it subsided a little on the fifth Day, and the Pain was mitigated. At this time was outwardly applied to the Neck a ripening Plaister of Melilot and Saffron, on which were laid warm Rags, and her Mouth was wash'd with a Decoction of Emollients. By these means the Tumor was brought to Maturation, and happily broke in the Night, unknown to the Patient; but the acrimonious Matter was certainly fallen down upon the Lungs, and seem'd to threaten Suffocation. To remedy this, was prescrib'd Hyssop-water, with Essence of Castor and Liquorice, with an Addition of some Drops of Spirit of Hartshorn, prepar'd with Amber; also an Infusion of the pectoral Herbs in hot Water, after the manner of Tea: Upon this a Sweat broke out over all her Body; and at the same time a tough, viscid Matter, six times at least in a Day, came off by Stool, not without griping Contractions of the Belly. But the Physician, being apprehensive, that this Diarrhœa might be hurt-

ful, consider'd how to suppress it; and for that End order'd an Electuary of Diacordium, Conserve of Roses, the Powder of the Hamatites, and Nutmeg. The Looseness was immediately stopp'd, but was succeeded by Hiccups, with a burning Heat in all the Region of the Oesophagus, a Spitting of viscid Matter, and a Decay of Strength. Under these Circumstances another Physician was consulted, who judged these Symptoms to proceed from the wrong and injudicious Suppression of the Flux of the Belly; wherefore he prescribed Pills of choice Myrrh, Diagrydium sulphurated, *Mercurius dulcis*, Saffron, Castor, and Salt of Amber, to be taken in a hot Vehicle. By these means the Hiccups were not only cured, but the Excretion of serous Matter by Stool was recall'd, to the great Relief of the Patient, who afterwards by degrees recover'd her Health.

REFLECTION.

It is very remarkable in this Case, that the Inflammation of the Fauces had a Solution by the serous and pituitous Flux of the Belly; that the preposterous Restraining of this Flux occasion'd grievous Symptoms, which vanish'd at its Return: But very often, in inflammatory Affections of the Fauces, the Oesophagus and the Stomach itself are afflicted, so that they seem to labour under the same Distemper. Of the *Aphthæ* I have often observed, that they infect the Oesophagus and the Stomach, which appears from that burning Heat which runs through the Oesophagus, and reaches even to the Diaphragm. Under this Circumstance the Patient can by no means suffer any thing that is salt, acrid, or hot; but finds Relief from Barley-broth, Water-gruel, and Infusion of dried Turneps, after the Manner of Tea, with Milk; by which means the Heat, Dryness, Pain, and Anxiety about the Diaphragm, have been removed. On the other hand, I have known, that when the Stomach has been inflam'd in burning Fevers, by Poisons, or by some of the more acrimonious Cathartics, the Inflammation has been propagated to the Fauces, and the Muscles of the Larynx. Hence we may take it as an establish'd Truth, that in Affections of the Fauces and Mouth, especially if they are infested with a viscid and thick Phlegm, laxative Medicines afford present Relief.

CASE II.

A Man, sixty Years of Age, had been long afflicted with a Quartan; and after he was cured, became very subject to Catarrhs, and Weakness of the Stomach. After travelling in a rainy Night he fell into a Disorder of the Fauces, in such a manner, that he could swallow solid Food, but not Liquids, without much Straining, Anxiety, and a subsequent copious Excretion of Phlegm. Inwardly the Fauces appear'd somewhat red, but nothing of a Tumor could be seen outwardly. We judged therefore, that the Epiglottis, which, like a Lid, covers the Orifice of the *Aspera Arteria*, was embarrass'd and turgid with a mucous Serum, and by that means render'd incapable of exactly closing the subjected Orifice: Hence, in Deglutition, the Liquids slipp'd into the *Aspera Arteria*, which was the Cause of the subsequent Anxieties. Upon this Account, I order'd, outwardly, an Application of Spirit of Wine camphorated; and inwardly, for the Mouth, a Collution of Water of Elder-flowers, mix'd with Spirit of Sal Ammoniac, and Essence of Saffron, to be used now-and-then; and my Pills to be taken every Day (of *Aloes with Balsamics*). By these Remedies the Disorder was happily removed in a few Days, and the Patient recover'd his Health.

REFLECTION.

The proper Symptom of a Quinsy is, a Difficulty of Deglutition, as well with respect to Solids as Liquids; for if a pretty large Tumor affects the Beginning of the Oesophagus, and contracts it, then Liquids, but not Solids, may be transmitted through it; but if the Tumor be seated in the Beginning of the Throat, which is cover'd by the Epiglottis, solid Substances, by compressing the tumid Epiglottis, find a Way to the Oesophagus; while Liquids, not pressing with the like Force as the others, slide through the gaping Space; by the Tumors, into the *Aspera Arteria*, and there occasion great Molestation.

CASE III.

A Woman was thought by the Physicians to be infected with the *Lues Venerea*, upon which Presumption they had order'd her to be salivated with Mercury: From that time, upon every slight Occasion, as from cold or foggy Air, a Fit of Anger, acrimonious Meats, Refrigeration of the Head, or some Irregularity in the Menfes, she would be seiz'd with an exquisite Pain, and burning Heat, in the internal Parts of the Fauces, about the Larynx and Pharynx, with a Difficulty of Respiration, but without a Fever. Now it happen'd, that this Woman slept in a low Chamber newly built, and full of the Vapours of Lime; whence she was taken not only with a Pain in the Head, but a vehement Heat and Pain in the Fauces and Neck, with Restlessness, Straightness of Breach, Anxiety, and Tossings.

Tossings. Being call'd to attend her, I omitted Bleeding, because there was no Redundancy in the Vessels, and only order'd a Cataplasim to be applied to the Neck, prepar'd of Meal of Lin-seed, Flowers of Elder, Figs, Saffron, Oil of sweet Almonds, and Milk. I advis'd also a Clyster of Milk, Nitre, common Salt, Honey, and Oil. For Drink, I allow'd Milk, mix'd with half the Quantity of Barley-water, or Ptisan, with an Addition of a proper Quantity of Nitre, or Syrup of Violets: Of this she drank plentifully, and often held it in her Mouth. By these means the Disease in a short time was discuss'd. To prevent her frequent Relapses, I advis'd the Drinking of the Spaw, or the Selteran Waters, with Milk, for a Month or more; and every Day, in the Morning, either to gargarize the Fauces, or to wash them with the *Aqua Sclopetaria*, (*Eau d'Arquebuse*) or a Decoction of Plantain in Wine.

REFLECTION.

A Quinsy is very speedily produced, when the fibrous, glandular, and tubular Compages of the Fauces, is weaken'd and deprived of its Tone, which is frequently done by a mercurial Salivation: For this Reason, those who have once or twice labour'd under a Quinsy, which has not been carried off by proper Means, and a due Regimen, very readily fall into the same Disorder again, by raising their Voice too high, Excess of Passion, or of Wine, or by drawing in a cold moist Air: But Relapses are most effectually prevented by a speedy and perfect Cure, which leaves the Parts free from all Taint.

CASE IV.

I knew an honest Man, upwards of fifty Years old, of a sanguine, melancholic, but robust Constitution, who had never any Blood taken from him, but enjoy'd an excellent State of Health, even tho' addicted to the drinking of hopped Ale, and spirituous Liquors: This Man, happening to be put into a violent Passion by his Wife, was seiz'd with an exquisite Pain in his Head, the Arteries of which became turgid, his Face red, and his Eyes stern; in fine, his Nights were pass'd without Sleep, and his Arteries beat so strong, that he complain'd of a painful Sensation, resembling the Beating of a Hammer, in his Head. Upon this, a Cataplasim made of the Crums of Bread, Bay and Juniper-berries, with Vinegar of Roses, was laid to his Head; and, by the Advice of an old Woman, the White of an Egg, beat up with Alum, was applied to his Forehead and Temples. The Patient, having used these things for some time, complain'd at last of an exquisite and pricking Pain of his Fauces, a Difficulty of Deglutition, and a Shortness of Breathing; his Tongue swell'd prodigiously, and became black: He thrust his parch'd Tongue out of his Mouth, and had an insatiable Craving after Drink; the Pulse in his Arm was quick and vehement. For removing these terrible Symptoms, the following Method was used with Success: He was blooded plentifully, and had a pretty sharp Clyster injected. A Cataplasim of Dog's Dung, Swallow-necks, Figs, roasted Onions, Elder-flowers, Chamomile, Melilot, Cummin-seed, Nitre, and Camphire, with Elder-flower-water and Wine, was applied warm to his Neck. He used internally a Mixture of Elder-flower and Rose-water, of each two Ounces; distill'd Vinegar, six Drams; of Crabs-eyes, one Dram; Nitre, half a Dram; Camphire, four Grains; dissolv'd in Oil of sweet Almonds; and a sufficient Quantity of Julep of Roses, given pretty often, in the Quantity of some Spoonfuls; and for his ordinary Drink, an Infusion of Male Speedwell, Elder-flowers, and Liquorice-root; by which means the Danger of Suffocation was happily carried off. Afterwards a laxative Preparation of solutive Syrup of Roses, Cream of Tartar, Diagrydium, and Rhubarb, was administer'd; which gave him a Stool each time. His Mouth also was frequently wash'd with Rain-water, in which a little Nitre and Vitriol had been dissolved, and to which as much Sugar was added as render'd it palatable: By these means this dangerous Disease was, in a short time, thoroughly carried off.

REFLECTION.

The Origin of this terrible Disorder justly claims our greatest Attention; for it proceeded from a Congestion of Blood in the Head. The external Applications for that Disorder were Astringents; by these the Blood was driven inwards, and towards the Fauces themselves: Here the Blood, being collected in a great Quantity, ceased to flow, and brought on the Heat, and all the Train of other Symptoms; for that the White of an Egg, beat up with Alum, is a strong Repellent and Astringent, is plain from its Use in Disorders of the Eyes; and that, from a Constriction of the external Parts, the Conveyance to the internal is easy, is plain from the mutual Communication of the Vessels: But the Cure could not fail of Success, when the Stagnation was encounter'd by Bleeding, and by internal as well as external Discutients; for if Opportunity is ever speedily to be embraced, 'tis certainly in inflammatory Congestions, which, unless speedily removed, degenerate into a sphacelous and deadly Corruption. *Hoffman. Medicin. Rational. Systemat.*

CASE from HILDANUS.

Last Autumn Mr. John Merulam, a Clergyman of great Learning and Worth, was, for two Months successively, afflicted with a violent Dysentery; from which when he was almost recover'd, he was, during my Absence, seiz'd with a new and very terrible Disorder: For Nature being in him weaken'd, both by the Distemper itself, and his great Age, (for he was now past Sixty-six) could not drive those Pustules, which generally appear on the Lips towards the End of the Disease, so far; but threw them out about the Uvula and Root of the Tongue, with very considerable Pain and Inflammation. Whilst Matters stood thus, he took the Advice of a foolish Barber, who three or four times a Day blow'd Powder of Pepper and Saffron into his Throat and Fauces; upon which the Pain, Inflammation, and Fever, were augmented, and fainting Fits seiz'd him at certain Intervals. Then, in order to dispatch the Patient the more speedily and effectually, he gave him a Medicine which operated both by Vomit and Stool; and which, from its Effects, I conceived to be Antimony. I, being call'd, went to him with all imaginable Hast, but found him as if in the Agonies of Death; for he could scarce breathe, and his Inquietudes were very great. His Tongue also and Fauces were so swell'd, that he could neither breathe, nor swallow a little Broth without the greatest Pain, accompanied with involuntary and convulsive Agitations of his whole Body.

I cured him in the following manner: First, I order'd him to wash his Mouth and Fauces with Milk, just come from the Cow; he also wash'd his Mouth, now-and-then, with Barley, Rose, or Scabious Water, mix'd with Honey of Roses: He every Hour also took a little of the Oil of sweet Almonds. We also, three or four times a Day, and as often by Night, anointed his Throat, Neck, and Breast, with Oil of white Lillies and sweet Almonds; and applied warm greasy Wool to them. We also, by means of Clysters, drew downwards the Matter which the immoderate Pain had drawn to the affected Parts; and after treating him in this Matter for about the Space of thirty Hours, an Impostumation broke in his Fauces, from which he discharg'd a purulent Matter by his Mouth.

Upon this his Pain was immediately lessen'd; and he began to breathe more freely; and sup a little Broth: Then by washing his Mouth frequently with Barley-water, and sometimes taking a little Honey of Roses; and by using a proper Regimen, and restorative Medicines, he was at last, thro' the Blessing of God, restor'd to Health in a miraculous Manner, and beyond the Expectation of all that were acquainted with his Situation. And tho' he is now in the seventieth Year of his Age, he nevertheless enjoys a good State of Health, and discharges the several Offices of his Function with Applause to himself, and Advantage to the Church. *Hildanus, Cent. 3. Observat. 27.*

The Sentiments and Practice of our Countryman Dr. Sydenham must not be omitted; it must be observed, that his Practice corresponds pretty exactly with that of *Hippocrates*, and his Transcribers.

1. This Disease comes at any time of the Year, but especially between Spring and Summer: It principally attacks the Young and Sanguine, and also red-hair'd Persons. It begins (first) with a Chills and Shivering; (secondly) a Fever succeeds; and (thirdly) immediately after, a Pain and Inflammation of the Fauces, which, without speedy Relief, hinder Deglutition, and prevent Breathing thro' the Nose; whence Suffocation is endanger'd from the Inflammation and Tumor of the Uvula, Tonsillæ, and Larynx. This Disease is extremely dangerous, and sometimes kills the Patient in a few Hours; that is, when a large Quantity of the febrile Matter is thrown upon the above-mention'd Parts, and the approaching Tumult is not timely enough prevented by proper Remedies.

2. In order to the Cure, I immediately bleed plentifully in the Arm, and presently afterwards in the Veins under the Tongue; and then I order the inflamed Parts to be anointed with Honey of Roses, strongly acidulated with Spirit of Sulphur; and prescribe a Gargarism to be used, not in the common way, but to be held quietly in the Mouth till it grows warm, and then spit out; and this to be repeated between whiles. *The Prescription for this Gargarism is specify'd in the last Paragraph of the Article ALBUMEN, which see.*

I also order the following Emulsion, or the like, to be taken daily:

Take seven blanch'd sweet Almonds, the Seeds of Melons and Pumpions, of each half an Ounce; the Seeds of white Poppies, two Drams; beat them together in a marble Mortar; then pour on, by degrees, a Pint and half of Barley-water; mix them well, and, when strain'd, add two Drams of Rose-water, and half an Ounce of white Sugar: Let four Ounces be taken every fourth Hour. *This would be much better with an Addition of Nitre.*

3. I bleed again in the Arm the next Morning, unless the Fever, and Difficulty of swallowing, be in some measure abated; in which Case I give a gentle Purge, much Experience having taught me, that this is highly necessary and useful after Bleeding.

ing. If the Fever, and other Symptoms, threaten Disturbance even after purging, which yet seldom happens, they are to be quieted by repeated Bleeding, and applying a large and strong Epispastic between the Shoulders. During the whole Course of the Disease, a cooling and emollient Clyster must be given every Morning, except on the purging Day.

4. I injoin a total Abstinence from Flesh, and Broths made thereof; allowing Barley-broth, Water-gruel, roasted Apples, and the like, for Diet; and Pilsan and small Beer for Drink. The Patient must likewise sit up some Hours every Day; for the Warmth of the Bed increases the Fever, and its Concomitants, which I endeavour to conquer by this Method. *Sydenham*.

Of BRONCHOTOMY.

As Bronchotomy is principally of Use in a Quinsey, I shall chuse to give a particular Account of the Operation in this Place, rather than under the proper Article.

Paulus is, according to *Dr. Freind*, the first Author who describes the Operation of Bronchotomy. Our best Surgeons, says he, have described this Operation; *Antyllus* particularly thus. We think this Practice useless, and not to be attempted, where all the Arteries and the Lungs are affected; but when the Inflammation lies principally about the Throat, the Chin, and the Tonsils, which cover the Top of the Wind-pipe, and the Artery is unaffected, this Experiment is very rational to prevent the Danger of Suffocation. When we proceed to perform it, we must cut thorough some Part of the Wind-pipe, below the Larynx about the third or fourth Ring; for to divide the whole would be dangerous. This Place is the most commodious, because it is not cover'd with any Flesh, and because it has no Vessels near it. Therefore bending the Head of the Patient backward, so that the Wind-pipe may come more forward to the View, we make a transverse Section between two of the Rings; so that in this Case, not the Cartilage, but the Membrane, which incloses and unites the Cartilages together, is divided. If the Operator be a little fearful, he may first divide the Skin, extended by a Hook; then proceeding to the Pipe, and separating the Vessels, if any are in the Way, he must make the Incision. Thus far *Antyllus*. *Paulus* adds, That he (*Antyllus*) thought upon this Way of cutting, by observing (when it was, I suppose, cut by chance) that the Air rush'd through it with great Violence, and that the Voice was interrupted. When the Danger of Suffocation is over, the Lips of the Wounds must be united by Suture, that is, by sowing the Skin, and not the Cartilage; then proper vulnerary Medicines are to be applied. If these do not agglutinate, an Incarnant must be used. The same Method must be pursued with those who cut their Throat, with a Design of murdering themselves.

Heister gives the following Account of this Operation. What he observes with respect to People just drown'd, is of Importance enough to deserve Regard, as it may possibly save the Lives of many, if properly practised.

The Words Bronchotomy, Laryngotomy, and Tracheotomy, are convertible Terms, and mean no more than an Incision of the Aspera Arteria, or what we commonly call the Throat; and, indeed, various are the Causes and Reasons which may render this Operation necessary; for, in the first Place, it becomes principally and indispensably so, when, in a Quinsey, the Fauces are so terribly inflamed, that the Patient is in imminent Danger of having his Respiration quite stopp'd, and a thorough Suffocation brought on. Secondly, It becomes necessary, when a Bean, a Prune, or Cherry-stone, a Pea, little Stone, or any other foreign and adventitious Substance, falls into the Aspera Arteria, and seems to threaten a Suffocation. Thirdly, The Aspera Arteria may also be open'd in such Persons as have been suffocated, in consequence of their having been immers'd in Water, or, as we express it, in newly drown'd People. For sometimes a Power of Breathing has been restored to People in this Situation, by opening the Aspera Arteria, and by that means giving the Air free Access to the Lungs (See *Detbardingii Dissert. de Methodo Subveniendi Submersis per Laryngotomiam*). I am sufficiently apprised, that a great many Physicians forbid making an Incision in the Aspera Arteria, and consequently condemn this Operation, because they think it productive of Death, and are therefore prompted by a foolish Zeal to brand their Fellow-physicians, who attempt an Operation so dangerous in their Eyes, with the odious Appellations of barbarous and inhuman. But the Gentlemen who are in this narrow and confin'd Way of Thinking, are highly mistaken. For, in this Operation, the small Incisions made in the Aspera Arteria are so far from killing the Patient, that they do not even produce that Effect, when made considerably large; and *Garengot* gives Examples of various Cures performed by this Operation: For this Reason we think ourselves justly authorized with *Casseri* [in *Traetat. de Vocis Auditufq; Organis*] to pronounce those Men unskilful, cowardly, and even cruel, who, in the Cases above-mentioned, foolishly neglecting this Operation, which is often safe in itself, and attended with the most speedy and salutary Effects, suffer the Pa-

tients to die, for want of this proper and seasonable Assistance. Instances of this Nature may be seen in *Nicolaus Fontanus Observat. Rarior. Analect.* and in *Casseri*.

Now when this Operation is to be performed, that Part of the Trachea seems most proper for making the Aperture in, which is situated betwixt its second and third cartilaginous Annuli, or Ringlets. The Incision may nevertheless be made a little lower, without any Danger. The Method of performing the Operation, especially when the Stone of any Fruit, a Bean, a large Pea, a small Stone, or any other such Substance, falling into the Aspera Arteria, and threatening a Suffocation, is to be extracted, is in this Manner: The Patient is first of all to be placed in a reclining Posture, either in Bed, or in some convenient Chair, and his Head is to be held firm by an Assistant standing behind his Back. Then a longitudinal Incision thro' Skin, Fat, and Muscles, is to be made, from about two Fingers Breadth below the *Cartilago Thyroides*, or *Scutiformis*, or the *Pomum Adami*, in the Middle of the Trachea, down to the very Sternum; so that the Length of the Incision may be equal to two or three, or even, in tall Patients, to four Fingers Breadth (See *Tab. 42. Trib. 14. A. A.*).

Then an Assistant is carefully to draw the Lips of this Orifice from each other, either with proper Hooks, or his Fingers; and having absorb'd and wip'd away the Blood, either by a Sponge, or a linen Cloth, so that the Aspera Arteria may be seen, three or four of the Annuli or Ringlets of this spiral Pipe are to be cut in such a manner, that the Incisions made in the Whole may form one continued Line: And thus, whatever Substance may have slip't into it, must be artfully and warily extricated; either by a Probe, Hook, or Forceps. This being done, the Wound is to be cleansed with a Sponge, and its Lips being kept in Contact by agglutinating Plaisters, proper Compress and Bandage are to be apply'd. 'Tis afterwards carefully to be agglutinated by means of vulnerary Balsams, as in case of Wounds in the Aspera Arteria: And in this very manner, here in *Helmstadt*, I myself happily extracted a Piece of boil'd Mushroom from a Patient, who happening to laugh whilst he was supping Broth, in which, among other things, there were Mushrooms, had the Misfortune to have a Piece of one of them slip into his Arteria Aspera, by which he was in Danger of being suffocated. *Ravius* also informed me, that, in this very Method, he happily extracted a Bean from the Throat of a Patient; but the modern Surgeons are entirely silent with regard to this Method. Some, in order to induce a more speedy and seemly Cicatrix on the Wound, recommend the Method of Agglutination by Suture, as in the Cure of Hair-lips, by passing Needles thro' them, whether the Operation be performed for a Quinsey, or for some other Disorder. But, in my Opinion, 'tis highly improper to follow a Practice which is attended with immense Pain to the Patient, when, at the same time, a Method that is far milder, and equally safe and secure, may be fallen upon.

But if in a Quinsey, after the Use of proper Medicines, and repeated Evacuations of Blood from different Veins, there is still a Necessity for making an Incision in the Trachea, in order to prevent a Suffocation, the Operation may be performed in three different Manners, a Description of each of which my present Design calls for.

First then the Patient must be plac'd in a Bed, or Chair, with his Head reclin'd at the Surgeon's Discretion, and held firm by an Assistant, as we have already said. Then let the Surgeon make an Incision in that middle Part of the Throat, and in that Manner we have above directed, till he reaches the Trachea itself; or, if 'tis thought proper, the Skin also on both Sides may be laid hold on by the Surgeon, and his Assistant. Then it may be rais'd and cut longitudinally: After which, the Fat and Muscles lying above the Trachea may be cut. Some would have these Muscles first disengaged from the Trachea, or very warily separated from each other; but there is no Occasion for all this Labour, since they may be cut safely, and without any Danger. Then the Surgeon cleanses the Wound with a Sponge wrung out of warm Wine, or warm Spirit of Wine, for the more effectual stopping of the Blood, and orders his Assistant to separate and retract its Lips, either by Hooks, or his Fingers. Then he passes his Knife between two of the Annuli of the Trachea, or, in my Opinion, he may even pass it in such a manner, as to cut one of them, since by that means any Silver or Lead Pipe, whether round or flat, such as we have represented, (*Tab. 23. T, U, and X*) may the more conveniently be inserted into the Wound. But before the Surgeon withdraws his Knife, some Probe, fit for the Purpose, ought to be inserted into the Wound, by the Side of the Knife, that by its Assistance a Pipe may afterwards be more commodiously put into it. This Pipe is fixed in the Wound, by means of a Ligature pass'd thro' its Annuli, or small Holes, and carry'd round the Neck, and by a perforated Plaister. But great Care is to be taken, that the End of the Pipe, which is inserted into the Wound, be not allow'd to touch the posterior Part of the Aspera Arteria, lest by that means a troublesome Cough should be created. But that the Lungs may not be

be injured by the external Cold, or by any Filth falling upon them, 'tis highly proper to lay upon the Pipe a Sponge often impregnated with warm Wine, and again wrung out; or, as *Garengeot* advises, a thin linen Cloth, and afterwards a perforated Plaster. These Directions being duly observed, Blood is to be drawn from the Veins in the Arms, or those of the Feet, those under the Tongue, or those situated in the Neck. Then Clysters, Gargarisms, Injections into the Fauces, Malagmas under the Chin, deep Cuppings on the Sides of the Neck, and on the Insides of the Thighs a little above the Knees, with such other Medicines as are effectual against a Quinsy, are diligently to be applied and continu'd, till such time as the Respiration either becomes free and easy, or the Patient dies; one or other of which generally happens within four Days after the Operation is performed. When, after the third or fourth Day, the Disease is found milder, and Respiration more easy, which may be most quickly and expeditiously judg'd of, by stopping up the Pipe with one Finger, the Pipe is to be taken out, and the Wound to be agglutinated and treated in the manner already directed. But when the Difficulty of Breathing at the Mouth is as yet found considerable, the Pipe ought to be allow'd to remain for some time longer in the Wound, and the other Medicines to be continued, either till Respiration becomes more free, or the Patient expires.

Another and more expeditious Manner of opening the Trachea is this: A two-edg'd Knife (represented Tab. 22. I) is apply'd to the above-mention'd Part of the Throat, and cautiously pass'd thro' Skin, Fat, and Muscles, into the Cavity of the Trachea itself, and a Pipe is forthwith inserted into the Wound, and artfully fix'd and secur'd in the Manner already directed. This Method of Operation is not only quicker, but the Cicatrix is less, than in the former Method.

The third and last Method of Operation is by an Instrument which the Surgeons call a *Trocar*, (see Tab. 42. Fig. 15, 16.) and is to be performed in such a Manner, that this Instrument, apply'd to the very Middle of the Trachea, may, as it were, at one Thrust, be pass'd thro' the Skin, Fat, and Muscles, into its very Cavity, and, having drawn out the perforating Part, let the Pipe remain in the Orifice, till the Patient breathes freely, or dies. This Method of Cure I learnt from the worthy *Fredericus Decker*, some time Professor of Physic at *Leyden*, and my old Master, who has also described it in Page 243. of his *Exercit. Pract.* This Method of performing the Operation seems, in one respect, to have the Advantage of all the rest, which is, that it is soon over, and the Pipe, at the same time, introduc'd into the Wound with far less Pain to the Patient, than by any other Method. But even in this Case, the same Caution ought to be used, and the same Directions follow'd, which we have above specified.

Nor ought this material Caution to be forgot, that the Operation is to be performed as soon as possible, and whilst as yet the Strength of the Patient lays a Foundation for the Hopes of the Surgeon: For, when the Patient's Strength is too far exhausted, and he already sinking, as it were, under the Agonies of Death, 'tis then too late, and, generally speaking, to no Purpose, to attempt the Operation for his Relief. It also seems to be a safe and prudent Step, in a Case of imminent Danger, to call in the Aid and Advice of the most skilful Physicians that can be had, before the Operation be attempted: For, since this Operation is by most, who are ignorant of its real Nature, esteem'd so dangerous, and pronounced so fatal to Life, 'tis highly probable, that if the Cure does not succeed so well as could be wish'd, the Surgeon shall be said to have murder'd the Patient, who is, in Reality, cut off by the Violence of his own Distemper; and thus the innocent Operator shall be loaded with all the Infamy and Reproach that Ignorance, and popular Prejudice, can throw upon him.

If Persons drown'd in Water are already, tho' but just dead, their *Aspera Arteria* is to be open'd with all Expedition, either with an Incision-knife, or any other Instrument the Physician shall judge fitting. Then 'tis proper strongly to blow into the Orifice made, either with the naked Mouth, or by means of a Pipe, if any such Thing is at hand, because, in this Case, above all others, Delays are dangerous. For that justly celebrated Physician *Detbardingius*, some time Professor of Physic at *Rostock*, now at *Copenhagen*, in a Dissertation upon this very Subject, publish'd not long ago, informs us, that by this Method, if speedily put in Execution, Life returns to the suffocated Patient with the injected Air, and that he is, in a manner, miraculously rais'd from the Dead. For this Reason I think the Operation is not, in Cases of this Nature, to be neglected, but performed, whenever the Opportunity offers, with all the Haste and Expedition imaginable.

I must here likewise observe, that this Operation, as it is neither performed in the *Larynx*, nor in the *Branchia*, but in the *Aspera Arteria*, or *Trachea*, ought neither to be called *Laryngotomy*, nor *Branchotomy*, as it commonly is by most Physicians and Surgeons; but rather, and that too more properly, *Tracheotomy*.

Fredericus Montanus, and *Seacherus*, Professor at *Leipsic*,
VOL. I.

have each of them published a Book on Bronchotomy; and *Julius Casserius* has treated of Laryngotomy in the Book above quoted, where he illustrates this Operation by a Variety of elegant Cuts. *René Moreau* also, in his *Epistola de Laryngotomia*, and *Th. Piemus*, in his *Chirurgical Books*, have written very learnedly upon this Operation.

Mr. *Sharp* observes, that this Operation is easy to perform, and utterly void of any Danger whatsoever, notwithstanding the frightful Cautions laid down by Authors.

The Manner of doing it is by making a longitudinal Incision thro' the Skin, three Quarters of an Inch long, between the third and fourth Ring of the Trachea, if you have the Choice of the Place; and when you cannot make it so high, the Rule will be to wound a little below the Tumor. It is always advis'd to pinch up the Skin for this Process, which, however, may be left to the Discretion of the Surgeon. When the Skin is cut thro', you must make a small transverse Incision into the Wind-pipe, and immediately introduce a crooked Cannula near half an Inch long, of Silver or Lead, with a couple of little Rings at the Top of it, thro' which a Ribband may be pass'd round the Neck to keep it fix'd in the Wound.

Some have prescribed making an Incision thro' the Skin and Trachea at once, with a Lancet, or Knife, as the more easy and expeditious Method, and I once saw it perform'd in that Manner; but it prov'd very inconvenient; for the Wind-pipe in Respiration, moving up and down, slipp'd from the Orifice of the Skin, and made it very difficult to introduce the Cannula, and afterwards to maintain it in its Situation: Wherefore I think it absolutely necessary to make the external Incision longitudinal, and even pretty large, as I have directed above.

The Caution laid down of raising the *Sternohyoidei*, and *Sternothyroidei* Muscles, before cutting the Wind-pipe, is not to be regarded; and as to the Division of the recurrent Nerves, and great Blood-vessels, so much apprehended in this Operation, 'tis not in the least to be feared, since they are quite out of the Reach of the Instrument, as any one skill'd in the Anatomy of those Parts must very well know.

The Method of Dressing will be easily understood, since after the Patient can breathe by the natural Passage, if you withdraw the hollow Tent, the Wound will become a simple one; and, notwithstanding its Penetration thro' a Cartilage into a large Cavity, require a superficial Application only. *Sharp's Surgery*.

The following Case, communicated to the Royal Society by Dr. *Martyn*, contains something new and ingenious, and must not, for that Reason, be omitted.

A young Lad, being in a good State of Health, was all of a sudden taken ill with a violent Disorder in his Throat; in which, however, I could see nothing wrong, the Amygdalæ, and other Parts in View, being in all Appearance sound enough, but only looking a little drier than ordinary, without any external Tumor appearing about the Larynx, and no considerable Frequency or Strength in his Pulse: But he had great Pain and a Dyspnoea, with an Impossibility of swallowing either Liquids or Solids; every thing returning forcibly by the Mouth and Nose, when he made an Effort to get it over. From all which I reckon'd it an Angina of one of the worst Kinds, without any apparent Tumor, and the Seat of the Disease in the Larynx and the Fibres common to it, and the Top of the Gullet.

Notwithstanding repeated Bloodings, Blisterings between his Shoulders, Cupping, &c. the Disease continu'd so obstinate, and the Patient so like to suffocate, that next Day in the Afternoon his Friends, altho' very averse in the Morning, when I first propos'd the piercing the Wind-pipe, at length, earnestly desired, that the Operation might be performed; and the poor Lad bad us try any Experiment to preserve his Life. He had good Reason so to do; for, indeed, in all Probability, in a few Hours he would have been strangled to Death most miserably. We directly set about the Operation, which was done with such Success, that in less than four Days his Breathing being perfectly easy, and his Deglutition being almost so, we remov'd the Cannula, and left the Glottis to do its own Office.

According to *Caelius Aurelianus*, and the Author of the *Liber Introductorius*, ascribed to *Galen*, Bronchotomy was propos'd by *Aesclepiades*, (however inconsistent with his Delicacy, and the rest of his Character, the seeming Harshness of this Operation may appear) and is described and earnestly recommended by almost all the Systematical Writers of Surgery, from *Paulus of Ægina*, and, as he says, *Antyllus*, and some others of the best Surgeons before him, down to the present Times. But when they are at so much Pains to defend the Reasonableness of it, and when they shew so much Fondness of citing and telling Examples of healing accidental Wounds of the Trachea, without ever mentioning their own regular Performance of the Operation (which would have been a shorter, and much more effectual Recommendation of it); when, I say, I consider all this, I find myself oblig'd to think, that it has very seldom been reduced to Practice. So rare had it been, that *Aræteus*, a Man of vast Judgment and Skill in Diseases, thought the Operation had never been actually done with Success. And *Caelius Aurelianus*

Lianus looked on it as an impracticable Whim of *Asclepiades*. Neither *Avenzoar*, nor *Albucasis*, knew any thing of their Countrymen who had undertaken it. And the *Arabians* are reputed to have been hardly Surgeons enough. The most I know of amongst them of this Kind is in *Avenzoar*, who try'd the Experiment on a Goat, and cured the Wound, which shews the Ingeniousness and Industry of the Author: For as to what you will find some Writers telling you, that *Rafes* saw *Andrusius* the Physician do it (the Copy I looked into, printed at Venice 1505. calls him *Ancilifus*; and, perhaps, it should be *Antyllus* for them both); I think this flows from a mistaken Interpretation of that Author's Meaning. If you read the whole Context, I think you will easily conceive, that all he says of the Operation is upon Hearsay; and consequently, that he had only seen in Books, that such an one had done it. That most accomplished Anatomist and Surgeon *Fabricius ab Aquapendente* frankly acknowledges, that neither he, nor any of his Contemporaries, had ever ventur'd to perform it: Neither does his Successor in the Profession of Surgery, and his Rival in Anatomy, *Julius Casserius* of *Placentia*, pretend to have done it, tho' he has endeavour'd to illustrate the Operation by some very neat Figures, which you will not readily suspect to be from any but dead Bodies. And next to him *M. Aurelius Severinus*, who was a very judicious and learned Man, and the best and boldest Surgeon of his Time, though he recommends it with a great deal of Warmth and Keeness, yet it seems, even in his latter Days, he never had Occasion to try it; so that the first undoubted and distinctly recorded History I can find of this Operation being actually practised, is in the learned *Anton. Musa Brasavolus*, who performed it in a desperate Quinsy, when the Surgeon refused to do it; and repeated it again in the like Case. *Mr. Arnaud*, the Frenchman, did it, but his Patient died: However, his Countryman, *Mr. Binard*, had better Success. *Dr. Freind* cites *Purman* doing it; and tells us of another Case communicated to him by a Surgeon, whom he does not name. And besides these, I believe there are but few Instances can be produced, of any who really performed the Operation on a living Person. I hear now, that *Mr. Baxter*, a Surgeon in *Coupar*, of *Fife*, not far from us, and *Dr. Oliphant*, in *Gask* in *Perthshire*, did it with very good Success within these few Years.

In the actual Performance of the Operation they certainly did, or might have observed some things omitted by Authors, and even some not perfectly agreeing with the common Accounts that are given of it. I think it worth while to observe, that in the very Cutting, before we got a free Aperture into the Trachea, and the Pipe introduced, the Patient felt some Relief; which, I thought, might be ascribed to the Effusion of Blood in the Operation; a small Quantity whereof, evacuated so near the Part affected, could not, according to the true Laws of Hydraulics, and the Observations and Practice of the Antients, (however disagreeing with *Bellini's* Theory) but make a more considerable Revulsion, than a much greater, taken away at a great Distance. Whence the judicious *Fabricius ab Aquapendente*, with very good Reason, supposed, that by the Derivation here, the Patient would be more apt to feel some Relief, than Trouble; of which *Julius Guastavinus* too made no Doubt in his Dispute upon this Subject against *Arctaeus*. And now their Supposition and Conjecture is confirmed by Experience. And since there continued a greater Flux of Blood to the Wound while it was suppurating, I reckoned the Circulation in the Muscles of the Larynx to be with less Force than ordinary, and so probably to contribute to the diminishing the Strength of the Voice, which, for a good many Days after the Operation, was observed to be much weaker than it used to be; which I all along thought was rather owing to this, and the Lowness of his Body by his slender Diet, than to any Hurt of the recurrent Nerves, which, being cut, do indeed destroy the Voice; but by their Deepness, are in less Hazard than some in old Times used to think.

In doing the Operation on a living Person, one cannot but remark at the very first, that the Cannula should not be made near so short as is ordinarily proposed in Books and chirurgical Lectures: For we found, that, upon cutting, the Parts, especially the Thyroid Gland, (which is not so much minded in most of the common Descriptions of this Operation as should be) soon become so tumified, that it will require a Pipe above an Inch long, to penetrate sufficiently into the *Aspera Arteria*, which is double *Garengot's* Allowance of six Lines; who is one of the recentest Writers, and has communicated to us all the Surgery the French are Masters of. The leaden Pipe we had prepared not answering the Design, that which we made use of was too long, and too small, being the common Cannula for tapping in the Dropsy, flattened a little at the End, and hindered by a very thick Compress, perforated in the Middle, from penetrating too deep into the Trachea.

The mucous Particles, and Steams arising from the Lungs, made a constant Weeping of a thin slavery Liquor, from the Mouth of the Pipe, Part whereof thickening, and stuffing its Cavity, sometimes very much incommoded the Patient's Respi-

ration by it, so as to render it necessary to have it taken out and cleaned. And hence, when some Moderns very precisely bid us put a thin Slice of Sponge, or a Bit of Muslin, &c. close over the Orifice of the Cannula, to prevent the Ingress of Dust, Down, or the like, into the Lungs, it confirms what I said before, of the Unusualness of the Operation, and looks as if they had only contemplated the Matter in Abstraction, as the Metaphysicians say, without considering they had not to do with a pure thin dry Air, but with a heterogeneous Fluid, that is moistened and thickened with viscid Particles, which are apt to run together in stiff Concretions. And therefore, though it must be acknowledged, that there would have been less Hazard of a Stoppage, if our Cannula had been shorter, and wider, especially at the Mouth, I cannot but think it an ingenious Proposal of one of our Ministers here, to make the Pipe double, or one within another, that the innermost might safely and easily be taken out and cleaned when necessary, without any Molestation to the Patient: For it is no small Trouble to him, to be obliged to have the Bandage frequently removed, and the Pipe fitted anew to the Orifice made in the Trachea.

And indeed we found no Inconvenience in our Patient's breathing the Air as it passed through the Pipe, without any cleansing or intercepting Medium, though the House was none of the cleanest, being an ordinary Tradesman's here. But if by a larger, and consequently a more patent Tube, one, especially of more delicate and ticklish Lungs, should be incommoded that way, I think the Access of Dust, &c. might conveniently enough be hindered by a Piece of Muslin, or thin Hair Crape, tied slackly about the Neck over the Orifice of the Cannula, so however, as not to touch it, or to be wetted by the Liquor coming from it.

The Patient was soon perfectly recovered: He breathes, speaks, eats, drinks, and performs all the other Offices of Life, and goes about his Calling as formerly. And now I cannot but take Notice of the needless Pains some Writers are in about healing up the Wound by Bandaging, Stitching, &c. For we found it easily to fill up of itself, in a very few Days, by only dressing it every other Day, or so, with a soft Tent, made less and less every Dressing, and armed in the common way with *Linimentum Arcei*. I believe indeed it would have taken a little more Time to heal, if our Patient had been older. *Phil. Trans. Abr. Vol. 8.*

In the preceding Account of a Quinsy, I have purposely omitted *Boerhaave's* Sentiments concerning this Distemper, which I reserved for this Place, that they may serve as a Recapitulation of what has been already specify'd; and that the Reader may have in one View, the Sum of what has been delivered by a Multitude of Authors; and at the same time the Opinion of this Author, an excellent Judge of Medicinal Subjects.

A very difficult and excessively painful Deglutition, or Respiration, or both together, which happens from any morbid Cause acting upon the Organs subservient to these Functions situated above the Lungs and Stomach, is called a Quinsy, of which two Species have been observed; one without any manifest Tumor, either internal, or external; in the other, some sort of Tumor is always discovered in some of the Organs before-mentioned.

The first Species usually happens at the End of Chronical Distempers, principally after great and frequently repeated Evacuations. It is attended with a Paleness, Extenuation, and Dryness of the Fauces; whence 'tis evident, that the Nerves and Muscles of the Parts affected are paralytic. It is almost always a Sign of approaching Death, and very seldom admits of any Cure; but, whenever it does, it must be performed by Remedies which are warming and corroborating, and which fill the empty Vessels with good vital Juices, such as nourishing Aliment taken in Quantities proportioned to the digestive Powers, and Wine.

This Species also sometimes appears without any manifest Signs of a preceding Distemper, and then is generally fatal. Dissections of Bodies after Death, have discovered that this Case is almost always attended with a Suppuration of the Lungs.

That Species which appears with a Tumor, takes different Denominations, either from the Nature of the Tumor, or the Part which it affects. Hence Quinsys are distinguished into Oedematous, Catarrhus, Inflammatory, Purulent, Scirrhus, Cancerous, and Convulsive.

These Tumors affect the Tongue, and its Muscles; the Palate, Tonsils, the Uvula, and its Muscles; the Cavities of the Os Frontis, the Maxilla superior, and Os Sphenoides, when a Polypus, arising in any of these, increases to such a Degree as to stop up the Nostrils, depress the pendulous Veil of the Palate, streighten the Fauces, and obstruct the Passages of the Pharynx and Larynx; either some or all the Muscles of the Os Hyoides; the Muscles of the Larynx, whether internal, external, proper or common; the internal Muscular Membrane of the *Aspera Arteria*; the superior Muscles of the Pharynx, and Oesophagus, otherwise called *Sphincter Gulae*; the muscular Parts of the Oesophagus; and those Glands which are situated

situated so near the Aspera Arteria and Oesophagus, that, by their Tumefaction, these Conduits may be compressed, amongst which are all the Salival Glands, and others dispersed about these Parts, and lastly, the Thyroide Glands.

From this History of the Disease, Reasons may be readily assigned for all those various, unforeseen, and fatal Accidents, which sometimes attend a Quinsy.

But as this Distemper is attended with a Variety of Circumstances, which are productive of various Events, it will be necessary to specify Particulars.

Of a Quinsy arising from a watry, oedematose, and catarrhus Tumor.

This is a laborious and painful Exercise of Respiration and Deglutition, from a lymphatic or oedematose Tumor of the Parts destined for these Functions, or those adjacent to them.

The Seat of such a Tumor, like that of every Coacervation of Lymph, is in that Part of the Glands, where the Lymph, secreted by the Arteries, is separated from the Mass of Blood, and deposited.

The Cause therefore of such a Tumor is, whatever prevents a free Discharge of the Lymph from these Reservoirs; and the Causes of such Obstructions are manifold and various, as,

Any Compressure of the Vessels into which the excretory Ducts of these Glands naturally discharge the secreted Fluid.

An Obstruction formed in the Follicule of the Glands, from chalky, pituitous, calculous, fungous, or such-like Concretions.

The same Kind of Concretions in the Emissaries, or excretory Ducts, of these Glands.

A Compressure of any of the Parts above-mentioned.

Cold apply'd to the Extremities of the Excretory Ducts.

A languid Circulation of the Humours.

The Effects of these Obstructions are a watry, white, cold Tumor; a Compressure of the adjacent Parts; and consequently an Impediment of those Functions, which depend upon the natural State of these Parts.

Hence the Diagnostic Signs will be easily known; and also the Prognostic, which is, that if the Tumor is suffered to advance much, the Patient will soon be suffocated.

The Cure is to be attempted by resolving and removing the obstructing Matter, by means of emollient, aperient, and relaxing Remedies, apply'd either in the Form of Fomentations, Cataplasms, Gargarisms, Injections, Collutions, or Vapours; or if necessary, by Frictions apply'd to the Part affected, Caustics convey'd through a Cannula to the Part, or by Incisions, which are preferable to Caustics.

Mean time, such Remedies as diminish the Quantity of Lymph, by evacuating a Portion of it either at the Mouth, or distant Parts of the Body, are by no means to be neglected. Such are,

Apoplegmatisms, which consist of such Ingredients as by stimulating the Parts affected; or those adjacent to them, incline them to discharge a considerable Quantity of the morbid Matter, or of Lymph easily convertible into it. Of this Sort are the Roots of Pellitory of Spain, and Horse-radish, Mastich, Ginger, Pepper, and particularly Nitre. In the *Pharmacopœia Pauperum*, there is a Powder under the Title of *Pulvis Synechicus*, which is very well adapted to these Purposes, and should seem of Efficacy in an oedematous Quinsy, tho' for one of the inflammatory Kind, for which the Author recommends it, much too acrid.

Take Salt of Prunella, (or Nitre) an Ounce and an half; white Pepper, three Drams; white Sugar, four Ounces; make into a Powder for the Patient to hold in his Mouth, and swallow gently. This causes a large Evacuation of Saliva.

As Vescicatories draw off a considerable Quantity of Lymph, and direct it from the Fauces to distant Parts, where it is less capable of doing Mischief; these are also of singular Use in a Quinsy of this Kind. They are to be apply'd to the Back, under the Ears, or to any other Part.

Such gentle Sudorifics also as are not accompany'd with any considerable Degree of Heat, as they contribute to the Discharge of the serous Humours, are of Service, if administered internally, or apply'd externally, in a dry Form. As are, for the like Reasons, Diuretics of the same Kind. But those Kinds of Cathartics, which are called *Hydragogues*, from their Efficacy in evacuating watry Humours, are, in this Case, of singular Use. Of this Sort are Jallop, Scammony, and their Preparations.

Mean time, the Patient must avoid large Quantities of Fluids, and take Aliments which are warm and drying; for by this means he will be carrying on the End proposed, that of diminishing the Quantity of Lymph in the Habit.

Lastly, the Circulation of Blood must be considered; and if this be found too languid, it must be accelerated by means adapted to that Purpose; amongst which are Frictions of the exter-

nal Parts; and volatile oily aromatic Salts administered internally.

A Scirrhus Quinsy.

It sometimes happens, that a scirrhus Tumor occupies the Tonsils, or some other of the Glands mentioned above; and this is said to be frequently caused by exposing these Glands, weakened by a preceding Tumor, before they have recovered their natural Tone and Strength, to the cold Air, or too cold Applications.

This Case may be distinguished by the ordinary Signs of a Scirrhus (See SCIRRHUS). And if it be foreseen, that it will be, or if it actually is, any Impediment to Deglutition, or Respiration, or both, the safest way is to extirpate the Scirrhus by Excision, if it can be easily come at. Or it may be wasted by Degrees with corroding Applications. For this Purpose, let a Pledget of Lint, fitted to the Shape of a Quill, be impregnated with Oil of Tartar *per Deliquium*, and apply'd immediately to the Part affected, by means of a Cannula.

A stronger Cathartic may be prepared of Quick-lime; but there is more Danger in the Application.

An inflammatory Quinsy.

When the Muscles and Glands employed in Respiration and Deglutition, or those adjacent to them, are by any means inflamed, an inflammatory Quinsy is formed, which is particularly to be regarded, because of its excessive Acuteness, and often insuperable Violence.

The Causes of this, in general, are the same as those which are productive of Inflammations in other Parts (See INFLAMMATIO). But a great many Causes may contribute to determine the Inflammation to the Parts above specify'd, particularly to the Larynx, Pharynx, Os Hyoides, and their Muscles, and to the superior Part of the Aspera Arteria, which, just under the Glottis, is furnished with a prodigious Number of Blood-vessels, running in Directions somewhat peculiar.

Amongst these Causes may be numbered, a natural Disposition, which principally prevails in young Constitutions, abounding with Blood, and particularly in those who have red Hair.

Frequent and violent Exercise of the Parts above-mentioned, either in Declaiming, Singing, or Vociferation; riding briskly against a cold Wind; blowing into musical Instruments; great Heat succeeding intense Cold, in the Spring; Dryness of the Fauces, occasioned by respiring hot Air, in the Summer; or in an inflammatory Fever.

When an Inflammation is produced by the Causes above-mentioned, very terrible Symptoms are excited, which are various, as the Disorder happens principally to affect different Parts.

Thus, if the internal Muscular Membrane of the Aspera Arteria is only affected, a Tumor, Heat, Pain, and burning acute Fever are excited, without any external Signs of the Distemper. In this Case the Voice is small, shrill, and uttered with a hissing Noise. Inspiration is excessively painful; Respiration is small and frequent, and scarcely performed but in an erect Posture, and then not without much Difficulty; hence the Circulation of the Blood through the Lungs is much obstructed, the Pulse begins to sink surprisingly soon, great Anxieties come on, and the Patient quickly expires. This is one of those fatal Cases, which destroy without any external Appearance; and the nearer the Seat is to the Glottis and Epiglottis, the more fatal it is.

If the Larynx is affected with an acute Inflammation, which principally seizes the Musculus Albus of the Glottis, together with the fleshy Muscles, which, when they act, close it, a most terrible and strangulating Quinsy arises, because, upon this Occasion, the Passage of the Air from and to the Lungs is utterly obstructed by the closing of the Glottis.

The Signs of this Species of Quinsy are much the same as those of the preceding, except that the Pain is intolerable during the Elevation of the Larynx, in order to swallow; and is remarkably increased by Speaking, or Vociferation; the Voice is extremely acute and shrill; excessive Anxieties come on, and Death quickly ensues. This is, of all those Quinsys, without any external Signs, the most dangerous.

If the Muscles only, which are employ'd in elevating the Os Hyoides and Larynx, suffer an acute Inflammation, it may be distinguished by these evident Signs: Respiration is tolerably free and easy; but the first Part of the Action of Deglutition is attended with excessive Pain, because on this Occasion the Muscles above-mentioned act. Add to these the general Signs of an Inflammation, which will appear evidently in these Muscles upon Examination.

When the Pharynx alone is affected, the specific Signs of it will appear upon inspecting the Fauces. In this Case, Respiration is tolerably easy; but Deglutition extremely painful, or utterly impossible; for upon any Attempt to swallow, the Substance intended to be convey'd to the Stomach, is return'd by the Nose, or sometimes forced into the Aspera Arteria, there exciting a violent Cough. Hence arises an Impossibility of taking

taking any Aliment, either solid or fluid, the Consequence of which is, that the Body must become extenuated and dry; and that the Fluids must contract an Acrimony, for want of a fresh Supply of balsamic Chyle. The Fever, however, in this Case, is not so intense, as in those preceding; nor does it so suddenly terminate in Death.

If the Tonsils, Uvula, and pendulous Veil of the Palate, together with the Muscles called *Pterygostaphylini*, are much inflam'd, nearly the same Symptoms will arise as in the preceding Case. Respiration is, however, somewhat laborious, and is little, or not at all perform'd thro' the Nose, and by the Fauces not without some Difficulty; whatever is attempted to be swallowed, is forced back again thro' the Mouth, by reason of the Obstruction it meets with, and the excessive Pain it excites; there is a perpetual Discharge of Saliva by hawking, and a continual and copious Diffusion of Phlegm into the Cavities of the Tonsils; an acute Pain is perceiv'd in the internal Ear, and the *Tuba Eustachiana*, which passes from the Fauces to the Ear; a crackling Noise is perceived in the Ear, during Deglutition, and sometimes utter Deafness ensues. This Case is in our Days frequent from the Venereal Disease, and is attended with much Danger.

If all or most of these Parts are inflam'd, the Disease is in Proportion more severe, as the Inflammation affects the greater Number of the Parts above specify'd; and hence more Symptoms may be expected to arise, and those of a worse Kind.

For the Return of the Blood into or thro' the external Jugulars now compress'd, being intercepted, the Fauces, Lips, Tongue, and Face, swell; the Tongue hangs out of the Mouth, is intorted and inflamed; the Eyes are red, prominent, and ghastly; the Brain is, as it were, suffocated by an Abundance of Blood retained in it; hence the Sight, Hearing and Feeling, are rendered dull; hence also a Delirium, a perpetual Gaping of the Mouth, a Stertor, an Impossibility of lying down, because of the Strangulation attending that Posture; and a manifest Redness, Tumor, Pain, and Pulsation, in the Breast and Neck; whence the Jugular, and Frontal Veins, and those under the Tongue, called *Ranina*, becoming varicose, are distended.

These inflammatory Quinsies run thro' the same Stages as other Inflammations, are susceptible of the same Alterations, and, like them, terminate in Resolution, Suppuration, a Gangrene, or Scirrhus, unless they strangle the Patient before any of these can happen. See INFLAMMATIO.

Therefore as soon as we are satisfied by the Signs above specify'd, that the internal Muscular Membrane of the Aspera Arteria, or the Muscles about the Glottis and Larynx, are affected, we must immediately inquire, whether the Distemper is still in a State of Inflammation, which may be discovered by the Signs mentioned under the Article INFLAMMATIO; and, if we find it is, Resolution must by all possible means be instantly attempted. See INFLAMMATIO.

Therefore let Blood be immediately taken away by a large Orifice, and in great Quantities, and let this be repeated, till such time as a general Weakness, Paleness, Refrigeration, and Subsiding of the Vessels, shew that the Force of what remains is not capable of augmenting the Tumor and Rigidity of the small Vessels about the Parts affected.

This is nearly the Direction of *Hippocrates*, who, in his third Book of Diseases, advises, as the first Step in the Cure of a Quinsy, to take away Blood, which, he says, is of most Service, if drawn from under the Breast. He also orders Blood to be taken from the Cubit.

Next, strong Purges must be administered, either by the Mouth, or by Clysters, and these must be repeated.

The following Purge is adapted to this Intention:

Take of Diagrydium, eight Grains; make an Emulsion with half an Ounce of Water; to which add an Ounce and an half of Syrup of Sena, for a Draught.

A proper Clyster may be thus prepared:

Take Sena-leaves, an Ounce; boil these in a sufficient Quantity of Water to eight Ounces; and to the strained Liquor, add of Nitre and Syrup of Sena, each an Ounce. *Boerb. de Mat. Medic.*

This is exactly conformable to the Advice of *Hippocrates*, who, in the Place above quoted, says, that the Belly must be purged downwards with a purging Medicine, or a Clyster.

The Regimen must be extremely slender, both with respect to solid and fluid Aliments.

Hippocrates also orders the Patient to abstain entirely from Wine, and to sup the strained Juice of Pissan, in the Treatise above-mentioned.

The other Medicines should be principally nitrous and subacid; for Nitre is of all Remedies, perhaps, the most powerful for resolving Inflammations.

Mean time, let the Patient receive some tepid, moist, resolving Vapour at his Mouth; let Fomentations be used externally; and let Vesicatories be apply'd, in order to derive a Portion of the offending Humours from the Parts affected.

The following Form may serve for an Example of a Vapour:

Take Elder, Rose, and Marigold Vinegar, each an Ounce; Elder-flower Water, six Ounces: Mix together; let the Vapour of this be convey'd to the Fauces by means of a Funnel. *De Mat. Medic.*

Hippocrates also advises Fumigations of the Fauces, with *Cilician Hyssop*, Sulphur, and Asphaltus.

When the Muscles which are employ'd in elevating the Os Hyoides and Larynx, are only affected, the Case is not so dangerous; the same Sort of Remedies, however, are required, tho' not so powerful. In this Case, anodyne, relaxing, and emollient Cataplasms, apply'd externally, are particularly useful. For this Purpose,

Take of the Lens Palustris, (Ducks Meat) six Ounces; of the Flowers of Water-lillies, five Ounces; Flowers of Poppies, eight Ounces; of Marsh-mallows, six Ounces; of Elder and Melilot, each four Ounces. Boil these in Water, adding at the End of the Decoction, two Swallows Nests, and a sufficient Quantity of Meal of Lin-seed; make a Cataplasma with three Ounces of Oil of White Lillies.

The strained Liquor may be used for a Fomentation. *De Mater. Medica.*

If the Disorder affects the Pharynx only, or the Tonsils, Uvula, and pendulous Veil of the Palate, with the *Musculi Pterygostaphylini*, or many of these Parts together, and the State of Inflammation still subsists, all the Remedies above specify'd are to be called in to our Assistance, that by their united Force they may relieve the Patient. But besides these, the Mouth and Fauces must be kept continually moist, by mild attenuating nitrous Liquids, diluting aqueous Fluids, or relaxing Decoctions of pinguious Ingredients; these must be kept perpetually in the Mouth, without Motion, or they may be gargled gently, or injected with a Syringe. But the Benefit arising from these depends upon their continual Use; for otherwise the Parts grow immediately dry.

Take of the Decoction of the Ingredients, specify'd in the preceding Prescription, twelve Ounces; Elder Vinegar, Syrup of Marsh-mallows, each two Ounces; purify'd Nitre, two Ounces; mix for a Gargarism: Or,

Take of fat Figs, twenty-two; Leaves of Marsh-mallows, two Ounces. Boil for a considerable time, and use the strained Liquor in the Manner above directed.

But if the Remedies above-mentioned are not at all made use of, or are applied too late, or without Effect, provided the Distemper is recent, threatens Strangulation, and resides in any Part above the Place where the Incision is to be made, the Operation of Bronchotomy must be performed, after prognosticating the Danger of the Distemper.

After this Operation, the Causes of the Difficulty in Respiration, which rendered it necessary, must be removed by the Methods above specify'd; and if, during the Cure, the Patient is not able to swallow sufficiently for his Nourishment, nutritive Clysters must be frequently administered, after emptying the Intestines by one which is cathartic.

Take of good Broth of Flesh-meat, ten Ounces; Nitre, ten Grains; Spirit of Salt, six Drops; make a Clyster to be injected every eight Hours, and retain'd as long as is possible.

If the Inflammation has proceeded so far, that the Part affected begins to suppurate, which may be known by the Signs of an Abscess, (See ABSCESSUS, and INFLAMMATIO) Resolution being no longer possible, we must endeavour to free the Patient from the offending Matter, by promoting an Abscess. See ABSCESSUS.

Use therefore emollient Gargarisms perpetually; apply large relaxing Cataplasms; and, when the Matter of the Abscess is perfectly formed, and the exact Situation of it is discovered, let it be opened. Mean time, if it should be absolutely necessary for the sake of Respiration, the Operation of Bronchotomy may be performed.

It must be remark'd, that the Species of Quinsy which affects the internal Membrane of the Aspera Arteria, and the Larynx with its Muscles, can very seldom arrive at Suppuration, because, if not resolv'd, it must be fatal before this can happen.

As all Inflammations may terminate in a Gangrene, that which causes any Species of inflammatory Quinsy may do so likewise. This Case may be distinguish'd by the general Signs of a Gangrene (see GANGRENE) apply'd to the Parts affected, and whose Functions are impair'd; and also by Signs which are peculiar to this Disease.

Thus if a Tumor, and Redness, which were before conspicuous, suddenly disappear without evident Cause; if the Pain vanishes in like manner; if the Fauces on a sudden become equal, smooth, dry, and livid; we may be certain, that a Gangrene is begun; and if so, it admits of no Remedy.

An Inflammation of the Tonsils, Uvula, and Palate, may terminate in a Scirrhus, which may be readily discover'd by the general Signs of a Scirrhus, (see SCIRRHUS) but is not so easily cur'd, especially when it degenerates into a Cancer.

If the Nerves which convey Sensation and Motion to the Organs of Deglutition and Respiration, are by any means prevented from exercising their Functions upon those Parts, a nervous or paralytic Quinsy is form'd: This is said sometimes to happen from a Luxation of the Tooth-like Process of the second Vertebra of the Neck inwards.

If the Muscles of the Larynx or Pharynx are convulsed by any Cause whatever, a sudden and suffocating Quinsy may arise. This frequently happens in Epileptic, Spasmodic, Hypochondriac, and Hysterical Cases, where it frequently goes off, and returns, without any great Danger. As it is only a Symptom of the original Disorder, and depends upon that, it is to be cur'd by Remedies adapted to remove its Cause.

The Musculus Oesophageus, or Sphincter Gulæ, when it acts, presses the Pharynx to the back Part of the Larynx, and stops the Orifice of the Pharynx; now this also happens in involuntary Contractions of this Muscle, so that Wind coming from the Stomach, and not being able to pass the Orifice of the Pharynx, swells the Oesophagus, and causes a Sensation of a Swelling in the Throat.

From the preceding History of Quinsys, all the Prognostics related above are readily accounted for, and confirm'd. I shall only remark farther in this Place, that any artificial Compressure of the Jugular Veins will cause a Discharge of frothy Saliva from the Mouth, as well as that Compressure of these Veins, which happens from a Quinsy.

ANGIOSPERMOS, Ἀγγειόσπερμος, from ἀγγείον, a Vessel, and σπέρμα, a Seed, an Epithet for such Plants as have their Seed or Fruit inclosed in two Membranes, not easily separable from the Nucleus, by way of Distinction from the Gymnospermoi, γυμνόσπερμοι, derived from γυμνός, naked, &c. which have their Seed for the most part surrounded with three Integuments. *Castellus* from *Volcamer's Flor. Noremberg*, and the *Acta Erudit. Lips.*

ANGLICUS SUDOR. See SUDOR ANGLICUS.

ANGOLAM, H. M. P. 4. T. 17. p. 39. *Arbor Indica baccifera, Fructu umbilicato rotundo, Cerasi Magnitudine, dicocco.*

It is a very tall and beautiful Tree, running up to an hundred Feet in Height, and about twelve Feet in Thickness, and grows in the rocky, sandy, and mountainous Parts of *Malagatti*, and other Provinces of *Malabar*; it is an Evergreen, bears a Fruit like a Cherry, and lives a long time.

This Tree is accounted by the *Malabarians* an Emblem of Royal Majesty, because its Flowers stick along upon its stiff Thorns in the Form of an Imperial Diadem.

The expressed Juice of the Root kills Worms, and purges bilious and phlegmatic Humours, and evacuates the Water of hydropical Persons. The Root pulverized is accounted good against the Bites of Serpents, and other venomous Creatures. *Raii Hist. Plant.*

ANGOR, Ἀγρία, ἀδυναμία, is a Contraction and Concentration of the natural Heat, the Consequence of which is a Pain of the Heart, Palpitation, and Sadness; and if it happens in the Beginning of acute Fevers, it is a very bad Prognostic. *Galen. in Hippocr. Epid. L. 1. See AGONIA.*

ANGOS, ἄγγος, the same as ἀγγείον, signifying a Vessel in general, and a Receptacle of Humours. Used once by *Hippocrates, Lib. 6. Epid.* as *Galen* expounds him, in a special Sense for the Uterus.

ANGSANA, Offic. *Angsava*, Ephem. Germ. *Anno 13. fœe Decur. 11. Anno 13. p. 107. Draco arbor Indica siliquosa, Populi folio, Angsana vel Angsava Javanica*, Commel. Hort. Amst. 1. 213. Tab. 109. *Raii Dendr. 113.*

It grows in the *East-Indies*; the Part used in Medicine is the Liquor which distils from the wounded Tree, and condenses into a red Tear, wrapt in thin, reedy Coverings, as sold in the Shops.

The Gum of this Tree, as the very learned and ingenious *Commelin* says, is sold in the Shops for Sanguis Draconis. Hence I cannot but observe, that either our Botanical Authors are at a great Loss, and in much Confusion and Perplexity, about what Kind of Tree this should be, or else there are several Sorts of Trees which produce this Gum.

It is esteem'd an Astringent, and an excellent Remedy in Aphthæ. *Dale. Raii Hist. Plant.*

ANGUILLA, the Eel, thus distinguish'd:

Anguilla, Offic. Schrod. 325. Mer. Pin. 188. Aldrov. de Pisc. 544. Gefn. de Aquat. 40. Charlt. de Pisc. 34. Salv. de Aquat. 75. Rondel. de Pisc. 2. 198. Schonef. Ichth. 14. Bellon. de Aquat. 295. *Raii Ichth. 109. Ejusd. Synop. Pisc. 37. Jons. de Pisc. 81. THE EEL.*

There are two Sorts of them, the large and the small, of both which you are to chuse those that are tender, fat, well fed, and that have been taken in a fine clear River.

They are very nourishing, and well tasted; they are sometimes salted for the better keeping of them, and then they are more wholesome, than at any other time.

They produce a viscous and thick Juice, are hard of Digestion, cause Wind, are injurious to those who are afflicted with the Gout, or Stone, and have a bad Stomach: It is also pretended, that they hinder the Catamenia. *Hippocrates, L. de intern. Aff.* would have them used by those that are lean and wasted, and subject to the Spleen. Lastly, there are some who will not eat the Head of an Eel, because they fancy it is prejudicial to their Health.

The Eel contains much Oil, volatile Salt, and viscous and gross Phlegm.

It agrees at all times with young People of a bilious and hot Constitution, who abound with thin and sharp Humours, provided they have a good Stomach, and that they use it moderately.

REMARKS.

The Eel is a fresh-water Fish well known; sometimes it is found in the Sea, not that 'tis produced there, but because it goes often out of Rivers into the Sea, and so back again into Rivers; it delights in pure and running Waters; and they assure us she grows lean, poor, and dies at last, when confined to muddy Water. She requires also a great deal of Water, for otherwise she dies; as also it happens to many other Fishes. It is said she cannot bear any considerable Difference of living; for in Case she should in Summer-time be conveyed into a much colder Water than that wherein she was before, she is soon destroyed. In the mean time, they say, she can live out of the Water five or six Days, provided the North Wind blows at that time; she feeds upon Roots, Herbs, Fish, Insects, and any thing she can find in the Bottom of Rivers. *Athenæus* says, he had seen Eels in a certain Country, which were so far tamed, that if they offered them any thing to eat, they would come and take it out of the Persons Hands. This Fish lives commonly seven or eight Years. *Aristotle* assures us, that in dissecting Eels, he found no Difference of Sex in them; that they had neither Seed, Eggs, Matrix, nor Seminal Pipes; and that they did not ingender, inasmuch that 'tis pretended, they were generated out of the Corruption that is in Mud. *Pliny* frames another Symptom for the Explication of it: He says, that when the Eels rub themselves against Rocks, the Off-scouring of their Bodies comes afterwards to take Life, and so gives Being to an Infinity of small Eels; but neither of the Explications seem to be easily apprehended. I am confident, if those two famous Authors were now alive, and acquainted with the new Anatomy, they would be more cautious of advancing Notions, that have so little Resemblance of Truth in them. It is now discover'd, that they are viviparous.

The Eel is good Aliment, and much used; she is tender, soft, and nourishing, because she contains many oily and balsamic Parts: She has also a great many that are dull, viscous, and gross, which makes the Eel hard of Digestion, and apt to produce the many ill Effects we have before-mentioned. In the mean time the Eel that has been salted to keep, doth not produce so many bad Effects; because one Part of its viscous and gross Phlegm is spent, and the other attenuated and scattered by the Salt.

They eat Eels either roasted or boiled: Those that are roasted, seem to me to be more wholesome than the other; and the Reason is, because they are thereby the more divested of their viscous Phlegm, than by the other way. They should also be well season'd, and you should drink good Wine upon them, in order to help the digesting of their Phlegm in the Stomach.

The Fat of an Eel is looked upon to be good to take away the Signs of the Small-pox in the Face, to cure the Piles, and to make the Hair grow: It is also put into the Ears to help Hearing.

They make a kind of Mucilage of Eel's Skin, by steeping and boiling it in Water, which is applied to Swellings, in order to the softening and dissolving of them: It is good for *Hernia's*. *Lemery on Foods.*

The Oil of the Eel is so offensive to some Stomachs, that they cannot bear it without being sick.

As the Eel is a Fish of Prey, the Salts for that Reason must be more plentiful and exalted.

ANGUIS.

Serpens, Offic. Schrod. 5. 305. *Serpens Anguis*, Schw. Rept. 137. *Anguis*, Gefn. de Serp. 43. *Anguis Caluber*, Mer.

Mer. Pin. 204. *Natrix torquata*, Aldrov. Hist. Serp. 287. Jonf. de Serp. 89. Raii Synop. A. 334. Charlt. Exer. 35. THE SNAKE.

The Fat and Slough, or last Skin, are used in Medicine. The Fat mollifies stumous Swellings, cures Redness of the Eyes, clears them of Specks, and sharpens the Sight; it mitigates the Pain of the Gout. *Dale*. See ANGIUM SENECTA.

Snakes are not so venomous or terrible in Italy, and the colder Countries, as in warmer Climates. For a Remedy against their Bites, it will be sufficient to make use of Betony, Cantabrica, [Lavender-leav'd Bindweed, according to *Dale*] or Centaury, or Agrimony, or Germander, or Burdock, or Water-parsnips. One or two of these Simples bruised, the Juice drank in Wine, and the Herb apply'd to the Place, are enough to work a Cure.

We ought to know, that the Bites of all Serpents are most venomous, when they are hungry, and do most Harm when the Patient is fasting. Therefore these Creatures are most pernicious in the Time of their Incubation; and the best way, when you are under any Apprehensions of Danger from them, is not to stir out of your House upon an empty Stomach. *Celsus*, Lib. 5. Cap. 27.

Our Snakes are perfectly innocent, as is generally believ'd, and their Bite is not attended with any Danger; tho' they have sometimes been blam'd for the Mischief which Vipers have done, by Mistake.

ANGUIS ÆSCULAPII, *Johnston*,

Is the only Species of Serpent now known, which can be made so tame; as to do no Harm. It is found in many Parts of Italy, Germany, Poland, Spain, Asia, Africa, and America; it is of a gentle Nature, and People confide so much in its Gentleness, that they sometimes leave it in their Beds, where it is found, without Fear of being bit; it is full of volatile Salt and Oil; they prepare it in the same manner as the Vipers.

It is good against the Plague, resists Poison, and carries off Humours by Transpiration. *Lemery de Drogues*.

ANGUIUM SENECTA. The cast Skin, or Slough, of a Serpent, boiled in Wine, and the Decoction instilled into the Ears, eases their Pains; and, used as a Collution, helps the Tooth-ach. It is also an Ingredient in Medicines for the Eyes, especially the Slough of the Viper. *Dioscorides*, Lib. 2. Cap. 19.

The Slough of a Snake, burnt and pulverized, then mixed with Oil, and reduced to the Consistence of Honey, is an admirable Remedy for the greatest Pain of the Teeth, if apply'd to them, and thrust into their Cavities; or rub the unfound and aching Teeth with the Slough itself not burnt, and they will fall out. *Aetius*, Teir. 2. Serm. 4. Cap. 33.

ANGULI OCULI, *Kavdoi*, the Corners of the Eyes. See CANTHUS.

ANGURIA, a Plant of the cucurbitaceous Kind. See CITRULLUS and CUCUMIS.

ANGUSTIA, in the common Sense, imports an Anxiety or Restlessness in Distempers; but ANGUSTIA, or ANGUSTATIO, also signifies a Narrowness of the Vessels, or Passages.

ANHALDINUM, an Epithet of a Corrosive described by *Hartman*, Praxis Chym. Tom. 1. *Castellus*.

ANHALTINA REMEDIA, Medicines which facilitate Respiration, such as vulnerary Plants, some Preparations of Sulphur, &c.

ANHALTINUS, an Epithet of a very rich and comforting medicinal Water and Spirit, describ'd in some old foreign Dispensatories.

ANHELATIO, ANHELITUS, *Ἀσθμα*, a Shortness of Breath, or a difficult, and small, but quick Respiration, which happens to sound Persons, but especially to Valetudinarians, after vehement Exercise, getting up an Ascent, running or dancing. Fat Persons, with prominent Bellies, are much subject to this Disorder, which also happens after Repletions, especially with the cruder or flatulent Sorts of Aliment, whether the Patient be sitting or lying; and worse, if he be running, or getting up an Ascent; and worst of all, if it be in the Summer Season. In Fevers, Dropsy, Tumors of the Viscera, Pleurisy, Cardialgy [Heartburn], and Asthma, there is always an Anhelatio, or Shortness of Breath. See ASTHMA and ORTHOPNOEA.

ANHELITUS, with the Chymists, signifies Smoke, and sometimes Horse-dung. *Rulandus*.

ANHIMA.

Anhima, *Johnston*, is an Aquatic Bird of Prey, of Brasil, bigger than a Swan; its Head is no larger than a Cock's, and its Beak is black, and crooked near the Point; it has fine Eyes of the Colour of Gold, surrounded with a black Circle; the Ball of the Eye is black; on the Top of its Head, near the Root of the Beak, arises a Horn, as thick as one of the largest Strings of a Fiddle, and about the Length of two Inches, crooked at its Extremity, round, as white as a Bone, surrounded with small and very short Feathers, black and white;

its Neck is above seven Inches in Length, and its Body near a Foot and an half; the Wings are large, and of different Colours; its Tail is ten Inches long, and as large as that of a Goose; each Foot hath four Toes, armed with Claws; it has a strong Voice, crying *vibu, vibu*; they never find it alone; the Female is always accompanied with the Male; and when one of the two dies, the other presently follows. It is the Female that I am here describing, the Male is as big again. She makes her Nest with Dirt, in Form of an Oven, in the Trunks of Trees, upon the Ground.

The Horn of this Bird is esteemed a good Remedy to resist Poison, for Suffocation of the Matrix, and to provoke Labour; they infuse it for a Night, and next Day order the Infusion to be taken. *Lemery de Drogues*.

ANHUIBA. See SASSAFRAS.

ANIADA, the Term by which the Alchymists express what they call the Fruits and Powers of Paradise and Heaven; also the Christian Sacraments. In Physics it means the astral and celestial Powers; which, by Influence, Imagination, Estimation, and Phantasy, promote in us long Life. *Rulandus*.

ANIADAY, in the Jargon of the Alchymists, the eternal Spring, and the new World and Paradise to come. *Johnson*.

ANIADON, ANIADUM, ANIADUS, Terms in *Paracelsus*, signifying either the Efficacy and essential Forces of things, or the celestial Body planted in Christians by the Holy Spirit by means of the Sacraments, or the spiritual Man regenerated. *Castellus*.

These seem the same as Aniada and Aniaday.

ANICETON, *Ἀνικητός*, Invincible, an Epithet of a Plaster ascribed to *Crito*, and so called, because it was an infallible Remedy for the Achores. It is thus described by *Galen*, de Camp. Pharm. Sec. Loc. L. 1. C. 8.

Take of Litharge, three hundred and twelve Drams; Rha, [a sort of Rhubarb] an hundred and four Drams (some put but fifty-two); of Cerufs, an hundred and four Drams; Frankincense, twenty-six Drams; plumous Alum, sixteen Drams forty Grains; Turpentine, twenty-six Drams; white Pepper, three Drams seven Grains; Oil, one Pint: Pound the dry Ingredients, but boil the Oil, Litharge, and Cerufs, in a new earthen Pot; and when they have received an Alteration, put in Wax and Rosin, and stir them about till it will no longer foul the Hands; then take it off the Fire, and when it is somewhat cooled, add the dry Ingredients, and beat them well together in a Mortar. Spread it on Linen, and shift the Plaster every third Day.

Another *Emplastrum Anicetum* describ'd by *Aetius*.

It is very much in Use; for it draws, breaks, cleanses, conglutinates, extracts Pus thro' the Bolster, and is used as a Collyrium. It dissolves Hardnesses, and helps contracted Nerves, if applied without Embrocation, that they might not be refrigerated. Being dissolved, it serves instead of an Ointment for Lascitudes, removing such as arise in the Beginning of a Disease, or from an obscure Cause. Apply'd on large Bolsters, it mollifies the extreme Parts. It is an Agglutinant of bleeding Wounds, after a Suture, or Imposition of Hooks; a folded Piece of Linen, moisten'd only with Vinegar, being laid upon the Compress, which must be cold in the Summer, and warm in the Winter. It is good for Soreness or Putridness of the Soles of the Feet, or Maladies of the Fingers, and for Wounds and Fractures; and you may safely rely on it for an Incarnative and Cicatrizer, without any other Medicine. It cures the Bites of Men, Dogs, and wild Beasts: But one extraordinary Effect it has, which is, to prevent any secret Abscess from forming in the Colon or Peritonæum, if there be yet no Suppuration; or, if there be one to attenuate it, and divert its Rupture upon the Intestines; but a Bolster must be laid upon the Place, and upon that a Lock of Wool, moisten'd with Vinegar or warm Oil; which Moistening must be renew'd twice in a Day, but the Plaster must not be removed till after three or four Days; and then, after fomenting the Place, laid on again. It takes its Name from its manifold and wonderful Effects, and is thus prepared:

Take of Squama Aris, fifty-eight Drams; Pellitory of Spain, Staveacre, Cnidian Grains, Mustard-seed, Rosemary-seed, Pigeons Dung, long Birthwort, Verdegrise, Cyprian Misy, Rocket-seed, Cummin, each sixteen Drams; Nitre, Sal Ammoniac, each thirty-two Drams; Manna of Frankincense, Bay-berries, Orris, each one hundred and twenty Drams; of the strongest Vinegar, sixteen Pints; of a Decoction of dry'd Figs, half a Pint: Let five Pounds of fat dry'd Figs be boiled in six Pints of Water to one Third. Let all these, together with the Vinegar, be bruised and sifted, and then levigated in the Heat of the Dog-days. When the Medicine is grown dry, and looks green, pour upon it the Decoction of the dry'd Figs, and soften it, and then lay it up in a Box of red Copper.

When

When Occasion requires, mix one Part of this Medicine, diluted with Vinegar to a frumentitious Consistence, with six Parts of Wax and Colophony melted in a moderate Quantity of Oil. If you would have it harder, take four Parts to one of Wax and Colophony; if you like it softer, take eight to one of the same. It is said to be good for malignant Tetters, if used with little Mixture. *Aetius, Tetr. 4. Serm. 3. Cap. 16.*

ANIDROS, ἀνιδρῶς, sweatless. From a Neg. and ἰδρῶς, to sweat. *Ἀνιδρῶς πυρετὸς ἐξ ἀνείδου*, in *Hippocr. de Rat. Viſi. in Morb. Acut.* signifies a Fever protracted to a great Length, without critical Sweats; because Nature has been disturbed by purging Medicines.

ANIDROSIS, ἀνιδρῶσις, a Nullity or Privation of Sweat. *Hippocr. L. 7. Epidem.*

ANIDROTI, ἀνιδροτῖ, an Adverb expounded by *Galen* in several Places of his *Comment. upon Hippocr.* and by *Hesychius*, to signify without Sweat.

ANIL. *Anil*, Garz. *Acoft. Nil*, *ſive Anil*, *Cam. Agnil*, *Fragoſo. Coachira Indor. Anil ſive Indigo, Gali ſive Nil, herba rorifmarini facie*, *Linſc. 4. Part. Ind. Orient. Herba Anil, ſive Enger*, 4. Part. *Ind. Orient.*

It is a Plant of *Braſil*, about the Height of two Feet, reſembling Roſemary; the Leaves are round, thick, the Flowers reſembling thoſe of Peas, and reddiſh; they are ſucceeded by long and crooked Pods, containing Seeds like thoſe of a Radish, of an Olive-colour. All the Plant hath a bitter and pungent Taſte: They extract from it Indigo. It is vulnerary, deterges and cleanses old Ulcers, being applied in Powder on the Part: It is uſed alſo as a Frontal for the Head-ach. *Remery de Drogues.*

Anil alia Species, *Marcgrav. Coachira ſecunda*, *Piſon. An Glaſto affinis*, C. B.

It grows to the Height of two or more Feet; the Stalk is round, full of Joints, of a viscid, juicy, ſpongy, or Reed-like Subſtance. At the Joints of the Stalk and the Branches ſtand two Leaves, directly oppoſite, without Pedicles, of the Length of three or four Fingers Breadth, and narrow like the Leaves of yellow Willow-herb, green, and ſet with ſhort white Hairs on both Superficies, feeling a little rough. At the ſame Joints where the Leaves are, on each Side, grow two Pedicles, near one another, ſtanding upright, two or three Fingers Breadth long, and bearing at Top a round white Flower, of the Bignefs of a Daisy, with ſmall white Leaves, ſet round about with minute white Stamina. The Root is half a Foot long, or a little more, ſomewhat bent, with few Sprays, of a viscid and ligneous Subſtance, and cover'd with a Bark of a dark Colour, which may be ſtrip'd off. The whole Plant, with its Root, is full of Juice; and if any one breaks the Stalk or Root, there immediately iſſues a Juice of an azure Colour.

They make *Anil* of it, only by bruſing the Herb, and pouring Water on it. They then leave it to ſubſide; and after drawing off the Water, dry the Sediment in the Sun.

This Plant is of a quite different Kind from the other *Anil*, of which they make Indigo. *Raii Hiſt. Plant.*

The Plant *Anil*, the Method of extracting its ſeculent Parts, and the ſeveral Uſes to which they are applied, have been ſo often, and ſo fully, inſiſted on by Phyſicians and Travelers, that we have no Occaſion to enter upon theſe Points at preſent.

Since the Medicinal Uſes of *Anil* in the *Indies* are unknown to us, becauſe of the Scarcity of this Plant; and ſince the ſeveral Authors who have handed down their Accounts of it to us, differ from one another, not only with regard to its Deſcription, but its Medicinal Virtues, we ſhall only mention ſuch of its Properties as are moſt univerſally agreed upon by Botanists and Phyſicians. 'Tis then generally concluded, that a Decoction of its Root is good againſt a Nephritic Colic; that its Leaves, bruſed and macerated in Water, are ſucceſsfully applied to the Belly in Suppreſſions of Urine; and that, applied by way of Cataplaſm, they aſſuage and mitigate Pains of the Head. *Mem. de l'Acad. A. 1718.*

ANIMAL. Every organiz'd Body endowed with Life, and ſpontaneous Motion, is call'd an Animal. Hence all Subſtances which are procured from Animals, are ſaid to belong to the Animal Kingdom, in order to diſtinguiſh them from others, which belong to the Vegetable and Mineral Kingdoms.

The Earth of Animals is not found to differ from that of Vegetables in any reſpect; but the Salts of Animals differ remarkably from thoſe of Vegetables, in being volatile; that is, in riſing by the Force of Fire in Diſtillation; whereas thoſe of moſt Vegetables, before they have undergone Putrefaction, are fixed, ſo as not to be capable of being elevated by the moſt intense Fire. See ANALYSIS.

The Oils of Animals alſo are different from thoſe of Vegetables in many Particulars; which are ſpecified in the following Obſervations of *Hoffman*, with reſpect to Animal Oils.

In all Bodies produced by the Earth there is a fat, oily, and inflammable Subſtance contain'd; but this Subſtance is not confined to theſe Bodies alone, for 'tis found in great Plenty in all Animals, of every Species; neither is it poſſible to find an Ani-

mal, that has not ſome Portion of Fat lodged in its internal Parts. In all their ſolid Parts alſo, in their Fleſh, in their Bones, and even in their Fluids, duly dry'd, this inflammable Principle diſcovers itſelf; ſince they are very eaſily made to flame, and alſo yield a great Quantity of Oil in Diſtillation: But there is this Difference between Vegetable and Animal Oils, that the finer of the latter Sort are not, like the former, procured by a moiſt, but by a dry Diſtillation, that is, by Combustion; and for this Reaſon, all Animal Oils have an empyreumatic Smell, and ſtrike the Nerves of the Noſtrils in an ungrateful and diſagreeable Manner.

Then again, all Fats and Oils, drawn from Animals, differ much in another reſpect from thoſe of Vegetables; ſince the latter have a ſubtile Acid intimately mix'd with them; whereas the former contain, inſtead of that, a certain alkaline Principle. An Acid manifeſts and diſcovers itſelf in Oils expreſs'd from Seeds and Fruits; ſince theſe Oils, by remaining any conſiderable time in Copper Veſſels, extract a greeniſh Colour from them, which can only be done by an Acid; whereas the Fats of Animals, if kept for any time in Copper or Silver Veſſels, aſſume a beautiful blue Colour, which Effect can only be produced by an alkaline Principle.

Befides, that the æthereal Oils of Vegetables contain a certain acid Salt, is plain from the following Experiment: Let Salt of Tartar be levigated very finely on a Marble; let ſome diſtill'd Oil, that of Juniper, for Inſtance, Turpentine, or even Lavender, be dropp'd into it; continue the Trituration for ſome Hours, till ſuch time as the ſmalleſt oleous Particles are mixed with the lixivial Salt, and the Maſs aſſumes the Form of a Pulvis, without the Oil being any more diſcovered. This Maſs is to be expoſed to the free Air, upon the Marble, for a conſiderable time, till the Salt, becoming dry, is again render'd capable of being levigated; after which, let it be a ſecond time impregnated with Oil. Let this Method be follow'd, till, at leaſt, two Pounds of the Oil are abſorb'd by one Pound of the Salt of Tartar. This Maſs, when become dry, is to be diſſolved in common Water; and, after Filtration, let the Water be drawn off; and then there remains a Salt of a neutral Nature, ſuch as the *Arcanum Tartari*, or vitriolated Tartar.

Now there is no Doubt to be made, but this Acid, by means of which the Alkali was converted into a Subſtance of a neutral Nature, was originally contained in the Oil pour'd into it, ſince the Air alone could not poſſibly produce ſuch an Effect; however, I don't deny but the univerſal Acid, contained in the Air, concurs, and has its proper Influence in this Affair.

That an Acid enters the Composition even of the fineſt Oils, is plain from an Experiment, in which is ſhewn, that the moſt highly rectified Spirit of Wine may, by the Addition of the moſt acid Oil of Vitriol, be converted into the moſt ſubtile and penetrating Oil.

But in the diſtill'd Oils of Animals the Caſe is quite different; for they are richly impregnated with a volatile Salt, which may be drawn from them in great Plenty; and, which is more, the diſtill'd Oils of Animals, that of Hartſhorn, for Inſtance, or Ivory, if long digeſted with a lixivial Salt, are themſelves converted into volatile Salts.

The volatile alkaline Salt, therefore, contained in the Oils of Animals, is the Reaſon why they are far more ſubtile and penetrating than the diſtill'd Oils of Vegetables, and have a more immediate Tendency to put the Maſs of Blood into a Commotion; for 'tis well known, that the moſt highly rectified Spirit of Wine quickly imbibes and reſolves Oils extracted from Animal Subſtances, that of Ivory, for Inſtance, Worms, or Hartſhorn; but yet in ſuch a Manner, that a few Drops of theſe Oils not only tinge a great Quantity of this Spirit, but alſo communicate an adventitious Taſte and Quality to it; for three or four Drops of theſe Oils are ſufficient for tinging at leaſt three Ounces of the Spirit of Wine with a browniſh Colour.

Hence we plainly diſcover the ſubtile Nature, and the Smallneſs of the Parts, of theſe Oils, which entirely preſerve their original Texture and Qualities; for two ſmall Drops of the Oil of Hartſhorn, intimately mix'd with half an Ounce of highly rectified Spirit of Wine, are ſufficient to produce a copious and plentiful Sweat, if divided into four Doſes, and exhibited to four different Men. Hence we learn, how cautious Phyſicians ought to be in preſcribing theſe Oils, eſpecially for young People, and in Diſtempers accompanied with intense and preternatural Heat: Hence we alſo diſcover the Reaſon, why Oils are ſo powerful and efficacious in diſcuſſing and reſolving Tumors, which will not yield to any other Medicines.

But what moſt of all deſerves our Attention is, that all Oils, extracted from Animal Subſtances, may, by a frequent and reiterated Rectification, acquire ſuch a Degree of Subtility as to be able, if exhibited in a pretty large Doſe, to eradicate the moſt terrible and inveterate Diſorders.

The Preparation is made thus:

Take any Oil diſtill'd from Animal Subſtance, that of human Blood, for Inſtance, that of Worms, Ivory, or Hartſhorn;

horn; and, without the Addition of any thing, let it be drawn off from a Glass Retort, and rectified to such a Degree, that no black and burnt Fæces may remain in the Bottom, which can scarce be obtain'd by twelve repeated Distillations.

This Oil, which was formerly thick, and of a disagreeable and foetid Smell, gradually assumes a more grateful one, and becomes more pungent to the Taste.

Twenty or more Drops of such an Oil, taken on an empty Stomach, before the Access of an Intermitting Fever, bring on a calm and gentle Sleep, and wonderfully carry off feverish Disorders. This is also an efficacious Medicine for the Cure of Epilepsies of long Standing, and allaying convulsive Motions, especially when taken before the ordinary Time of the Access, and when such Medicines are previously used, are as proper for evacuating the too great Quantity of Humours.

It produces its Effects by its gentle, safe, anodyne, and somniferous Qualities; for it induces a calm and pleasant Sleep, which often lasts for twenty Hours, and which is so far from being followed by Drowsiness, Torpor, and Weakness, that it rather exhilarates and enlivens the Body. Besides, it promotes a gentle Sweat, without increasing the Heat of the Blood. The Effects produced by this Medicine are owing to the prodigious Smallness of its sulphureous Parts, occasioned by its frequent and reiterated Rectifications; and since its sulphureous Particles, in consequence of their Subtlety, penetrate all the smallest Meanders of the Parts, and diffuse themselves thro' the whole Mass of Humours, the Tenuity and Elasticity of the *Dura Mater*, and of the whole nervous and membranous System, the depraved and preternatural spasmodic Motion of which is the very Essence and Cause of Intermitting Fevers, and Epileptic Motions, are by this Medicine so much changed and diminished, as afterwards to become unsusceptible of such spasmodic Motions.

By this chymical and practical Observation, we are taught, that uncommon Medicinal Virtues are treasured up in the minutest Particles of sulphureous and oily Substances; which Circumstance is owing to their reaching the inmost Recesses of the solid Parts, especially those of the Nerves and Membranes; upon the due Tone and Motion of which, almost all the Functions and Motions of our Bodies depend.

This Experiment, and practical Observation also, proves, that the hottest Medicine, and such as, when administer'd in a very small Dose, is sufficient to throw the whole Mass of Blood into a vastly quick Motion, may be render'd so mild and safe, that, when exhibited in a larger Dose, it shall be so very far from increasing the Motion of the Blood, that it will rather quell it, and induce a moderate Calm; and we plainly find, that this Circumstance is owing only to the Change produced in the Texture of the Medicine; that is, by rendering the tenacious viscid Oil as subtle as possible.

In fine, this Experiment explains and accounts for the anodyne and somniferous Qualities of Camphire, which is no more than a most subtle coagulated Oil, when used prudently, and as Exigencies require. *Hoffman. Observat. Physico-Chym. L. I. C. 15.*

The rectified Oil, above describ'd, is certainly possess'd of many and considerable Virtues. Its Character is, that it is a most excellent Remedy against the Plague, or any pestilential Disorder: It cures the Pleurisy, it strongly fortifies Nature, it cheers the Heart, and revives the Spirits; it causes a free Circulation of the Blood, and thoroughly purifies the whole Mass, and clears the Skin from Erysipelas, Scurs, and Scabs. It cures the Itch, scald Heads, Tetters, Ring-worms, &c. It is most powerful in the Cure of the Leprosy and Elephantiasis; it opens the Obstructions of the Liver and Spleen; it cures all the Disorders of the Head and Brain, as Lethargies, Apoplexies, Megrims, Vertigos, Convulsions, Palsies, &c. It strengthens the Stomach, and helps Digestion; it surprisingly prevails in Faintings, Swoonings, and Palpitation of the Heart. A safer, speedier, better, or more effectual Medicine, is not to be found in the whole Art of Physic: Its Dose is from twenty to thirty Drops upon a Lump of Sugar, drinking after it a Glass of Wine.

ANIMAL BEZOARTICUM Orientale. The Bezoar Goat. See BEZOAR.

ANIMAL BEZOARTICUM Occidentale. The lesser American Deer. See BEZOAR.

ANIMAL MOSCHIFERUM. The Musk Animal. See MOSCHUS.

ANIMAL ZIBETHICUM. The Civet Cat. See ZIBETHUM.

ANIMALCULA. Those who have made the most minute Researches, and the most accurate Inquiries, into the Natures of the several Objects subjected to their Senses, have found, that the Substances upon which they employ'd their Curiosity, were often quite different from what, at first View, they appear'd to be. Thus, for Instance, the whole Earth has been found replenish'd with an inexhaustible Store of what we should least of all suspect, that is, an infinite Number of Animalcules float-

ing in the Air we breathe, sporting in the Fluids we drink, or adhering to the several Objects we see and handle. The Conjectures and Hypotheses relating to the Production, Generation, Structures, and Uses of these Animalcules, have been as various, and perhaps as far remote from Truth, as any that ever were either contrived by the Caprice, or embraced by the Credulity, of Mankind: But Conjecture, Obscurity, and Darkness, are now, in a great measure, banished from this Branch of Learning; since, by the Assistance of Microscopes, we not only know, that these Animalcules exist, but are also enabled to discover their particular Shapes, and various Degrees of Motion.

Water, the simplest and least compounded of any Fluid we are yet acquainted with, not only contains a large Number of these Animalcules, but also proves a proper Medium for their Multiplication.

This is confirmed by a Story told of a Gentleman, in the *History of the Royal Academy of Sciences for 1707*, who imagined, that, in some of the Experiments he had made, the Animalcules, discovered by a Microscope in Water, did not multiply in it, but that they proceeded from certain small and invisible Flies, which laid their Eggs in the Air; and that since these Animalcules were a Species of small Worms, they might naturally be supposed, as well as some other Worms, to proceed from some wing'd Species of Insect. But he was convinced of his Mistake by the following Experiment: He boiled Water and Dung, mixed together, and filled two equal Phials with it: When the Liquor, contain'd in these Phials, was become tepid, he put into one of them two small Drops of Water, taken from a Vessel, the Water of which was stored with Animalcules; and eight Days after he found that same Phial stock'd with an infinite Number of Animalcules, of the same Species with those contain'd in the Liquor, from which the two Drops of Water had been taken. As for the other Phial, nothing of the like Nature was discovered in it, tho' the Dung, as one would have thought, might have, in all Appearance, produced some Animalcules. Both Phials had been very carefully stopp'd. This Experiment, then, establishes the Multiplication of these Animalcules in the Water; but it will be more effectually confirm'd, if what this Philosopher asserts be true, that he saw them copulate. True it is, he saw them unite by Pairs; one may readily say, but it was perhaps to beat one another; but why should they never beat one another, except in Pairs?

If then Water, the most simple of all other Fluids, thus abounds in Animalcules, and proves, if I may so speak, a proper Medium for their Production and Multiplication, how much more must we suppose this to be the Case with other Fluids of a richer Texture, and a more compound Nature? What, for Instance, must we think of the vast Store, and surprising Variety, of Animalcules contained in that heterogeneous Fluid the Air? What Numbers of them must be contained in fermented Liquors, generous Wines, and Acids of every Kind? How must they abound in the Testicles, the Seed, and other Juices of Animals? What must their Number be in Fowls and Fishes, and even in Reptiles, and in Insects of the most small and inconsiderable Size? However romantic this may appear to one unaccustomed to pry into the hidden Wonders of the Works of Nature, 'tis nevertheless far from being one of those curious Hypotheses, which tantalize the Mind with delusive Appearances of Truth for a while, and leave it at last to sit down in a dejected State, and bewail its want of Evidence; for Mr. *Lewenhoeck*, that great Enricher of Natural History, and accurate Observer of the minutest Works of God, has subjected these Matters to the Evidence of Sense; and even given an irrefragable Demonstration that the Number of Animalcules contain'd in the Seed of one Cod-fish, is more than ten times that of all the Men living upon the whole Surface of our Globe.

In short, Animalcules abound so much in every Part of Nature, that the very Food we use is mix'd and incorporated with the Eggs laid by them. Thus Mr. *Hornberg* (in the *History of the Royal Academy of Sciences for 1707*) acquaints us with the Case of a young Man of his Acquaintance, who enjoy'd a very good State of Health, and discharged every Day by Stool, for the Space of four or five Years, a great Number of Worms five or six Lines long, tho' he eat neither Fruit nor Salad, and us'd all the Medicines that could possibly be thought of, in order to perfect his Cure. He once or twice also discharged an Ell and a half of a flat knotted Worm, call'd by the *French, Solitaire*. From this he thinks we have Reason to conclude, that there are vast Stores of the Eggs of Insects mix'd with, and treasur'd up in, all those Aliments, where we least suspect them; and that nothing is wanting but a Stomach, or an Oven, as it were, to hatch them.

Our own Philosophical Transactions give very surprising Accounts of small Animals found in various Substances, and of different Sorts. Thus an anonymous Author takes notice of a very extraordinary Insect found amongst Sand.

As we examin'd, says he, with an excellent Microscope, some little Grains of Sand searced, we perceived an Animal with many Feet, its Back white and scaly, but less than any of those hitherto observed. For altho' the Microscope shew'd every

every Grain of Sand as big as an ordinary Nut; yet this Animal appeared no bigger than one of those Grains of Sand seen without a Microscope.

Mr. J. Harris also gives the following Account of Animalcula July 7. 1694: I examin'd a small Drop of Rain Water, that had stood in a Gally-pot in my Window for about two Months. I took it (with the Head of a small Pin) from the discolour'd Surface of the Water, and in it I observ'd four Sorts of Animals. In the clear Part of the Drop were two Kinds, and both very small. Some were of the Figure of Ants Eggs; these were in continual Motion, and that very swift: And I find, that this Kind of oval Figure is the most common to the Animalcula found in Liquors. The other Sort, that were in the Clear of the Drop, were much more oblong, about three times as long as broad: these were exceeding numerous, but their Motion was slow, in comparison of the former.

In the third Part of the Drop (for the Water, from whence I took it, had contracted a thickish Scum) I found also two Sorts of Animals, as a kind of Eels, like those in Vinegar, but much smaller, and with thin Extremes more sharp. These would wriggle out into the clear Part, and then suddenly betake themselves back again, and hide in the thick and muddy Part of the Drop, much like common Eels in the Water. I saw here also an Animal like a large Maggot, which would contract itself up into a spherical Figure, and then stretch itself out again: the End of its Tail appeared with a Forceps, like that of an Earwig; and I could plainly see it open and shut its Mouth, from whence Air-bubbles would frequently be discharged. Of these I could number about four or five, and they seemed to be busy with their Mouths, as if feeding.

These four Kinds of living Creatures I found afterwards also in many other Drops of the same corrupted Water; that is, in its Film, or Scum which was on the Surface. For under that, in the lower Parts of the Water, I could never find any Animals at all, unless when the Water was disturbed, and the Surface shaken down into, and mingled with, the lower Parts.

April 27. 1696. With a much better Microscope, I examined some Rain-water that stood uncover'd a pretty while, but had not contracted any such thick and discolour'd Scum, as that before-mentioned had. In this, where it was clear, I could not find any Animals at all: But a little, thin, white Scum, that, like Grease, began to appear on the Surface, I found to be a Congeries of exceeding small Animalcula of different Shapes and Sizes, much like those produced by steeping Barley in Water.

At the same time I look'd on a small Drop of the green Surface of some Puddle-water which stood in my Yard: This I found to be altogether compos'd of Animals of several Shapes and Magnitudes; but the most remarkable were those which I found gave the Water that green Colour, and were oval Creatures, whose middle Part were of a Grass-green, but each End clear and transparent. They would contract and dilate themselves, tumble over-and-over many times together, and then shoot away like Fishes: their Head was at their broadest End; for they still moved that Way. They were very numerous, but yet so large, that I could distinguish them very plainly, with a Glass that did not magnify very much. Among these were interspers'd many other smaller and transparent Animals, like those mention'd but now, as found in the whitish Scum that was on some Rain-water which had stood a while uncovered.

April 29. 1769. I found another Sort of Creatures in the Water (some of which I had kept in a Window, in an open Glass); they were as large as three of the other, with a green Border about their Middles, but these were perfectly clear and colourless.

Then also examining more accurately the Belts, or Girdles, or Green, that were about the Animals mentioned above, I found them to be compos'd of Globules, so like the Rows or Spawn of Fish, that I could not but fancy they served for the same Use in these little Creatures. For I found now, since April 27. many of them without any thing at all of that green Belt or Girdle; others with it very much, and that unequally, diminished, and the Water filled with a vast Number of small Animals, which before I saw not there, and which I now look'd on as the young animated Fry, which the old ones had shed. I continued looking on them, at times, for two Days; during which Time, the Number of the old ones, with the green Girdles, decreased more and more, and at last I could not see one of them so encompass'd, but they were all clear and colourless from End to End.

May 18. 1696. I look'd on some of the Surface of Puddle-water, which was bluish, or, rather, of a changeable Colour, between Blue and Red; in a very small Drop of which I found prodigious Numbers of Animals, and of various Bignesses; but among those were none with those Girdles before-mentioned, either of Green or any other Colour.

I then also examined the Surface of some other Puddle-water, that look'd a little greenish; and this I found stock'd with such

infinite Numbers of Animals, that I never saw the like anywhere, but in the Genitura Masculina of some Creatures. Among these there were very many of a greenish Colour; but they all moved so strangely swift, and were so near to each other, that tho' I tired my Eyes, I could not distinguish whether the green Colour were all over their Bodies, or whether it were only round their Middle in Girdles, as before. But from the Roundness of their Figure, and their Smallness, I judge that they chiefly consist of the young animated Spawn of that Kind of Animals I mention'd above. I found, that the Point of a Pin dipp'd in Spittle would presently kill them all, as I suppose it will other Animalcula of this Sort.

The same Day also I looked on the Surface of some Mineral (Chalybeate) Water, which had stood in a Phial stopp'd for about three Weeks: in it I saw two Kinds of Animals, one exceeding small, and the other very large; which latter Sort had on the Tail something that looked like Fins. There were but very few of either Sort.

The compounded Salt, or Vitriol of the Water, was shot into pretty Figures, but all irregular. They looked all like a small Heap of little Sticks, laid across each other at all Angles and Positions; only they were transparent, and a little greenish, as Crystals of a chalybeate Nature use to be.

I infused whole Pepper-corns, Bay-berries, Oats, Barley, and Wheat, in Water, whose Scum, after two or three Days, afforded Animals, as hath been often already found by others, at least, as to some of them: But I found the greatest Numbers and Variety in Wheat and Barley Water; and the fewest in that wherein Bay-berries had been steeped.

How such vast Numbers of Animals can be thus (as it were, at Pleasure) produced, without having recourse to equivocal Generation, seems a very great Difficulty to account for. But though the solving of it that way makes short Work of the Matter, (for 'tis easy enough to say, they are bred there by Putrefaction) yet the asserting equivocal Generation seems to me to imply more Absurdities and Difficulties, than perhaps may appear at first Sight: I wish therefore, that this Matter would a while employ the Thoughts of some ingenious and inquisitive Man. In the mean time, I have conjectured, that these Animalcula may be produced by one or both of the following ways:

1. I have thought, that the Eggs of some exceeding small Insects, which are very numerous, may have been laid or lodged in the Plicæ, or Rugæ, of the Coats of the Grain, by some Kinds that inhabit on those Seeds, as their proper Places. For that Insects of the larger Kinds do frequently thus deposit their Eggs on the Flowers and Leaves of Plants, is often experimented; and 'tis very probable, that the smaller or microscopical Insects do the same. Now these being washed out of the Seeds, by their Immersion in Water, may rise to the Surface, and there be hatched into those Animals which we see so plentifully to abound there.

2. Or the Surface of the Water may receive the straggling Eggs of some microscopical Insects, that perhaps were about in the Air, and being fitted and prepared for this Purpose, by the Infusion of proper Grain, or a proportionable Degree of Heat, may compose so proper a Nidus for them, that they may by the Warmth of the Sun be easily hatched into living Creatures, which, it is probable, (like the strange Water-insect, from whence a Gnat is produced, mentioned by the learned Dr. Hook, in his *Micrographia*, whose Metamorphosis I have often with Pleasure seen) may afterwards turn into Flies, or winged Insects of the same Species of the Animal Parent. And, perhaps, sometimes, both these Circumstances, and other of the like Nature, concur for their Production.

Mr. Gray's Account of Animalcula.

I have observed in Hæmispærules of Water, duly apply'd to the End of a Wire, two Sorts of microscopical Insects, globular and elliptical. Those of a globular Form are but little less transparent than the Water they swim in; they have sometimes two dark Spots diametrically opposite, but these are rarely seen; there are sometimes two of these globular Insects sticking together; where they are joined, 'tis opacous: possibly they may be in the Act of Generation. They have a twofold Motion, a swift progressive irregular one, and at the same time a Rotation on their Axes at Right Angles to the Diameter that has the dark Spots: But this is seen only when they move slowly. They are almost of an incredible Minuteness.

I have examined many transparent Fluids, as Water, Wine, Brandy, Vinegar, Beer, Spittle, Urine, &c. and do not remember to have found any of them without more or less of the Bodies of these Insects; but I have not seen any in Motion, except in common Water, that has stood for sometimes a longer, at others a shorter time, as has been observed by M. Leewenboeck; though I do not remember he has observed, that they are existent in the Water, before they revive. In the River, after the Water has been thickened by Rain, there are such infinite Numbers of them, that the Water seems in great part to owe its Opacity and Whiteness to these Globules. Rain-water,

water, so soon as it falls, has many; and Snow-water has more, of these Globules. The Dew, that stands on glass Windows, has them; and so far as Rains and Dews are continually ascending or descending, I believe we may say, the Air is full of them. They seem to be of the same specific Gravity with the Water they swim in, the Dead remaining in all Parts of the Water. Of many Thousands that I have seen, I could discern no sensible Difference in their Diameters, they appearing of equal Bigness. In Water that has been boiled, they retain their Shapes, and will sometimes revive.

There is another Sort of Insects I have this way seen, but these are not so frequently (at least this Winter-season) to be found; they are much longer than the former; they can transform themselves into many Shapes; they are for the most part elliptical; but sometimes they contract themselves so as to be almost globular; and sometimes they contract themselves so, as to be twice or three times longer than broad; these sometimes turn themselves round on their Axes and Diameters as they go; they consist of transparent and opacous Parts. *Philos. Trans. Abr. Vol. 3.*

Sir Edmund King's Observations of Animalcula.

Having steep'd Oats in Rain-water some Days, (perhaps nine or ten) and looking upon it with my bare Eye, I saw a Substance, that seemed to me like that usually called a *Mother* (on other Liquors); and laying as much of it as a small Pin's Head upon the Object Plate of my best Microscope, I could very easily discern seven or eight Sorts of *Animalcula* of different Sizes and Shapes (or more) swimming in this Substance. Their Shapes and Sizes were after this manner, as near as I could guess: They were all very nimble in their Motions, by Computation, seven thousand times magnified.

The thin Scum upon a Pepper-water, that resembled Flakes of Salt upon some Sorts of human Urine, applied in the same manner to the Object Plate of the Microscope, was only Clusters of *Animalcula*, that had liquid Matter enough to swim in; and I was in Admiration at their Numbers, Motions, Variety, and Minuteness.

In a Decoction of Herbs, that was strained, and set by for a particular Use; in a little of the Settling of that, (as much as a Pin's Head) I saw Creatures like little Eels, which seemed to be sharp at both Ends, with a wriggling Motion.

I observe these small Creatures above-mentioned (if I may so call them) resemble the Nature of Fish, in several respects:

1. They'll flock together, and lie close together, as if they were in Shoals like Carps in a Pond, that has been shallow, as I have often seen, sometimes in one Place, sometimes in another; but when disturbed, they are, as to your Sight, all dispersed and lost in a trice; and so are these little Creatures in their original Liquor, if you shake the Liquor before you look to find them in Shoals, or after; at least, I am sure I did, and could never find any in that Parcel of Liquor, till next Day, or till they associated again.

2. They will follow their Liquor, to act in, to the last Particle of it, till they have no more to swim in, and then will seem to struggle for want of it, till their Strength fails them, and then after a Minute they will seem dead upon the Object Plate, when the watry Parts are dried away.

3. They will lie as if they were dead, near half an Hour, or more; then put a little Water to them, in half a Minute they will begin to move themselves again, and by Degrees begin to swim faintly and feebly at first (as Fish will do); then recovering their Strength again, will perform their brisk Motion as vigorously as ever.

4. Those that are almost dead, will look flat, as if pressed thin; but when they move, turn themselves over and over, without any regular Motion; so that you might see them as thin as the thinnest Spangle you ever saw, and like it in Shape; and they will continue so, so long as they are faint and sick: But within about an Hour's time, they will grow plump and well again, if you add fresh Liquor to them in time.

These *Animalcula* chuse, for the most part, the Top of the Liquor; I suppose, for the sake of the Air.

If you perceive them lie dead upon the Object Plate, as I did, and do not remember to add Water to revive them, within an Hour, they will be dead indeed: But you may see them in the Posture you left them, many Days after.

Now to give farther Testimony, that they are *Animalcula*, which some doubt, I have noted the following Observations:

If you take a fine Needle, and put the Point into Spirit of Vitriol, though you can see none of the Spirit with your bare Eye upon its Point when you take it out, yet if you prick the same Point of that Needle into the Middle of that Drop, no bigger than a small Pin's Head, when some Hundreds of these *Animalcula* are swimming, very nimbly frisking about, you shall immediately see these minute Creatures (if I may so call them) presently affected from the acid Particles, so as to spread themselves, and tumble down seemingly dead.

If you dissolve Salt, and, with the Point of the same Needle, repeat the Experiment (in the same manner) in some of the

same Liquor that contains some of the same Parcel of *Animalcula*, you shall see the Creatures afore-mentioned be affected too, stop in their Motion, but in another manner quite; not spread flat, as those with Spirit of Vitriol did, but shrink long and round, in Form and Figure of that we call whole Oatmeal, or an excoriated Oat. And whereas the first with the Spirit fell down flat without turning; these, as soon as affected, turn round, when they begin to be sick, and wabble, as we say, before they fall down to the Bottom and die, unless you quickly recover them with fresh Water, and then you will perceive them get a new Life by Degrees.

Tincture of Salt of Tartar, put into them in the same manner, kills them more immediately; but yet they will be first so sick, or so affected, call it what you please, as you may see by a surprising convulsive Motion, they will grow faint and languid apace, as you may see them fall to the Bottom of the Drop upon your Object Plate dead, but in their own Shape, as they were before you applied your Needle; and will neither be flat, as with Spirit of Vitriol, nor cylindrical, as with common salt Liquor.

Ink kills them as soon as Spirit of Vitriol, but makes them seem to shrink divers ways; I suppose by the Solution, of Copperas, which is in its Composition.

Blood (newly pressed from a Prick purposely made in your Finger) kills them almost as soon as Spirit of Vitriol, by reason (I suppose) of the Salt therein: But it is a fine and surprising Sight, to observe them swimming and bustling, first among the Globules of the Blood jostling one another, like Fish that are suddenly deprived of Water, and bustle together amongst Mud; for so they appeared to me.

Urine kills them too, in a little time, tho' not so soon.

Sugar, dissolved like Salt, kills them also, if used in the same manner, and with that some die flat, and some die round.

Sack will kill them, but not so speedily as the other Liquors. *Phil. Trans. Abr. Vol. 3.*

Animalcula in the Itch, by Dr. Bononio.

I found an itchy Person, and asking him where he felt the greatest and most acute Itching, he pointed to a great many Pustules not scabbed over; of which picking out one with a very fine Needle, and squeezing from it a fine Water, I took out a very small white Globule, scarcely discernible. Observing that with a Microscope, I found it to be a very minute living Creature, in Shape resembling a Tortoise, of whitish a Colour, a little dark upon the Back, with thin and long Hairs, of nimble Motion, with six Feet, a sharp Head, with two little Horns at the End of the Snout.

Not satisfied with the first Discovery, I repeated the Search in several itchy Persons of different Age, Complexion and Sex, and at differing Seasons of the Year, and found in all the same Animals, and that in most of the watry Pustules; for now-and-then, in some few, I could not see any.

And though by reason of their Minuteness, and Colour the same with the Skin, 'tis hard to discern these Creatures upon the Surface of the Body; nevertheless I have sometimes seen them upon the Joints of the Fingers in the little Furrows of the *Cuticula*, where with their sharp Head they first begin to enter, and, by this gnawing and working in with their Body, they cause a troublesome Itching, till they are got quite under the *Cuticula*; and then 'tis easy to see, how they make ways from Place to Place by their biting and eating, one single one happening sometimes to make several Pustules, of which I have often found two or three together, and for the most part very near to one another.

I examined whether or no these *Animalcules* laid Eggs, and at last, from the hinder Part I saw drop a very small and scarcely visible white Egg, almost transparent, and oblong, like the Seed of a Pine-apple. I oftentimes found these Eggs afterwards, from which, no doubt, these Creatures are generated.

From this Discovery it may be no difficult matter to give a more rational Account of the Itch, than Authors have hitherto delivered; it being very probable, that this contagious Disease is no other than the continual Biting of these *Animalcules* in the Skin, by means of which some Portion of the Serum oozing out through the small Apertures of the Cutis, little watry Bladders are made, within which the Insects continuing to gnaw, the Infected are forced to scratch, and by Scratching increase the Mischief, and thus renew the troublesome Work, breaking not only the little Pustules, but the Skin too, and some little Blood-vessels, and so making Scabs, crusty Sores, and such-like filthy Symptoms.

From hence we come to understand how the Itch proves to be a Distemper so very catching, since these Creatures, by simple Contact, can easily pass from one Body to another, their Motion being wonderfully swift, and they as well crawling upon the Surface of the Body as under the *Cuticula*, being very apt to stick to every thing that touches them; and a very few of them being once lodged, they multiply apace by the Eggs which they lay. Neither is it any wonder, if this Infection be propagated by the means of Sheets, Towels, Handkerchiefs, Gloves,

Gloves, &c. used by itchy Persons; it being easy enough for some of these Creepers to be lodged in such things as those; and indeed I have observed, that they will live out of the Body two or three Days.

Nor shall we be at a Loss to know the Reason of the Cure of this Malady, by Lixivials, Washes, Baths, and Ointments made up with Salts, Sulphurs, Vitriols, Mercuries Simple, Precipitate or Sublimate, and such Sort of corrosive and penetrating Medicines; these being infallibly powerful to kill the Vermin lodged in the Cavities of the Skin, which Scratching will never do, partly by reason of their Hardness, and partly because they are so minute as scarcely to be found by the Nails: Neither do inward Medicines perform any real Service in this Case. And if in Practice we oftentimes experience, that this Disease, when we think it is quite cured by Uction, does nevertheless in a short time return again, this is not strange, since though the Ointment may have killed all the living Creatures, yet it may not probably have destroyed all their Eggs, laid, as it were, in the Nests of the Skin, from which they may afterwards breed again, and renew the Distemper. And upon this Account, 'tis very advisable, after the Cure is once performed, still to continue the Anointing for a Day or two more; which it is the easier to do, because these Liniments may be made agreeable enough, and of a good Smell, as particularly is that compounded of the Ointment of Orange-flowers, or Roses, and a small Quantity of red Precipitate. *Phil. Trans. Abr. Vol. 4.*

Leeuwenhoek calculates, that a thousand Million of Animalcula, which are discovered in common Water, are not, altogether, so large as a common Grain of Sand. This Author, upon examining the Male Sperm of various Animals, discovered, in many, infinite Numbers of Animalcula, not larger than those above-mentioned. The white Matter also, which sticks to the Teeth, abounds with Animalcula of various Figures, to which Vinegar is fatal. And we have seen under the Article *ACETUM*, that Vinegar contains Animalcula in the Shape of Eels. In short, there is scarcely any thing which corrupts, without producing Animalcules; but I am not yet satisfy'd, that Animalcula are discoverable in any Animal Substance in Nature, which is not in a State of Putrefaction, notwithstanding what the Author above quoted has asserted. It is certain, that Animal Substances very soon incline to Putrefaction, and the Sperm the soonest of all others, that is, in a very few Minutes, or perhaps Moments. I would not from hence infer, that Animalcules are generated by Putrefaction; but I am inclined to think the Heat necessary to Putrefaction may hatch the Seeds of Animalcula deposited in various Substances thus putrefy'd; and perhaps these Substances may afford them a convenient Medium to subsist in.

But as most Discoveries in Natural Philosophy have laid a Foundation for the warm Imaginations of some Men to build a lame Theory upon, to the great Prejudice of real Knowledge; so those relating to Animalcula have been drawn in, however improperly, to support the most whimsical and chimerical Systems.

Thus some have asserted, that the Animalcules found in the Sperm of Male Animals, were the future Animals in Miniature; and that by these Generation was perform'd. Others have attempted to prove, that all Diseases were produced by Animalcula, not considering that these, when found in the putrid Parts of Animals, were the Effects, and not the Causes of Distempers. Thus *Desault* has with much Labour endeavour'd to make it appear, that the Venereal Disease, and Hydrophobia, were caused by Animalcula; and I remember somewhere to have met with a Theory of the Plague, which makes that terrible Disorder produced by Insects brought by the East Wind.

ANIMALIS FACULTAS, vel VIRTUS. The Animal Faculty, or Power. See *FACULTAS*.

ANIMALIS MOTUS, Animal Motion.

ANIMALIS SPIRITUS, Animal Spirit. See *SPIRITUS*.

ANIMATIO, Animation; an enigmatical Word used by the Alchymists in the Affair of Transmutation of Metals, when the white foliated Earth is to be fermented with the philosophical or celestial Water of Sulphur. Mercury is said to be animated, when, by Conjunction with a perfect Metal, it is reduced to a certain Species. *Libav. Apoc. Hermet. Part. 1. Cap. 10.* Such a Mercury is wanted by the Spagirists to help them to the Philosopher's Stone. *Castellus.*

ANIME. *Animi gummi, Gummi Amineae, Serap. Minea, Galeni. Amineae, Myrrba, Cels. Animum, Amato.*

Is a Gum, or white Resin, brought to us from America; it flows from an Incision made in a Tree, of a moderate Bigness, the Leaves of which are much like those of Myrtle; its Fruit is of a good Size, and called *Lobus*.

The best Gum Animé ought to be white, dry, friable, clean, of a good Smell, that soon consumes when thrown into the Fire: It contains a great deal of Oil, and essential Salt.

It is proper to discuss, to soften and dissipate cold Humours, for the Head-ach; to strengthen the Brain, they apply it to the

Top of the Head, and perfume Night-caps with it: It is also used for cleansing and cicatrizing Wounds. *Lemery de Drogues.*

Its principal Use in Medicine is external, in cold, painful, rheumatic, flatulent Affections of the Head; Nerves and Joints, Palsies, Contractions, Relaxations, Contusions, &c. It is an Ingredient in Plaisters and Cerates for these Purposes. *Raii Hist. Plant. 1846.*

There are two Sorts of Gum Animé, the Oriental, and the Western.

The Western Animé is the Tear, or white Resin, of a Tree that grows in New Spain. It is somewhat inclining to the Colour of Frankincense, [pellucid, white, inclining to a Citron-colour] but more oleaginous than Copal. We have it imported in Grains like Frankincense, but they are bigger, and, if broken, appear of a yellow Colour like Rosin. It is of a most grateful and fragrant Smell; and, thrown upon hot Coals, is easily consumed. It differs from the Oriental, in that it is not so white or shining. The Oriental also is imported in great transparent Lumps.

The Oriental is of three Kinds; first, the white; secondly, the blackish, which is somewhat like Myrrh, sweet-scented; and reckoned, by *Dioscorides*, a bad Species of Myrrh. He calls it *Minaea*, from the Country where it principally grew. *Serapio* calls it *Aminaea*, which Word the Portuguese corrupted into Animé. A third Kind is added by *Clusius*, which is the pale, resinous, and very dry and scorch'd Sort. All the Kinds exhale a grateful Odour in Suffumigations.

J. Bauhine reckons up five Species of Gum Animé.

1. The Animé of the Colour of yellow Amber.
2. What is like Rosin, being of a White inclining to Yellow.
3. The white, pellucid Sort, of the Taste of Vernix, [the Gum of the Juniper-tree] and the Smell of Mastich.
4. What is of the Colour of Colophony.
5. The white Species, which the Indians call *Copal*.

Raii Hist. Plant. See *BDELLIUM*.

ANIMELLÆ. The Glandules seated under the Ears, and all along under the lower Jaw. They are otherwise called *Lacticia*. *Castellus* from *Vesalius*.

ANIMI & ANIMÆ DELIQUIUM. See *DELIQUIUM*, *LIPOTHYMIA*, and *SYNCOPE*.

ANIMI PATHEMATATA. Affections of the Mind.

ANIMUS, Νῆς, νῆς, θυμὸς, γράμην, διάνοια. The same as *Mens*, the MIND. It is usually taken, in a strict Sense, for that Power and Faculty of the human Soul, whereby it discerns, judges, and ratiocinates.

As there is a very strict Connection betwixt the Mind, or Soul, and the Body, insomuch that it is impossible, that one should be disturbed without Injury to the other, the following Observations, with respect to their Effects upon each other, will not be foreign to a Work of which Medicine is the Subject.

A laudable and temperate Blood, duly carried through the Vessels of the Brain, imparts Vigour and Strength to the Faculties of the Soul.

'Tis confirmed to us, by daily Experience, that Presence of Mind, Moderation of Passions, and even Brightness and Force of Genius, in a great measure depend upon the due and moderate Circulation of a laudable Blood thro' the Brain; for as soon as its Motion begins to grow impetuous, or too much accelerated, so soon a Propensity to Rashness, and Excess of Passion, lays a Foundation for Wrath and Discord: When its Motion becomes too quick, Madness is to be dreaded as the Consequence, as may be observed in Fevers. If the Quantity of the Blood is too small, Dread and Terror ensue; if it moves too slowly, a mournful and dejected State of Mind is the Result.

The various Inclinations and Propensities of our Minds, either to Virtue or Vice, depend very much on the Circulation of the Blood thro' the Head.

This accounts for the Affections of the Mind being influenced by the Temperament and Constitution of the Body; for we observe, that the Actions, commonly called *Animal*, are regulated, as it were, by the Motion of the Blood. Choleric People, whose Blood flows very rapidly, are exceeding prone to Rashness, Ambition, Factions, Seditions, Enmities, and Hatreds. People of sanguine Constitutions, whose Blood flows in a gentle, easy Stream, are inclined to Pleasures, Luxury, Ease, Lust, and all the other Means of gratifying the Senses. Those of phlegmatic Habits, whose Blood flows in a faint and languid Manner, are prone to Sloth, Laziness, Nastiness, Baseness, and a Turn for esteeming or valuing nothing. And those who have a Tincture of Melancholy in their Constitutions, and whose Blood moves very slow, are cowardly, jealous, and obstinate.

The Dispositions of our Minds, and the Operations of our Souls, receive a different Turn, and are variously modified, not only by the Quality and Motion, but also by the Quantity of our Blood.

As there is a wide Difference betwixt the Quantity and Effects of that Degree of Motion wherewith a small Body, and that

that whereby one larger, is moved; so likewise, in the Animal Economy, a certain Degree of Force is impress'd on the Mind by the Circulation of a large Quantity of Blood, and a proportionably less, by the Circulation of a small Quantity of Blood. Thus we observe, that if a choleric Man abounds in Blood, all the Operations of his Mind are vehement; hot, and impetuous; by which means his Vigour of Mind, his Courage, his Solidity, his Constancy, and his vehement and indefatigable Inclination to bring about his own Measures, are augmented; all which are proportionably impair'd and lessen'd, by diminishing the Quantity of the Blood. In melancholic Constitutions, if a large Quantity of thick Blood is carried thro' the Membranes of the Brain, and their minutest Vessels, a great Steadiness or Composure of Ideas, sure and lasting Impressions of Objects, and uncommon Constancy and Resolution in acting, are the Result. When Persons of sanguine Constitutions abound in Blood, they are voluptuous, lustful, and fierce; but if a scanty Portion of Blood flows in their Veins, they become cowardly, fluctuating, and inconstant.

As a large Quantity of thick Blood contributes to Strength of Body and Fortitude, so a small Quantity of thin Blood lays a Foundation for Cowardice, and is, as it were, the Instrument of a quick and lively Sensation.

The Sentiments of *Aristotle*, upon this Point, are excellent, when [*Lib. 2. De Partibus, Cap. 4.*] he talks in this Strain: "Those Animals whose Blood abounds with many thick Fibres, are bold and furious; for all solid Bodies, when heated, convey a strong Degree of Heat: Hence it is, that Bulls and Boars are courageous, wrathful and fierce; for their Blood is replenish'd with Fibres." The same venerable Author asserts, [*Lib. 2. De Partibus Animalium, Cap. 2.*] "That a thick hot Blood contributes to Strength, but not to Understanding; and that a thin Blood is better calculated for the several Purposes of Sensation and Understanding."

Thus the Circulation of the Blood not only unites the Soul with the Body, but also governs and directs its Operations.

So long as the Circulation of the Blood is duly carried on, the vital and animal Functions are regularly and exactly performed; or, in other Words, the Man perceives, sees, hears, thinks, and reasons: But as soon as the Circulation of the Blood is impaired, diminished, or quite stopp'd, so soon his Senses, and his Memory, the Force of his Imagination, and the Faculty of his Reason, are proportionably diminish'd, impair'd, or lost. Whoever is desirous, therefore, that his Soul and Body should long maintain their darling Union, and carry on their mutual Intercourse; or that his Soul should perform her Operations with Ease, Delight, and Freedom; ought to bend all his Thoughts, and direct his principal Care, to this one Point, the preserving sound and entire the Circulation of the Blood, and those vital Motions, which, as it were, influence and govern it; which End is most effectually obtained by a proper Regimen, with regard to the Non-naturals. Whoever also is fond of that happy State, which is the genuine Result of a sound Mind in a healthy Body, must be at due Pains to preserve the Circulation of his Blood temperate, or in a due Medium; for just and excellent is that Observation of *Hippocrates*, [*Lib. de Flatibus*] where he talks in this Strain: "I am of Opinion, that nothing in the whole Body is more conducive to Wisdom than the Blood; therefore, so long as it remains in a good and natural State, Wisdom and Prudence are not wanting; but when the State of it is changed, Prudence shares its Fate, and vanishes. This is very observable in Persons that are drunk, where, by the sudden Increase of the Blood, the Mind itself, and its Prudence, receive, as it were, a sudden Shock; and they become insensible of present Evils, and bless themselves in the flattering and delusive Prospect of a future Good." There is a very remarkable Passage, to this Purpose, in a certain Letter which *Democritus* wrote to *Hippocrates*, where he says, "That the Understanding is increased by the Presence of Blood, of which those who think aright are bless'd with Store; but when the Body is diseased, and the Mind void of sufficient Force to think on Virtue, the Disease darkens the Mind herself, and draws her Prudence into Consent." *Hoffman's Medicin. Rational. Systemat. Vol. 1.*

There is so noble and sublime an Harmony and Consent between the Economy of the vital and animal Motions, that the least Defect in the Circulation of the Blood, forthwith produces a proportionable Alteration in the animal Functions; as, on the other hand, a depraved Imagination not only influences, but even vitiates and spoils, the Functions of the whole Body.

This Truth might be illustrated and confirm'd by numberless Instances; a few of which will well enough answer my present Purpose. Whenever the Motion of the Heart ceases, the Mind forthwith forbears to exert her several Operations, and all Reflection and Thought are at an End with her. A due Circulation of the Blood thro' the Brain maintains the Powers of the Soul, and the Force of the Genius, in their native Splendor and Vigour; but as soon as this due Circulation is disturbed or changed, either by a Diminution or an Acceleration of Motion,

the Mind is forthwith disposed to inordinate Affections; and Deviations from the Laws of Reason: Hence it is, that the Dispositions and Propensions of the Mind depend upon the Temperament of the Body, or the due Circulation of the Blood thro' the Brain. The drinking Wine, or taking any other Substance, which can impart a brisk and lively Motion to the Blood, uses generally to brighten the Genius, and advance the Wit above its common Standard. Medicines which, by their ungrateful Steams, contaminate the Juices, such as Narcotics, impair and sometimes quite destroy, the Reason, the Memory, the Genius, and all the Senses. How great the Influence of a depraved and ill-governed Fancy is, in changing the Motions of the Parts, may be proved from the vehement Passions of the Mind, the obstinate Fancies of melancholy People, and all the disquieting and uneasy Train of unreasonable and ill-grounded Desires and Aversions. *Hoffman. Medicin. Rational. Systemat. Vol. 1.*

The Passions and Affections of the Mind plainly prove, that the nervous Fluid, when ill-disposed, or put into a preternatural Commotion, induces a Change upon the Tone, the Elasticity, and the Strength of the Parts.

Thus we observe, that Fear or Terror contract and compress the external Parts so strongly, that the Blood is forced from the Circumference to the large internal Vessels about the Heart and Lungs; which sufficiently accounts for the Palpitation of the Heart, the Uneasiness in the Bowels, and the Cold in the extreme Parts, which are found in People upon such Occasions. By Sadness the Influx of the nervous Fluid is considerably intercepted; hence almost all the Parts of the Body lose their Tone and Strength, and a great Disposition to chronical Disorders ensues. Besides, Disorders, that are otherwise benign and gentle, easily acquire a dangerous Malignity, by reason of the Loss of Strength. The Passion of Anger, by putting the nervous Fluid into a violent Commotion, occasions a strong Stricture in all the nervous System: Hence the Pulse and Breathing become quick, the natural Heat is increased, and Men are at that time possess'd of most Strength and Vigour. *Hoffman. Medicin. Rational. System. Vol. 1.*

Since the Blood and its Motion have, by means of the Fluid of the Brain, such an Influence on the Operations of the sensitive Soul, it must of course follow, that all such Things as are possess'd of a Power of altering the Quality or Motion of the Blood, must have a proportionable Influence on the Mind.

We are not therefore to be surpris'd, if particular Climates, Regimens, or Medicines, are capable of inducing a Change in our Minds, Dispositions, and Understandings; for *Hippocrates* has very justly maintained, [*Lib. 1. de Diet.*] that the Mind may be improved and rendered wiser by Diet; and in the same Book he asserts, that if the Body be sound, and free from Diseases, the Frame and State of the Mind must, in Consequence of that, be bless'd with Wisdom; and that the Temperament of the Blood conduces much to Wisdom, is likewise asserted by the same Author. Besides, Experience teaches us, that, among the People of different Climates, some are acute, others dull; some excel their Neighbours in Force of Genius, and Reach of Thought; and others are addicted to various Vices, almost unknown to People of other Climates. It is also confirmed by Experience, that rich and generous Wine renders Men chearful and witty; whereas flatulent Substances, such as Peas and Beans, and also foetid Substances, such as Opium, and Henbane-seeds, render Men dull and mad; and 'tis well known to every Physician of Skill or Experience, that ardent Fevers produce Deliriums, and the Flatulencies of hypochondriac Persons Melancholy, and even Madness. *Hoffman. Medicin. Rational. System. Vol. 1.*

The Power of Fancy exerts itself also very strongly in changing the natural Actions. How pernicious to the Fetus the fantastical, sudden, and strong Impressions of Women with Child are, especially when accompanied with any Degree of Fear, is sufficiently proved from the Deformity of the Parts, the Marks and Spots left upon their Bodies; and how destructive of Health all vehement Desires are, is abundantly shewn from the Effects of a furious and distracted Love, the Longings of Women during Gestation, and the intense Desire of seeing one's native Country, and Relations. The Loathings, excited either by the Smell or Sight of ungrateful and disagreeable Substances, so disorder the Stomach, as to produce painful and uneasy Vomiting. Daily Experience shews us, what violent Commotions are raised through the whole Body by the innate Aversion to Cheese, Cats, Effusion of Blood, or other disagreeable Objects. Profound Meditation, and strong Application of Mind, weaken the whole Body, and the Stomach itself. We likewise observe, that they so contract, or sometimes relax, the Membranes of the Brain, as to prove the fruitful Sources of some very terrible Disorders of the Head. Accounts of Physicians, every-where to be met with, inform us, that on the bare Sight of epileptic People, or such as have the Small-pox, many have fallen into these very Distempers. Nothing is more certain, than that some People, from the very Dread of the Plague, have been seiz'd with it, even tho' it did not rage in the Country where they lived;

lived; and Experience has several times convinced us; that some have been purged, vomited, sweated, and even salivated, by pure Force of Imagination. These Accidents principally happen to delicate Constitutions, or such as have been previously weaken'd and enervated by the Shocks of some Distemper, or by some other Cause.

Hence it follows, that the more disengaged and calm the State of the Mind is, the less it disturbs and injures the Motions of the Body, the Operation of Medicines, and the salutary Effects of Aliments; and, for this very Reason, the Philosophers of all Ages, and all Countries, have, with one Voice, recommended Tranquillity of Mind, as the best and most effectual Means of lengthening our Life, and preserving the Constitution sound and vigorous. *Hoffman. Medicin. Rational. Systemat. Vol. I.*

The Female Sex, as daily Experience shews us, suffer generally very much by the menstrual Discharge being either disturb'd or obstructed; but enjoy a good State of Health when this useful and necessary Evacuation is duly and regularly carried on.

For this Reason a Physician ought to make it his principal Care to promote this Discharge in sufficient Quantities, and at due and proper Seasons; But nothing is more fatal to the due Excretion of this Recrement than violent Commotions of Mind, and more especially an Excess of Dread and Terror, the Influence of which is often powerful enough to put an immediate Stop to the Discharge, when going on in a natural, undisturb'd, and easy Manner. *Hoffman. Medicin. Ration. Systemat. Vol. I.*

As a further Confirmation of the general Doctrine here laid down by *Hoffman*, I cannot help mentioning the real, tho' scarce credible, Case of a young Lady, "who, from her natural Turn, or the Strictness of her Education, had become a remarkable *Devotee*. Her Disease, for such it was, at last degenerated into that most fatal of all Calamities, a religious *Melancholy*. Her false Apprehensions of the Supreme Being, and the Measures of his Administration, filled her Mind with all the black and ghastly Ideas of Gloom and Terror: Upon this, such a Suppression of her Menses ensued, as would yield to no *Emmenagogue*, even the most efficacious and best chosen. This unlucky Circumstance was attended with such fatal Consequences to her Health, that Life itself became a Burden, rather than a Blessing. During this disconsolate and deplorable State, she happily got acquainted with a Clergyman of a free and rational Turn of Thought, who, partly by the Graces of his Person, which sometimes are very effectual in convincing, and partly by the Strength of his Arguments, banish'd her religious Horrors, convinced her of the amiable Character of her Maker, reconciled her to Life, and reduced her clouded Mind to an easy and comfortable State: Upon this her Menses began to flow regularly, and in a due Quantity; she resumed her fresh Complexion, and her former Sprightliness returned. Her Regimen and Diet, in the mean time, were the same in both these so opposite States. But as the Diseases of the Mind, as well as those of the Body, are apt to recur on certain Occasions, so this Lady had a Relapse; her former State of Mind return'd, and brought along with it the same Disorder, with all its concomitant Train of Symptoms: She got cured a second time, by Means of the same Nature; upon which her Menses, together with her Health, return'd. In short, her Life, for some Years, was a Scene diversify'd with various Intervals of Superstition, and rational Religion: When she was under the direful Influences of the former, her Menses were obstructed, and her Health sensibly impair'd; but when under the benign Influences of the latter, her Menses flow'd regularly, and the State of her Health was good."

This, in my Opinion, is an Argument hitherto not insisted on, why young Ladies should be taught early to divest themselves of those unreasonable Fears, and gloomy Prejudices, which those who have the Care of their Education in their tender Years too frequently instil into them; for what is the Case with one of the Sex, may possibly be so with another. By this I do not mean to encourage that indecent and unpolite Scoffing at Things sacred, which has of late become too fashionable among the gayer Part of the World; but only to strip the Mind of those dark and narrow Notions, which represent God and Religion in a gloomy and disadvantageous Point of Light. The Physicians of the Platonic Sect were so sensible of the happy Influences even of natural Religion upon Health, that they used only a few simple Remedies, and ply'd their Patients with moral Precepts, and Arguments against Bigotry and Superstition, Enthusiasm, and ill-founded Horrors of the religious Kind.

This is so singular a Case, that I could not forbear inserting it as a Confirmation of *Hoffman's* Sentiments, with regard to the Influence of the Passions on the menstrual Evacuations of Women. The Account is Part of a Letter from a Gentleman, who has both Knowledge enough to represent the Case as it really was, and Candour enough to say nothing but what he knows to be true.

VOL. I.

The following Case will farther illustrate the Effects of the Mind upon the Body:

A Musician, who was a Connoisseur in his Art, and famed for his Compositions, was seiz'd with a Fever, which, gradually augmenting, became at last of the continued Kind, and was accompanied with terrible Paroxysms. On the seventh Day he fell into a very violent and almost uninterrupted Delirium, accompanied with Shrieks, Tears, Horrors, and a perpetual Want of Sleep. On the third Day of this Delirium one of those natural Instincts, which are commonly said to prompt Animals, when in Distress, to seek for those Herbs that are proper for their Case, made him desire to hear a small Concert in his Chamber. His Physician did not consent to the Proposal without some Reluctance. The thing, however, being agreed to, the *Cantatas* of Mr. *Bernier* were sung to him: No sooner had the soft melodious Strain touched him, than his Countenance assumed an Air of Sweetness and Serenity, his Eyes became calm, his Convulsions ceased entirely, he shed Tears of Joy, and was more affected with that particular Music than ever he had been with any before his Disorder, or has been with any he has heard since his Cure. He was free from the Fever whilst the Concert lasted, but, when it was at an End, relapsed into his former State. The Use of a Remedy, whose Success had been at once so happy and unexpected, was continued; the Fever and Delirium were always suspended during the Concert; and Music was become so necessary to the Patient, that in the Night-time he made a Relation of his own, who sometimes attended him, sing; and even dance, to him: This Relation, being pretty much afflicted, paid him such Pieces of Complaisance with a Kind of Reluctance. One Night in particular, when he had but his Nurse along with him, who could only blunder out the harsh and unharmonious Notes of some Country Ballad, he was obliged to put up with her Music, and even felt some Effects from it. A Continuation of the Music for ten Days cured him entirely, without the Assistance of any other Remedy, except once letting Blood from his Ankle, which was the second time that Operation had been perform'd on him during his Disorder, and which was follow'd with a very liberal Evacuation. Mr. *Dodart* acquaints us with this Case, which he says is a genuine one, but does not pretend, that it is to be set up as a Model or Standard in Cases of a like Nature. But 'tis worth while to observe, how effectually Concerts restored the Spirits, by little and little, to their natural Course in this Patient; in whom Music, by a long and protracted Habit, had become the very Soul. 'Tis not, however, probable, that a Painter should be cured by viewing the exquisite and masterly Touches of his Neighbour Artist in a Piece of Painting; since Performances in that way are not found to have the same Influences on the Spirits with Music: Neither, indeed, can the Productions of any other Art come up to it in this Particular. *Hist. de l'Acad. 1707.*

ANINGA-IBA Pisonis et Marcgr. *Arbor Brasiliensis aquatica, folio Nymphaeae, fructu reticulato, pulpa alba humida.*

It grows in the Water to the Height of five or six Feet, with no more than one brittle Stem, which is divided by a sort of Joints, and is of an Ash-colour like the Walnuts; on its Top are large, thick, smooth Leaves, of a chearful Green, shaped almost like the Leaves of Water-lily, or Sagittalis, [Arrow-head] and remarkably conspicuous for their strait main Rib, and Fibres that run off transversely from it; each Leaf is supported by a juicy Pedicle, above a Foot long; between the Leaves shoots forth one large, concave Flower, consisting of a single incarnated Leaf, of a pale-yellow Colour, with a thick yellow Style in the Centre, which is succeeded by a Catkin, that grows to be a Fruit, of the Shape, and about the Size, of an Ostrich's Egg, green, and full of a white moist Pulp, which, matured and dry'd, becomes of a farinaceous Savour, and in a time of Famine is eaten, but is dangerous, if taken to Excess; because by its Coldness and Flatulency, like Mushrooms, it threatens Suffocation.

The Wood of those that are grown to the Bigness of a Tree is used for various mechanical Purposes; for the Trunk, being light, tenacious, and of a corky Substance, is what is most used by the Natives, and the Negroes, to make their *Jangadas*, which are Rafts consisting of three Pieces of Wood join'd together for the hasty passing of Rivers; but the Medicinal Virtue consists in the bulbous Root, as specify'd below. *Raii Hist. Plant.*

ANINGA simpliciter dicta, seu J. Pisonis,

Grows in the same Place, and to the same Height, as the former. It has also one Stem, but which soon runs out into various, thick, soft, and reedy Branches, like the Plantain-tree, from every one of which grows out a very large oblong Leaf, conspicuous for its Veins here-and-there interspersed. It has only one large white Flower, which produces an extraordinary Fruit, first green, then ash-coloured inclining to yellow, of an oblong Figure, thick, compact, marked over with a sort of Grains and Points. The Natives eat it for want of better Aliment.

Both Aningas have a thick, bulbous Root, which is of more Use in Medicine than the Leaves or Fruit; for being of fine Parts, and a Deobstruent, it is apply'd to various Uses by the Portuguese, and the Natives. It is used in Fomentations against Inflammations and Obstructions of the Reins and Hypochondria. The expressed Oil is accounted excellent in the same Disorders, and supplies the want of Oil of Water-lily, or of Capers. A hot Bath, made of the Decoction of the Root in Urine, and several times renewed, affords the highest Relief under the Gout, whether recent or inveterate. *Raii Hist.*

ANINGA PERI. *Pison.*

A shrubby Plant, which grows plentifully in the thick Woods, and bears a small whitish Flower, which is succeeded by a few Grapes resembling Elder-berries, but of an azure Colour, inclining to black. The Leaves are downy, of an oval Figure, of a sad green Colour, but very pleasing to the Sight, soft to the Touch, feeling like Dead-nettle, and distinguish'd by numerous and thick Fibres.

The fresh Leaves bruised, or pulverized, cure both recent and inveterate Ulcers by the first Intention. *Raii Hist. Plant.*

ANISCALPTOR, from *Anus*, the Breech, and *Scalpo*, to scratch; that very broad Muscle, which, with its Fellow, covers almost the whole Back; so call'd, because it is in Use when that Office is perform'd. See LATISSIMUS DORSI.

ANISOS, *Ἀνίσος*, from *a* Neg. and *isos*, equal; unequal.

ANISOSTHENES, *Ἀνισοσθένης*, from *a* Neg. *isos*, equal, and *sthenos*, Strength; unequal in Strength.

ANISOTACHYS, *Ἀνισοτάχης*, from *a* Neg. *isos*, equal, and *tachys*, swift; unequal in Celerity, an Epithet of the Pulse.

ANISUM, a Plant thus distinguish'd:

Anisum, Offic. Ger. 880. Emac. 1035. Park. Theat. 911. *Raii Hist.* 1. 450. *Anisum veteribus*, J. B. 3. 92. *Anisum vel Anesum*, Chab. 396. *Anisum Herbariis*, C. B. Pin. 159. *Anisum vulgare*, Mor. Umb. 25. Buxb. 21. *Anisum officinarum*, Rupp. Flor. Jen. 229. *Anisum vulgatum minus annuum*, Hist. Oxon. 3. 297. *Apium Anisum dictum, semine suaveolente*, Tourn. Inst. 305. Boerh. Ind. A. 59. ANISE. *Dale.*

Anise, in general, is of a heating and drying Quality, makes the Breath sweet, is an Anodyne, Diaphoretic, Diuretic, and Discutient. Being drank, it restrains Thirst in a Dropsy, is good against the Poisons of venomous Creatures, and Inflammations; it stops a Looseness, and the Fluor albus; draws Milk to the Breasts, and stimulates to Venery. The Fume received up the Nostrils eases the Pain of the Head. The Powder, mixed with Oil of Roses, and distilled, cures Rup-tures in the Ears.

The best Seed is what is fresh, full, free from Mouldiness, and has a very strong Smell. The Anise of *Crete* is accounted the best of the Kind; and next to that the *Egyptian*. *Diosco-rides, Lib. 3. Cap. 65.*

Anise, drank in Wine, is good against the Venom of Scor-pions. It is one of those Simples which are most highly com-mended by *Pythagoras*, whether raw, or in Decoction. Green or dry it is an usual Ingredient in all Pickles and Sauces, and is put in the lower Crufts of Loaves, and in medicated Bags. It is used with bitter Almonds to add a Briskness to Wine. Eaten in the Morning with Alexanders and a little Honey, and washed down with a Draught of Wine, it takes off a stinking Breath, and makes the Countenance youthful. Put in a Pillow, so that it may be smelled, it relieves a Person under want of Sleep. It gives an Appetite to Food; for Luxury, among other Inven-tions, has found out a Method to render Labour unnecessary for procuring a good Stomach. For these Virtues some have called it *Anicetum* [insuperable]. It serves instead of Ligusticum [Lovage] in Pickles. *Jollas* applies its Root bruised in Wine to sore Eyes afflicted with Rheums: He also uses Anise bruised with Wine and Saffron, or bruised alone, and made into a Pul-tis, for great Defluxions on the Eyes, or to extract any thing that may have fallen into them. Used with Water, it con-sumes the Polypus in the Nose; mixed with Honey and Hyf-sop, and gargarized with Vinegar, it asswages the Quinsey; being roasted, it expectorates Phlegm, and the more effectually, if it be mixed with Honey; with half a quarter of a Pint of Anise bruise fifty bitter Almonds cleansed in Honey, for a Cough. A very easy Prescription is, to

Take three Drams seven Grains of Anise, and two Drams five Grains of Poppy; mix them with Honey to the Size of a Bean, and take one for three Days together.

It is particularly serviceable in Eructations, and therefore cures Inflammations of the Stomach, the Gripes, and the Colic. Being smelled to, or the Decoction of it drank, it represses the Hiccups. A Decoction of the Leaves digests Crudities; the Smell of the Decoction, with Smallage, stops Sneezing; being drank, it procures Sleep, represses Vomiting, and Tumors of the Præcordia, and is very useful in Disorders of the Breast and Nerves: There is nothing thought more friendly to the Belly

and Intestines; wherefore it is given roasted in the Dysentery and Tenefmus: Some add Opium, and prescribe three Pills of it in a Day, of the Size of a Lupine, diluted in a Glass of Wine. *Dieuches* gave the Juice of it for Pains in the Loins; and the Seed, bruised with Mint in Wine, to Persons afflicted with the Dropsy or Colic; and the Root in Diseases of the Kidneys. *Dalian*, the Botanist, apply'd a Cataplasm of this Herb and Smallage to Women in Labour, and for Pains in the Pudenda; and order'd it also to be drank with Dill in the Time of their Labour. In a Phrensy they rub the Patient with the green Herb and Polenta, and treat Infants under an Epi-plepsy or Convulsions after the same manner. *Pythagoras* affirms it impossible for one to be seized with a Fit of the Epilepsy, while this Herb is held in the Hand; that therefore it ought to be very much cultivated in the Gardens of such as are liable to this Distemper; and that the Smell of it facilitates the Birth; and advises, that the Woman should drink it mix'd with Po-lenta, immediately after Delivery. *Sosimenes* used it with Vine-gar for all Hardnesses, and also for Lassitudes; for which last Purpose he boiled it in Oil, and added Nitre. The Seed, drank, infallibly relieves the Traveller under Lassitude. *Heraclides* prescrib'd as much of the Seed as may be taken up with the Thumb and two Fingers, and eighteen Grains of Castor, to be taken in Mulsum, for Inflammations of the Stomach. In the same manner is it given in Inflammations of the Belly and Intestines. For the Orthopnea (a kind of Asthma) the same Quantity of Seed is given, with as much Seed of Henbane, in Ass's Milk. Many will advise half a quarter of a Pint of its Seed, with ten Bay-leaves bruised in Water, to be taken at Supper, by those who are inclin'd to vomit; eaten, and anointed warm, or drank with Castor in Oxymel, it appeaseth the Strangulation of the Uterus. Taken with the Seed of Cowcumbers and Lin-seed, each as much as may be grasped with three Fingers in a quarter of a Pint of White-wine, it cures the Vertigo that comes after Childbirth. *Tlepolemus* used the same Measure of the Seed, with the like of Fennel-seed, in Vinegar and a Glass of Honey, for a Quartan. It eases the Pains of the Gout, if the Place be anointed with it, and bitter Almonds. Taken in Wine, it gently promotes Sweat; it also preserves Garments from the Moths.

The newest and blackest is the best. It is not proper for the Stomach, except in case of Inflammations. *Pliny, L. 20. C. 17.*

It is a small tender Plant, producing one Stalk, seldom arising above two Feet high, whose lower Leaves are whole, round, and indented about the Edges; but those which grow upon the Stalk, are winged, and finely divided, of a pale green Colour; the Top is branch'd into several Umbels of small white Flowers, which are succeeded by round longish Seeds, swell-ing toward the Bottom, and ending in a bluntish Point of a greenish Colour, which are of a pleasant Smell, and of an hot but very sweet Taste. It flowers and seeds in July, the Root dying every Year, after it has yielded Seed. It is cultivated in Germany; but the best Seed, which is a smaller Sort, comes from Spain. The Seed only is used, being one of the four greater hot Seeds.

Aniseed is Carminative, expelling Wind out of the Stomach and Bowels, both given at the Mouth, and in Clysters. It is frequently put into Childrens Viçuals, for the Gripes and Wind. It is very useful against cold Affections of the Lungs, Difficulty of Breathing, and Asthma. Some commend it much to be taken frequently by Nurses to increase their Milk. It is often used as a Corrector of the stronger purgative Medicines. The Oil, distill'd from the Seed, is used for the same Purposes, and often applied outwardly in Carminative and Anodyne Lini-ments, and particularly for the Pleurisy, and other Pains in the Side.

Officinal Preparations are only the Chymical Oil distill'd from the Seed. *Miller's Bot. Off.*

The Moderns have added nothing to the Virtues specify'd by the Antients, except that it is a Corrector of Scammony.

For the Method of making Oil of Anise, see OLEUM.

ANISUM CHINÆ. See ZINGI.

ANISATUM, an artificial Wine, prepared of ten Pints of Honey, thirty Pints of Wine of *Ascalon*, (a maritime City of Syria) and five Ounces of Aniseeds. *Oribas. Med. Coll. Lib. 5. Cap. 33.*

ANNETESTES. The *Galenists* so call'd by *Paracelsus*, *Frag. de Morb. Gall.* by way of Derision, as ignorant and blind with respect to the Principles and Causes of things. *Castellus.*

ANNORA, calcin'd Egg-shells, or Quick-lime. *Rul. and Jehn.*

ANNOTATIO, the very Beginning of a febrile Paroxysm, when the Patients use to shiver, to be refrigerated, to yawn, stretch, and be drowsy, &c. *Gal. 2. Aph. 1.* It is also called *ἐπιπνοια*, and *ἐπὶ πρὸς τὴν πρῶτην*, the Attack of the Pa-roxysm.

There is another *Annotatio* or *Episemasia*, which is proper to Hætic Fevers, and happens when the Patient, an Hour or two after

after eating, feels an Increase of Heat, with a swifter and fuller Pulse than before, but without a Shivering, Refrigeration, or any of the forementioned Symptoms. Hence it is called by *Gal. Lib. de Diff. Feb. Cap. 9. ἐνσυνασία ἀβυσσῶς*, an inoppressive Annotatio. *Castellus*.

ANNUENTES MUSCULI, the same as *Relaxi Interni minores*, which see.

ANNUITIO. So *Pliny* calls the Motion of the Head forward.

ANNULARIS CARTILAGO, the Ring-like Cartilage or Gristle at the Head of the Larynx. See *CRICOIDES*.

ANNULARIS DIGITUS, the Ring-finger, or fourth Finger of the Hand.

ANNULARIS VENA, the Vein between the Ring-finger and the little Finger, which *Actius* advises to be open'd in Affections of the Spleen. *Actius, Tetrab. 1. Serm. 3. Cap. 12.*

ANNULUS, *Δακτυλίδιον, κέικον*. A Ring. *Quercetan de Med. Hermet.* and from him *Libavius*, mention a purging Ring prepared of Glass of Antimony. You find also in *Trallian*, and *Marcellus Empiricus*, several superstitious Rings recommended to be worn as Amulets against the Colic and Epilepsy. *Scultetus*, in his *Armament. Chirurg.* gives us the Descriptions and Figures of several Chirurgical Rings; and *Zecchius de Morb. Gallic.* writes, that a Gold Ring held in the Mouth extracts Quicksilver out of the Body.

ANNUS, *ἔτος, ἐνιαυτός*, the Year. The Antients divided the Year into Summer and Winter, as *Lind. Ex. 11. Sect. 196.* demonstrates out of *Theophrastus*; but those who came after them made a new Division of it into four Quarters, by adding Spring and Autumn.

Annus Philosophicus, the Philosophical Year, is a common Month. *Dorn. and Ruland.*

Annus Amadin, is long Life. *Dorn.*

The Seasons of the Year, and their Vicissitudes, are the Occasion of various Changes of Diseases, as *Hippocrates* observes; for which Reason their Temperatures and Alterations are to be well observed.

Annus Tempora Constantia, *καθεστῶτες καιροί*, consistent Seasons of the Year, are such as keep their usual and expected Temperature, and promise none but Diseases of a favourable Kind, and easy to be judged. On the contrary, the *Tempora Inconstantia*, *καίροι ἀκατάστατοι*, inconsistent Seasons, are unconstant, unstable, and unfit for forming a Judgment. *Hip. Aph.*

Annus unius Opus, the Work of one Year, is said of the Philosophers Stone, because it may be brought to Perfection, and the whole Process finished, in one Year, being no more than changing Gross into Subtile, and Fixed into Volatile. *Castellus.*

ANO, *ἄνω*, upwards. It is opposed to *κάτω*, downwards, and imports the superior Parts. In *Hippocrates*, and others, this Adverb is often join'd with *κοιλία*, the Belly; or *κοιλία* is understood when it implies Vomiting; as *κάτω* join'd with it, or understood, implies Purging. Of purgative Medicines also some are term'd *ἄνω*, which are Emetics, others *κάτω*, which purge downwards.

ANOCHEILON, *Ἀνώχειλον*, from *ἄνω* and *χείλος*, a Lip. The upper Lip, which is opposed to *κατώχειλον*, the under Lip. *Castellus.*

ANODIA, *Ἀνοδία*, from a Neg. and *ὁδός*, a Way. An unpassable Way. Metaphorically it signifies an improper Method of Teaching or Learning, *Hippoc. ἐν ᾧ δαΐσσει*. and is opposed to *ευοδία*, Euodia, an easy and expeditious Way of arriving at Knowledge, *Hippoc. ἐπὶ ευοδημον.*

ANODINA, narcotic Medicines. *Johnson.*

ANODMON, *Ἀνοδμων*, from a Neg. and *ὀσμὴ*, a Smell. Without Smell. Thus *ἀνοδμων πόνος* in *Hippoc. Coac.* is Pus that has no Smell, or at least no foetid Smell. It is the same as *Anosmon*, *ἀνοσμων*, and is opposed to *dysodes*, foetid.

ANODON, *Ἀνοδον* in *Hippocrates* is expounded by *Erotian* *βαθμὴν καὶ δῖον ἑδῶν*, the Threshold and Step of a Door; or a Stone at the Threshold of the Door, by which an Entrance opens into the House. The same, he says, is also called *ἐλάτ*. But if this Interpretation of *Erotian* be right, he seems to have in View that Passage *Lib. de Art.* where *Hippocrates* orders *τὴν κλίνην τὰς πόδας ἐρηρῆσαι πρὸς τὸν ἑδῶν*, the Feet of the Bed to be fasten'd to the Threshold of the Door. And also another Passage in the same Book, which runs thus: *τὸ μὲν ᾧ δὲ τὸ ἑδῶν ἐρεῖσθαι, τὸ δὲ ᾧ δὲ τὸ ξύλον τὸ ᾧ δὲ βαλμῆναι*, One of them (the Levers) is fasten'd to the Threshold, and the other to a Piece of Wood set up for the Purpose: So that *Erotian* seems to have read *ἀνοδον* for *τὸ ἑδῶν*. In *Suidas*, *ἑδῶς* signifies *βατήρ*, *ἐλάτ* καὶ *βαθμὴς*, and *τὸ κάτω τὸ βύρας*, the Stone, or wooden Step or Threshold, at the Foot of the Door, by which you enter the House. *Hesychius*, *ἑδῶς βατήρ* ὁ πρὸς τὴν βύραν, the Step before the Door: It is also called *ἑδῶς*, (*Odos*). *Foefius.*

ANODUS is the Chymists Word for what is separated from the Nourishment by the Kidneys. *Rul. Johnson.* The Greek Word *Ἀνόδης*, Anodus, from a Neg. and *ὀδός*, a Tooth, signifies Toothless.

ANODYNA, *ἀνόδυνα*, from a Negat. and *ὀδύνη*, Pain. Anodynes.

Medicines which procure Sleep, and Ease from Pain, were by the Greeks called *Hypnotic*, and *Anodyne*; and, if of a stronger Nature, *Narcotic*, or stupifying; and are such Substances as by their subtile, nauseous, and disagreeable Exhalations sometimes diminish, and sometimes quite destroy, the Motion and Sensation of the solid Parts.

Among the principal of the Hypnotic and Anodyne Medicines, are all the medicinal Preparations of the Poppy, especially Opium, which was by the Antients called the Tears of the Poppy, or Meconium, and is an Extract of the Poppy procured by boiling. But as for the Narcotic, or stupifying Medicines, all those of stronger Qualities may be reckon'd among them, such as the Preparatives of Mandrake, Henbane, Nightshade, Thorn-apple, and Dutory. (*Datura*).

Narcotics and Anodynes are justly rank'd in the Class of Poisons; for they quickly prove hurtful when given in a very small Dose, and kill entirely when exhibited in a little larger. Besides, they exert their Influences, and produce their Effects, principally upon the more noble Parts of our Bodies, in which the Powers of Sensation and Motion reside.

Celsus is of Opinion, that these should never be given without absolute Necessity, because they are of a violent Nature, and hurtful to the Stomach. And *Galen* says of Narcotics, that they are called Anodynes as improperly as a Man who was dead would be said to feel no Pain.

It is recorded of *Sylvius*, that he said he would not practise Physic without the Use of Opium; but notwithstanding this great Encomium, I am satisfy'd, that for one who receives any Benefit from Opium, a hundred lose their Lives. As Opium and its Preparations seldom fail to induce Ease from Pain, they too often lay a Temptation in the Way of People in the lower Class of Physic, to satisfy the Impatience of those they attend, tho' at the Expence of Life; insomuch that I was once a Witness of the Destruction of three People in this Way, by one and the same Person, and that in less than six Months: And in such Cases Physicians are usually called in too late to remedy the Evil.

It must, however, be confessed, that Anodynes are, in some Cases, of great Importance, if administer'd with Prudence and Judgment. Thus, if in Miscarriages the Placenta, or any Part of it, remains in the Uterus, Anodynes, by relaxing the Parts, and removing the Stricture, which is increas'd by Pain, make room for the Expulsion of what is retained. In like manner also, Anodynes are of Service, when a Stone is fixed in one of the Ureters, after proper Evacuations. And when a Suppression of Urine is caused by a painful Stimulation, and consequent Contraction, of the Sphincter Muscle of the Bladder, Anodynes, by removing the Cause, make way for a ready Discharge of Urine.

Hoffman is of Opinion, that Sleep and Anodyne Medicines quench Thirst, because they remove the Stricture from the Glands, and relax the Ducts of the Fauces, by which means a more plentiful Affusion of Moisture to them is procur'd.

But by Anodynes, in a more lax Sense, may be understood, all Remedies which relieve Pain. Thus a Lancet may, not improperly, be said to be an Anodyne, because, by evacuating a Part of the Blood, it mitigates inflammatory Pains. Thus all relaxing Remedies, Diluters, and Medicines which by any means destroy Acrimony, or expel Wind, are, in their Effects, Anodynes, when properly apply'd.

ANODYNIA, *Ἀνοδυνία*, Indolence, or Absence of Pain. *Castellus.*

ANODYNUM minerale, Sal Prunellæ. *Castellus.*

ANOEIA, *Ἀνοεία*, from a Neg. and *νῆς*, the Mind; the same as *Amentia*, Madnefs.

ANOMALIA, ANOMALUS, *ἀνομαλία, ἀνόμαλος*, from a Neg. and *ὁμαλός*, equal, smooth. Irregularity, Inequality, unequal, irregular.

An unequal or irregular Pulse is one, that falling higher in one Part of the Artery, which swells and dilates itself to a greater Degree, than in another Part which is more narrow; and, in a manner, contracted, beats with unequal Force, so that one Part of the Artery seems to be lifted up with vigorous, the other with weak Efforts. *Galen. in Definit. Med.*

An unequal Pulse is one that gives sometimes a stronger, sometimes a weaker Stroke. *Galen. ibid.*

We call that an irregular or unequal Pulse, which consists of one, two, three, or more Kinds of Pulses. This Irregularity lies sometimes in one Pulse; sometimes in more. We call it an Irregularity in one Pulse, when, feeling the Pulse with our Fore Fingers, we find a different Pulsation under each Finger. Sometimes we feel one kind of Pulse under two Fingers, and another kind under the other two Fingers; and sometimes one kind of Pulse under one Finger, and a different one under the other three. *Aetarius, Lib. 1. περὶ διαφόρων παθῶν; Cap. 1.*

Of unequal Pulses, some destroy the Equality in one Pulsation of the Artery, others in more; this latter Inequality is commonly called by Physicians Systematic (*collektive*). *Galen de Caus. Pulsf.*

ANOMOEOMERES, Ἀνομοιομερές, from a Neg. ἄνους, like, and μέρος, a Part. Dissimilar in Substance, or consisting of Parts of a different Kind. *Blancard.*

It is also called ἑτερογενές, heterogeneous.

ANOMOEOS, Ἀνόμοιος, dissimilar, or heterogeneous. The Word is apply'd by *Hippocrates* to preternatural and vicious Humours generated in the Parts, which, if they tend upwards, he advises, by way of Revulsion, to purge downwards; if downwards, to endeavour their Solution by Revulsion upwards. *Foetus.*

ANOMPHALOS, Ἀνόμφαλος, from a Neg. and ἰμφαλός, a Navel. Without a Navel, as were *Adam* and *Eve*, being created, and not nourished by the Umbilical Vessels, as some of the Learned have been at much superfluous Pains to prove.

ANONA.

The Characters are:

It is a Tree growing to the Height of an Apple-tree; the Leaves are for the most part single and oblong; the Flowers, for the most part, consist of three thick narrow Petals or Flower-leaves, and are produc'd single upon their Foot-stalks: These Flowers are succeeded by conical, squamous, or-netted Fruit, which have a pulpy Substance surrounding the Cells, in which are contain'd oblong hard Seeds.

The Species are,

1. *Anona maxima, foliis latis splendentibus, fructu maximo viridi conoide, tuberculis seu spinulis innocentibus aspero.* Sloan. Cat. Pl. Jam. THE SOUR-SOP; *vulgô.*

2. *Anona maxima, foliis oblongis angustis, fructu maximo luteo conoide, cortice glabro, in areolas distincto.* Sloan. Cat. Pl. Jam. THE CUSTARD-APPLE; *vulgô.*

3. *Anona foliis odoratis minoribus, fructu conoide squamoso parvo dulci.* Sloan. Cat. Pl. Jam. THE SWEET-SOP; *vulgô.*

4. *Anona aquatica, foliis laurinis atrovirentibus, fructu minore conoide luteo, cortice glabro, in areolas distincto.* Sloan. Cat. Pl. Jam. THE WATER OR SWEET-APPLE; *vulgô.*

5. *Anona foliis subtus ferrugineis, fructu rotundo majore laevi purpureo, semine nigro, partim rugoso, partim glabro.* Sloan. Cat. Pl. Jam. THE STAR-APPLE; *vulgô.*

6. *Anona foliis laurinis glabris viridi-fuscis, fructu minore rotundo viridi-flavo scabro, seminibus fuscis splendentibus, fissura albâ notatis.* Sloan. Cat. Pl. Jam. THE SAPPADILLA OR NASEBERRY-TREE; *vulgô.*

7. *Anona maxima, foliis laurinis glabris viridi-fuscis, fructu minimo rotundo viridi-flavo, seminibus fuscis splendentibus, fissura albâ notatis.* Sloan. Cat. Pl. Jam. THE BULLY-TREE; *vulgô.*

These Trees are the Produce of the warmest Parts of the West-Indies, as in *Jamaica*, *Barbados*, &c. where they are cultivated for their Fruits, which are in those Countries in very great Esteem, especially the *Sappadilla*, which they value more than any of the other Sorts, and hath been but lately introduc'd into some of those Islands. It is very probable, that none of these Trees were originally Natives of these Countries, but have been transplanted from some other Parts of the World; but being there planted, they thrive equally as well as if it were their native Soil, the *Sappadilla* only excepted, which is of a tenderer Nature than the others. *Miller's Dictionary.*

I take the first of these to be the *AHATE DE PANUCHO RECCHI.*

ANONIS, a Plant thus distinguish'd:

Anonis, Ononis, Aresta bovis, Offic. Chab. 168. Anonis fœve Rosta bovis, Ger. 1141. Emac. 1322. Anonis fœve Rosta bovis vulgaris, purpurea & alba, spinosa, J. B. 2. 391. Anonis spinosa, flore purpureo, C. P. Pin. 389. Park. Theat. 994. Raii Hist. 1. 957. Synop. 3. 332. Tourn. Inst. 408. Elem. Bot. 325. Boerh. Ind. A. 2. 33. Rupp. Flor. Jen. 214. Buxb. 21. Anonis, Rivin. Irr. Tetr. Dill. Cat. Giff. 147. Anonis, fœve Ononis, Rosta bovis, Remora aratri, Merc. Bot. 1. 19. Phyt. Brit. 8. Anonis purpurea vulgaris spinosa, flore purpureo, siliquis erectis lentiformibus, Hist. Oxon. 2. 169. REST-HARROW. Dale.

Miller enumerates twenty-six Species of this Plant.

Anonis, which some call *Ononis*, (I read ὀνώνιδα, according to *Theophrastus* and *Galen*) has Branches three Quarters of a Foot or more in Length, shrubby, full of Joints, and running out into many lesser Branches, or Sprays, with round Heads, and little thin Leaves like those of Lentils, and shaped like the Leaves of Rue or Meadow Trefoil, somewhat hairy, scented, and not of an unpleasant Smell.

Being gather'd before it produces Prickles, it makes a very grateful Pickle. The Branches are thick set with sharp, stiff Thorns, like a Palisade.

The Root is heating and attenuating. The Bark hereof, drank in Wine, provokes Urine, and breaks the Stone; the same absterges Ulcers which are crufted over. The Root boiled in Oxycras, and the Mouth washed therewith, cures the Tooth-ach. *Dioscorides, Lib. 3. Cap. 21.*

It is like Fenugreek, only more shrubby and hairy; after the Spring it shoots forth Prickles. The fresh Herb absterges the Margins of Ulcers. The Root is boiled in Posca for the Pain of the Teeth; and, drank in Wine, expels Stones and Gravel. Boiled in Oxymel to one half, it is given to those who are subject to the Falling Sickness. *Pliny, Lib. 21. Cap. 4.*

The Roots of Rest-harrow are very tough and woody, of a white Colour, running deep into the Earth, and sending out many shrubby Twigs or Branches, smooth and tender at the first springing, but afterwards tough, and full of long sharp Thorns, one growing at every Setting-on of the Leaves, which grow several together at the Joints, each being made of three Parts like Trefoil, and fastened to the Stalk by a flat Appendix: They are small, about half an Inch long, and crenated about the Edges; among these, towards the Tops of the Branches, grow the Flowers which are papilionaceous, or like the Flower of a Pea, but less and flat, of a reddish-purple Colour, growing in hairy five-pointed Calyces. After these are fallen, come small flat Pods, each containing two or three small kidney-like Seeds. It grows in waste Grounds, and by the Road-sides, and frequently among Corn, flowering in June and July.

This Root, which is one of the five opening Roots, is the only Part that is used, chiefly the cortical Part, and is a good Medicine against the Stoppage of Urine, Gravel, and Stone, to cleanse the Reins and Ureters from tough slimy Humours. It opens Obstructions of the Liver and Spleen, and helps the Jaundice. A Decoction of it in Vinegar and Water, used as a Gargle, helps the Tooth-ach from a Defluxion of Humours. *Miller Bot. Off.*

ANONTAGIUS, the Philosophers Stone, the Gift of God, the Sulphur fixed by Nature. *Dornæus.*

ANONYMOS, Ἀνώνυμος, from a Neg. and ὄνομα, a Name. It was formerly an Epithet of the second Cartilage in the Throat, afterwards called *CRICOIDES*, or *ANNULARIS*.

ANONYMOS is also an Epithet of several Exotic Trees or Shrubs; as

ANONYMOS Ribesii foliis is a particular kind of Shrub, with Leaves like those of Currans, and pentapetalous Flowers, of a faint-whitish Colour, and set together on the Extremities of the Sprays, in Form of an Umbella, and supported by small oblong Pedicles, the Flower-cup consisting of five Leaves. Each Flower is succeeded by two, and sometimes three Seed-vessels, or Pods, like those of Comfrey, but void of Seed, in our Gardens, because of the Inclemency of the Season. It is brought from *Virginia* and *Canada*. *Raii Hist. Plant.*

ANONYMUS flore Coluteæ Clusii, Myrto-genista quibusdam. Chamæbuxus fœve Chamæpyros quibusdam, J. B. Chamæbuxus flore Coluteæ, Ger. C. B. Pseudo-chamæbuxus, Park. It grows in several Parts of Germany. *Idem.*

ANONYMUS frutex Brasiliæ, flore keiri, Marcgrav. Its Bark is ash-coloured; the Leaves grow alternately opposite, keel-shaped, indented about the Extremity, of a chearful Green, bright, and elegantly distinguish'd with oblique Fibres; the Flowers grow in Spikes at the Extremities of the Boughs; and the Spike, before the Flowers open, is of a very fine carnation Colour, but then becomes yellow, as the Flowers are in opening, which are pentapetalous, each Petal supported by an acuminate pale-coloured Leaf; the Flower contains many yellow Stamina, and has a sweet Smell like our Wall-flower. *Idem.*

ANONYMOS Brasiliæ, floribus umbellatis albis hexapetalis.

ANONYMOS baccifera, foliis salignis, Brasiliæ, Marcgrav.

ANORA. See *ANNORA.* *Idem.*

ANORCHIDES, Ἀνὸρχιδες, from a Neg. and ὄρχις, a Testicle. Such as are born without Testicles. *Castellus.*

ANOREXIA, Ἀνορέξια, from a Neg. and ὄρεξις, Appetite. Inappetency, a want of Appetite, or Loathing of Food. *Paulus, Lib. 3. Cap. 27. Ἀνορέξια αἰσίων ἐστὶν ἀπορροῆς, ἢ τοῦ δυσχεραῖας ὑπερεχούσης κατὰ τὸν σῶμα, ἢ χυμῶν περιστάσεως.* "An Anorexy is an Aversion to Food, occasion'd either by a Distemperature of the Stomach, or a Redundancy of Humours." Hence ἀνὸρεξις (Anorecti) are called ἀνὸροι, such as will take no Food for want of Appetite. *Galen. Comm. i. in Lib. 1. Epidem. τοὺς ἀνὸρεκτοὺς ὃ ἀσῖτους ἐνομάζουσιν οἱ Ἕλληνες τοὺς μὴ προσεγεγμένους σιλία, τοὺς δ' ἀπετραμμένους προσέειδ' καλῶν ἀποσίτους.* "The Greeks call such as take no Food Anorecti and Asiti; but such as have an Aversion to Food when offer'd, are named ἀποσίτοι."

ANORGISMENON, Ἀνοργισμένον, in *Hippocrates*, is explain'd by *Galen* in *Exeg.* by ἀνήμεμα, ἀνήμερον, (anamemalagmenon) mollify'd afresh. It is from ἀνὰ, and ὀργίζω, the same as ὀργάζω, to prepare by mollifying, or other means. Thus ἀνοργισμένον, or ἀνοργισμένον σῶμα, signifies a Body mollified and prepared for taking of Medicines. *Foetus.*

ANOSIA, Ἀνοσία, from a Neg. and νόσις, a Disease. The Absence of a Disease. *Castellus.*

ANOTASIER, Sal Ammoniac. *Ruland. Johnf.*

ANOTHEN, *Anothen*, an Adverb, as well as *ano*, of Time and Place, according to *Galen*, being significative of the Beginning of a Disease, and the upper Parts in the Body. *Foefius*.

ANSER, a Fowl very well known, and of much Use, of which there are two Sorts, the tame, and the wild. The tame Sort is thus distinguish'd:

Anser, Offic. Charlt. Exer. 103. Bellon. des Oyse, 157. *Anser domesticus*, Schrod. 5. 314. Raii Ornith. 358. Ejusd. Synop. A. 136. Will. Ornith. 273. Aldrov. Ornith. 3. 102. Gefn. de Avib. 125. Jonf. de Avib. 92. Mer. Pin. 179. **THE GOOSE.** Dale.

The wild Sort is thus distinguish'd:

Anser ferus, Offic. Schrod. 5. 314. Aldrov. Ornith. 3. 147. Mer. Pin. 179. Raii Ornith. 358. Ejusd. Synop. A. 136. Will. Ornith. 274. Gefn. de Avib. 140. Jonf. de Avib. 93. Charlt. Exer. 103. *De L'Oye sauvage*, Bellon. des Oyse, 158. **THE WILD GOOSE.** Dale.

Lemery says you are to chuse of either of them; that which is tender, neither too young nor too old, well fed; and that hath been bred in a pure and serene Air.

Geese are nourishing enough, and very solid and durable Food.

A Goose is a little hard of Digestion; and when it is too young, its Flesh is viscous, and apt to produce gross and excrementitious Humours; whereas, on the contrary, when 'tis too old, it is dry, hard, has a bad Juice, and causes Indigestions and Fevers.

Goose contains much Oil, and volatile Salts. The tame one also contains much Phlegm, but the wild one has not so much.

Both the one and the other, in Winter-time, agree with young bilious People, who have a good Stomach, and are used to Exercise and Labour.

R E M A R K S.

Goose is a Food that is pleasing enough to the Taste. The wild one tastes better than the tame one; because that being much more upon the Motion than the other, its Flesh is not so full of viscous and gross Juices.

The Goose lives in cold, moist, and watery Places. You meet with this Bird almost in all Countries; they live long, especially the wild Goose, if we believe some Authors. *William Gratarolus* observes, that they'll live to be twenty; and *Albertus* says sixty Years old. The tame Goose flies but little, and rises not far from the Ground; whereas the wild one flies high and swift.

A Goose lives by Land and Water, as amphibious Animals do: But the tame one lives more upon Land than the other. In short, wild Geese are almost always found in moist and marshy Places; and there are a great many of them in *Ethiopia*, which make great Havock in the Country.

It's observed, that a Goose is very vigilant; and sleeps so slightly, that the least Noise awakes her; and some People pretend, that this Bird is at least as useful as a Dog in the Night; to watch a House; for as soon as it hears any thing, it ceases not to make a Noise, when she seems to call the People of the House to her Relief, of which there is indeed a remarkable Example: When the *Gauls* were in the Night upon entering the Capital of *Rome*, they gave the Dogs that were therein some Victuals, to prevent their barking, which had the desired Effect; but nothing of Food that they threw before the Geese could hinder their Clamour; which awak'd the *Romans*.

It may be said in general, that the Flesh of a Goose is more agreeable to the Taste, than it is wholesome. In short it always abounds with heavy and gross Juices, that make it hard of Digestion, and therefore it ought to be very moderately used; however, 'tis proper enough for robust People that have a good Stomach, because it is nourishing, and a durable and solid Food.

Some pretend to tell us, that Goose-flesh, on which the Jews frequently feed, does not a little contribute to make them of a melancholy Temper, of a dull, sad, gloomy Humour, and of a bad Colour. The antient *Britains* scrupled to eat Geese; but the *English* do it now with Pleasure.

Of all the Parts of a Goose, *Galen* approves of none but the Liver and Stomach for Food; however, the Wing is also very good. Some pretend, that *Scipio Metellus*, a Roman Consul, was the first who used Goose-liver; others ascribe this Honour to *M. Sestius*, a Roman Knight.

The Skin of a Goose's Feet is looked upon to be astringent, and good to stop Bleeding; or immoderate Fluxes of the Menstrues, if taken to the Quantity of half a Dram inwardly, after it has been first reduced to Powder.

Goose's Blood is looked upon to be good against Poison, of which two or three Drams are prescribed.

The Fat of a Goose is used in Physic. It is of a dissolving and mollifying Nature. It eases the Piles; and Pains in the Ears, if put into them. When taken inwardly, it loosens

the Body; and those Parts of the Body, which are affected with the Rheumatism, they rub with it.

They reduce Goose-dung into a Powder; and half a Dram of it is prescribed, in order to rarefy and attenuate the Humours; to provoke Sweating, Urine, and the Menstrues; as also to hasten Delivery. *Lemery on Foods*.

Dale, from *Schroder*, farther relates, that the Fat of a Goose is good in an Alopecia; and that it cures Fissures in the Lips (see *ADERS*); that the Dung dries, incises, and opens to a very great Degree; promotes the Discharge of the Secundines; and is excellent in the Jaundice, Dropsy, and Scurvy; and that the Cuticle of the Feet is a good Application to Chilblains.

The Salts of the wild Goose must be more highly exalted than those of the tame Sort, by reason of their habitual Exercise; and the Food of both Sorts, which consists of Worms, and other Insects, as well as Vegetables, furnishes their Flesh and Fat with a highly volatile and penetrating Salt: Hence they are subject to be very rank.

ANSERINA. See **POTENTILLA**.

ANSJELI. See **ANGELINA**.

ANTACHATES, *Ἀσάχης*, Amber, or a bituminous Stone of another Colour, which in burning smells of Myrrh, as *Agricola* writes of it. *Gorræus*.

ANTACIDA. Such Remedies as resist or correct the Acidity of the Humours.

ANTAGONISTA, *Ἀνταγωνιστής*, from *ἀντί*, against, and *ἀγωνίζω*, to strive. Antagonist, a Word apply'd to such Muscles as are contrary to others; for Instance, the *Musculus Abductor*, and the *Musculus Adductor Brachii*, are Antagonists.

ANTALGICUS, *Ἀνταλγικός*, from *ἀντί*, against, and *ἄλγος*, Pain. 'Tis apply'd in general to such Remedies as ease Pain. *Castellus*.

ANTALIMUM, *five Antale, Tubulus Marinus.* *Rondel*.

Is a little Shell like a Pipe, about an Inch and an half long, of the Bigness of a large Quill at the thick End, and that of a little Quill at the other, having little strait hollow Lines, reaching from one End to the other, of a white or greenish-white Colour. It is found upon Rocks, and at the Bottom of the Sea. It incloses a small Sea-worm; and contains a little fix'd and volatile Salt, with a very little Oil, and a great deal of Earth.

It is alkaline, resolute, and desiccative. *Lemery de Drogues*.

ANTAPHRODISIACOS, *Ἀνταφροδισιακός*, from *ἀντί*, against, and *Ἀφροδίτη*, Venus. Antivenereal, an Epithet of such Medicines as extinguish amorous Desires.

ANTAPHRODITICA, the same as *Antaphrodisiaca*.

ANTAPODOSIES, *ἀνταποδosis*, from *ἀνταποδίδωμι*, to reciprocate. I think this may properly be translated Returns, or Periods, or Vicissitudes of the Paroxysms of Fevers. *Hippocrates*, *Aph.* 12. Section the first, says, That the Paroxysms and Forms of a Distemper are made evident from a Consideration of the Disease in itself, the Seasons of the Year, and the Reciprocations of the Periods, (*ἀνταποδosis τῶν περιόδων πρὸς ἀλλήλας*) that is, the Manner of; or Time in which they succeed each other, whether every Day, or every other Day, or at longer Intervals.

ANTARTHRITICUM, *Ἀνταρθριτικόν*, from *ἀντί*, against, and *ἀρθρίτις*, the Gout. A Medicine against the Gout. *Blancard*.

ANTASTHMATICA, *Ἀντασθματικά*, from *ἀντί*, against, and *ἄσθμα*, an Asthma. Remedies against the Asthma. *Blancard*.

ANTATROPHON, *Ἀντατροφόν*, from *ἀντί*, and *ἀτροφία*, a Consumption. An Epithet of some Medicines against Consumptions.

ANTECEDENS, *Προηγμένη*, from *πρὸ*, before, and *ἵκωμαι*, to lead. Preceding, commonly apply'd to Cause. See **CAUSA**.

Antecedentia Signa, preceding Signs, are such as are observ'd before a Disease, as a bad Disposition of the Blood, which is the Cause of infinite Diseases.

ANTELABIA, *Πρόχειλα*, from *πρὸ*, and *χείλος*, a Lip. The Extremities of the Lips.

ANTEBALLOMENOS, *Ἀντεβαλλόμενος*, from *ἀντί*, instead of, and *ἐμβαλλω*, to contribute. Substituted, spoken of such Medicines as may be substituted in the room of others. They are also called *succedanea*, succedaneous. *Castellus*.

ANTEBASIS, *Ἀντεβασίς*, from *ἀντί*, mutually, and *ἐμβαίνειν*, to enter. A mutual Insertion, or Ingress, apply'd by *Galen* to the Bones.

ANTEMETICA, *Ἀντεμετικά*, from *ἀντί*, against, and *ἐμεῖναι*, vomitory. Remedies against preternatural Vomiting.

ANTEDEIXIS, *Ἀντεδείξις*, from *ἀντί*, against, and *ἐνδείκνυμι*, to indicate. A Contra-indication; as when any thing happens in a Distemper contrary to the primary Indication; as, for Instance, an inflammatory Pleurisy indicates Phlebotomy, but the Weakness of the Patient indicates the contrary.

ANTENEASMUS, or **ANTENEASMUM**, a particular Kind of *Mania*, or Madness, when the Patients are furiously irritated, and endeavour to lay violent Hands on themselves.

ANTEPHIALTICUS, *Ἀντεφιαλτικός*, from *ἀντί*, and *ἐπι-ἀλγος*, the Incubus, or Night-mare. An Epithet of Remedies adapted to the said Disorder.

ANTEPILEPTICA, *Ἀντεπιληπτικά*, from *ἀντί*, against, and *ἐπιληψία*, the Epilepsy. Remedies against the Epilepsy, and convulsive Disorders.

ANTEPRIMA MATERIA, in *Paracelsus*, *Chirurg. Mag. Lib. 3. Cap. 11.* is a Name for that Tincture, which has a Power of tincturing and altering the *Prima Materia* (first Matter) of the Body, agreeably with, or contrary to Nature. *Castellus*.

ANTERA. See **ANTHERA**.

ANTEREISIS, *Ἀντερείσις*, from *ἀντί*, and *ἐρείδω*, to prop or sustain. The Renitency, or Resistance, which a firm and hard Body makes against an Impression. In this Sense the Word is used with respect to the Bones of the Ribs by *Hippocrates*, *Lib. de Artic.*

ANTERIT, Mercury. *Ruland. Johnson.*

ANTEROS, *Ἀντερός*, the Stone properly called **AMETHYSTUS**, which see. *Goræus*.

ANTHEDON, the Name of a Tree in *Theophrastus*, which *Ray* takes for the *Mespilus Aronia*. See **MESPILUS**.

ANTHELIX, *Ἀνθελίξ*, from *ἀντί*, and *ἑλξ*, the Helix. The inward Protuberance of the external Ear; within the **HELIX**, which see.

ANTHELMINTHICA, *Ἀνθελμινθικά*, from *ἀντί*, and *ἑλμινς*, a Worm. Remedies against Worms.

ANTHEMIS. See **CHAMÆMELUM**.

ANTHERA, *Ἀνθήρα*, from *ἀνθός*, a Flower. A compound Medicine, so called from its florid and very red Colour. Of this there are various Compositions. The following are from *Celsus*, which he prescribes for incrustated Ulcers in the Mouth:

Take of *Juncus Quadratus*, (round-rooted *Cyperus*, according to *Parkinson*) Myrrh, Sandarach, Alum, each an equal Quantity: Or,

Take Saffron, Myrrh, each two Drams five Grains; Orris, Plumous Alum, Sandarach, each four Drams ten Grains; *Juncus Quadratus*, eight Drams twenty Grains: Or,

Galls, Myrrh, each two Drams five Grains; Plumous Alum, two Drams five Grains; Rose-leaves, four Drams twelve Grains. Some, he says, take

Saffron, Plumous Alum, Myrrh, each one Dram two Grains and an half; Sandarach, two Drams five Grains; *Juncus Quadratus*, four Drams twelve Grains. The three former Compositions are pulverized, and sprinkled on the Parts affected; but this last is made into a Litus with Honey. *Celsus*, *Lib. 6. Cap. 11.*

An *Anthera* for incrustated Ulcers in the Mouth, and for swelled and stinking Gums:

Take *Iris Illyrica*, (*Florentine Orris*) Sandarach, *Cyperus*, each four Drams ten Grains; Plumous Alum, (some Copies add Myrrh) Saffron, Crocomagma, each two Drams; pound them, and mix them together. *Galen. de Comp. Medic. Sec. Loc. Lib. 6. Cap. 2.*

An *Anthera*, or *Collyrium*, for Defluxions and Pains in the Eyes, which gives Relief within an Hour:

Take of Saffron, four Drams ten Grains; Frankincense, two Drams five Grains; Cinnabar, four Drams ten Grains; Gum Arabic, two Drams five Grains. Infuse them in Wine, and when there is Occasion, bruise them till you have reduced them to a solid Mass, which make into a Litus with Honey. *Idem ibid. Lib. 4. Cap. 7.*

This Composition, as prepared by *Oribasius* and *Aetius*, *Aetii Tetr. 2. Sem. 4. Cap. 22.* is little different from the preceding, and recommended by them in Ulcerations of the Mouth.

This Medicine *Anthera* is recommended by *Caelius Aurel. Acut. Morb. Lib. 3. Cap. 3.* as good in a Quinsey.

The same is recommended by *P. Æginet. Lib. 3. Cap. 66.* in an Ulceration of the Womb.

ANTHERA in *Galen*, *Celsus*, *Paulus*, *Aetius*, and others, is the Name of a compounded Medicine appointed for different Parts of the Body, as *Anthera Stomachica*, &c. some in the Form of Powders, and some made up with Honey, still keeping the same Name, not taken from the Flowers of Roses, whereof in many of them there were none, but from the lively Colour of the Ingredients.

ANTHERÆ, in Botany, signifies the Summits, or little

Heads, in the Middle of the Flower, supported by the Stamina, but properly those of Roses.

ANTHEREON, *Ἀνθέρων*, the Chin, and that Part of the Face where the Beard grows. *Hesychius* takes it for that Part under the Chin whence the Beard begins to sprout. *Pollu. Lib. 2.* understands it much in the same Sense. *Suidas* explains it of the Beginning of the Neck and Throat; and in this Sense it is taken by *Caelius Aurel. Lib. 3. Cap. 3. & 4. Acut.* where he renders it *Gutturis Exordium*, "the Beginning of the Throat." And again, *Lib. 1. Cap. 3. Tard.* he says, *Utramque Gutturis Partem, quam Græci Ἀνθέρων vocant*, "both Parts of the Throat, which are called by the Greeks, *Antheron*, by the Latins, *Ruma*." *Hippocr. Lib. 5. Epidem. and Lib. περὶ ὁρίων φάρ.* seems by *Ἀνθέρων* to mean the Chin.

ANTHERICOS, *Ἀνθέρικος*, the Name the Antients gave to the Stalk or Stem of the Asphodel. "Theophrastus, as *Pliny* says, *Lib. 21. Cap. 17.* and the Greeks for the Generality, and amongst them their principal Leader *Pythagoras*, call'd the Stalk of this Plant, which is a Cubit, and oftentimes two Cubits long, with Leaves like the Wild Leek, by the Name of *Anthericos*; and its bulbous Root they call'd *Asphodelos*. We, says he, call the Stalk *Albus*, and the Asphodelos is "our *Hastula Regia*." *Dioscorides, Lib. 1. Cap. 199.* makes *Anthericos* to be the Flower of the Asphodel. *Hesychius* expounds *ανθέρικας*, the Stalk of the Asphodel, and also a Kind of Herb. *Eustathius*, *Varinus*, and the Scholiast on the first Idyl of *Theocritus*, make it the Fruit or Stalk of the Asphodel. *Hippocrates (Coaca Præ.)* seems to take it for the cubital Stem of the Asphodel, when, in order to examine whether there be any Bone of the Head broken or not, he advises the putting of the Stalk of Asphodel, or of Galbanum, *ανθέρικον ἢ γάλβανον*, between the Teeth, and bidding the Patient to chew it.

Suidas tells us, that the Stalks of the Asphodel were called by *Theocritus* and *Herodotus*, *ανθέρικες*, which he says, were of so tenacious a Substance, that they could not be broken. The same Author says, that *ανθέρικξ*, (*Antherix*) is so to be taken in the Scholiast on *Theocritus*, in *Theophrastus* and *Idæus*. *Apollodorus Dorienfis* will only have the Stalk called by that Name. Some take *ανθέρικξ* for the Tops of the Beards of Corn, or for the Stalks.

Plutarch, in his Banquet of the Seven Wise Men, when he explains that noted Passage in *Hesiod*, "Ὅσον ἐν μαλάχῃ τε καὶ ἀσφodelῷ μέγ' ὄνειαρ," "What great Refreshment there is in Mal-lows and Asphodel," seems to take *Ἀνθέρικος* for the Asphodel.

ANTHERON, *Ἀνθέρων*, florid. See **ANTHOS**.

ANTHEROPHYLLUS, **ANTHOPHYLLUS**. See **CARYOPHYLLUS**.

ANTHIA, *Ἀνθία*, a kind of Fish, as appears from *Oppian*, *Aristot. Rondeletius*, and *Aldrovandus*; but they disagree in their Descriptions. The Gall of this Fish is recommended by *Kiramesides*, as he is quoted by *Aldrovandus*, as good against *Exanthemata*, and the Fat against Tumors and Abscesses. *Castellus*.

ANTHINES, **ANTHINOS**, *Ἀνθίνης*, *ανθίνος*, from *ανθός*, a Flower. An Epithet of some medicated Wines and Oils. Such Wines had Flowers infused, or were sweet-scented, and called *Vina Odorata*, smelling like Flowers. The Oil that had this Epithet, was *Oleum Liliaceum*, or *Lirinum*, or *Susinum*, which are all the same. There was also the *ανθίνον μέγρον*, *Anthinum Unguentum*, the same also as the *Susinum* or *Liliaceum*, and differed from the Oil of that Name only, as *Galen* says, by the Mixture of some Spices.

ANTHONOR, the same as **ATHANOR**, which see.

ANTHORA. See **ACONITUM**.

ANTHOS, *Ἀνθος*, a Flower. *Ἀνθος*, in *Hippocrates*, signifies not only all Sorts of Flowers, but sometimes, according to *Galen*, signifies Seeds also; and in *Coac. Præn.* *Ἀνθρα* (in the plural Number) means the same as *ἐρυθρόμαλα*, Rednesses. He also frequently puts *ανθός*, for the *Flos Æris*. The Adjective *Antheron*, *ανθέρων*, in *Hippocrates*, is used to signify florid, very red, and bloody. Thus, *Lib. 6. Epid.* *Galen* explains *ανθέρων πύσμαλα*, (florid Spit) by *ἐρυθρὰ καὶ ὕδαμα*, red and bloody; and so in many other Places. *Aræteus* also, in *Peripn.* has *πύσμαλα διαμύρον, ανθέρων σπέρμα*, "bloody Spit, extremely florid." Such as are of a very red Complexion, are called by *Hippocr. in Prorrh.* *Ἀνθέρων*, "florid;" and *ανθέρων σῶμα*, "a florid Body," in *Epid. 6. Aph. 3. Sect. 3.* is a Body that has a Redness diffused over it, by the Increase of the natural Heat, and recalling the Blood and Spirits to the external Habit, which is the Sign of a plentiful and laudable Supply of Aliment.

ANTHOS, when used alone, signifies the Flowers of Rosemary; and is sometimes taken for the Plant, tho' improperly.

ANTHOSMIAS, *Ἀνθοσμίας*, from *Ἀνθος*, a Flower, and *σμία*, Smell. An Epithet applied to Wines that are sweet-scented, and of a most fragrant Smell. *Foefius*.

ANTHOUS, properly *Rosemary*; but, transferr'd to Metals, signifies the fifth Essence, or Elixir of Gold. *Rulandus*.

ANTHRACIA, **ANTHRACOSIS**, **ANTHRAX**. See **CARBUNCULUS**.

ANTHRA-

A N T

ANTHRACITES, 'Ανθράκις. See SCHISTOS.

ANTHRISCUS. See SCANDIX.

ANTHROPE, 'Ανθρωπὴ, or 'Ανθρώπιν, from ἄνθρωπος, a Man. The human Skin, so called by Herodotus, as Vesalius observes, Lib. 2. Cap. 5.

ANTHROPOLOGIA, 'Ανθρωπολογία, from ἄνθρωπος, a Man, and λόγος, a Discourse. A Description of Man. *Blancard*.

ANTHROPOMETRIA, 'Ανθρωπομετρία, from ἄνθρωπος, a Man, and μέτρον, a Measure. A Survey of Man in all his Dimensions. *Castellus*.

ANTHROPOMORPHOS, 'Ανθρωπομορφος, from ἄνθρωπος, a Man, and μορφή, Shape. A Name for the *Mandragoras*, or *Mandrake*.

ANTHROPOSOPHIA, 'Ανθρωποσοφία, from ἄνθρωπος, a Man, and σοφία, Wisdom, or Knowledge. The Knowledge of the Nature of Man. *Castellus*.

ANTHYLLIS is a Plant, of which there are two Species: The first is,

ANTHYLLIS PRIOR, Offic. *Anthyllis leguminosa marina* *Bætica*, vel *Cretica*, sive *Auricula muris Camerarii*. Park. Theat. 1094. *Anthyllis falcata Cretica*, ejusd. *Loto affinis*, siliquis hirsutis circinatis, C. B. Pin. 333. *Loto affinis*, siliquis hirsutis circinatis, C. Bauhini, Hist. Oxon. 2. 181. *Loto affinis*, *Anthyllis falcata Cretica Parkinsoni*, Ejusd. *Tripholium falcatum*, Alp. Exot. 257. *Auricula muris Camerarii*, J. B. 2. 387. Chab. 167. Raii Hist. 1. 922. *Medicago Cretica*, *Vulneraria facie*, Elem. Bot. 328. Tourn. Inst. 412. *Medicago Vulneraria facie*, *Hispanica*, Ejusd. & Boerh. Ind. A. 2. 35. **SEA KIDNEY-VETCH**.

It grows in Candy and Sicily, &c. by the Sea-shores, and flowers in the Summer. *Dale*.

ANTHYLLIS LEGUMINOSA, *Vulneraria*; Offic. *Vulneraria rustica*, J. B. 2. 362. Raii Synop. 3. 325. Tourn. Inst. 391. Elem. Bot. 311. Boerh. Ind. A. 2. 48. Dill. Cat. Giff. 128. *Vulneraria rustica*, *Anthyllis magna*, *Anthyllis leguminosa*, Chab. 167. *Anthyllis leguminosa*, Ger. 1060. Emac. 1240. Raii Hist. 1. 922. Mer. Pin. 8. *Anthyllis leguminosa Belgarum*, Merc. Bot. 1. 20. Phyt. Brit. 9. *Anthyllis leguminosa vulgaris*, Park. *Anthyllis leguminosa*, *Loto affinis*, *Vulneraria pratensis*, Hist. Oxon. 2. 182. *Anthyllis*, Rivin. Irr. Tetr. *Anthyllis Rivini*, Buxb. 22. Rupp. Flor. Jen. 208. *Anthyllis Loto affinis*, *Vulneraria pratensis*, C. B. P. 332. **KIDNEY-VETCH, LADY'S-FINGER**.

It grows in Pastures, and flowers in June. The Herb is in Use, and accounted a Vulnerary. *Dale*.

There are two Species of *Anthyllis*; one has soft Leaves very like those of Lentils, a Palm in Height; the Root is small and slender. It grows in sandy and sunny Places, and is of a saltish Taste.

The other Species has Leaves and Branches resembling Groundpine, but more hairy, shorter, and rougher. It bears a purple Flower, which has a very strong Smell, and has a Root like Succory.

The Herb, drank to the Quantity of four Drams ten Grains, is a powerful Remedy against a Difficulty of Urine, and Diseases of the Kidneys. Both Kinds bruised, and applied as a Pessary with Oil of Roses and Milk, assuage Inflammations of the Uterus, and are also Vulneraries. That Species which is like Groundpine, besides other Virtues, being taken in Oxymel, cures the Falling-sickness. *Dioscorides*, Lib. 3. Cap. 153.

I find no Virtues attributed to the *Anthyllis*, but what are transcribed from *Dioscorides*. *Dale* translates φλεγμονάς, τὰς ἐν ὕτῃ, Uteri Pituitas, which is a Mistake; for it signifies Inflammations of the Uterus.

ANTHYPNOTICA, 'Ανθυπνωτικά, from ἄντι, against, and ὕπνος, Sleep. Medicines against excessive or preternatural Sleep. *Blanc*.

ANTHYPOCHONDRIACA, 'Ανθυποχονδριακά, from ἄντι, against, and ὑποχόνδρια, the Hypochondria. Medicines against Disorders in the Hypochondria. *Blancard*.

ANTHYSTERICA, 'Ανθυστερικά, from ἄντι, and ὕστερον, the Uterus, Medicines against the Hysterical Passion. *Blanc*.

ANTIADDES, 'Αντιάδες, the Tonfils. It sometimes signifies the Tonfils when inflamed.

ANTIAGRI, from 'Αντιάδες, and ἄγος, a Prey. Tumors of the Tonfils.

ANTIARTHRITICA, 'Αντιαρθρικά, from ἄντι, and ἀρθρίτις, the Gout. Medicines against the Gout.

ANTIBALLOMENA, 'Αντιβαλλόμενα. See ANTEBALLOMENOS.

ANTICACHECTICA, 'Αντικαχετικά, from ἄντι, against, and καχεξία, a Cachexy. Remedies which amend a Cachexy. See CACHEXY.

ANTICADMIA, a Species of Cadmia, called also *Pseudocadmia*; ἄντι is here joined with it, to express its being substituted for the true Cadmia. See CADMIA.

ANTICAR, Borax. *Dorn*. *Rulandus*, *Johnson*, *Castellus*.

ANTICARDIUM, the same as SCROBICULUM CORDIS, which see.

A N T

ANTICATARRHALIS, the Epithet of any Remedy for a Catarrh.

ANTICAUSOTICUS, from ἄντι, against, and αἰσός, a burning Fever. An Epithet for Remedies against a *Causus*, or burning Fever.

ANTICHEIR, ἀντίχειρ, from ἄντι, over-against, and χεῖρ, the Hand. The Thumb. See POLLEX.

ANTICIPANS, this the *Greeks* express by προπαύειν. It is applied to Diseases, whose Paroxysms anticipate the Time of the preceding Paroxysm; that is, each of whose Fits begin somewhat sooner than the preceding. Thus, if a Quotidian comes one Day at Four in an Afternoon, the next Day at Three, and the next at Two, it is said to anticipate.

If the Catamenia also arrive sooner than the ordinary Period, they are said to anticipate.

ANTICNEMION, ἀντικνήμιον, from ἄντι, over-against; and κνήμη, the Leg, or Calf, of the Leg. In *Hippocrates* it signifies the Fore-part of the Tibia, which is bare of Flesh.

ANTICOLICA, Remedies against the Colic.

ANTICONTOSIS, ἀντικόνσις, from ἄντι, against; and κόνις, a Staff, or Pole. In *Hippocrates* it signifies the supporting a Person with a Staff, or Crutch.

ANTIDINICA, from ἄντι, against, and δίνη, Circumgyration. Medicines against a Vertigo, according to *Blancard*.

ANTIDOTARIUM, a Book wherein Antidotes are described, or the Place where they are made. It is much the same as *Dispensatory*.

ANTIDOTUS, or **ANTIDOTUM**, from ἄντι, against; and δίδωμι, to give. An Antidote. This Word is explained under the Article ANDROMACHUS, which see.

The Philosopher's Stone also is called by some Chymical Authors **ANTIDOTUS**, by way of Excellence.

ANTIDYSENTERICA, Remedies against a Dysentery.

ANTIFEBRILE, an Epithet for a Remedy against a Fever.

ANTIFIDES, the Calx of Metals. *Rulandus*.

ANTIGONI COLLYRIUM NIGRUM, the black Collyrium, invented by *Antigonus*, is thus prepared:

Take of Cadmia, thirty-six Drams twenty Grains; Antimony, twenty-five Drams; Pepper, eight Drams twenty Grains; Verdegris, eight Drams twenty Grains; Gum Arabic, twenty-five Drams; bruise them, and make them up in Rain-water. *Cosmus* added to this Remedy, ten Drams twenty-five Grains of the Juice of Centaury; in which he did right, in my Opinion. *Marcellus Empiricus*.

ANTIHECTICA, Remedies against a Hectic Fever. *Blancard*.

ANTIHECTICUM POTERI, a Medicine invented by *Poterius*, called also *Antimonium Diaphoreticum Joviale*. It is thus prepared:

Take equal Quantities of Tin, and Martial Regulus of Antimony, melt them in a large Crucible; then put to them; by little and little, three times the Quantity of Nitre; after the Detonation and Noise is over, wash the Whole with warm Water, till no Saltiness remains.

This is accounted a forcible penetrating Medicine; inasmuch as to make way through the minutest Passages, and search even the nervous Cells; whence, in all Disorders of that Original, it is reckoned very effectual. In those Heavinesses of the Head, Giddiness, and Dimness of Sight, whence proceed Apoplexies and Epilepsies, it does great Service. And in all Affections and Foulnesses of the Viscera of the lower Belly, it is reckoned inferior to nothing in cleansing away and discharging their Impurities. Thus it obtains in the Jaundice, Dropsies, and all Kinds of Cachexies. It is likewise esteemed of great Service even in obstinate Venereal Cases, in clearing the Blood from all Impressions of Contagion, and cleansing the Glands from those corrosive Recrements which such Distempers frequently lodge upon them, and occasion Blotches, and ulcerous Deformities. In short, there is hardly a Preparation in the Chymical Pharmacy, of greater Efficacy in most obstinate Chronic Distempers; but it is not often met with in Prescription, although constantly kept in the Shops. The Dose is from six Grains to a Scruple in grown Persons; for it is seldom given to Children, their tender Vessels not well bearing the Force of such Medicines. *Quincy's Dispensatory*.

ANTILEPSIS, ἀντιληψις, from ἀντιλαμβάνειν, or ἀντιλαμβάνομαι, to lay hold of. *Hippocrates* in his Book κατ' ἰντρεῶν, speaking of Bandages, says, that if there is any Danger of a Bandage slipping upwards, the **ANTILEPSIS** must be below; but if the Danger is of its slipping downwards, it must be above. By **ANTILEPSIS**, therefore, he means the Hold or Fixation of a Bandage upon a sound Part, either above or below the Part to be defended, in order to secure it from slipping off.

ANTIOBIUM, ἀντιόβιον, that Part of the Ear which is opposite to the Lobe. I suppose it means the Tragus.

ANTIOLOGIA,

ANTILOGIA; from *ἀντί*, against, and *λέγω*, to speak. Contradiction.

ANTILOMICA, from *ἀντί*, against, and *λοιμός*, the Plague. Remedies against the Plague.

ANTILOPUS, Offic. *Gazella Africana*, Raii Synop. A. 79. *Capra strepsiceros*, Aldrov. de Quad. Biful. 740. Charlt. Exer. 10. *Strepsiceros*, Bellon. Obs. ed. Clus. 21. Cui de Animal. 56. Gafn. de Quad. 294. **THE ANTELOPE**. Dale.

This is an African Beast like a Deer, remarkable for Swift-ness. The Hoofs and Horns are used in Medicine, and are esteemed good against the Epilepsy and Hysterics.

ANTILYSSUS, from *ἀντί*, against, and *λύω*, that Species of Madness which is caused by the Bite of a mad Dog. An Epithet for a Composition against this Madness. Thus a Composition of equal Parts of the *Lichen Cinereus Terrestris*, Greyground Liverwort, and black Pepper, is given in the College Dispensatory, under the Title of *Pulvis Antilyssus*.

ANTIMONIUM, Antimony. A great many excellent Medicines are furnished by this Mineral, to the regular Practice of Physic; and most of the empirical Nostrums which have made any considerable Figure, have been found to be Preparations thereof. Hence it has become a very important Subject, inasmuch that many Volumes have been written concerning it. Amongst these are *Basil Valentine's Currus Triumphalis* of Antimony, which, by the way, is not always to be depended on; and *Lemery's Traité de l'Antimoine*. *Angelus Sala* has also written well upon it.

Stibium, or Antimony of the Shops, *στίβιον* of *Dioscorides*, probably the *τρίβιον* of *Hippocrates*, *Lapis Spumæ candidæ nitentisque, non tamen translucentis*, of *Pliny*; *Ailmad*, or *Alamad*, of the *Arabians*; is a metallic, solid, heavy, brittle Substance, of a Lead-colour, with long shining Streaks, fusible by Fire, but not ductile. Native Antimony is of different Kinds; some is dug up with the Appearances of polished Iron or Lead, but brittle, and mixed with white or crystalline Stones. Some is composed of fine shining Lines-like Needles, sometimes disposed in regular Ranks, sometimes without any observable Order, which is termed Male Antimony. Some is disposed in thin broad Plates, or *Laminae*, called Female Antimony by *Pliny*. Some is a Congeries of small Lead-colour'd Rods, got from a tender white Stone, and easily melting in the Fire like Sulphur, which enters its Composition in great Quantities. Antimony of this Kind is found in several Parts of *Italy*. Some is marked with Saffron-colour'd or reddish Spots, as the *Hungarian* Antimony, mightily esteem'd by Chymists, because of the Golden Sulphur with which they imagine it to be stor'd. Antimony is sometimes found in a particular Ore, but most commonly mixed with other Metals; and hence its Name may have been derived, Antimony being the same as *ἀντιμύω*, an Enemy to Solitude.

Ores of Antimony are found in many Countries, and very plentifully in several Provinces of *France*, as *Auvergne*, *Poitou*, *Britany*, and others. The Glebes of Antimony are dug out of the Earth, mixed with a stony Matter, and the pure Mineral or Metal is separated by breaking the Glebe into small Pieces, and afterwards treating it in the same Manner as in refining other imperfect Metals.

The *French* Antimony consists of almost equal Parts of common Sulphur, and of a Reguline Substance. The Sulphur in Antimony is discover'd by the Smell, and the blue Flame which it emits, when calcin'd in a dark Place; and when thrown into a Crucible with Nitre, it fulgurates in the same manner as a Mixture of Nitre and Sulphur. By distilling Antimony with corrosive Sublimate, we get the Cinnabar of Antimony, which consists of the Sulphur of Antimony, and the Quick-silver of the Sublimate. If Antimony be boiled in common Water, mixed with four times its Quantity of Quick-lime, or Pot-ash, the Sulphur it contains, being dissolved in the Water, by means of the alkaline Salts, may be precipitated by Vinegar, or any other Acid. The Reguline Substance is fusible, not ductile, shining like polish'd Iron, and seems to consist of broad *Laminae*; which, when the Regulus is rightly prepared, are disposed in a radiated Manner, so as to exhibit the Appearance of a Star on its upper Surface. This Regulus may, by being calcin'd in the Sun, be separated from almost all its Sulphur, and turned to an ash-colour'd, true, vitrifiable Calx; which, being melted by a strong Fire, is converted into a hyacinth-colour'd Glass. If to this Glass, while in Fusion, any sulphurous or other inflammable Substance be added, it presently recovers its Reguline Form and Splendor. Because of the great Quantity of Sulphur which Antimony contains, an acid Liquor may be extracted from it, in nothing different from Spirit of Sulphur. From all which Observations, it is evident, that Antimony consists of a sulphurous Acid, of a bituminous, inflammable Part, and of a vitrifiable, metallic Earth. The Regulus of Antimony is dissolved by *Aqua Regia*; but is only calcined by the other Dissolvents of Metals. Antimony dissolves and destroys all Metals, except Gold, when melted with them. From this Property of Antimony, many Names have

been given it by Chymists; such as, the devouring Wolf; *Saturn*, who eats his Children; the Lead of the Wife; and the Sugar of the Sun; because Gold, melted with Antimony, is purified from all other Metals with which it is mixed, and comes out brighter and cleaner than before. Antimony is commonly thought by Chymists to contain a true, but unripe, solar Sulphur; and hence it has been called Leprous Gold, and the *Ens primum solare*; but the Sulphur of Metals is not different from the pure, original Sulphur, or Oil of Animals and Vegetables.

Among the Antients, Antimony was used to dye the *Supercilia* and *Cilia* black. Accordingly we find in Scripture, that the wicked Queen *Jezebel*, in order to charm the King her Husband, painted her Eyes with Antimony; and the Women, who used that Practice, are also reproved by the Prophets; and from thence it was, that this Mineral got the Name of *γυναικῶν*. See **ALCOHOL**.

Antimony, according to *Dioscorides*, is astringent, obstructs the Passages, cools, prevents Excrescences in the Flesh, cicatrizes Ulcers, stops Bleeding, and cleanses the Filth and Ulcers of the Eyes. *Galen* mentions its astringent and drying Virtue, and says, that it was used by Oculists in their dry Collyriums in that Intention. It was the Custom of the Antients to burn it, then to quench it in Womens Milk, or Wine, and, having afterwards reduced it to Powder, to make it up into little Pastils, which being perhaps of a quadrangular Figure, it was from thence called *τρίβιον* by *Hippocrates*. The emetic Virtue of Antimony seems to have been unknown to the Antients, or, at least, they seldom used it as such, or as a Cathartic. *Dioscorides*, indeed, mentions it in one Place, as an Ingredient in a purging Medicine made of *Elaterium* and Salt; but the Antimony seems to have been there ordered only to give a Colour to the Composition. Its cathartic Quality became generally known about the twelfth Century, in which a *German* Benedictine Monk, named *Basil Valentine*, published a Book called *Currus Triumphalis Antimonii*, where he extols the Virtues of that Mineral, and its Preparations in the Cure of an infinite Number of Diseases. In the 15th Century, *Paracelsus*, following the reigning Opinion, made the Fame of the Virtues of Antimony become still more universal; however, Physicians disputed afterwards with great Warmth and Virulence, concerning the beneficial and deleterious Qualities of Antimony. At present they are all agreed, that it is a very powerful and safe Medicine; and they acknowledge two Virtues in it, depending on its different Preparations, one emetic, or cathartic, the other diaphoretic; for all Medicines prepared from Antimony do either purge upward or downward, or are diaphoretic and sudorific. Crude Antimony is seldom used in Physic; tho' it is certain, that it possesses no hurtful Qualities, since it may be taken inwardly in the Quantity of a Dram or two, without exciting any Nausea, and is often boil'd in sudorific and drying Apozems, without communicating to them any emetic or other prejudicial Quality; and, indeed, that Way of treating Antimony has no Effect at all, since it communicates nothing to the Water, at least nothing that the Water can retain, how long soever it be boiled in it. The active Qualities of this Mineral are therefore entirely owing to its Preparations, except it be render'd emetic by some acid Juices which it meets with in the Stomach.

Crude Antimony, taken inwardly, in the above-mentioned Quantity, dissolves Viscidities in the Fluids, opens Obstructions, and is commended by some as a safe Remedy in cutaneous Diseases, in Consumptions and Epilepsies. It is likewise of great Use in fattening Brutes. The external Use of it is likewise recommended for drying Ulcers, in curing the Itch, and other Diseases of the Skin, when mixed in Ointments; in Plaisters for resolving Tumors; and in *Collyria* for Inflammations, and other Affections of the Eyes.

The most common Preparations of Antimony are the *Hepar*, or Liver of Antimony; *Crocus Metallorum*, *Vinum Stibiatum*, Emetic Tartar, Glass of Antimony; the Golden Sulphur of Antimony; and the Flowers, Butter, and Cinnabar of Antimony; the Powder of Algaroth; the universal *Panacea*, Bezoar Mineral; Diaphoretic Calx, or Diaphoretic Mineral; and the Tincture. *Geoffroy*.

Mr. Reaumur gives the following Account of the Contexture of Antimony.

Nothing is more common than to observe, as it were, long and shining Needles on the Surface of broken Antimony; and that on which they are most distinct and visible, is esteem'd the best. Sometimes these Streaks are rang'd with so much Order, and branch out with so much Regularity in certain Directions, that even those who have daily Opportunities of observing this Phenomenon, can't help being struck with its Beauty. The Figures of the constituent Molecules of this Mineral may possibly contribute something to the Formation of these Needles: But the Texture and Configuration of the constituent Parts will not alone account for the Disposition of these Streaks, and their Arrangement with regard to each other; since upon breaking different Lumps of the same Antimony, and of the same

same Shape, we often observe quite different Arrangements of these Streaks or Needles. Let us take, for Instance, equal Masses of Antimony, of a regular conical Figure, because this Mineral is generally melted in a Species of Crucibles which resemble a Funnel, or an inverted Cone. Let several of these conical Masses be broken, each into several Parts; and we shall find the Needles of the same Cone disposed in different Directions, and varying in each different Piece. In one of these Masses, from a certain Height, we may observe all the Needles directed to the Point of the Cone; a little higher, the Needles shall be horizontal, or nearly perpendicular to the former; above these we shall observe others which shall sometimes be all directed to some Point of the Base of the Cone, and sometimes divide themselves into Cones, which shall have different Summits. In another of these Masses we shall not find the Needles disposed in an horizontal Direction, but running into conical Parcels, in Directions quite the reverse of each other; that is, one conical Parcel shall have its Summit pointing to the Apex of the Cone, and that of the other shall be directed to the Base. In some Lumps we shall perceive Needles every-where; in others we shall discover none at all. Often these Needles appear in one Part of the Lump, when no such thing is to be seen in the rest. Very commonly we see them disposed in Parcels of a conical Figure, whatever the external Form and Shape of the Lump is; for the internal Cones have no Dependence upon the external conical Form of the common Mass. Sometimes the Needles are disposed along the Sides of the Cone, and their Direction seems to follow the Sides of the Vessel in which they became fixed.

Notwithstanding these Varieties, the Cause which contributes to the Production and Arrangement of these Needles, is manifest; and however little we may advert to it, seems to be owing to nothing else but that Refrigeration, by means of which the mineral Substance is changed from a fluid into a solid State. It is to this Refrigeration, and its Progress, that the Needles of Antimony owe their Production and Direction: Any Substance, whose Fluidity depends only on the gross Particles of the Fire, which separate and agitate its constituent Molecules, resumes its former Solidity, when 'tis left to itself, and when the Particles of the Fire are dissipated: Now these cannot possibly be dissipated but successively, and in a certain Order, which is generally such, that those Parts of the melted Substance, which are either next to the Sides or the Mouth of the Crucible, first assume a Consistence; then the Molecules next to these become fixed, and so on till the whole Mass loses its Fluidity: Now each fixed Molecule applies itself so much the more effectually and necessarily to that which is contiguous, as the Contact of each fix'd Molecule with that which is contiguous, contributes not a little to fix it, and deprive it of Motion.

Molecules, successively added to each other, form a kind of Fibres, Threads, or Needles, the Directions of which shew the particular Order in which the Refrigeration has been carry'd on. If the Crucible was of the Shape of a hollow Bowl; if its Sides were every-where equally thick, equally warm, of the same Consistence, and equally acted upon by an Air equally cold; and if the melted Substance was of the same uniform Nature in all its Parts, all the Needles or Fibres would be so many Rays terminating in the Centre of the Bowl. If the Substance was such, that its fix'd Particles were almost all of a Length, we should find also concentrical Beds of Needles, form'd by Parcels of each Ray, and lying at equal Distances from the Centre.

But so many remarkable Circumstances do by no means concur in the ordinary Refrigeration of Antimony; neither is it possible they should: Hence the Irregularities, of which we have been talking, must necessarily arise. I have, nevertheless, made some Experiments in Crucibles of a conical Form, in which I have generally given the Needles Directions pretty near those I intended they should have. When the Crucible, immediately after it is taken off the Fire full of fluid Antimony, is plac'd upon any Substance more capable of cooling it than the common Air, then the Bottom and the Top of the Antimony contained in the Crucible, must necessarily become cool first. Accordingly, I have, upon trying the Experiment, often found the Needles divided into two Cones, one of which had its Apex at the Bottom of the Crucible, and the other its Apex near the superior Surface of the Antimony. When, after taking the Crucible from the Furnace, I have put it upon some Coals, and also laid some upon the superior Surface of the Antimony, that the Sides might cool as soon, if not sooner than the rest, I have then found a Part of the Needles disposed horizontally, or, at least, there were Parcels of them which form'd Cones, some of which were almost perpendicular to certain Parts of the Sides of the Crucible. I have also more surely produced the same Effect, by accelerating the Refrigeration of particular Parts of the Crucible by touching them with a wet linen Cloth. Sometimes there is a Hollow form'd in the Middle of the conical Mass of Antimony,

and in that Case we see Needles directed from the Sides of this Hollow; the first Beds which have become fixed, have serv'd instead of the Sides of the Crucible in this Case.

That the Needles may be arranged with Regularity, 'tis above all things necessary, that the Refrigeration be carried on slowly, or otherwise one Molecule becomes fixed before it can be well adapted and adjusted to the End of another fix'd Molecule. If, nevertheless, the Refrigeration is too slowly made, we shall have no more Needles than if it had been too precipitately carry'd on; that same Arrangement, which existed during the State of Fusion, remaining, the Particles of the Fire make their Escape insensibly, and almost equally, from all the Parts of the Mass: In this Case, all the Molecules owe their Dispositions, as well as their State of Rest, to the Fire's ceasing to agitate them; and here the Contact of the Molecules already fixed, does not any more contribute much to stop the Motions of the other Molecules. Thus when I have left the Crucible full of melted Antimony upon live Coals, till they were extinguished, it has sometimes happened that I have not found a single Group of Needles in all the Mass; and even when I found any, they were very few in Number.

In short, it seems so probable, that the Formation and Disposition of the Needles of Antimony are the Effects of a Refrigeration, that is neither too quick, nor too slow, that it would be superfluous to support and maintain this Opinion by a longer Detail of Experiments. Instead of being surpris'd at such a Phenomenon in this Mineral, methinks we ought rather to be astonish'd, that we do not find the same Appearances in all other Substances, which have been melted by the Fire, and afterwards become fixed. The Refrigeration in them must be made in the same Order as in Antimony, and must consequently produce similar Arrangements. This is, indeed, a plausible Dilemma, and a Circumstance, which throws a kind of Diffidence into the Mind, with regard to the Truth of a very specious and probable Hypothesis: For Masses of Metal, upon being broken, do not present us with the same Appearances that Antimony does. I am not ignorant, that curious and skilful Naturalists have purposely cool'd Masses of Metal as slowly as possible, without ever being able by that means to render the Arrangement of their Parts sensible. But because the Arrangement of the Parts is not perceptible in a Mass of Metal, as it is in Antimony, does it thence follow, that there is no such Arrangement in the former, as well as in the latter? Surely not. The Mass of Antimony is a brittle Substance, and its Parts are so much the more easily and thoroughly disengaged, as they do not mutually yield to each other. If one strikes a Mass of Antimony, it flies into Pieces, every one of which retains the same Arrangement of Parts it did before the common Mass was broken. This is not the Case with Masses of Metal; for they yield to Blows, a Circumstance which makes their Parts assume new Arrangements. One cannot break them till these new Arrangements have put the Parts into such a State, as that it is more easy for them to separate from one another, than to dispose themselves otherwise than they are; and consequently this State is very different from that which they were in originally. All the Parts then may be as regularly arrang'd in a ductile Mass, as in a brittle one, without our being able to discover that Arrangement, which we must necessarily conceive to be in it. But there are Means, notwithstanding the Ductility, and even the greatest Ductility, of observing this Arrangement of Parts which has hitherto escap'd our Eyes. Lead itself will even discover its Arrangement, if observ'd in the favourable Moment. All Metals are more or less ductile when cold; they also are so, when hot in a certain Degree, beyond which they are no more, properly speaking, ductile; their Molecules, being too far removed from each other, cohere but slightly, and may be entirely separated by the first Blow they receive, provided it is but moderately severe. What happens to all brittle Bodies, happens partly to them on this Occasion; so that their being broken, when in this State, allows us to discover the Disposition and Arrangement of their internal Parts. This Observation I made first upon Lead. If it is broken when cold, we observe no Granulations in it; but I happen'd to break a Mass of it when pretty hot, and was surpris'd to find it as much granulated as a Piece of temper'd Steel when broken. The same Lead, when become cold, could not be broken without reiterated Blows, neither did Granulations appear any more in the Parts where it was broken: Now since Lead, when hot, has Granulations; since it retains them at the very Time it acquires a perfect Consistence, and when its Heat is too faint to keep it in a State of Fusion; hence it is evident, that it must also have Granulations when entirely cold. There is no Cause to reunite these Granulations, and reduce many of them into one, in the one Case more than in the other; but the Blows of the Hammer will occasion such a Reunion in the cold Lead, whereas they will produce no such Effect in that which is hot.

Having observed the Granulation of Lead, I imagin'd I might also discover a regular Arrangement of Parts in it: With this View I melted some of this Metal in a conical Crucible, and allow'd it to

assume a Consistence by little and little; and when it had acquired a sufficient one, I took it, as yet very hot, from the Crucible; then a Blow of a Hammer easily divided it into some large Lumps; the fractured Parts of which discovered to me those Needles and Fibres which I wanted to see: The Granulations, applied one against another, in certain Directions, formed these Fibres; there were Groupes of them parallel to each other, and almost perpendicular to the Sides of the Crucible. In other Groupes all the Fibres were perpendicular to the Bottom of the Crucible; and, in a Word, I saw, in the Lead, Fibres, such as are observed in Antimony, and whose Arrangement and Disposition were the same.

But, at the same time, I observed certain Differences between the Fibres of Lead, for I shall give them that Name, and the Needles of Antimony: These latter are very shining, have a lively sparkling Gloss, and are like so many Mirrors, or small Glasses, applied to each other's Ends; whereas the Fibres of the Lead are less sparkling, and are so very far from being flat, that they are visibly round: To the naked Sight; or even with a Glass that magnifies moderately, they only have the Appearance of a Groupe of small Bowls, arranged like the Grains of a Chaplet: A Glass which magnifies more, or a Microscope, represents each of these Fibres not as very round; and by their means it appears, that the Fibre is form'd of Grains applied one against another, only by a small Part of their Ends; and that, whereas the Sides of the Needles of Antimony are strait, those of the Fibres of Lead are denticulated. When this Affair, which I only hint at, at present, is more narrowly inquir'd into, it will perhaps be found, that it is upon this Figure of the Granulations, and their Arrangement, that the Ductility of Metals, and some other Substances, depends. We perceive already, that this Disposition leaves empty Spaces, which are filled up by the Parcels put out of their former Situation by the Blows of the Hammer; that, by the Force of Blows, these Vacuities, or empty Spaces, must be in some measure filled up; and that the Substance then becomes less malleable. In fine, Laminæ, applied one above another, or one against another, without leaving between them Interstices proportion'd to their Largeness, must necessarily compose brittle Masses, such as that of Antimony. I have already hinted, but I here repeat it again, that, in order to see the Disposition of the Fibres of Lead, it is necessary to catch it in the favourable Moment. If a Metal is struck when too hot, it is too much divided by the Blows of the Hammer, and crumbled into Parcels, most of which are no larger than Grains of Sand: If, on the other hand, the Metal is struck when it is not sufficiently hot, it yields to the Blows, and discovers neither the Arrangement of the Granulations, nor the Granulations themselves. By repeating the Experiment twice or thrice, one may find the exact Moment.

I have broken Masses of Tin, Copper, and Zinc, when hot, and was at no great Loss to find, in each of them, the same Granulation, and the same Fibres, I had discovered in Lead. We have no Reason to doubt, but the same Filaments are to be discovered in Gold and Silver; but I have not, as yet, made any Experiment with that View.

All soft Bodies, or such as are easily soften'd, as Wax, Tallow, Fat, Butter, have no Occasion for such a Disposition of Parts; or if they have, we can never perceive it, because they never become brittle.

All Masses which have been melted, tho' brittle, may possibly not discover this Arrangement of their Parts upon their being broken. We have already observed, that too quick, or too slow a Refrigeration, may prevent their being discovered, even in Antimony. In those Salts which are most disposed to form themselves into Crystals, if they are made to crystalize too quickly, or agitated whilst the Crystalization should be carrying on, none will appear. The Parts of melted Bodies, in like manner, do not assume a regular Arrangement, if they are too quickly refrigerated, or agitated during the Refrigeration. Another Cause may, as yet, concur to disturb, or even totally prevent this Arrangement; which is, when the melted Body is not an uniform Fluid; when it is composed of Parts, some of which have a greater Disposition to become fix'd than others, which have only the same Degree of Heat with themselves. The Formation of Fibres, Filaments, and Needles, is the Effect of a successive Refrigeration; or, to speak more accurately, of the Parts acquiring a successive Consistence. If those Parts of any melted Substance, which are remote from the Sides of the Vessel, should become fixed, before such Parts as are nearer them have lost their Fluidity, there is no more any Reason, why these Parts should form a continued right Line with the others. The more any Fluid is mixed with these Parts, which have an equal Disposition to become fixed, the more difficult it will be for Needles to form themselves in it; and when it assumes a Consistence, the Threads will be the more interrupted in it. *Mem. de l'Acad. Roy. 1724.*

Mr. Geoffroy makes the farther following Remarks upon Antimony, and its Preparations:

Vegetable Acids, being, of their own Nature, more attenu-

ated than those which belong to Minerals, easily unite with the rarefied Sulphur of Antimony; and thus separating that Sulphur from the vitriolic Acid contained in the Antimony, an emetic Compound is formed; but mineral Acids, being more dense, fix and wrap up the sulphurous Parts of Antimony, so as not to stimulate the Stomach and Intestines, but to let them pass freely into the Blood, before they can be disengaged, and act according to their own Nature. Spirit of Wine destroys the emetic Quality of Antimony, because of the too great Proportion of sulphurous Parts, by which the saline *Spicula* are so much involved, as not to be able to act on the Stomach.

Antimony is the most excellent Emetic we have, and the most sovereign Remedy in many Diseases, when rightly exhibited. In giving Emetics, three things are to be considered; the Patient, the Disease, and the Medicine. We ought, first of all, to be informed, whether the Patient vomits easily: Some Persons cannot be made to vomit with any Dose of an antimonial Medicine; some are so weak as not to be able to bear the Fatigue and Straining of a Vomit at all; some are so subject to a Spitting of Blood, that, by giving them a strong Emetic, a fatal Hæmorrhage might ensue. We ought likewise to know, whether the Patient has any considerable *Hernia*, in which Case violent Vomiting might produce very dangerous Consequences; whether the Vessels be so full, as that a Rupture of any of them may be apprehended; and lastly, whether the Patient, if a Woman, be with Child. In all these Cases, Vomits seldom ought to be ventured upon, and never without taking the greatest Precautions before-hand.

The second Thing to be considered, is the Disease itself; and especially, whether the Seat of it be in the Blood, or in the *Præputia*; the last of which may be discovered by a bitter Taste in the Mouth, Nausea, bilious Eructations, acid Vomiting, &c.

Some imagine, that Emetics can be of no real Service when the morbid Matter has reached the Mass of Blood, or when the Disease proceeds from an *Ataxia*, or Depravation of the Spirits, as in many spasmodic, hysterical, and hypochondriacal Affections: But this is a Mistake; for we find, antimonial Vomits are given with very great Success in such Cases; not so much as they evacuate what was before contained in the Stomach, as by deriving the morbid Matter from the principal Parts, the Lungs, for Instance, or *Pleura*, when threaten'd, or actually affected, into the Abdomen, from whence it is easily and readily carried out of the Body. And, for this Reason, *Hippocrates*, very wisely, advises to have recourse to Vomits in the Beginnings of such Diseases. In Convulsions an Emetic, by applying a Stimulus to the Fibres, of a contrary Nature to that from whence the Disorder proceeds, very often gets the better of that morbid Cause, and thus cures the Disease: For the same Reason *Hippocrates* gave Emetics in Diarrhoeas and Dysenteries, that the Tendency of these Evacuations might be directed upwards, and so destroyed. In Comatose Affections, Emetics powerfully shake the Viscera, increase the Oscillations of the nervous Fibres over the whole Body, and accelerate the Motion of the Fluids, or restore it, when lost, in any particular Part, so as to make them pass through the smallest Canals to their proper Emunctories. Thus we often see one Dose of an antimonial Emetic prove likewise cathartic, sudorific, &c. in a very plentiful Degree. In giving these Emetics great Care ought to be taken, that none of the abdominal Viscera be inflamed; because such Inflammations might very probably be increased by the Strain of Vomiting. We must not likewise be misled by all kinds of Reaching, or Attempts to vomit; for these are many times owing to convulsive Contractions of the Stomach, which by giving an Emetic may be increased, or perhaps that whole Bowel may be inflamed.

Thirdly, such Preparations of Antimony are to be chosen as may be given with Safety, of which the Dose may not be too great for the Strength of the Patient, and yet may answer the Intention of the Physician. Antimonials given in Powders often disappoint Physicians, either by vomiting too much, or not at all. The Effects of Antimonial Wines are very uncertain, because of the different Qualities of Wines: But the most excellent Preparation of this kind is Emetic Tartar, which ought always to be given, dissolved in a proper Liqueur, and not in too small a Dose; because if it is not strong enough to have the desired Effect, it will be apt to fatigue and torment the Patient with fruitless Nauseas and Reachings. Too great a Dose may likewise be dangerous, by exciting too violent Contractions in the Stomach, and Strainings of other Viscera, so as to cause spitting or vomiting of Blood, long-continued Reachings without bringing up any thing, Convulsions, and Inflammations of the Viscera.

If from any Dose of Antimonial Preparations, either too violent or too long-continued Vomittings should happen, the best Method is to drink a Glass of Water or Pilsan, acidulated with a few Drops of *Ol. Sulphuris per Campanam*, or Spirit of Vitriol; which will presently check the emetic Quality of the Antimony, and stop the Vomiting much more safely than Opium.

A N T

While the Emetic works, the Patient ought to drink very plentifully, either luke-warm Water, Whey, or Vcal or Chicken-water, with a View both to dilute the Contents of the Stomach, to be thrown up, and to make the Vomiting more easy, and less straining. On the other hand, Oils, and all fat Substances, check the Force of the Emetic too soon, and prevent the Dilution of the Contents of the Stomach, and are therefore to be guarded against.

Besides the medicinal Uses of Antimony, it is employed by several Artificers, to give the Silver Sound to Tin, in casting Bells, making metalline *Specula*, and Types for Printing, &c. It is likewise used by Goldsmiths in refining Gold; for when melted with that Metal, it destroys all other Metals that can be mixed with it, Silver itself not excepted, and turns them to Dross. *Geoffroy*.

PROCESSES upon ANTIMONY.

PROCESS I.

The Solution of ANTIMONY in Aqua Regia.

Take of the purest Antimony, collected from the Tops of the Cones, half a Pound; reduce it to Powder, and put it into a glass Vessel that is low, and pretty large, and cut off in such a manner as to have a wide Mouth. Set the Vessel, with the Antimony, under a Chimney that will carry the Fumes up without dissipating them; and then pour upon it half a Pound of Aqua Regia. By this means there will be excited an incredible Effervescence, with a prodigious Heat, Noise, and very red and dense Fumes, all which will soon be over. There will then remain at the Bottom a moist, thick, pappy Matter, of an Ash-colour, inclining to Yellow. Dry this with a very gentle Fire, keeping it now-and-then stirring with a Stick.

REMARKS.

This is called an immerfive or humid Calcination of Antimony, by which this Fossil, which before was neither emetic nor purgative, acquires the most virulent Qualities. The yellow Matter interspersed through this Calx, is a true Sulphur of Antimony, which the Acid not being able to dissolve, is discharged from the other metalline Part of the Antimony, which is corroded by the Aqua Regia. Hence, therefore, in this Operation, there is both a Calcination and Separation. This Process is necessary to those that follow.

PROCESS II.

True Sulphur of ANTIMONY.

Upon the Calx of the preceding Process pour some clean Water, shake them together, and pour off the turbid Liquor into another Vessel; add more Water, shake and decant as before; and proceed in this manner, till the yellow lighter Part, being thus dispersed thro' the turbid Waters, is separated from the more heavy metalline Portion. Mix the decanted Waters together, pour off the whitish Water at Top from the sulphurous Matter that falls to the Bottom, which dry with a very gentle Fire, and it will be a true Sulphur in every Character. If you put larger Lumps of Antimony into Aqua Regia, and so perform the Solution, then the Masses of Sulphur will be larger; for the Aqua Regia, penetrating to the larger Portions of the Metal, that lie concealed in the Sulphur, will dissolve and extract them, and so render the Masses of Sulphur more visible.

REMARKS.

Hence it appears, how intimately Sulphur may lie concealed under the Appearance of a shining Metal, and how surprisingly the Aqua Regia can find out the metalline Part amongst the Sulphur. But how wonderfully does the Sulphur here retain its proper Nature, without any Alteration? This is that Sulphur of Antimony which *Van Helmont* orders to be extracted, and which, he says, scarcely differs from the common Sulphur, except that it is a little more upon the Greenish; and, indeed, there is scarcely any Difference: Nor, perhaps, does the Cinnabar that is made with it, in regard of its Virtues, deserve so much Trouble: Certainly, the subliming it seven times, as he directs, is not so easily done as directed. In this Operation, however, we have an ocular Demonstration, that Antimony consists of a sulphurous and a metalline Part.

PROCESS III.

Glass of ANTIMONY.

1. Take of the purest Antimony, reduced to Powder, two Pounds; put it into a large earthen Dish that is not glazed, and, in the open Air, place it over a Fire, in such a manner, that the Powder shall fume, but not melt. The whole Art depends on thus moderating the Fire: Keep

A N T

the Powder continually stirring with an earthen Rod: A white, thick, foetid Fume will arise, which is prejudicial, and therefore must be cautiously avoided by the Operator's standing so, that the Wind shall blow it from him. Carefully continue this Calcination, in an equable manner, till the Matter fumes no longer. Then increase your Fire a little, and, if it begins to fume, keep it up till it ceases; and then make your Fire pretty strong, till the Dish begins to be red-hot, and the included Matter emits no more Fumes; and you will, by this means, have a Calx of a greyish Colour. If you proceed to calcine this with a still greater Degree of Fire, till the Powder grows red-hot, you will then have a yellow Calx, which is more purified from the volatile Part. If, in the Beginning of the Operation, your Fire should happen to be so strong as to melt the Antimony, and make it run into Lumps, you must immediately slacken your Fire, and reduce these again to Powder. This is the Calcination of crude Antimony, by means of Fire alone, and it is of great Use.

2. Put this Calx into a Crucible, round which place Fire at a Distance, gradually bringing it nearer and nearer, that the Crucible may gently and equably grow warm, hot, very hot, and at last red-hot, it being all the time close covered with a Tile, that no Coals or Ashes may fall into it. Increase your Fire till the Calx is put in Fusion, in which State let it stand for half a Quarter of an Hour, and then pour it out upon a very hot, dry Marble, and you will have a brittle, sub-pellucid, hard Cake, of a dark-yellow Colour, which is called Glass of Antimony, and is so much clearer as it stands longer in the Fire.

REMARKS.

Antimony consists of common Sulphur, and a metalline Glebe. All the Sulphur becomes volatile, by the Fire made use of for this Calcination; but the metalline Part bears a melting Fire, as appears when it is melted into Cones; but then it always yields a white suffocating Fume. Hence we know, that when powdered Antimony is sublimed with such a Fire as is not sufficient to melt it, then the external Sulphur is gradually expelled; by which means the metalline Part is purified, and at last is converted into a torrifed Calx, which, tho' the Antimony was innocent before, is a most virulent Emetic: How this should happen, is not hitherto well explained. This Calx, being put in Fusion, is Antimony converted into Glass. The Adepts say, that there is a great Agreement betwixt Lead and Antimony, which is confirm'd by the melting this Calx into Glass. This is almost a fatal Emetic: If it is infused in a soft Wine, not too acid, it yields an Emetic with very little Loss of its Substance. The Virtue, however, may be pretty soon drawn out, by repeating the Infusion: This makes the Emetic Wine every-where sufficiently known. This Glass of Antimony consumes almost all metalline Bodies in the Test, but to Gold it gives a beautiful Colour. *Boerhaave*.

This, *Geoffroy* says, is of a Hyacinth-colour; but it may be made white, yellow, red, or black, by the Addition of Borax, Sulphur, Sal Gem, or Orpiment. Glass of Antimony is a very strong Emetic, but may be weaken'd by powdering it on a Marble, and then burning Spirit of Wine upon it, for three or four times: Thus deflagrated, it may be given in the Quantity of ten or twenty Grains, which will either vomit or purge gently, and sometimes only cause a Sweat; on which Account it sometimes cures intermitting Fevers, if given a little before the Paroxysm. If this Glass, reduced to an impalpable Powder, be digested, for two or three Days, with Spirit of Wine, in which half an Ounce of Mastich has been dissolved, shaking the Vessel often; and the Spirit be afterwards evaporated by a gentle Heat; the remaining Glass of Antimony and Mastich, incorporated in this manner, will have no emetic Quality: This Powder may be taken in the Quantity of six Grains. *Geoffroy*.

PROCESS IV.

A Regulus of ANTIMONY, with Salts.

1. A Regulus is procured from Antimony by every Method in which the metalline Part is separated from the sulphurous; and the more accurate this Separation is, the purer always is the Regulus. In order to this, then, the fossil Antimony, in its native Glebe, is sometimes put into conical earthen Pots, and melted with a moderate Fire, that only makes it a little red, and thus is formed into Cones; the lower Parts of which, or those towards the Vertex, are heavy, purer, and more metalline; whilst the broader Parts, towards the Base, are less solid, darker, and more sulphurous. In this manner is Antimony depurated to a Regulus, by Fusion alone.
2. Take of common crude Nitre, two Parts; of good Tartar, three Parts; and of pure Antimony, four Parts: Dry these well, and separately reduce them to a fine Powder; and

and whilst they are exceedingly dry, mix them intimately, by rubbing them together. Make the Mixture moderately hot, and by all means very dry. Take a large Crucible, heat it gradually in the Fire till it is perfectly red-hot, and then throw into it two Drams of this dry hot Powder, which will take Fire violently, and with a great Noise, and throw out Sparks on every Side. When every thing is quiet, throw in the same Quantity more, and you will again have the very same Phenomena. Proceed in this manner till you have consumed all your Powder. And here the following Cautions are absolutely necessary: Let the Crucible be a large one, that the Matter, when it is violently agitated, may not run over: Throw in but a little at a time, lest the Mixture, when it takes Fire, should fly in large Sparks out of the Vessel: Let the preceding Portion be always thoroughly on Fire, be at Rest, and perfectly red-hot, before you throw in another; for fear the Matter, being hotter underneath, and colder at Top, should form a Crust, under which the Fire, being confin'd, would cause an Explosion much louder, and more violent, than that of a Cannon: For you have here a true *Pulvis tonitruans*, from the Nitre, Tartar, and Sulphur of the Antimony. And lastly, let the Crucible be thoroughly red-hot, for fear of the same terrible Accident. If a young Beginner, not aware of these things, goes about to make a Regulus, according to the common Directions, he runs a Risque of his Life: If he observes these Cautions, he may perform the Operation safely. After the Detonation is completed, in the manner described, cover the Crucible with a Tile, and increase your Fire till the Matter flows like Water: Have by you, at the same time, a metal-melting Cone, perfectly dry, a little warm, and rubb'd over on its Inside with Tallow, into which pour the melted Matter with one Stream, and immediately strike the Cone. Upon pouring in the Matter, a sudden Flame will burst out from the lighted Tallow. Let the Whole stand quiet and cool, and then invert the Mould, and with a Hammer strike it at the Base, and the Antimonial Cone will drop out; the lower or vertical Part of which will be the metalline Part of the Antimony, whilst that towards the Base will consist of the Salts and Sulphur. The upper Surface of the metalline Mass, where it is covered with the Scorizæ, will be marked with the Figure of a Star. The Scorizæ will liquefy, and swell in the Air.

R E M A R K S.

As this Process discovers to us the true Principles of the Metallurgic Art, it is worth while to consider it a little attentively: First, the fossil Antimonial Glebe, being melted with a proper Fire, becomes liquid and heavy: Hence the lighter Bodies that are in it, as Stones and the like, and which do not adhere to the metalline Part, according to the Laws of Hydrostatics, are cast upwards; and so the heavier metalline Part is rendered purer. And thus, in the Metallurgic Art, the metalline Matter is often, by Fusion, separated from the rest.

But, by another Metallurgic Operation, the metalline Part of the Antimony is now freed from that Sulphur, from which it could not be separated by simple Fusion, but which still remained closely combined with it; and this is done by the Help of the Powder of Tartar, and Nitre, which is therefore a fluxing Powder. When the Antimony, which consists of a sulphureous and metalline Part, is mixed with the Nitre and Tartar, and committed to the Fire, then the Nitre, Tartar, and Sulphur of the Antimony take Fire with a prodigious Impetus; and by this means there is produced a fix'd Alkali from the Nitre and Tartar: But this fix'd Alkali, being agitated with this intense Fire, greedily attracts the Sulphur, and intimately unites it with itself; and then the metalline or mercurial Part, as it is called, which is unaffected by an Alkali, being freed from its Sulphur, and put in Fusion, subsides from the lighter Parts, and collects itself at the Bottom into a Mass, which goes by the Name of *Regulus*. And as the long sharp Spicula of the Antimony dispose themselves horizontally, from the Centre to the Surface, hence they form a Star, which the Alchemistical Magi call a *Stella Signata*, and have in great Veneration. This Regulus, tho' it appears pure, will, upon being fused again with an Alkali, produce fresh Scorizæ: Nor, perhaps, can it be ever entirely freed from its Sulphur; and hence, probably, it always remains brittle; for Sulphur will render Metals so. The Scorizæ are the Sulphur of the Antimony, dissolved in a fixed Alkali; and hence their Virtues are easily understood. The Regulus is emetic, as is the Glass, and, by Infusion, yields an Emetic Wine in the same manner. This, then, is another Method of purifying Metals, by the Help of Salts, from every thing sulphurous, oily, and arsenical, which render the metalline Glebes brittle and volatile; and which being entirely separated, the Metals become pure and fixed. *Berhaave*.

The Proportions of the other Ingredients to the Antimony, and to each other, are somewhat different, in the Receipts of different Authors.

Lemery says, this may be given from two to eight Grains internally; and *Wilson*, transcribing from him, is of the same Opinion. However, a Person that ventures to give it internally, should be very well acquainted with the Effects of the Remedy, as well as with Diseases and Constitutions.

Of this Regulus of Antimony Cups are made, which communicate an emetic Quality to Wine which has stood in them for a Night's-time. It is likewise made into little Balls or Pills, which are both emetic and cathartic, though swallowed a thousand times, from whence they have the Name of the *Perpetual Pills*.

Reguli of Iron, Copper, Tin, Lead, Silver, and Gold, are made by melting these Metals with the *Regulus* of Antimony. The *Scorizæ* found above the *Regulus* in the Cone, are of a yellow or saffron Colour, and fully impregnated with the Sulphur of Antimony. *Geoffroy*.

P R O C E S S V.

Martial Regulus of ANTIMONY.

Take of new Filings of Iron, half a Pound; make them red-hot in a Crucible, and then gradually add of Antimony, very finely powdered, and made hot and dry, sixteen Ounces. Keep these in a strong Fire till they are thoroughly melted; and, whilst they are in this State, throw in gradually, of the purest, driest, fine Powder of Nitre, made very hot likewise, four Ounces. Urge this Mixture with the strongest Fire, till it flows like Water, and keep it in that Condition for a Quarter of an Hour; and then, whilst it is perfectly fluid, pour it into a melting Cone, exactly as in the preceding Process. By this means I have had a starry Regulus, as bright as Silver, to the Quantity of seven Ounces and a half. The Scorizæ are of a very different Nature from the former, dry, hard, irony, sulphurous, saline, and acrid, and scarcely dissolve in the Air.
